

EMERALD ASH BORER INFESTATIONS – AS OF JUNE 1, 2017

NOTES:

- 1) As of March 7, 2014, the entire state of Iowa is under quarantine. Firewood cannot be transported across state borders without a federal permit. To avoid the spread within the state, do not transport firewood county to county.
- 2) The emerald ash borer (EAB) is a small invasive wood-boring beetle that attacks and is 100 percent fatal to native ash trees of any size, age, or state of health. Native to East Asia, it was first discovered in Michigan in 2002.
- 3) It is estimated by the Iowa Dept. of Natural Resources that approximately 15-20% of public trees in Iowa cities are green ash. Statewide, there are over 50 million ash trees in forests and another 30 million ash trees in urban areas.
