| Public use areas (not<br>including roads or<br>highways)                                              |                  |                  |                                                           | Anaerobic<br>lagoons only <sup>16</sup> |                       |                  |                   | 300 |
| GHEX loop boreholes <sup>18</sup>                                                                     | 50               | 100              |                                                           |                                         |                       |                  |                   |     |
| Roadside ditches                                                                                      | 10               |                  |                                                           |                                         |                       |                  |                   |     |
| Road rights-of-way                                                                                    |                  |                  |                                                           | 25 <sup>20</sup>                        |                       |                  |                   |     |
| Property lines                                                                                        | 10 <sup>19</sup> |                  |                                                           | 25 <sup>20</sup>                        |                       |                  |                   |     |
| Suction water lines                                                                                   | 50               | 100              |                                                           |                                         |                       |                  |                   |     |
| Water lines continually<br>under pressure,<br>foundation drains, or<br>subsurface tiles <sup>21</sup> | 10               |                  |                                                           |                                         |                       |                  |                   |     |

<sup>7</sup>PSDS (private sewage disposal system) is defined in 567—subrule 69.1(2). For the purposes of this table, “onsite treatment system” includes any wastewater treatment system not included in the definition of a PSDS (i.e., provides treatment or disposal of domestic sewage from more than four dwelling units or 16 or more individuals on a continuing basis) that is utilizing wastewater treatment technologies described in 567—Chapter 69 to treat domestic waste. Closed portion refers to the part of a treatment system that is fully contained and does not allow effluent or pretreated effluent to enter soil or groundwater (e.g., septic tank or impervious vault toilet). Open portion refers to the part of a treatment system that allows effluent or pretreated effluent to discharge into soil or groundwater for treatment or disposal (e.g., soil absorption system or unlined ISSF system). These SDs also apply to onsite treatment systems that are not considered privately owned.

<sup>7</sup>The SDs for building sewer service lines and laterals shall be considered minimum distances when constructing sewer lines, and shall be increased where possible to provide better protection. “Water main” and “standard sanitary sewer” are the type of materials or pipe used to construct the specified type of sewer, in accordance with 567—subrule 43.3(2) and Section 2.4 of the IWFDs.

<sup>8</sup>For the purposes of this table, “wastewater treatment works” includes lagoons as specified in superscript 4 and mechanical treatment works as specified in superscript 5. When the SDs for wastewater treatment systems and structures other than wells cannot be maintained for the expansion, upgrading, or replacement of existing facilities, the SDs shall be maintained at no less than 90 percent of the existing distance on the site, providing no data is available indicating that a problem has existed or will be created. The wastewater treatment works SDs shall not apply to control buildings, including but not limited to laboratories, offices, and toilet or shower rooms.

<sup>9</sup>The term “lagoons” includes aerated lagoon systems, advanced aerated lagoon systems, and waste stabilization lagoons, as defined in 567—subrule 81.1(1), and holding ponds, equalization basins, and sludge digestion or holding tanks, as described in the IWFDs. The term does not include lagoons used to dispose of water treatment plant wastes and anaerobic lagoons used for animal wastes (as noted in superscript 8). The SD from lagoons shall be measured from the water surface.

<sup>10</sup>The term “mechanical” includes activated sludge systems and fixed film biological treatment systems, as defined in 567—subrule 81.1(1), and any other wastewater disposal system that is not a PSDS, an onsite treatment system, or a lagoon. The mechanical wastewater treatment plant SDs are recommended for pumping stations at sites remote from new or expanded wastewater treatment facilities. All pumping stations shall be off the traffic ways of streets and alleys.

<sup>11</sup>The wetted disposal area is the land and area that is normally wetted by wastewater application. The wetted disposal area shall be established at least 50 feet inside the property line on all sides of the land application site. Distances may be reduced depending upon the extent of pretreatment and operational techniques.

<sup>12</sup>Deep and shallow wells are defined in 567—subrule 40.2(1).

<sup>13</sup>The SD between a private well and an anaerobic lagoon, earthen manure slurry storage basin, earthen manure storage basin, or runoff control basin shall be 1,000 feet. If an applicant for a private well construction permit demonstrates through percolation testing that the seepage loss through the lagoon or basin does not exceed 1/16 inch/day (0.0625 inch/day), the SD shall be 400 feet. The percolation test shall meet the requirements of ASTM D1587/D1587M-15 and 567—subrule 65.15(11).

<sup>14</sup>The SD between an existing, nonpotable, deep or shallow private well and an industrial treatment works may be reduced from 400 feet to 200 feet to accommodate the expansion of an existing industrial treatment works, provided the well and the treatment works share the same ownership.

<sup>15</sup>Required distance between a new PSDS and an existing other type of PSDS.

<sup>16</sup>If sewage sludge or septage is land applied within 200 feet upgradient of a stream, lake, sinkhole, or tile line surface intake, it shall be injected or applied to the surface and mechanically incorporated into the soil within 48 hours of application unless otherwise approved by the department.

<sup>17</sup>Includes drainage channels that may have a direct connection to the groundwater table or a surface water.

<sup>18</sup>If an onsite treatment system (as described in superscript 1) has a design AWW flow of greater than 1,500 gpd and less than or equal to 5,000 gpd, the SD between an inhabitable residence, other inhabitable structure, or commercial building and the onsite treatment system shall be 100 feet.

<sup>19</sup>The SDs between an inhabitable residence, other inhabitable structure, or commercial building and the types of lagoons specified in this superscript shall apply as indicated. If a flow equalization basin is covered and at a site that is remote from new or expanded wastewater treatment facilities, the SD may be reduced to 300 feet at the department’s discretion. If the top of a remote flow equalization basin is underneath the surface of the earth, the 1,000-foot SD is recommended but not required, and the minimum SD is 100 feet. If a wastewater treatment lagoon is used solely for the retention or storage of the industrial waste from a boiler or cooling tower blow down facility and its sole use is filed with the county recorder for abstract of title purposes, the 1,000-foot distance is recommended but not required, and the minimum SD is 100 feet.

<sup>20</sup>If the inhabitable structure or commercial building is the property of the owner of the proposed lagoon or mechanical treatment facility, or there is written agreement with the owner of the building, the 1,000-foot distance shall not apply. Any such written agreement shall be submitted to the department and filed with the county recorder for abstract of title purposes, and a copy submitted to the department.

<sup>21</sup>See 60.2(2) “d” for specific anaerobic lagoon SDs.

<sup>22</sup>Septage shall not be applied within 750 feet of an occupied residence, except for the residence of the owner of the septic tank that was pumped or the residence of the licensed commercial septic tank cleaner.

<sup>23</sup>GHEX loop boreholes are defined in 567—subrule 49.2(1).

<sup>24</sup>The 10-foot distance between a PSDS and property lines applies unless a mutual easement is signed and recorded by both parties.

<sup>25</sup>An SD of at least 300 feet between a wastewater treatment works and property lines or rights-of-way is recommended where treatment works may be expanded in the future.

<sup>26</sup>“Foundation drain” is defined in 567—subrule 69.1(2).

*d.* For anaerobic lagoons used in connection with industrial wastewater treatment or pretreatment, the following SDs shall apply between the anaerobic lagoon and the nearest inhabitable residence, other inhabitable structure, or commercial building not owned by the owner of the lagoon, or from a public use area other than a public road. These SDs do not apply to controlled discharge or aerated facultative lagoon systems.

- (1) Where the average rated flow is 100,000 gpd or less, the SD shall be at least 1,250 feet.
- (2) Where the average rated flow is greater than 100,000 gpd, the SD shall be at least 1,875 feet.

(3) A person may build or expand an anaerobic lagoon closer to an inhabitable residence, other inhabitable structure, or commercial building not owned by the owner of the anaerobic lagoon, or to a public use area other than a public road, if the affected landowners sign a written agreement with the anaerobic lagoon owner to waive the SDs under such terms the parties negotiate. Any such agreement shall be submitted to the department and filed with the county recorder for abstract of title purposes.

(4) When the SDs in this subparagraph cannot be maintained for the expansion, upgrade, or replacement of existing anaerobic lagoon facilities, the SD may be reduced to 1,000 feet provided all of the following criteria are met:

1. The anaerobic lagoon will be completely covered and provided with approved off gas treatment throughout its entire operation life;

2. An operation and maintenance manual shall be prepared and submitted to the department in accordance with the IWFDS; and

3. No data are available indicating that a problem has existed or will be created.

**60.2(3)** *Construction permit applications—general.*

- a. *General.* All applications for a construction permit required under this rule shall be made in accordance with the requirements in the IWFDS and on forms provided by the department. The applicant will be promptly notified if the application is incomplete or improperly filled out, and an application will not be reviewed until it is complete. A construction permit will be denied when the application does not meet all requirements for permit issuance. For a system with permits conditioned by limitations on additional loads under 60.2(4), construction permit applications must be accompanied by an accounting of connections and additional loading since the time the initial conditioned permit was issued.

- b. *Submission date.* Applications for a construction permit must be submitted to the director at least 120 days in advance of the construction start date.

- c. *Site surveys.*

- (1) For new or expanded wastewater treatment facilities, an application for a site survey must be submitted by the applicant's engineer in advance of a full application for construction permit. An applicant should allow 60 days from the submission date of the site survey application for preliminary approvals.

- (2) A site survey application must include the following minimum information:

1. A preliminary engineering report or a cover letter that contains a brief description of the proposed treatment process and assurance that the project is in conformance with the long-range planning of the area.

2. The general information, treatment project site selection, and treatment project design data portions of the construction permit application forms, as provided by the department.

- (3) If a site survey application is incomplete, it will be returned to the engineer for completion. When a site survey application is complete, it will be reviewed as follows:

1. If the data submitted indicates on its face that the site would be unsuitable for its intended purpose, a letter of rejection will be sent to the applicant and the engineer. Clarifications and additional data may be requested of the applicant and the engineer.

2. If the data submitted indicates on its face that the site may be suitable, a site survey will be conducted by department staff.

- d. *Fee.* A single construction permit application fee of \$100 as specified in Iowa Code section 455B.197(2) is due at the time of construction permit application submission.

- e. *Director action.* The director shall act upon the application within 60 days of receipt of a complete application by either issuing a construction permit or denying the construction permit in writing unless a longer review period is necessary and the applicant is so notified in writing.

- f. *Modification after construction permit issuance.* Applicants seeking a modification to plans and specifications after having been issued a construction permit shall submit an addendum to plans and specifications, a change order, or revised plans and specifications, along with the reasons for the proposed changes, to the department. A supplemental written permit or approval will be issued when the changes submitted by the applicant meet department requirements. Construction shall not proceed until such changes have been approved.

**60.2(4)** *Sanitary sewer extension construction permit applications.* Applications for sanitary sewer extension construction permits shall conform to the IWFDS. If a sanitary sewer extension construction

permit application does not provide sufficient information to grant or deny a sewer system construction permit, additional information may be requested and evaluated. Sanitary sewer extension approval shall be subject to the following:

*a.* A sanitary sewer extension construction permit may be denied if, at the time of application, the treatment facility treating wastewater from the proposed sewer is not in substantial compliance with its operating permit or if the treatment facility receives wastes in volumes or quantities that exceed its design capacity and interfere with its operation or performance. If the applicant is operating under a compliance schedule that is being adhered to and that will lead to resolution of the substantial compliance issues, or if the applicant can demonstrate that the problem has been identified, the planning completed, and corrective measures initiated, then the construction permit may be granted.

*b.* A sanitary sewer extension construction permit may be denied if bypassing has occurred at the treatment facility, except when any of the following conditions are being met:

(1) The bypassing is due to a combined sewer system, and the facility is in compliance with a department-approved long-term CSO control plan;

(2) The bypassing occurs as a result of a storm with an intensity or duration greater than that of a storm with a return period of five years, according to the NOAA Atlas 14 Point Precipitation Frequency Estimates; or

(3) The department determines that timely actions are being taken to eliminate the bypassing.

*c.* A sanitary sewer extension construction permit may be denied if an existing downstream sewer is or will be overloaded or surcharged, resulting in bypassing, flooded basements, or overflowing manholes, unless:

(1) The bypassing or flooding is the result of a precipitation event with an intensity or duration greater than that of a storm with a return period of two years, according to the NOAA Atlas 14 Point Precipitation Frequency Estimates; or

(2) The system is under full-scale facility planning and the applicant provides a schedule that is approved by the department for rehabilitating the system to the extent necessary to handle the additional loadings.

**60.2(5)** *Application review.*

*a.* Review of construction permit applications shall be based on the criteria listed in 60.2(2) “*b*” and on the Iowa Antidegradation Implementation Procedure, incorporated by reference in 60.7(2) “*d*”(4). In any conflict between the criteria, the IWFDS shall prevail.

*b.* *IWFDS waivers.* Requests for waivers from the IWFDS shall be submitted and reviewed in accordance with 561—Chapter 10.

**60.2(6)** *Commencing construction.* Notwithstanding the 120-day requirement in 60.2(3) “*b*,” construction of the approved system may commence immediately after the issuance of a construction permit.

**60.2(7)** *Expiration.* The construction permit shall expire if construction thereunder is not commenced within one year of the date of issuance thereof. The director may grant an extension of time to commence construction if it is necessary or justified, upon showing of such necessity or justification to the director.

**60.2(8)** *Modification or revocation.* The director may modify or revoke a construction permit for cause, including but not limited to the following:

*a.* Failure to construct said wastewater DS or part thereof in accordance with the approved plans and specifications;

*b.* Violation of any term or condition of the permit;

*c.* Obtaining a permit by misrepresentation of facts or failure to disclose fully all material facts; or

*d.* Any change during construction that requires material changes in the approved plans and specifications.

**60.2(9)** *Certification of completion.* Within 30 days after completion of construction, installation or modification of any wastewater DS or part thereof or extension or addition thereto, the construction permit holder shall submit a certification by a registered professional engineer that the project was completed in accordance with the approved plans and specifications.

[ARC 9203C, IAB 5/14/25, effective 6/18/25]

**567—60.3(455B) Operation permits.**

**60.3(1) Operation permit requirement.** Except as otherwise provided in this subrule, in 567—Chapter 65, and in 567—Chapter 69, no person shall operate any wastewater DS or part thereof without, or contrary to any condition of, an operation permit issued by the director. An operation permit is not required for the following:

- a. A PSDS that does not discharge into, or have the potential to reach, a designated water of the state or subsurface drainage tile (Note: PSDSs under this exemption are regulated under 567—Chapter 69).
- b. A semipublic sewage DS, the construction of which has been approved by the department and that does not discharge into a water of the state.
- c. A pretreatment system, the effluent of which is to be discharged directly to another DS for final treatment and disposal.
- d. A discharge from a geothermal heat pump that does not reach a navigable water.
- e. Water well construction and well services related discharge that does not reach a WOTUS.
- f. Discharges from the application of biological pesticides and chemical pesticides where the discharge does not reach a WOTUS. Aquatic pesticides may be applied to any WOTUS in accordance with this chapter and NPDES General Permit No. 7, “Pesticide General Permit (PGP) for Point Source Discharges to Waters of the United States From the Application of Pesticides.”
- g. Agricultural stormwater discharges. This exclusion applies only to the operation permit requirement set forth in this rule and does not alter other requirements of law, including but not limited to any applicable requirements of Iowa Code chapters 459 and 459A.
- h. Dewatering discharge from the installation, repair, or maintenance of agricultural drainage systems that does not reach a water of the state. This activity is not considered operation of a wastewater DS.
- i. A wastewater discharge from a water treatment plant that does not reach a WOTUS.

**60.3(2) Applications.****a. Individual permit applications.**

(1) Application Forms. Applications for operation permits required under this paragraph shall be made on forms provided by the department.

**(2) Application due dates.**

1. Applications for an individual permit for a new discharge of stormwater associated with construction activity as defined in 40 CFR §122.26(b)(14) under “stormwater discharge associated with industrial activity” must be submitted at least 60 days before the date on which construction is to commence.

2. The due date for an application for a new discharge of wastewater is 180 days prior to the date the operation is scheduled to begin unless a shorter period is approved by the director.

3. The due date for a renewal application is 180 days prior to the expiration date of the current permit. For a POTW, permission to submit an application at a later date may be granted by the director.

**(3) Application completeness.**

1. A permit application is complete and approvable when all necessary questions on the application have been completed and the application is signed pursuant to this subrule, and when all applicable portions of the application, including the application fee, treatment agreement forms, and required attachments, have been submitted. The director may require the submission of an antidegradation alternatives analysis or other additional information deemed necessary to evaluate the application.

2. Incomplete applications may be returned to the applicant for completion. Authorization to discharge will be suspended if a complete application is not submitted to the department before the expiration date of the current permit. In the case of new applications, no discharge will be allowed until an operation permit is issued. In the case of existing discharges, if a permit application is incomplete or has not been submitted, the department shall notify the applicant of a violation of this rule.

3. If a permittee becomes aware that it failed to submit any relevant facts in a permit application, or submitted incorrect information in a permit application, the permittee shall promptly submit such facts or information.

(4) Application receipt. Upon completion of a tentative determination with regard to a permit application as described in 60.5(1), the director shall issue an operation permit for applications filed

pursuant to this subrule within 90 days of the receipt of a complete application unless the application is for an NPDES permit or unless a longer period of time is necessary and the applicant is notified.

*b. GP applications.* A Notice of Intent (NOI) for coverage under a GP shall be completed on forms provided by the department and in accordance with 60.6(1). An NOI must be submitted for any of the following:

- (1) Stormwater discharge associated with industrial activity;
- (2) Stormwater discharge associated with small construction activity;
- (3) PSDSs that discharge to a WOTUS;
- (4) Discharges, except a stormwater only discharge, from a mining or processing facility;
- (5) Discharges from hydrostatic testing, tank ballasting and water lines, if required to be submitted by GP No. 8; or
- (6) Discharges from dewatering or residential geothermal systems, if required to be submitted by GP No. 9.

*c. Application fees.* Required fees shall be submitted with all permit applications pursuant to Iowa Code section 455B.197(3).

*d. Signatories of permit applications.* Permit applications for operation and NPDES permits shall be signed in accordance with 40 CFR §122.22.

**60.3(3) Indirect discharger requirements.**

*a. Information requirement.* The director may require an indirect discharger to submit information similar to that required in an application for an operation permit, but no operation permit is required for such discharge. This subrule does not apply to indirect dischargers that discharge to POTWs with department-approved pretreatment programs.

*b. Treatment agreement (TA).* A POTW intending to accept waste from a SIU as defined in 40 CFR §403.3(v) must submit a TA that:

- (1) Is on the TA form provided by the department;
- (2) Identifies and limits the monthly average and daily maximum flows and identifies and limits all other pollutants or pollutant parameters necessary to ensure that the discharge will be in accordance with the applicable requirements in 567—Chapter 62; and
- (3) Is signed and dated by the SIU and the owner of the POTW accepting the wastewater.

*c. TA submittal timelines.* A POTW receiving waste from an existing or proposed SIU shall submit a complete TA form to the department in accordance with the following time lines:

- (1) For an existing SIU with an existing TA, 60 days in advance of a proposed expansion, production increase or process modification that may result in discharges of sewage, industrial waste, or other waste in excess of the discharge stated in the existing TA.
- (2) For an indirect discharger that would become a SIU as a result of a proposed expansion, production increase or process modification, 60 days in advance of the proposed expansion, production increase or process modification.
- (3) For a new indirect discharger that will qualify as a SIU, 180 days in advance of a proposed discharge.

*d. Construction and operation permit applications—TA submittal.*

(1) A construction permit application for the construction or modification of a POTW must include current TA forms for each SIU discharging to the POTW. These TAs will be used in determining the design basis of the new or upgraded system.

(2) An operation permit application from a POTW must include information and current TA forms for each SIU discharging to the POTW, and information on any Non-Significant Categorical Industrial User discharging to the POTW.

**60.3(4) Effective period.** NPDES permits may be granted for any period of time not to exceed five years. All other operation permits may be granted for an appropriate period of time as determined by the director, based on the type of wastewater DS being permitted. GPs will be issued for a period not to exceed five years. Each permit to be renewed shall be subject to the provisions of all department rules in effect at the time of the renewal.

**60.3(5) *Permit conditions.*** Operation permits shall contain conditions deemed necessary by the director to ensure compliance with all applicable department rules, including monitoring and reporting conditions, to protect the public health and beneficial uses of waters of the state, and to prevent water pollution from waste storage or disposal operations.

**60.3(6) *Modification or termination.*** The director may amend, revoke and reissue, or terminate in whole or in part any permit for cause, either at the request of any interested person (including the permittee) or upon the director's initiative, according to the provisions of this subrule.

*a. GP.* The director may revoke and reissue or terminate in whole or in part any GP or coverage under a GP for cause. A waiver or amendment of the terms and conditions of a GP shall not be granted. If a waiver or amendment of a GP is desired, the permittee must apply for an individual permit following the procedures in 60.3(2) "a."

*b. Individual permit.* All requests to amend, revoke and reissue, or terminate an individual permit shall be in writing and contain information or reasons supporting the request.

(1) A permittee shall furnish to the director, within a reasonable time, any information that the director may request to determine whether cause exists for amending, revoking and reissuing, or terminating a permit, including a new permit application.

(2) Required amendment fees shall be submitted in accordance with 60.14(3).

(3) The filing of a request by an interested person for an amendment, revocation and reissuance, or termination does not stay any permit condition.

*c. Cause.* Cause under this subrule includes but is not limited to the following:

(1) Violation of any term or condition of the permit.

(2) Obtaining a permit by misrepresentation of fact or failure to disclose fully all material facts.

(3) A change in any condition that requires either a temporary or permanent reduction or elimination of the permitted discharge.

(4) Failure to submit records and information the director requires, both generally and as a condition of the permit, in order to ensure compliance with the discharge conditions specified in the permit.

(5) Failure or refusal of an NPDES permittee to carry out the requirements of 60.7(7) "f."

(6) Failure to provide all the required application materials or appropriate fees.

(7) Causes listed in 40 CFR §§122.62 and 122.64.

*d. Individual permit compliance schedule amendments.*

(1) A request to amend an interim date in a compliance schedule shall be made at least 30 days prior to the next scheduled date that the permittee contends it is unable to meet. The request shall include proposed changes to the existing compliance schedule and documentation supporting the need for an extension.

(2) A request to amend a final date in a compliance schedule shall be made at least 120 days prior to the final compliance date. An extension of the final date may be granted by the department for cause, including unusually adverse weather conditions, equipment shortages, labor strikes, federal grant regulation requirements, or any other extenuating circumstances beyond the control of the requesting party. Cause does not include economic hardship, profit reduction, or failure to proceed in a timely manner.

*e. Reduction of individual permit minimum monitoring requirements.* The minimum monitoring requirements in an existing or reissued individual permit as established in 567—Chapter 63 may be modified or reduced at the director's discretion or when requested by the permittee.

(1) A request to modify or reduce the minimum monitoring requirements in an existing individual permit is considered a waiver request. A request shall include a written description of the proposed modification or reduction, monitoring results that are frequent enough to reflect variations in wastewater characteristics over a period of time and are consistent in results from sample to sample, and a completed Petition for Waiver form, available on the department's website.

(2) Any request to modify or reduce minimum monitoring requirements must adequately justify that the modified or reduced monitoring will accurately reflect actual wastewater characteristics and will not adversely impact facility operations.

(3) The department will evaluate a request to modify or reduce the minimum monitoring requirements in an existing permit based upon whether or not less frequent sample results would accurately reflect actual wastewater characteristics and whether operational control could be maintained.

(4) All reductions or modifications of monitoring incorporated into an individual operation or NPDES permit by amendment or upon reissuance are only effective until the expiration date of that permit.

*f. Requests to amend, revoke and reissue, or terminate.*

(1) Individual permit requests.

1. If the director tentatively decides to amend or revoke and reissue an individual permit, a draft permit shall be prepared according to 60.5(1)“a.” When an individual permit is amended under this subrule, only those conditions to be amended shall be reopened when a new draft permit is prepared. All other aspects of the existing permit shall remain in effect for the duration of the permit. If an amendment falls under the definition of “minor amendment,” the individual permit may be amended without a draft permit or PN.

2. If the director decides to terminate an individual permit, a termination decision shall be prepared and transmitted to the permittee. The permittee will have 60 days to appeal the termination.

(2) GP requests. If the director tentatively decides to revoke and reissue or terminate a GP, a draft reissuance or termination will proceed in accordance with Iowa Code sections 455B.103A and 455B.173.

(3) When an individual or general permit is revoked and reissued under this subrule, the entire permit is reopened just as if the permit had expired and was being reissued.

(4) During any amendment, revocation and reissuance, or termination proceeding, the permittee or permittees shall comply with all conditions of the existing permit until a new final permit is reissued or the existing permit is terminated.

(5) If the director decides the request is not justified, the director shall deny the request and send the requester a brief written response giving a reason for the decision. Denials of requests for permit amendment, revocation and reissuance, or termination are not subject to PN, comment, hearings, or appeals.

**60.3(7)** *Prohibitions on permit issuance.* 40 CFR §122.4 is adopted by reference.

**60.3(8)** *Public access to NPDES information.* Department records connected with NPDES permits are available for public inspection and copying to the extent provided in 567—Chapter 2.

[ARC 9203C, IAB 5/14/25, effective 6/18/25]

#### **567—60.4(455B) Issuance of NPDES permits.**

**60.4(1)** *Individual permit.* An individual NPDES permit is required when there is a discharge of a pollutant from any point source into navigable waters. An NPDES permit is not required for the discharges listed in 40 CFR §122.3.

**60.4(2)** *General permits (GPs).*

*a.* The director may issue GPs consistent with this chapter to regulate one or more categories or subcategories of discharges, if the sources within each category or subcategory meet the criteria in 40 CFR §122.28(a)(2).

*b.* Each GP issued by the department must be adopted as an administrative rule in accordance with Iowa Code chapter 17A. Each proposed permit will:

(1) Be accompanied by a rationale setting forth the principal facts and methodologies considered during permit development,

(2) Correspond to existing geographic or political boundaries, and

(3) Be identified in rule 567—60.13(455B).

*c.* If an NPDES permit is required for an activity covered by a GP, the applicant may seek either GP coverage or an individual permit as provided in this chapter.

**60.4(3)** *Effect of a permit.* 40 CFR §122.5 is adopted by reference. Compliance with a permit during its term constitutes compliance, for purposes of enforcement, with equivalent limitations and standards set out in 567—Chapters 61 and 62.

[ARC 9203C, IAB 5/14/25, effective 6/18/25]

**567—60.5(455B) Notice and public participation in the individual permit process.**

**60.5(1)** *Formulation of tentative determination.* The department shall make a tentative determination to issue or deny an operation or NPDES permit for the discharge described in a permit application in advance of the PN (described in 60.5(2)). If the tentative determination is to:

*a.* Issue an NPDES permit, the department shall prepare a permit rationale pursuant to 60.5(3) and a draft permit. The draft permit shall include:

(1) Effluent limitations identified pursuant to 60.7(2) and 60.7(3) for those pollutants proposed to be limited;

(2) If necessary, a proposed compliance schedule, pursuant to 60.7(4) and 60.7(5) that includes interim dates and requirements for meeting the effluent limitations and other permit conditions; and

(3) Any other special conditions (other than those required in 60.7(7)) that will have a significant impact upon the discharge described in the permit application.

*b.* Deny an NPDES permit, the department shall prepare a notice to deny the permit application and place it on PN as described in 60.5(2).

*c.* Issue an operation permit (non-NPDES permit), the department shall prepare a final permit and transmit it to the applicant. The applicant will have 60 days to appeal the final operation permit.

*d.* Deny an operation permit (non-NPDES permit), no PN is required. The department shall send written notice of the denial to the applicant. The applicant will have 60 days to appeal the denial.

**60.5(2)** *Public notice (PN) for individual NPDES permits.*

*a.* Prior to the issuance of an NPDES permit, a major NPDES permit amendment, or the denial of a permit application for an NPDES permit, a PN shall be circulated in a manner designed to inform interested and potentially interested persons of the proposed discharge and of the tentative determination to issue or deny an NPDES permit for the proposed discharge.

(1) The PN shall be transmitted by the department to the persons noted in 40 CFR §124.10(c)(1).

(2) The PN shall be transmitted by the department to any person upon request. Any person or group may request to receive copies of any PNs concerning the tentative determinations with respect to the permit applications within the state or within a certain geographical area.

(3) The department shall periodically notify the public of the opportunity to receive PNs. The director may update the PN distribution list from time to time by requesting written indication of continued interest from those listed. The director may delete from the list the name of any person or group who fails to respond to such a request.

*b.* The director may publish all notices of activities described in 60.5(2)“a” to the department’s website. If this option is selected for a draft permit, the director must post the draft permit and permit rationale on the website for the duration of the public comment period.

*c.* The department shall provide not less than 30 days following the PN date during which time interested persons may submit their written views on the tentative determinations with respect to the permit application and request a public hearing pursuant to 60.5(4). Written comments may be submitted by paper or electronic means. All pertinent comments submitted during the 30-day comment period shall be retained by the department and considered by the director in the formulation of the final determinations with respect to the permit application. The comment period may be extended at the department’s discretion. Pertinent and significant comments received during either the original comment period or an extended comment period shall be responded to in a responsiveness summary pursuant to 60.5(5).

*d.* A PN of a draft NPDES permit, a major permit amendment, or the denial of a permit application for an NPDES permit shall contain:

(1) The name, email address, and telephone number of the permit writer.

(2) The name and address of the applicant.

(3) A brief description of the applicants’ activities or operations that result in the discharge described in the permit application.

(4) The name of the waterway to which each discharge of the applicant is made.

(5) A statement of the department’s tentative determination to issue, amend, or deny an NPDES permit for the discharge or discharges described in the permit application.

(6) A brief description of the procedures for the formulation of final determinations, including the 30-day comment period required by 60.5(2)“c,” procedures for requesting a public hearing and any other means by which interested persons may influence or comment upon those determinations.

(7) The address, telephone number, email address, and website of places at which interested persons may obtain further information and request copies of, or inspect and copy the tentative determination, permit rationale, and any associated documents.

*e.* No PN is required for a minor permit amendment.

*f.* No PN is required when a request for a permit amendment or permit termination is denied. The department shall send written notice of the denial to the requester and the permittee only. No PN is required if an applicant withdraws a permit application.

**60.5(3)** *Permit rationales and notices of intent to issue or deny.*

*a.* When the department has made a determination to issue or deny an NPDES or operation permit as described in 60.5(1), it shall prepare and send the following information, specific to each determination.

(1) NPDES permit issuance. For a determination to issue an NPDES permit, the department shall prepare and, upon request, shall send to any person a permit rationale with respect to the application described in the PN. Permit rationales shall include at least the following information:

1. For each discharge described in the permit application, a detailed description of the discharge location and a quantitative description of the discharge.

2. A brief citation, including a brief identification of the uses for which the receiving waters have been classified, of the WQS applicable to the receiving waters, and of the effluent standards and limitations applicable to the proposed discharge.

3. An explanation of the principal facts and the significant factual, legal, methodological, and policy questions considered in the preparation of the draft permit.

4. Any calculations or other necessary explanation of the derivation of effluent limitations.

(2) NPDES permit application denial. For a determination to deny an application for an NPDES permit, the department shall prepare and, upon request, shall send a notice to deny with respect to the application described in the PN. A notice to deny shall include:

1. The location of the discharge; and

2. A description of the reasons supporting the tentative decision to deny the permit application.

(3) Operation permit issuance. For a determination to issue an operation permit, the department shall prepare and issue a permit. The reasons supporting the decision to issue an operation permit can be sent to the operation permit applicant upon request.

(4) Operation permit application denial. For a determination to deny an application for an operation permit, the department shall prepare and send written notice of the denial to the applicant only. The written denial shall include a description of the reasons supporting the decision to deny the permit application.

*b.* Upon request, the department shall add the name of any person or group to a distribution list to receive copies of permit rationales and notices to deny and shall make copies of all permit rationales and notices to deny available.

**60.5(4)** *Public hearings on proposed NPDES permits.* The applicant, any affected state, the regional administrator, or any interested agency, person, or group of persons may request a public hearing with respect to a tentative determination to issue or deny an NPDES permit.

*a.* Public hearing requests shall:

(1) Clearly state issues and topics to be addressed at the hearing;

(2) Be filed with the director within the 30-day period prescribed in 60.5(2)“c”; and

(3) Indicate the interest of the party filing the request and the reasons why a hearing is warranted.

*b.* The director shall hold an informal and noncontested case hearing if there is a significant public interest in holding a hearing. Frivolous or insubstantial requests for hearing may be denied by the director. Instances of doubt should be resolved in favor of holding a hearing.

*c.* Any hearing held pursuant to this subrule shall be held in the geographical area of the proposed discharge when possible or other appropriate area at the director’s discretion. Web-based hearings may also be held at the director’s discretion. In addition, any hearing held pursuant to this subrule may, as appropriate, consider related groups of permit applications.

*d.* PN of any hearing held pursuant to this subrule shall be circulated at least as widely as was the notice of the tentative determination with respect to the permit application. Notice pursuant to this paragraph shall be made at least 30 days in advance of the hearing. Notice shall be transmitted to:

(1) All persons and government agencies that received a copy of the notice for the permit application; and

(2) Any person or group upon request.

*e.* The contents of a PN of any hearing held pursuant to this subrule shall include at least the following:

(1) The name, email address, and telephone number of the permit writer;

(2) The name and address of each applicant whose application will be considered at the hearing;

(3) The name of the waterbody to which each discharge is made;

(4) A brief reference to the PN issued for each NPDES application, including the date of notice;

(5) Information regarding the time and location for the hearing;

(6) The purpose of the hearing;

(7) A concise statement of the issues raised by the person or persons requesting the hearing;

(8) The address, telephone number, email address, and website where interested persons may obtain further information and request copies of, or inspect and copy the draft NPDES permit, permit rationale, and any associated documents;

(9) A brief description of the nature of the hearing, including the rules and procedures to be followed; and

(10) The final date for submission of comments regarding the tentative determination.

**60.5(5) *Response to comments.*** At the time a final NPDES permit is issued, the director shall respond to significant and pertinent comments in the form of a responsiveness summary. A copy of the responsiveness summary shall be sent to the permit applicant and made available on the department's website. The responsiveness summary shall:

*a.* Specify which provisions, if any, of the draft permit have been changed in the final permit decision and the reasons for the changes; and

*b.* Briefly describe and respond to all significant and pertinent comments on the draft permit raised during the public comment period provided for in the PN or during any hearing. Comments on a draft permit may be submitted by paper or electronic means or orally at a public hearing.

[ARC 9203C, IAB 5/14/25, effective 6/18/25]

#### **567—60.6(455B) Completing a Notice of Intent (NOI) for coverage under a GP.**

**60.6(1) *Contents of a complete NOI.*** An applicant proposing to conduct activities covered by a GP shall file a complete NOI by submitting to the department materials required in this subrule, as applicable. An NOI is not required for discharges authorized under GPs No. 6 or No. 7, for certain discharges under GP No. 8, or for certain discharges under GP No. 9.

*a. NOI Form.* Electronic NOI forms provided by the department must be completed in full and may be obtained on the department's website. Paper NOI forms, when provided, must be completed in full.

*b. GP fee.* The applicable GP fees are listed in 60.14(2).

*c. Public notice (PN) for GPs No. 1, No. 2, and No. 3.* Applicants for GPs No. 1, No. 2 and No. 3 must publish a PN in accordance with Iowa Code section 455B.103A. The newspaper notice shall, at the minimum, contain the following information:

(1) A brief description of the applicants' activities or operations that result in the discharge described in the NOI;

(2) The name of the waterway to which each discharge of the applicant is made and a short description of the location of each discharge of the applicant on the waterway; and

(3) The address, telephone number, email address, and website of places at which interested persons may obtain further information or inspect and copy the NOI.

**60.6(2) *Authorization to discharge under a GP.***

*a.* Upon the submittal of an NOI in accordance with 60.3(2)"b" and 60.6(1), an applicant is authorized to discharge after the department has determined that the contents of the NOI satisfy the requirements of this chapter and of a GP. The department will notify the applicant of coverage under a GP.

If any of the items required for filing an NOI specified in 60.6(1) are missing, the department will consider the NOI incomplete and will notify the applicant of the incomplete items.

b. If the discharge described in the NOI does not meet the requirements of a GP, an NOI may be denied. The department will notify applicants of denial within 30 days.

c. Authorization to discharge is automatic only for the GPs that do not require an NOI under 60.3(2) “b,” provided the discharge is a covered activity and the permittee complies with all applicable permit requirements.

**60.6(3) *GP suspension or revocation.*** In addition to the causes for suspension or revocation listed in 60.3(6), the director may suspend or revoke coverage under a GP and require the applicant to apply for an individual NPDES permit in accordance with 60.3(2) “a.” The department will notify the affected discharger and establish a deadline, not longer than one year, for submitting an individual permit application. Coverage may be suspended or revoked for the following reasons:

a. The discharge would not comply with Iowa’s WQS pursuant to 567—Chapter 61,

b. The department finds that the activities associated with an NOI do not meet the conditions of the applicable GP, or

c. The department finds that any discharge covered under a GP is not consistent with the conditions specified in the applicable GP.

**60.6(4) *Eligibility for individual NPDES permit holders.*** A person holding an individual NPDES permit for an activity covered by a GP may apply for coverage under a GP by filing an NOI according to the procedures described in 60.3(2) “b” and this rule. In addition to these requirements, the permittee must submit a written request, with the NOI, to either terminate the individual NPDES permit or to amend the individual NPDES permit to remove the GP-covered activity.

a. Upon receipt of a complete NOI and request for individual NPDES permit termination or amendment, the applicant shall be authorized to discharge under the GP in accordance with 60.6(2). The applicant will receive notification from the department of coverage under the GP and of the termination or amendment of the individual permit.

b. Authorization to discharge under a GP that does not require an NOI will be automatic in accordance with 60.6(2) and shall commence upon completion of individual NPDES permit termination or amendment.

c. Individual NPDES permit amendments under this subrule shall follow the applicable PN procedures in rule 567—60.5(455B).

**60.6(5) *Filing a Notice of Discontinuation (NOD).*** A notice to discontinue discharge associated with an activity covered by a GP shall be made electronically or in writing to the department in accordance with the conditions established in each GP.

[ARC 9203C, IAB 5/14/25, effective 6/18/25]

#### **567—60.7(455B) Terms and conditions of NPDES permits.**

**60.7(1) *Prohibited discharges.*** No NPDES permit may authorize any of the discharges prohibited by rule 567—62.1(455B).

**60.7(2) *Application of effluent and pretreatment standards, WQS, and other requirements.*** Each NPDES permit shall include any of the following that is applicable:

a. An effluent limitation guideline; a standard of performance for a new source; or an effluent standard, effluent prohibition, or pretreatment standard promulgated by the administrator under Sections 301, 304, 306, or 307 of the CWA and adopted by reference in 567—Chapter 62.

b. A water quality-based effluent limitation established by the administrator pursuant to Section 302 of the CWA.

c. Prior to promulgation of applicable effluent and pretreatment standards under Sections 301, 302, 306, and 307 of the CWA, such conditions as the director determines are necessary to carry out the provisions of the CWA.

d. Any other limitation, including those necessary to:

(1) Meet or implement any applicable WQS, treatment or pretreatment standards, or compliance schedules established pursuant to any Iowa law or regulation;

(2) Meet any other federal law or regulation;

(3) Implement total maximum daily loads established pursuant to Section 303(d) of the CWA; or  
 (4) Comply with the antidegradation policy requirements of 567—subrule 61.2(2) implemented according to the “Iowa Antidegradation Implementation Procedure,” effective February 17, 2010, hereby incorporated by reference, and available on the department’s website.

*e. Limitations pursuant to 40 CFR §122.44(d)(1)(i), (ii), and (iii).*

**60.7(3) *Effluent limitations in NPDES permits.***

*a. In the application of effluent standards and limitations, WQS, and other legally applicable requirements, pursuant to 60.7(2), the director shall, unless impracticable, specify average and maximum daily quantitative limitations for the level of pollutants in the authorized discharge in terms of weight (except pH, temperature, radiation, and any other pollutants not appropriately expressed by weight). The director may, in addition to the specification of daily quantitative limitations by weight, specify other limitations for the level of pollutants authorized in the discharge.*

*b. The manner in which effluent limitations are expressed will depend upon the nature of the discharge.*

(1) Continuous discharges shall be limited by daily loading figures and, where appropriate, may be limited as to concentration or discharge rate (e.g., for toxic or highly variable continuous discharges).

(2) Noncontinuous discharges should be more particularly described and limited in accordance with 40 CFR §122.45(e).

**60.7(4) *Compliance schedules in NPDES permits.*** An NPDES permit may specify a compliance schedule in accordance with 40 CFR §122.47. Compliance shall be achieved as soon as possible, consistent with the guidelines and requirements of the CWA and with the provisions of Iowa Code sections 455B.173(2) “b” and 455B.173(3) “b.” If a permittee fails or refuses to comply with an interim or final requirement in an NPDES permit, such noncompliance shall constitute a violation of the permit for which the director may, pursuant to this chapter and 567—Chapter 7, modify, suspend or terminate the permit or take direct enforcement action. Compliance schedules shall not relieve the permittee of the duty to obtain a construction permit pursuant to this chapter.

**60.7(5) *Compliance schedules in NPDES permits for disadvantaged communities (DCs).*** If compliance with applicable federal or state regulations or an order of the department will result in substantial and widespread economic and social impact (SWESI) to ratepayers and an affected community, the director may establish in an NPDES permit a compliance schedule that will result in an improvement of water quality and reasonable progress toward complying with the applicable requirements but does not result in SWESI.

*a. DC status.* The director shall find that a regulated entity and the affected community are a DC according to Iowa Code section 455B.199B(2).

*b. DC analysis (DCA).* A regulated entity or affected community must submit a DCA to the director to be considered for disadvantaged status.

(1) When new requirements in a proposed or reissued NPDES permit may result in SWESI, a DCA may be submitted by:

1. A POTW or semipublic facility;
2. A wastewater DS for the treatment or disposal of domestic sewage that is not a semipublic DS or a PSDS and that is not owned by a city or sanitary sewer district; or
3. Any other owner of a wastewater DS that is not a PSDS and does not discharge industrial wastes.

(2) A DCA may be submitted prior to the issuance of an initial NPDES permit if the facility does not discharge industrial wastes and is not a new source or new discharger.

*c. DCA contents.*

(1) A DCA must contain all of the following:

1. Proposed TAPC as defined in 60.7(5) “d.”
2. The number of households or ratepayers in the affected community.
3. A description of the bond rating of the affected community over the last year, if available.
4. The user rates, as follows:

- For a municipality or other community, the current sewer rate ordinances, including the sewer rates of any industrial users;

- For a water treatment facility, the water rate schedules or tables; or
  - For any other entity, the monthly ratepayer charge for wastewater treatment.
5. An explanation of why the regulated entity or affected community believes that compliance with the proposed requirements will result in SWESI.
- (2) If a DCA is submitted by or for an entity other than a municipality, community, or water treatment facility, the DCA must also contain either:
1. For entities with more than ten households or ratepayers, the MHI or ratepayer income, as determined by an income survey conducted by the regulated entity; or
  2. For entities with ten or fewer households or ratepayers, an estimate of MHI or ratepayer income.
- d. *Definition of total annual project costs (TAPC).* “Total annual project costs” means the current costs of wastewater treatment in the community (if any) plus the future costs of proposed wastewater system improvements that will meet or exceed all applicable federal or state regulations or requirements of an order of the department. The TAPC shall include any current and proposed facility O&M costs and any existing and proposed system debt, as expressed in current and proposed sewer rates. The costs shall be amortized for a 30-year loan period at an interest rate equal to the current state revolving fund interest rate. Awarded grant funding must be subtracted from the TAPC.
- The TAPC formula is:  $TAPC = [(Estimated\ costs\ to\ design\ and\ build\ proposed\ project - Awarded\ grant\ funding)\ amortized\ over\ 30\ years] + Current\ annual\ system\ budget,\ including\ O\&M\ and\ existing\ debt\ service + Future\ annual\ O\&M\ costs.$
- e. *DC matrix (DCM).* Upon receipt of a complete DCA, the director shall use the DCM to evaluate the disadvantaged status of an entity or community. A regulated entity or affected community shall be considered a DC if the point total derived in the DCM is equal to or greater than 12. The following data sources shall be used to derive the point total in the DCM:
- (1) The TAPC, the number of households or ratepayers in a community, and the bond rating of the community, as stated in the DCA;
  - (2) The MHI of either:
    1. The community, as found in the most recent American Community Survey or United States Census or as stated in an income survey conducted by the regulated entity or community; or
    2. The ratepayer group, as stated in an income survey conducted by the regulated entity; and
  - (3) The unemployment rate of the local county and of the state as found in the most recent Iowa Workforce Information Network unemployment data.
- f. *Ratio and determination.* The ratio of the TAPC per household or per ratepayer to MHI shall be calculated in the DCM as follows: the TAPC shall be divided by the number of households or ratepayers to obtain the costs per household or ratepayer, and the costs per household or ratepayer shall be divided by the MHI to obtain the ratio. If the ratio of compliance costs to MHI is:
- (1) Less than 1 percent, the entity or community is not considered disadvantaged.
  - (2) Greater than or equal to 2 percent, the entity or community is considered a DC.
  - (3) Greater than or equal to 1 percent and less than 2 percent, the director shall use the point total in the DCM to determine if the entity or community is disadvantaged.
- g. *DC compliance schedule—first part.* A compliance schedule established in an NPDES permit for a DC as a result of SWESI may contain one or two parts. The first part of a DC compliance schedule shall encompass one five-year NPDES permit cycle and require the permittee to submit an alternatives report, an alternatives implementation compliance plan (AICP), and annual progress reports.
- (1) Alternatives report. An alternatives report shall be submitted no later than two years after permit issuance and shall:
    1. Detail the alternative pollution control measures that will be investigated and contain an examination of all other appropriate measures that may achieve compliance with applicable federal or state regulations or an order of the department without creating SWESI;
    2. Describe which measures will be evaluated for feasibility and affordability during the next portion of the compliance schedule; and
    3. Include a plan for pursuing funding options, including grants and low-interest loans.

(2) Alternatives implementation compliance plan (AICP). An AICP shall be submitted no later than 4½ years after permit issuance and shall include:

1. The results of the investigation detailed in the alternatives report;
2. A description of any feasible and affordable alternative(s) that will be implemented;
3. A schedule of the time necessary to implement the alternative(s); and
4. An updated DCA.

*h. DC compliance schedule—second part.* If the entity or community continues to qualify as disadvantaged according to the DCM evaluation of the DCA submitted with the AICP, the entity or community may receive a second compliance schedule as specified in this subrule.

(1) AICP schedule. If the AICP proposes an implementation schedule, the proposed schedule shall be included in the community's NPDES permit.

(2) Future compliance plan (FCP). The submittal of an FCP will be necessary only if the AICP concludes that the DC cannot feasibly implement any alternatives and if the community is still disadvantaged according to the DCM evaluation of the DCA submitted with the AICP. An FCP shall be submitted no later than three years after permit issuance. A compliance schedule requiring an FCP shall also require annual progress reports, including an updated DCA. If a DCM evaluation determines that an entity or community is no longer disadvantaged based on the most recent DCA, the NPDES permit may be amended to change the compliance schedule. An FCP shall:

1. Detail how the DC will meet the applicable federal or state regulations or an order of the department and the period necessary to do so, and
2. Review the types of technology capable of treating the pollutant of concern and the costs of installing and operating each technology. All technically feasible alternatives shall be explored.

(3) Schedule extension. The second part of a DC compliance schedule may be extended at the director's discretion.

- i.* Compliance schedules issued in accordance with this subrule shall comply with 60.7(4).

**60.7(6) Disadvantaged unsewered communities (DUCs).** If compliance with applicable federal or state regulations or an order of the department will result in SWESI to the ratepayers of an unsewered community, the director may negotiate a compliance agreement that will result in an improvement of water quality and reasonable progress toward complying with the applicable regulations but does not result in SWESI.

*a. DUC status.* The director shall find that an unsewered community is a DUC according to Iowa Code section 455B.199B(3).

- b. DUC analysis (DUCA).*

(1) An unsewered community must submit a DUCA to the director to be considered for DUC status. Only unsewered communities may submit a DUCA under this subrule. For the purposes of this subrule, an unsewered community is defined as a grouping of ten or more residential houses with a density of one house or more per acre and with either no wastewater treatment or inadequate wastewater treatment. An entity defined in 60.1(2) as a PSDS may not submit a DUCA or qualify for a DUC compliance agreement under this subrule.

(2) An unsewered community may submit a DUCA to the director prior to the issuance of or amendment to an administrative order with requirements that could result in SWESI and that are based on applicable federal or state regulations or an order of the department.

- c. DUCA contents.* A DUCA must contain all of the following:

- (1) Proposed TAPC as defined in 60.7(6)“d”;
- (2) The number of households in the unsewered community and source of household information;
- (3) Total amount of any awarded grant funding;
- (4) MHI or ratepayer income information. If no MHI information is available for the unsewered community, the community should conduct a rate survey to determine the MHI; and
- (5) An explanation of why the unsewered community believes that compliance with the proposed requirements will result in SWESI.

*d. Definition of total annual project costs (TAPC).* “Total annual project costs” means the future costs of proposed wastewater system installation or improvements that will meet or exceed all applicable federal

or state regulations or requirements of an order of the department. The TAPC shall include the proposed facility O&M costs and the proposed debt of the system as expressed in the proposed sewer rates. The costs shall be amortized over a 30-year loan period at an interest rate equal to the current state revolving fund interest rate. Awarded grant funding must be subtracted from the TAPC.

The TAPC formula for an unsewered community is:  $TAPC = [(Estimated\ costs\ to\ design\ and\ build\ proposed\ project - Awarded\ grant\ funding)\ amortized\ over\ 30\ years] + Future\ annual\ O\&M\ costs.$

*e. DUC matrix (DUCM).* Upon receipt of a complete DUCA, the director shall use the DUCM to evaluate the disadvantaged status of an unsewered community. An unsewered community shall be considered a DUC if the point total derived from the DUCM is equal to or greater than 10. The following data sources shall be used to derive the point total in the DUCM:

- (1) The TAPC and number of households in the unsewered community, as stated in the DUCA;
- (2) The MHI of the unsewered community as found in the most recent American Community Survey or United States Census or as stated in an income survey conducted by the unsewered community; and
- (3) The unemployment rate of the local county and of the state as found in the most recent Iowa Workforce Information Network unemployment data.

*f. Ratio and determination.* The director shall not require installation of a wastewater DS by an unsewered community if the director determines that such installation would create SWESI, in accordance with Iowa Code section 455B.199B.

(1) The ratio of TAPC per household to MHI shall be calculated in the DUCM as follows: the TAPC shall be divided by the number of households to obtain the costs per household, and the costs per household shall be divided by the MHI to obtain the ratio.

- (2) If the ratio of compliance costs to MHI is:
1. Less than 1 percent, the unsewered community is not considered disadvantaged.
  2. Greater than or equal to 2 percent, the unsewered community is considered a DUC.
  3. Greater than or equal to 1 percent and less than 2 percent, the director shall use the point total in the DUCM to determine if the unsewered community is disadvantaged.

*g. DUC compliance agreement.* A compliance agreement negotiated with a DUC as a result of SWESI shall require the unsewered community to submit an alternatives report and an AICP.

(1) Alternatives report. An alternatives report shall be submitted no later than two years after a DUC determination and shall:

1. Detail the alternative pollution control measures that will be investigated and contain an examination of all other appropriate measures that may achieve compliance with the WQS without creating SWESI;
2. Describe which measures will be evaluated for feasibility and affordability after the report submittal; and
3. Include a plan for pursuing funding options, including grants and low-interest loans.

(2) Alternatives implementation compliance plan (AICP). An AICP shall be submitted no later than 4½ years after a DUC determination. An AICP shall include:

1. The results of the investigation detailed in the alternatives report,
  2. A description of any feasible and affordable alternative(s) that will be implemented,
  3. A schedule of the time necessary to implement the alternative(s), and
  4. An updated DUCA.
- (3) AICP schedule. If the AICP proposes an implementation schedule of one or more feasible alternatives, the proposed schedule shall be included in an administrative order between the department and the unsewered community. If the feasible alternative that will be implemented requires a construction, operation, or NPDES permit, the unsewered community shall comply with the rules regarding those permits in this chapter.

(4) Future compliance plan (FCP). The submittal of an FCP will be necessary only if the AICP concludes that the unsewered community cannot feasibly implement any alternatives and if the community is still disadvantaged according to the DUCM evaluation of the DUCA submitted with the AICP. An FCP shall be submitted no later than seven years after a DUC determination. An administrative order requiring an FCP shall also require the submittal of biennial progress reports containing an updated DUCA. If the

DUCM evaluation determines that an unsewered community is no longer disadvantaged based on the most recent DUCA, the order may be amended at the director's discretion. An FCP shall:

1. Detail how the unsewered community will meet the WQS and the period necessary to do so; and
2. Review the types of technology capable of treating the pollutant of concern and the costs of installing and operating each type of technology. All technically feasible alternatives shall be explored.

**60.7(7)** *Other terms and conditions of NPDES permits.* Each NPDES permit shall provide for and ensure all of the following:

a. That all discharges authorized by the NPDES permit shall be consistent with the terms and conditions of the permit.

b. That facility expansions, production increases, or process modifications that result in new or increased pollutant discharges will be reported by submission of a new permit application or, if such discharge does not violate effluent limitations specified in the NPDES permit, by submission to the director of notice of such new or increased discharges of pollutants.

c. That the discharge of any pollutant more frequently than or at a level in excess of that identified and authorized by the permit shall constitute a violation of the terms and conditions of the permit.

d. That if the terms and conditions of a GP are no longer applicable to a discharge, the applicant shall apply for an individual NPDES permit.

e. That the permit may be amended, revoked and reissued, or terminated in whole or in part for the causes provided in 60.3(6) "c."

f. That the permittee allows for facility inspection and entry pursuant to 40 CFR §122.41(i), which is adopted by reference.

g. That, if the permit is for a discharge from a POTW, the permittee shall provide notice to the director:

(1) 180 days in advance of any new introduction of pollutants into the POTW from a new source if such source was discharging pollutants;

(2) 60 days in advance of any substantial change in the volume or character of pollutants being introduced into the POTW by a source introducing pollutants into the POTW at the time of permit issuance; and

(3) Pursuant to 60.3(3) "c."

Such notice shall include information on the quality and quantity of effluent to be introduced into the POTW and any anticipated impact of such change on the quantity or quality of effluent to be discharged from the POTW.

h. That, if the permit is for a discharge from a POTW, the permittee shall require any industrial user to comply with the requirements of Sections 204(b), 307, and 308 of the CWA.

i. That the facility is properly operated and maintained pursuant to 40 CFR §122.41(e), which is adopted by reference.

j. That the permit will be modified upon the establishment of a toxic effluent standard or prohibition pursuant to 40 CFR §122.44(b)(1), which is adopted by reference.

k. That the permittee shall take all reasonable steps to minimize or prevent any discharge in violation of the permit that has a reasonable likelihood of adversely affecting human health or the environment.

l. That the need to halt or reduce the permitted activity is not a defense in an enforcement action pursuant to 40 CFR §122.41(c), which is adopted by reference.

**60.7(8)** *POTW compliance—plan of action (POA).* The owner of a POTW must prepare and implement a POA to achieve and maintain compliance with final effluent limitations in its NPDES permit as specified below:

a. The director shall notify a POTW owner of the POA requirement and of an opportunity to meet with department staff to discuss the plan requirements. The POTW owner shall submit the POA to the appropriate regional department field office within six months of such notice unless a longer time is needed and is authorized in writing by the director.

b. A POA must identify the deficiencies and needs of the system, describe the causes of such deficiencies or needs, propose specific measures and a schedule to correct the deficiencies or meet the needs, and discuss the method of financing the proposed improvements. A POA may include the submittal

of a DCA in accordance with 60.7(5) or may provide for a phased construction approach to meet interim and final limitations.

This rule is intended to implement Iowa Code chapter 455B, subchapter III, part 1 (Iowa Code sections 455B.171 through 455B.187 and 455B.199B).

[ARC 9203C, IAB 5/14/25, effective 6/18/25]

**567—60.8(455B) Reissuance of operation and NPDES permits.**

**60.8(1)** *Individual operation and NPDES permit reissuance.* Any operation or NPDES permittee who wishes to continue to discharge after the expiration date of the permit shall file an application for reissuance pursuant to 60.3(2) “a.”

**60.8(2)** *Renewal of coverage under a GP.* A permittee authorized to discharge under a GP is subject to the permit terms until coverage is obtained under an individual permit or the permitted discharge has ceased and, if required, an NOD is submitted in accordance with the GP.

a. If a permittee continues the activity beyond the expiration date of a GP and the permit will be reissued, the conditions of the expired GP will remain in effect until the effective date of the reissued GP.

b. If a permittee continues the activity beyond the expiration date of a GP and the permit will not be reissued or renewed, the discharge must be permitted with an individual NPDES permit in accordance with 60.3(2).

**60.8(3)** *Continuation of expiring operation and NPDES permits.*

a. The conditions of an expired operation or NPDES permit will continue in force until the effective date of a new permit if:

(1) The permittee has submitted a timely and complete application under 60.3(2); and

(2) The department does not issue a new permit with an effective date on or before the expiration date of the previous permit.

b. Operation and NPDES permits continued under this subrule remain fully effective and enforceable.

c. If a permittee is not in compliance with the conditions of the expiring or continued permit, the department may choose to do any of the following:

(1) Initiate enforcement action on a permit that has been continued or reissued;

(2) Issue a notice of intent to deny a permit under 60.5(3);

(3) Reissue a permit with appropriate conditions in accordance with this subrule; or

(4) Take other actions authorized by this chapter.

[ARC 9203C, IAB 5/14/25, effective 6/18/25]

**567—60.9(455B) Monitoring, recordkeeping and reporting by operation permit holders.** Operation permit holders are subject to the applicable requirements and provisions specified in 567—Chapter 63 and those specified in the operation permit issued by the department.

[ARC 9203C, IAB 5/14/25, effective 6/18/25]

**567—60.10(455B) Silvicultural activities.** The following is adopted by reference: 40 CFR §122.27.

[ARC 9203C, IAB 5/14/25, effective 6/18/25]

**567—60.11(455B) Stormwater discharges.**

**60.11(1)** The following are adopted by reference: 40 CFR §§122.26, 122.32, 122.33, 122.34, and 122.35.

**60.11(2)** Small municipal separate storm sewer systems (MS4s).

a. The following municipal MS4s that are not qualified as medium or large MS4s, in accordance with 40 CFR §122.26, are considered regulated small MS4s:

(1) All MS4s located in urban areas with a population of at least 50,000 people as defined by the latest decennial census, and

(2) All MS4s located outside urbanized areas that serve 10,000 people or more where the average population density is 1,000 people/square mile or more.

b. *NPDES permit applications for small MS4s.* An NPDES permit application shall be submitted for any discharge from a regulated small MS4 designated under this subrule. The first permit application

submitted by a small MS4 shall demonstrate how the applicant will develop, implement, and enforce a stormwater management program designed to reduce the discharge of pollutants from the small MS4 to the maximum extent practicable, in order to protect water quality and to comply with the CWA. Renewal applications shall demonstrate how the existing stormwater management program is being implemented and enforced. An application shall:

- (1) Discuss the manner in which the permittee will or has addressed:
  1. Public education and outreach on stormwater impacts;
  2. Public involvement and participation;
  3. Illicit discharge detection and elimination;
  4. Construction site stormwater runoff control;
  5. Post construction stormwater management in new development and redevelopment; and
  6. Pollution prevention for municipal operations.
- (2) Include measurable goals that the applicant intends to meet and dates by which the goals will be accomplished.

*c. Permit coverage waivers for small MS4s.*

(1) Permit coverage for small MS4s located in urbanized areas that serve 1,000 people or more and fewer than 10,000 people may be waived if the following requirements are met:

1. Where the small MS4 discharges any pollutants of concern that have been identified as a cause of an impairment of any waterbody to which the MS4 discharges, the department has determined that stormwater controls are not needed based on a wasteload allocation that is part of an EPA-approved TMDL that addresses the pollutants of concern.

2. Where the small MS4 discharges any pollutants of concern to an unimpaired waterbody or to a waterbody for which a TMDL has not been approved, the department has determined that stormwater controls are not needed based on an analysis equivalent to a TMDL that determines sources and allocations for the pollutants of concern. The pollutants of concern are BOD, sediment or a parameter that addresses sediment, pathogens, or oil and grease.

3. The department has determined that future discharges from the small MS4 do not have the potential to result in exceedances of WQS, including impairments or other significant water quality impacts.

(2) Permit coverage for small MS4s located in urbanized areas that serve fewer than 1,000 people may be waived if the following requirements are met:

1. Where the small MS4 discharges any pollutants of concern that have been identified as a cause of an impairment of any waterbody to which the MS4 discharges, the department has determined that stormwater controls are not needed based on a wasteload allocation that is a part of an EPA-approved TMDL that addresses the pollutants of concern.

2. The system is not contributing substantially to the pollutant loadings of a physically interconnected MS4 that is regulated under this rule.

(3) Permit coverage for small MS4s located outside of urbanized areas that serve 10,000 people or more where the average population density is 1,000 people/square mile or more may be waived if the MS4 is not discharging pollutants that are the cause of an impairment of any waterbody to which the MS4 discharges.

(4) Should conditions under which a waiver was granted change, the waiver may be rescinded by the department and permit coverage may be required.

[ARC 9203C, IAB 5/14/25, effective 6/18/25]

**567—60.12(455B) Transfer of title and owner or operator address change.**

**60.12(1) *Transfer.*** If title to any DS or part thereof for which a permit has been issued under this chapter is transferred, the new owner or owners shall be subject to all terms and conditions of the permit. Whenever title to a DS or part thereof is changed, the department shall be notified in writing of such change within 30 days of the occurrence. No transfer of the authorization to discharge from the facility represented by the permit shall take place prior to notification of the department of the transfer of title.

**60.12(2) *Address change.*** Whenever the address of the owner is changed, the department shall be notified in writing within 30 days of the address change.

[ARC 9203C, IAB 5/14/25, effective 6/18/25]

Rules 567—60.3(455B) through 567—60.12(455B) are intended to implement Iowa Code section 455B.173.

**567—60.13(455B) General permits (GPs) issued by the department.** The following is a list of GPs adopted by the department through the Administrative Procedure Act, Iowa Code chapter 17A, and the term of each permit.

**60.13(1)** “Storm Water Discharge Associated with Industrial Activity,” NPDES General Permit No. 1, effective March 1, 2023, to February 29, 2028.

**60.13(2)** “Storm Water Discharge Associated with Industrial Activity for Construction Activities,” NPDES General Permit No. 2, effective March 1, 2023, to February 29, 2028.

**60.13(3)** “Storm Water Discharge Associated with Industrial Activity from Asphalt Plants, Concrete Batch Plants, Rock Crushing Plants, and Construction Sand and Gravel Facilities,” NPDES General Permit No. 3, effective March 1, 2023, to February 29, 2028.

**60.13(4)** “Discharge from Private Sewage Disposal Systems,” NPDES General Permit No. 4, effective March 1, 2023, to February 29, 2028.

**60.13(5)** “Discharge from Mining and Processing Facilities,” NPDES General Permit No. 5, effective July 1, 2023, to June 30, 2028.

**60.13(6)** “Discharge Associated with Well Construction Activities,” NPDES General Permit No. 6, effective July 1, 2023, to June 30, 2028.

**60.13(7)** “Pesticide General Permit (PGP) for Point Source Discharges to Waters of the United States from the Application of Pesticides,” NPDES General Permit No. 7, effective July 1, 2023, to June 30, 2028.

**60.13(8)** “Discharge from Hydrostatic Testing, Tank Ballasting and Water Lines,” NPDES General Permit No. 8, effective July 1, 2023, to June 30, 2028.

**60.13(9)** “Discharge from Dewatering and Residential Geothermal Systems,” NPDES General Permit No. 9, effective July 1, 2023, to June 30, 2028.

[ARC 9203C, IAB 5/14/25, effective 6/18/25]

**567—60.14(455B) Fees.**

**60.14(1)** *Fee types.*

*a.* Application and NOI fees.

(1) For individual nonstormwater NPDES and operation permits, an application fee must be submitted with the application as specified in this rule.

(2) For authorization under GPs Nos. 1, 2, 3 and 5, an applicant has the option of paying an annual permit fee or a multiyear permit fee when the NOI is submitted as specified in this rule.

(3) For MS4 permits and individual stormwater permits, a one-time, multiyear permit fee must be submitted at the time of application as specified in this rule.

(4) If a facility needs coverage under more than one NPDES or operation permit, fees for each permit must be submitted appropriately.

*b.* Annual fees. Certain individual nonstormwater facilities covered by NPDES and operation permits must submit annual fees on a yearly basis as specified in this rule.

*c.* Fees are nontransferable. Failure to submit the appropriate fee at the time of application renders the application incomplete, and the department shall suspend application processing until the fee is received. Failure to submit the appropriate annual fee may result in permit revocation or suspension as noted in 60.3(6).

**60.14(2)** *Fee payment.* Fees shall be paid by check, credit card, electronic payment, or money order made payable to the “Iowa Department of Natural Resources.” For facilities needing coverage under more than one permit (e.g., general, individual stormwater, individual nonstormwater), separate payments shall be made according to the fee schedule in this rule.

**60.14(3)** *Fee schedule.* The following fees have been adopted:

*a.* *GP fees.* No fees shall be assessed for coverage under GPs not listed in this paragraph. The following fees are applicable to the described GPs:

(1) Storm Water Discharges Associated with Industrial Activity, NPDES General Permit No. 1; Storm Water Discharge Associated with Industrial Activity for Construction Activities, NPDES General Permit No. 2; and Storm Water Discharge Associated with Industrial Activity from Asphalt Plants, Concrete Batch Plants, Rock Crushing Plants, and Construction Sand and Gravel Facilities, NPDES General Permit No. 3.

|                       |                  |
|-----------------------|------------------|
| Annual permit fee     | \$175 (per year) |
| or                    |                  |
| Five-year permit fee  | \$700            |
| Four-year permit fee  | \$525            |
| Three-year permit fee | \$350            |

All fees are to be submitted with the NOI.

(2) Discharge from Mining and Processing Facilities, NPDES General Permit No. 5.

|                       |                  |
|-----------------------|------------------|
| Annual permit fee     | \$125 (per year) |
| or                    |                  |
| Five-year permit fee  | \$500            |
| Four-year permit fee  | \$400            |
| Three-year permit fee | \$300            |

New facilities seeking GP No. 5 coverage shall submit fees with the NOI. Maximum coverage is for five years. Coverage may also be obtained for four years, three years, or one year as shown in the fee schedule above. Existing facilities shall submit annual fees by August 30 of every year unless a multiyear fee payment was received in an earlier year. In the event a facility is no longer eligible to be covered under GP No. 5, the remainder of the fees previously paid by the facility shall be applied toward its individual permit fees.

*b. Individual NPDES and operation permit fees.* The following fees are applicable for the described individual permits:

(1) For individual stormwater permits, the following fees are due at the time of application, in accordance with whether or not the discharge will reach an OIW identified in the “Iowa Antidegradation Implementation Procedure” (incorporated by reference in 60.7(2)“d”(4)), as follows:

1. Where the discharge will not reach an OIW: a five-year permit fee of \$1,250.
2. Where the discharge will reach an OIW: a two-year permit fee of \$500.

(2) For permits that authorize the discharge of only stormwater from MS4s and any allowable nonstormwater, a five-year permit fee of \$1,250 must accompany the application.

(3) For individual nonstormwater NPDES and operation permits, a single application fee of \$85 as established in Iowa Code section 455B.197 is due at the time of a new application, renewal application, or amendment application.

1. The \$1,250 fee in 60.14(3)“b”(1) and (2) is not required for individual nonstormwater permits that authorize stormwater discharges along with other wastewater discharges.

2. Before an approved amendment request submitted by a facility holding a nonstormwater NPDES or operation permit can be processed by the department, the \$85 fee must be submitted, except when an amendment is initiated by the director, when the requested amendment will correct an error in the permit, when the amendment is for a DC compliance schedule or the Iowa nutrient reduction strategy, or when there is a transfer of title or change in the address of the owner as noted in rule 567—60.12(455B).

(4) For individual nonstormwater NPDES and operation permits, the following annual fees as established in Iowa Code section 455B.197(3) are due by August 30 of each year:

1. Major municipal facility: \$1,275.
2. Minor municipal facility: \$210. For a city with a population of 250 or less, the maximum fee shall be \$210 regardless of how many individual nonstormwater NPDES permits the city holds.
3. Semipublic facility: \$340.
4. Major industrial facility: \$3,400.
5. Minor industrial facility: \$300.

- 6. Facilities that hold an operation permit: \$170.
- 7. Animal feeding operations covered by a nonstormwater NPDES permit: \$340.
- (5) For a municipal water treatment facility with an individual nonstormwater NPDES permit, no fees shall be assessed.

(6) For a new facility covered by an individual nonstormwater NPDES or operating permit, a prorated annual fee, calculated by taking the annual fee amount multiplied by the number of months remaining before the next annual fee due date divided by 12, is due 30 days after the new permit is issued.

**60.14(4) Fee refunds.**

a. Individual and general permit application, permit, and annual fees may be refunded, completely or in part, at the director's discretion. Permittees who wish to receive fee refunds should notify the department electronically or in writing. Fees may be refunded under various circumstances, including but not limited to:

- (1) Submission of a duplicate fee;
- (2) Overpayment of a fee;
- (3) A fee was submitted but is not required; or
- (4) The department returns an application to the applicant without decision.

b. Fees shall not be refunded under any of the following conditions:

- (1) If a permit or permit coverage is suspended, revoked, or modified, or if an activity is discontinued or ceased;
- (2) If a permit is amended; or
- (3) If a permit application is withdrawn by the applicant or denied by the department pursuant to 60.5(1).

This rule is intended to implement Iowa Code section 455B.197.

[ARC 9203C, IAB 5/14/25, effective 6/18/25]

**567—60.15(455B) Nutrient reduction exchange.** The department shall maintain a registry of nonpoint source nutrient reduction practices installed by permittees. Practices listed in the registry may be eligible for future regulatory incentives.

[ARC 9203C, IAB 5/14/25, effective 6/18/25]

**567—60.16(455B) Validity of rules and applicability.**

**60.16(1) Validity.** If any section, paragraph, sentence, clause, phrase or word of these rules, or any part thereof, be declared unconstitutional or invalid for any reason, the remainder of said rules shall not be affected thereby and shall remain in full force and effect.

**60.16(2) Applicability.** This chapter shall apply to all waste DSs treating or intending to treat sewage, industrial waste, or other waste except waste resulting from livestock or poultry operations. All livestock and poultry operations constituting animal feeding operations as defined in 567—Chapter 65 shall be governed by the requirements in 567—Chapter 65. However, the provisions of this chapter concerning NPDES permits that relate to notice and public participation, permit terms and conditions, permit reissuance, and monitoring, reporting and recordkeeping activities shall apply to animal feeding operations that are required to apply for and obtain an NPDES permit to the extent that such requirements are not inconsistent with 567—Chapter 65.

[ARC 9203C, IAB 5/14/25, effective 6/18/25]

These rules are intended to implement Iowa Code chapter 455B, subchapter III, part 1.

<sup>1</sup> April 15, 2009, effective date of Item 2 of ARC 7625B delayed 70 days by the Administrative Rules Review Committee at its meeting held April 8, 2009; at its meeting held April 28, 2009, the Committee voted to lift the delay, effective April 29, 2009.

CHAPTER 61  
WATER QUALITY STANDARDS  
[Prior to 7/1/83, DEQ Ch 16]  
[Prior to 12/3/86, Water, Air and Waste Management[900]]

Chapter exempt from chapter rescission pursuant to Iowa Code section 17A.7

WATER QUALITY STANDARDS

**567—61.1** Rescinded, effective August 31, 1977.

**567—61.2(455B) General considerations.**

**61.2(1)** *Policy statement.* It shall be the policy of the commission to protect and enhance the quality of all the waters of the state. In the furtherance of this policy it will attempt to prevent and abate the pollution of all waters to the fullest extent possible consistent with statutory and technological limitations. This policy shall apply to all point and nonpoint sources of pollution.

These water quality standards establish selected criteria for certain present and future designated uses of the surface waters of the state. The standards establish the areas where these uses are to be protected and provide minimum criteria for waterways having nondesignated uses as well. Many surface waters are designated for more than one use. In these cases the more stringent criteria shall govern for each parameter.

Certain of the criteria are in narrative form without numeric limitations. In applying such narrative standards, decisions will be based on the U.S. Environmental Protection Agency's methodology described in "Guidelines for Deriving Numerical National Water Quality Criteria for the Protection of Aquatic Organisms and Their Uses," (1985) and on the rationale contained in "Quality Criteria for Water," published by the U.S. Environmental Protection Agency (1977), as updated by supplemental Section 304 (of the Act) Ambient Water Quality Criteria documents. To provide human health criteria for parameters not having numerical values listed in 61.3(3) Table 1, the required criteria will be based on the rationale contained in these EPA criteria documents. The human health criterion considered will be the value associated with the consumption of fish flesh and a risk factor of  $10^{-5}$  for carcinogenic parameters. For noncarcinogenic parameters, the recommended EPA criterion will be selected. For Class C water, the EPA criteria for fish and water consumption will be selected using the same considerations for carcinogenic and noncarcinogenic parameters as noted above.

All methods of sample collection, preservation, and analysis used in applying any of the rules in these standards shall be in accord with those prescribed in 567—Chapter 63.

**61.2(2)** *Antidegradation policy.* It is the policy of the state of Iowa that:

*a.* Tier 1 protection. Existing surface water uses and the level of water quality necessary to protect the existing uses will be maintained and protected.

*b.* Tier 2 protection. Where the quality of the waters exceeds levels necessary to support propagation of fish, shellfish, and wildlife and recreation in and on the water, that quality shall be maintained and protected unless the department finds, after full satisfaction of the intergovernmental coordination and public participation provisions, that allowing lower water quality is necessary to accommodate important economic or social development in the area in which the waters are located. In allowing such degradation or lower water quality, the department shall ensure water quality adequate to protect existing uses fully. Further, the department shall ensure the highest statutory and regulatory requirements for all new and existing point sources and all cost-effective and reasonable best management practices for nonpoint source control before allowing any lowering of water quality.

*c.* Tier 2½ protection—outstanding Iowa waters. Where high quality waters constitute an outstanding state resource, such as waters of exceptional recreational or ecological significance, that water quality shall be maintained and protected.

*d.* Tier 3 protection—outstanding national resource waters. Where high quality waters constitute an outstanding national resource, such as waters of national and state parks and wildlife refuges and waters of exceptional recreational or ecological significance, that water quality shall be maintained and protected.

Any proposed activity that would result in a permanent new or expanded source of pollutants in an outstanding national resource water is prohibited.

*e.* Rescinded IAB 8/31/16, effective 8/12/16.

*f.* All unapproved facility plans for new or expanded construction permits, except for construction permits issued for nondischarging facilities, shall undergo an antidegradation review if degradation is likely in the receiving water or downstream waters following February 17, 2010.

*g.* This policy shall be applied in conjunction with water quality certification review pursuant to Section 401 of the Act. In the event that activities are specifically exempted from flood plain development permits or any other permits issued by this department in 567—Chapters 70, 71, and 72, the activity will be considered consistent with this policy. Other activities not otherwise exempted will be subject to 567—Chapters 70, 71, and 72 and this policy.

**61.2(3)** *Minimum treatment required.* All wastes discharged to the waters of the state must be of such quality that the discharge will not cause the narrative or numeric criteria limitations to be exceeded. Where the receiving waters provide sufficient assimilative capacity that the water quality standards are not the limiting factor, all point source wastes shall receive treatment in compliance with minimum effluent standards as adopted in rules by the department.

There are numerous parameters of water quality associated with nonpoint source runoff which are of significance to the designated water uses specified in the general and specific designations in 567—61.3(455B), but which are not delineated. It shall be the intent of these standards that the limits on such nonpoint source related parameters when adopted shall be those that can be achieved by best management practices as defined in the course of the continuing planning process from time to time. Existing water quality and nonpoint source runoff control technology will be evaluated in the course of the Iowa continuing planning process, and best management practices and limitations on specific water quality parameters will be reviewed and revised from time to time to ensure that the designated water uses and water quality enhancement goals are met.

**61.2(4)** *Regulatory mixing zones.* Mixing zones are recognized as being necessary for the initial assimilation of point source discharges which have received the required degree of treatment or control. Mixing zones shall not be used for, or considered as, a substitute for minimum treatment technology required by subrule 61.2(3). The objective of establishing mixing zones is to provide a means of control over the placement and emission of point source discharges so as to minimize environmental impacts. Waters within a mixing zone shall meet the general water quality criteria of subrule 61.3(2). Waters at and beyond mixing zone boundaries shall meet all applicable standards and the chronic and human health criteria of subrule 61.3(3), Tables 1 and 3, for that particular water body or segment. A zone of initial dilution may be established within the mixing zone beyond which the applicable standards and the acute criteria of subrule 61.3(3) will be met. For waters designated under subrule 61.3(5), any parameter not included in Tables 1, 2 and 3 of subrule 61.3(3), the chronic and human health criteria, and the acute criterion calculated following subrule 61.2(1), will be met at the mixing zone and zone of initial dilution boundaries, respectively.

*a.* Due to extreme variations in wastewater and receiving water characteristics, spatial dimensions of mixing zones shall be defined on a site-specific basis. These rules are not intended to define each individual mixing zone, but will set maximum limits which will satisfy most biological, chemical, physical and radiological considerations in defining a particular mixing zone. Additional details are noted in the “Iowa Wasteload Allocation (WLA) Procedure,” as revised on November 11, 2020, for considering unusual site-specific features such as side channels and sand bars which may influence a mixing zone. Applications for operation permits under 567—subrule 64.3(1) may be required to provide specific information related to the mixing zone characteristics below their outfall so that mixing zone boundaries can be determined.

*b.* For parameters included in Table 1 only (which does not include ammonia nitrogen), the dimensions of the mixing zone and the zone of initial dilution will be calculated using a mathematical model presented in the “Iowa Wasteload Allocation (WLA) Procedure,” as revised on November 11, 2020, or from instream studies of the mixing characteristics during low flow. In addition, the most restrictive of the following factors will be met:

(1) The stream flow in the mixing zone may not exceed the most restrictive of the following:

1. Twenty-five percent of the design low stream flows noted in subrule 61.2(5) for interior streams and rivers, and the Big Sioux and Des Moines Rivers.

2. Ten percent of the design low stream flows noted in subrule 61.2(5) for the Mississippi and Missouri Rivers.

3. The stream flow contained in the mixing zone at the most restrictive of the applicable mixing zone length criteria, noted below.

- (2) The length of the mixing zone below the point of discharge shall be set by the most restrictive of the following:

1. The distance to the juncture of two perennial streams.

2. The distance to a public water supply intake.

3. The distance to the upstream limits of an established recreational area, such as public beaches, and state, county and local parks.

4. The distance to the middle of a crossover point in a stream where the main current flows from one bank across to the opposite bank.

5. The distance to another mixing zone.

6. Not to exceed a distance of 2000 feet.

7. The location where the mixing zone contained the percentages of stream flow noted in 61.2(4) “b” (1).

- (3) The width of the mixing zone is calculated as the portion of the stream containing the allowed mixing zone stream flow. The mixing zone width will be measured perpendicular to the basic direction of stream flow at the downstream boundary of the mixing zone. This measurement will only consider the distance of continuous water surface.

- (4) The width and length of the zone of initial dilution may not exceed 10 percent of the width and length of the mixing zone.

c. The stream flow used in determining wasteload allocations to ensure compliance with the maximum contaminant level (MCL), chronic and human health criteria of Table 1 will be that value contained at the boundary of the allowed mixing zone. This stream flow may not exceed the following percentages of the design low stream flow as measured at the point of discharge:

- (1) Twenty-five percent for interior streams and rivers, and the Big Sioux and Des Moines Rivers.

- (2) Ten percent for the Mississippi and Missouri Rivers.

The stream flow in the zone of initial dilution used in determining effluent limits to ensure compliance with the acute criteria of Table 1 may not exceed 10 percent of the calculated flow associated with the mixing zone.

d. For toxic parameters noted in Table 1, the following exceptions apply to the mixing zone requirements:

- (1) No mixing zone or zone of initial dilution will be allowed for waters designated as lakes or wetlands.

- (2) No zone of initial dilution will be allowed in waters designated as cold water.

- (3) The use of a diffuser device to promote rapid mixing of an effluent in a receiving stream will be considered on a case-by-case basis with its usage as a means for dischargers to comply with an acute numerical criterion.

- (4) A discharger to interior streams and rivers, the Big Sioux and Des Moines Rivers, and the Mississippi or Missouri Rivers may provide to the department, for consideration, instream data which technically supports the allowance of an increased percentage of the stream flow contained in the mixing zone due to rapid and complete mixing. Any allowed increase in mixing zone flow would still be governed by the mixing zone length restrictions. The submission of data should follow the guidance provided in the “Iowa Wasteload Allocation (WLA) Procedure,” as revised on November 11, 2020.

e. For ammonia criteria noted in Table 3, the dimensions of the mixing zone and the zone of initial dilution will be calculated using a mathematical model presented in the “Iowa Wasteload Allocation (WLA) Procedure,” as revised on November 11, 2020, or from instream studies of the mixing characteristics during low flow. In addition, the most restrictive of the following factors will be met:

- (1) The stream flow in the mixing zone may not exceed the most restrictive of the following:

1. One hundred percent of the design low stream flows noted in subrule 61.2(5) for locations where the dilution ratio is less than or equal to 2:1.

2. Fifty percent of the design low stream flows noted in subrule 61.2(5) for locations where the dilution ratio is greater than 2:1, but less than or equal to 5:1.

3. Twenty-five percent of the design low stream flows noted in subrule 61.2(5) for locations where the dilution ratio is greater than 5:1.

4. The stream flow contained in the mixing zone at the most restrictive of the applicable mixing zone length criteria, noted below.

(2) The length of the mixing zone below the point of discharge shall be set by the most restrictive of the following:

1. The distance to the juncture of two perennial streams.

2. The distance to a public water supply intake.

3. The distance to the upstream limits of an established recreational area, such as public beaches, and state, county, and local parks.

4. The distance to the middle of a crossover point in a stream where the main current flows from one bank across to the opposite bank.

5. The distance to another mixing zone.

6. Not to exceed a distance of 2000 feet.

7. The location where the mixing zone contained the percentages of stream flow noted in 61.2(4) "e" (1).

(3) The width of the mixing zone is calculated as the portion of the stream containing the allowed mixing zone stream flow. The mixing zone width will be measured perpendicular to the basic direction of stream flow at the downstream boundary of the mixing zone. This measurement will only consider the distance of continuous water surface.

(4) The width and length of the zone of initial dilution may not exceed 10 percent of the width and length of the mixing zone.

f. For ammonia criteria noted in Table 3, the stream flow used in determining wasteload allocations to ensure compliance with the chronic criteria of Table 3 will be that value contained at the boundary of the allowed mixing zone. This stream flow may not exceed the percentages of the design low stream flow noted in 61.2(4) "e" (1) as measured at the point of discharge.

The pH and temperature values at the boundary of the mixing zone used to select the chronic ammonia criteria of Table 3 will be from one of the following sources. The source of the pH and temperature data will follow the sequence listed below, if applicable data exists from the source.

(1) Specific pH and temperature data provided by the applicant gathered at their mixing zone boundary. Procedures for obtaining this data are noted in the "Iowa Wasteload Allocation (WLA) Procedure," as revised on November 11, 2020.

(2) Regional background pH and temperature data provided by the applicant gathered along the receiving stream and representative of the background conditions at the outfall. Procedures for obtaining this data are noted in the "Iowa Wasteload Allocation (WLA) Procedure," as revised on November 11, 2020.

(3) The statewide median background values as determined by the department.

The stream flow in the zone of initial dilution used in determining effluent limits to ensure compliance with the acute criteria of Table 3 may not exceed 5 percent of the calculated flow associated with the mixing zone for facilities with a dilution ratio of less than or equal to 2:1, and not exceed 10 percent of the calculated flow associated with the mixing zone for facilities with a dilution ratio of greater than 2:1. The pH and temperature values at the boundary of the zone of initial dilution used to select the acute ammonia criteria of Table 3 will be from one of the following sources and follow the sequence listed below, if applicable data exists from the source.

1. Specific effluent pH and temperature data if the dilution ratio is less than or equal to 2:1.

2. If the dilution ratio is greater than 2:1, the logarithmic average pH of the effluent and the regional or statewide pH provided in 61.2(4) "f" will be used. In addition, the flow proportioned average temperature of the effluent and the regional or statewide temperature provided in 61.2(4) "f" will be used.

The procedures for calculating these data are noted in the “Iowa Wasteload Allocation (WLA) Procedure,” as revised on November 11, 2020.

g. For ammonia criteria noted in Table 3, the following exceptions apply to the mixing zone requirements.

(1) No mixing zone or zone of initial dilution will be allowed for waters designated as lakes or wetlands.

(2) No zone of initial dilution will be allowed in waters designated as cold water.

(3) The use of a diffuser device to promote rapid mixing of an effluent in a receiving stream will be considered on a case-by-case basis with its usage as a means for dischargers to comply with an acute numerical criterion.

(4) A discharger to interior streams and rivers, the Big Sioux and Des Moines Rivers, and the Mississippi and Missouri Rivers may provide to the department, for consideration, instream data which technically supports the allowance of an increased percentage of the stream flow contained in the mixing zone due to rapid and complete mixing. Any allowed increase in mixing zone flow would still be governed by the mixing zone length restrictions. The submission of data should follow the guidance provided in the “Iowa Wasteload Allocation (WLA) Procedure,” as revised on November 11, 2020.

h. Temperature changes within mixing zones established for heat dissipation will not exceed the temperature criteria in 61.3(3) “b”(5).

i. The appropriateness of establishing a mixing zone where a substance discharged is bioaccumulative, persistent, carcinogenic, mutagenic, or teratogenic will be carefully evaluated. In such cases, effects such as potential groundwater contamination, sediment deposition, fish attraction, bioaccumulation in aquatic life, bioconcentration in the food chain, and known or predicted safe exposure levels shall be considered.

**61.2(5) Implementation strategy.** Numerical criteria specified in these water quality standards shall be met when the flow of the receiving stream equals or exceeds the design low flows noted below.

| Type of Numerical Criteria            | Design Low Flow Regime |
|---------------------------------------|------------------------|
| Aquatic Life Protection (TOXICS)      |                        |
| Acute                                 | 1Q <sub>10</sub>       |
| Chronic                               | 7Q <sub>10</sub>       |
| Aquatic Life Protection (AMMONIA - N) |                        |
| Acute                                 | 1Q <sub>10</sub>       |
| Chronic                               | 30Q <sub>10</sub>      |
| Human Health Protection & MCL         |                        |
| Noncarcinogenic                       | 30Q <sub>5</sub>       |
| Carcinogenic                          | Harmonic mean          |

a. The allowable 3°C temperature increase criterion for warm water interior streams, 61.3(3) “b”(5) “1,” is based in part on the need to protect fish from cold shock due to rapid cessation of heat source and resultant return of the receiving stream temperature to natural background temperature. On low flow streams, in winter, during certain conditions of relatively cold background stream temperature and relatively warm ambient air and groundwater temperature, certain wastewater treatment plants with relatively constant flow and constant temperature discharges will cause temperature increases in the receiving stream greater than allowed in 61.3(3) “b”(5) “1.”

b. During the period November 1 to March 31, for the purpose of applying the 3°C temperature increase criterion, the minimum protected receiving stream flow rate below such discharges may be increased to not more than three times the rate of flow of the discharge, where there is reasonable assurance that the discharge is of such constant temperature and flow rate and continuous duration as to not constitute a threat of heat cessation and not cause the receiving stream temperature to vary more than 3°C per day.

c. Site-specific water quality criteria may be allowed in lieu of the specific numerical criteria listed in Tables 1 and 3 of this chapter if adequate documentation is provided to show that the proposed criteria will protect all existing or potential uses of the surface water. Site-specific water quality criteria may be appropriate where:

- (1) The types of organisms differ significantly from those used in setting the statewide criteria; or
- (2) The chemical characteristics of the surface water such as pH, temperature, and hardness differ significantly from the characteristics used in setting the statewide criteria.

Development of site-specific criteria shall include an evaluation of the chemical and biological characteristics of the water resource and an evaluation of the impact of the discharge. All evaluations for site-specific criteria modification must be coordinated through the department, and be conducted using scientifically accepted procedures approved by the department. Any site-specific criterion developed under the provisions of this subrule is subject to the review and approval of the U.S. Environmental Protection Agency. All criteria approved under the provisions of this subrule will be published periodically by the department. Guidelines for establishing site-specific water quality criteria can be found in "Water Quality Standards Handbook," published by the U.S. Environmental Protection Agency, December 1983.

*d.* A wastewater treatment facility may submit to the department technically valid instream data which provides additional information to be used in the calculations of their wasteload allocations and effluent limitations. This information would be in association with the low flow characteristics, width, length and time of travel associated with the mixing zone or decay rates of various effluent parameters. The wasteload allocation will be calculated considering the applicable data and consistent with the provisions and restrictions in the rules.

*e.* The department may perform use assessment and related use attainability analyses on water bodies where uses may not be known or adequately documented. The preparation of use attainability analysis documents will consider available U.S. Environmental Protection Agency guidance or other applicable guidance. Credible data and documentation will be used to assist in the preparation of use assessments and use attainability analysis reports.

**61.2(6) *State water quality certification.*** This subrule describes the procedures the department will follow when processing certification requests for state water quality certification (certification) of federally issued licenses and permits pursuant to Section 401 of the Act, including but not limited to permits issued by the United States Corps of Engineers (Corps) pursuant to Section 404 of the Act.

*a.* General. The department shall receive, consider, and process certification requests in accordance with Section 401 of the Act.

*b.* Certification requests. Certification requests shall be made on the department's Section 401 Water Quality Certification Request form. This form is available on the department's website. Individual permits or licenses issued by federal agencies require submission of a prefilng meeting request and certification request to obtain certification. The prefilng meeting request must be submitted to the department at least 30 days prior to submitting the certification request.

*c.* Public notice. The department shall issue a public notice of a certification request. The public notice may be a joint public notice issued by a federal agency on behalf of the department. When there is no joint public notice issued by the federal agency, a public notice issued by the department will be provided on its website. The public notice shall solicit comments from the public regarding whether the proposed project complies with state water quality requirements in accordance with Section 401 of the Act. The public notice shall specify the procedure and time frame for submitting comments on the proposed project.

*d.* Public notice for new or renewed nationwide or regional permits. The department shall provide additional notice to the public of certification of new or renewed nationwide or regional permits issued by the Corps pursuant to Section 404 of the Act. The department shall provide such notice on its website. The public notice shall solicit comments from the public regarding whether the proposed permit complies with state water quality requirements in accordance with Section 401 of the Act. The public notice shall specify the procedure and time frame for submitting comments on the proposed certification.

*e.* Department action on certification request. After the close of the public comment period and consideration of comments received, the department may issue a certification letter which may include conditions necessary to ensure compliance with state water quality requirements, waive issuance of the certification, or deny certification in accordance with Section 401 of the Act.

*f.* Certification of federal permits or licenses may require conditions, which may include one or more of the following, to ensure water quality requirements are met:

(1) During construction and upon completion of the project, actions must be taken to prevent pollution affecting public health, fish, shellfish, wildlife, and recreation due to turbidity, pH, nutrients, suspended solids, floating debris, visible oil and grease, or other pollutants entering waters of the state;

(2) Equipment used in waters of the state shall be cleaned of all hazardous materials, pesticides, fuels, lubricants, oils, hydraulic fluids, or other construction-related, potentially hazardous substances before arriving on site. Wash water shall not be discharged into a water of the state;

(3) All cleared vegetative material shall be properly managed in such a manner that it cannot enter a water of the state and cause a violation of water quality requirements;

(4) All construction debris shall be properly managed in such a manner that it cannot enter a water of the state;

(5) Erosion shall be managed so that sediment is not discharged to a water of the state in a manner that causes a violation of water quality requirements;

(6) Riprap, treated lumber products, and temporary structures shall consist of clean material free of coatings of potentially hazardous substances. No asphalt or petroleum-based material shall be used as or included in material placed in any water of the state or within the high-water table;

(7) Stockpiled dredged materials on the shore shall be managed so that sediment is not discharged in a manner that causes a violation of water quality requirements;

(8) Water quality monitoring will be required for Federal Energy Regulatory Commission hydropower projects at the baseline, construction and operational phases of the project;

(9) Hydraulically dredged material shall be managed to ensure the return water meets water quality requirements.

g. Duration of certification. The department's certification shall remain in effect until the expiration date of the applicable permit or license.

#### **567—61.3(455B) Surface water quality criteria.**

**61.3(1)** *Surface water classification.* All waters of the state are classified for protection of beneficial uses. These classified waters include general use segments and designated use segments.

a. *General use segments.* These are intermittent watercourses and those watercourses which typically flow only for short periods of time following precipitation and whose channels are normally above the water table. These waters do not support a viable aquatic community during low flow and do not maintain pooled conditions during periods of no flow.

The general use segments are to be protected for livestock and wildlife watering, aquatic life, noncontact recreation, crop irrigation, and industrial, agricultural, domestic and other incidental water withdrawal uses.

b. *Designated use segments.* These are water bodies which maintain flow throughout the year or contain sufficient pooled areas during intermittent flow periods to maintain a viable aquatic community.

All perennial rivers and streams as identified by the U.S. Geological Survey 1:100,000 DLG Hydrography Data Map (published July 1993) or intermittent streams with perennial pools in Iowa not specifically listed in the surface water classification of 61.3(5) are designated as Class B(WW-1) waters.

All perennial rivers and streams as identified by the U.S. Geological Survey 1:100,000 DLG Hydrography Data Map (published July 1993) or intermittent streams with perennial pools in Iowa are designated as Class A1 waters.

Designated uses of segments may change based on a use attainability analysis consistent with 61.2(5)“e.” Designated use changes will be specifically listed in the surface water classification of 61.3(5).

Designated use waters are to be protected for all uses of general use segments in addition to the specific uses assigned. Designated use segments include:

(1) Primary contact recreational use (Class “A1”). Waters in which recreational or other uses may result in prolonged and direct contact with the water, involving considerable risk of ingesting water

in quantities sufficient to pose a health hazard. Such activities would include, but not be limited to, swimming, diving, water skiing, and water contact recreational canoeing.

(2) Secondary contact recreational use (Class “A2”). Waters in which recreational or other uses may result in contact with the water that is either incidental or accidental. During the recreational use, the probability of ingesting appreciable quantities of water is minimal. Class A2 uses include fishing, commercial and recreational boating, any limited contact incidental to shoreline activities and activities in which users do not swim or float in the water body while on a boating activity.

(3) Children’s recreational use (Class “A3”). Waters in which recreational uses by children are common. Class A3 waters are water bodies having definite banks and bed with visible evidence of the flow or occurrence of water. This type of use would primarily occur in urban or residential areas.

(4) Cold water aquatic life—Type 1 (Class “B(CW1)”). Waters in which the temperature and flow are suitable for the maintenance of a variety of cold water species, including reproducing and nonreproducing populations of trout (*Salmonidae* family) and associated aquatic communities.

(5) Cold water aquatic life—Type 2 (Class “B(CW2)”). Waters that include small, channeled streams, headwaters, and spring runs that possess natural cold water attributes of temperature and flow. These waters usually do not support consistent populations of trout (*Salmonidae* family), but may support associated vertebrate and invertebrate organisms.

(6) Warm water—Type 1 (Class “B(WW-1)”). Waters in which temperature, flow and other habitat characteristics are suitable to maintain warm water game fish populations along with a resident aquatic community that includes a variety of native nongame fish and invertebrate species. These waters generally include border rivers, large interior rivers, and the lower segments of medium-size tributary streams.

(7) Warm water—Type 2 (Class “B(WW-2)”). Waters in which flow or other physical characteristics are capable of supporting a resident aquatic community that includes a variety of native nongame fish and invertebrate species. The flow and other physical characteristics limit the maintenance of warm water game fish populations. These waters generally consist of small perennially flowing streams.

(8) Warm water—Type 3 (Class “B(WW-3)”). Waters in which flow persists during periods when antecedent soil moisture and groundwater discharge levels are adequate; however, aquatic habitat typically consists of nonflowing pools during dry periods of the year. These waters generally include small streams of marginally perennial aquatic habitat status. Such waters support a limited variety of native fish and invertebrate species that are adapted to survive in relatively harsh aquatic conditions.

(9) Lakes and wetlands (Class “B(LW)”). These are artificial and natural impoundments with hydraulic retention times and other physical and chemical characteristics suitable to maintain a balanced community normally associated with lake-like conditions.

(10) Human health (Class “HH”). Waters in which fish are routinely harvested for human consumption or waters both designated as a drinking water supply and in which fish are routinely harvested for human consumption.

(11) Drinking water supply (Class “C”). Waters which are used as a raw water source of potable water supply.

**61.3(2) General water quality criteria.** The following criteria are applicable to all surface waters including general use and designated use waters, at all places and at all times for the uses described in 61.3(1) “a.”

*a.* Such waters shall be free from substances attributable to point source wastewater discharges that will settle to form sludge deposits.

*b.* Such waters shall be free from floating debris, oil, grease, scum and other floating materials attributable to wastewater discharges or agricultural practices in amounts sufficient to create a nuisance.

*c.* Such waters shall be free from materials attributable to wastewater discharges or agricultural practices producing objectionable color, odor or other aesthetically objectionable conditions.

*d.* Such waters shall be free from substances attributable to wastewater discharges or agricultural practices in concentrations or combinations which are acutely toxic to human, animal, or plant life.

*e.* Such waters shall be free from substances, attributable to wastewater discharges or agricultural practices, in quantities which would produce undesirable or nuisance aquatic life.

f. The turbidity of the receiving water shall not be increased by more than 25 Nephelometric turbidity units by any point source discharge.

g. Cations and anions guideline values to protect livestock watering may be found in the “Iowa Wasteload Allocation (WLA) Procedure,” as revised on November 11, 2020.

h. The *Escherichia coli* (*E. coli*) content of water which enters a sinkhole or losing stream segment, regardless of the water body’s designated use, shall not exceed a Geometric Mean value of 126 organisms/100 ml or a sample maximum value of 235 organisms/100 ml. No new wastewater discharges will be allowed on watercourses which directly or indirectly enter sinkholes or losing stream segments.

**61.3(3) Specific water quality criteria.**

a. *Class “A” waters.* Waters which are designated as Class “A1,” “A2,” or “A3” in subrule 61.3(5) are to be protected for primary contact, secondary contact, and children’s recreational uses. The general criteria of subrule 61.3(2) and the following specific criteria apply to all Class “A” waters.

(1) The *Escherichia coli* (*E. coli*) content shall not exceed the levels noted in the Bacteria Criteria Table when the Class “A1,” “A2,” or “A3” uses can reasonably be expected to occur.

Bacteria Criteria Table (organisms/100 ml of water)

| Use or Category                                                                                                                        | Geometric Mean | Sample Maximum |
|----------------------------------------------------------------------------------------------------------------------------------------|----------------|----------------|
| Class A1                                                                                                                               |                |                |
| 3/15 – 11/15                                                                                                                           | 126            | 235            |
| 11/16 – 3/14                                                                                                                           | Does not apply | Does not apply |
| Class A2 (Only)                                                                                                                        |                |                |
| 3/15 – 11/15                                                                                                                           | 630            | 2880           |
| 11/16 – 3/14                                                                                                                           | Does not apply | Does not apply |
| [Class A2 and B(CW)] or OIW or ONRW                                                                                                    |                |                |
| Year-Round                                                                                                                             | 630            | 2880           |
| Class A3                                                                                                                               |                |                |
| 3/15 – 11/15                                                                                                                           | 126            | 235            |
| 11/16 – 3/14                                                                                                                           | Does not apply | Does not apply |
| Class A1 - Primary Contact Recreational Use<br>Class A2 - Secondary Contact Recreational Use<br>Class A3 - Children’s Recreational Use |                |                |

When a water body is designated for more than one of the recreational uses, the most stringent criteria for the appropriate season shall apply.

(2) The pH shall not be less than 6.5 nor greater than 9.0. The maximum change permitted as a result of a waste discharge shall not exceed 0.5 pH units.

b. *Class “B” waters.* All waters which are designated as Class B(CW1), B(CW2), B(WW-1), B(WW-2), B(WW-3) or B(LW) are to be protected for wildlife, fish, aquatic, and semiaquatic life. The following criteria shall apply to all Class “B” waters designated in subrule 61.3(5).

(1) Dissolved oxygen. Dissolved oxygen shall not be less than the values shown in Table 2 of this subrule.

(2) pH. The pH shall not be less than 6.5 nor greater than 9.0. The maximum change permitted as a result of a waste discharge shall not exceed 0.5 pH units.

(3) General chemical constituents. The specific numerical criteria shown in Tables 1, 2, and 3 of this subrule apply to all waters designated in subrule 61.3(5). The sole determinant of compliance with these criteria will be established by the department on a case-by-case basis. Effluent monitoring or instream monitoring, or both, will be the required approach to determine compliance.

1. The acute criteria represent the level of protection necessary to prevent acute toxicity to aquatic life. Instream concentrations above the acute criteria will be allowed only within the boundaries of the zone of initial dilution.

2. The chronic criteria represent the level of protection necessary to prevent chronic toxicity to aquatic life. Excursions above the chronic criteria will be allowed only inside of mixing zones or only

for short-term periods outside of mixing zones; however, these excursions cannot exceed the acute criteria shown in Tables 1 and 3. The chronic criteria will be met as short-term average conditions at all times the flow equals or exceeds either the design flows noted in subrule 61.2(5) or any site-specific low flow established under the provisions of subrule 61.2(5).

3. Rescinded IAB 2/15/06, effective 3/22/06.

(4) Rescinded IAB 2/15/06, effective 3/22/06.

(5) Temperature.

1. No heat shall be added to interior streams or the Big Sioux River that would cause an increase of more than 3°C. The rate of temperature change shall not exceed 1°C per hour. In no case shall heat be added in excess of that amount that would raise the stream temperature above 32°C.

2. No heat shall be added to streams designated as cold water fisheries that would cause an increase of more than 2°C. The rate of temperature change shall not exceed 1°C per hour. In no case shall heat be added in excess of that amount that would raise the stream temperature above 20°C.

3. No heat shall be added to lakes and reservoirs that would cause an increase of more than 2°C. The rate of temperature change shall not exceed 1°C per hour. In no case shall heat be added in excess of that amount that would raise the temperature of the lake or reservoirs above 32°C.

4. No heat shall be added to the Missouri River that would cause an increase of more than 3°C. The rate of temperature change shall not exceed 1°C per hour. In no case shall heat be added that would raise the stream temperature above 32°C.

5. No heat shall be added to the Mississippi River that would cause an increase of more than 3°C. The rate of temperature change shall not exceed 1°C per hour. In addition, the water temperature at representative locations in the Mississippi River shall not exceed the maximum limits in the table below during more than 1 percent of the hours in the 12-month period ending with any month. Moreover, at no time shall the water temperature at such locations exceed the maximum limits in the table below by more than 2°C.

Zone II—Iowa-Minnesota state line to the northern Illinois border (Mile Point 1534.6).

Zone III—Northern Illinois border (Mile Point 1534.6) to Iowa-Missouri state line.

| Month     | Zone II | Zone III |
|-----------|---------|----------|
| January   | 4°C     | 7°C      |
| February  | 4°C     | 7°C      |
| March     | 12°C    | 14°C     |
| April     | 18°C    | 20°C     |
| May       | 24°C    | 26°C     |
| June      | 29°C    | 29°C     |
| July      | 29°C    | 30°C     |
| August    | 29°C    | 30°C     |
| September | 28°C    | 29°C     |
| October   | 23°C    | 24°C     |
| November  | 14°C    | 18°C     |
| December  | 9°C     | 11°C     |

(6) Early life stage for each use designation. The following seasons will be used in applying the early life stage present chronic criteria noted in Table 3b, “Chronic Criterion for Ammonia in Iowa Streams - Early Life Stages Present.”

1. For all Class B(CW1) waters, the early life stage will be year-round.

2. For all Class B(CW2) waters, the early life stage will begin on April 1 and last through September 30.

3. For all Class B(WW-1) waters, the early life stage will begin in March and last through September, except as follows:

- For the following, the early life stage will begin in February and last through September:

- The entire length of the Mississippi and Missouri Rivers,

- The lower reach of the Des Moines River south of the Ottumwa dam, and

- The lower reach of the Iowa River below the Cedar River.

- For the following, the early life stage will begin in April and last through September:
  - All Class B(WW-1) waters in the Southern Iowa River Basin,
  - All of the Class B(WW-1) reach of the Skunk River, the North Skunk River and the South Skunk River south of Indian Creek (Jasper County), and the Class B(WW-1) tributaries to these reaches, and the entire Class B(WW-1) reach of the English River.
- 4. For all Class B(WW-2) and Class B(WW-3) waters, the early life stage will begin in April and last through September.
- 5. For all Class B(LW) lake and wetland waters, the early life stage will begin in March and last through September except for the Class B(LW) waters in the southern two tiers of Iowa counties which will have the early life stage of April through September.
- c. *Class “C” waters.* Waters which are designated as Class “C” are to be protected as a raw water source of potable water supply. The following criteria shall apply to all Class “C” waters designated in subrule 61.3(5).
  - (1) Radioactive substances.
    1. The combined radium-226 and radium-228 shall not exceed 5 picocuries per liter at the point of withdrawal.
    2. Gross alpha particle activity (including radium-226 but excluding radon and uranium) shall not exceed 15 picocuries per liter at the point of withdrawal.
    3. The average annual concentration at the point of withdrawal of beta particle and photon radioactivity from man-made radionuclides other than tritium and strontium-90 shall not produce an annual dose equivalent to the total body or any internal organ greater than 4 millirem/year.
    4. The average annual concentration of tritium shall not exceed 20,000 picocuries per liter at the point of withdrawal; the average annual concentration of strontium-90 shall not exceed 8 picocuries per liter at the point of withdrawal.
  - (2) All substances toxic or detrimental to humans or detrimental to treatment process shall be limited to nontoxic or nondetrimental concentrations in the surface water.
  - (3) The pH shall not be less than 6.5 nor greater than 9.0.
- d. *Class “HH” waters.* Waters which are designated as Class HH shall contain no substances in concentrations which will make fish or shellfish inedible due to undesirable tastes or cause a hazard to humans after consumption.
  - (1) The human health criteria represent the level of protection necessary, in the case of noncarcinogens, to prevent adverse health effects in humans and, in the case of carcinogens, to prevent a level of incremental cancer risk not exceeding 1 in 100,000. Instream concentrations in excess of the human health criteria will be allowed only within the boundaries of the mixing zone.
  - (2) Reserved.

**TABLE 1. Criteria for Chemical Constituents**

(all values as micrograms per liter as total recoverable unless noted otherwise)

Human health criteria for carcinogenic parameters noted below were based on the prevention of an incremental cancer risk of 1 in 100,000. For parameters not having a noted human health criterion, the U.S. Environmental Protection Agency has not developed final national human health guideline values. For noncarcinogenic parameters, the recommended EPA criterion was selected. For Class C waters, the EPA criteria for fish and water consumption were selected using the same considerations for carcinogenic and noncarcinogenic parameters as noted above. For Class C waters for which no EPA human health criteria were available, the EPA MCL value was selected.

\* units expressed as milligrams/liter

\*\* to include the sum of known and suspected carcinogenic PAHs (includes benzo(a)anthracene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, dibenzo(a,h)anthracene, and indeno(1,2,3-cd)pyrene)

† expressed as nanograms/liter

+ represents the noncarcinogenic human health parameters

++ The concentrations of 4,4-DDT or its metabolites; 4,4-DDE and 4,4-DDD, individually shall not exceed the human health criteria.

(a) units expressed as million fibers/liter (longer than 10 micrometers)

(b) includes alpha-endosulfan, beta-endosulfan, and endosulfan sulfate in combination or as individually measured

- (c) The sum of the four trihalomethanes (bromoform [tribromomethane], chlorodibromomethane, chloroform [trichloromethane], and dichlorobromomethane) may not exceed the MCL.
- (d) Class B numerical criteria for pentachlorophenol are a function of pH using the equation: Criterion ( $\mu\text{g/l}$ ) =  $e^{(1.005(\text{pH}) - x)}$ , where  $e = 2.71828$  and  $x$  varies according to the following table:

|         | B(CW1) | B(CW2) | B(WW-1) | B(WW-2) | B(WW-3) | B(LW) |
|---------|--------|--------|---------|---------|---------|-------|
| Acute   | 3.869  | —      | 4.869   | 4.869   | 4.869   | 4.869 |
| Chronic | 4.134  | —      | 5.134   | 5.134   | 5.134   | 5.134 |

- (e) This Class HH criterion would be applicable to any Class B(LW), B(CW1), B(WW-1), B(WW-2), or B(WW-3) water body that is also designated Class HH.
- (f) This Class HH criterion would be applicable to any Class C water body that is also designated Class HH.
- (g) inorganic form only
- (h) The acute and chronic criteria listed in main table are based on a hardness of 200 mg/l (as  $\text{CaCO}_3$  (mg/l)). Numerical criteria ( $\mu\text{g/l}$ ) for cadmium are a function of hardness (as  $\text{CaCO}_3$  (mg/l)) using the following equations:

|         | B(CW1)                                                                                                           | B(WW-1)&B(LW)                                                                                                     | B(WW-2)&B(WW-3)                                                                                                   |
|---------|------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------|
| Acute   | $(1.136672 - ((\ln \text{hardness}) \times (0.041838)))^*$<br>$e^{(0.9789 \times \ln(\text{hardness}) - 3.866)}$ | $(1.136672 - ((\ln \text{hardness}) \times (0.041838)))^*$<br>$e^{(0.9789 \times \ln(\text{hardness}) - 3.4210)}$ | $(1.136672 - ((\ln \text{hardness}) \times (0.041838)))^*$<br>$e^{(0.9789 \times \ln(\text{hardness}) - 2.5750)}$ |
| Chronic | $(1.101672 - ((\ln \text{hardness}) \times (0.041838)))^*$<br>$e^{(0.7977 \times \ln(\text{hardness}) - 3.909)}$ | $(1.101672 - ((\ln \text{hardness}) \times (0.041838)))^*$<br>$e^{(0.7977 \times \ln(\text{hardness}) - 3.909)}$  | $(1.101672 - ((\ln \text{hardness}) \times (0.041838)))^*$<br>$e^{(0.7977 \times \ln(\text{hardness}) - 3.909)}$  |

- (i) Class B(WW-1), B(WW-2), and B(WW-3) criteria listed in main table are based on a hardness of 200 mg/l (as  $\text{CaCO}_3$  (mg/l)). Numerical criteria ( $\mu\text{g/l}$ ) for copper are a function of hardness ( $\text{CaCO}_3$  (mg/l)) using the equation for each use according to the following table:

|         | B(WW-1)                                    | B(WW-2)                                    | B(WW-3)                                    |
|---------|--------------------------------------------|--------------------------------------------|--------------------------------------------|
| Acute   | $e^{[0.9422\ln(\text{Hardness}) - 1.700]}$ | $e^{[0.9422\ln(\text{Hardness}) - 1.700]}$ | $e^{[0.9422\ln(\text{Hardness}) - 1.700]}$ |
| Chronic | $e^{[0.8545\ln(\text{Hardness}) - 1.702]}$ | $e^{[0.8545\ln(\text{Hardness}) - 1.702]}$ | $e^{[0.8545\ln(\text{Hardness}) - 1.702]}$ |

- (j) The acute and chronic criteria listed in main table are based on a hardness of 200 mg/l (as  $\text{CaCO}_3$  (mg/l)). Numerical criteria ( $\mu\text{g/l}$ ) for lead are a function of hardness ( $\text{CaCO}_3$  (mg/l)) using the following equations:

|         |                                                                                               |
|---------|-----------------------------------------------------------------------------------------------|
| Acute   | $(1.46203 - ((\ln \text{hardness})0.145712)) \times e^{(1.2731\ln(\text{Hardness}) - 1.46)}$  |
| Chronic | $(1.46203 - ((\ln \text{hardness})0.145712)) \times e^{(1.2731\ln(\text{Hardness}) - 4.705)}$ |

- (k) The acute and chronic criteria listed in main table are based on a hardness of 200 mg/l (as  $\text{CaCO}_3$  (mg/l)). Numerical criteria ( $\mu\text{g/l}$ ) for nickel are a function of hardness ( $\text{CaCO}_3$  (mg/l)) using the following equations:

|         |                                                         |
|---------|---------------------------------------------------------|
| Acute   | $0.998 \times e^{[0.846\ln(\text{Hardness}) + 2.255]}$  |
| Chronic | $0.997 \times e^{[0.846\ln(\text{Hardness}) + 0.0584]}$ |

- (l) The acute and chronic criteria listed in main table are based on a hardness of 200 mg/l (as  $\text{CaCO}_3$  (mg/l)). Numerical criteria ( $\mu\text{g/l}$ ) for zinc are a function of hardness ( $\text{CaCO}_3$  (mg/l)) using the following equations:

|         |                                                         |
|---------|---------------------------------------------------------|
| Acute   | $0.978 \times e^{[0.8473\ln(\text{Hardness}) + 0.884]}$ |
| Chronic | $0.986 \times e^{[0.8473\ln(\text{Hardness}) + 0.884]}$ |

- (m) Acute and chronic criteria listed in main table are based on a hardness of 200 mg/l (as  $\text{CaCO}_3$  (mg/l)) and a sulfate concentration of 63 mg/l. Numerical criteria ( $\mu\text{g/l}$ ) for chloride are a function of hardness ( $\text{CaCO}_3$  (mg/l)) and sulfate (mg/l) using the equation for each use according to the following table:

|         | B(CW1), B(CW2), B(WW-1), B(WW-2), B(WW-3), B(LW)               |
|---------|----------------------------------------------------------------|
| Acute   | $287.8(\text{Hardness})^{0.205797}(\text{Sulfate})^{0.07452}$  |
| Chronic | $177.87(\text{Hardness})^{0.205797}(\text{Sulfate})^{0.07452}$ |

- (n) The copper criteria in Table 1 can be adjusted by a Water-Effect Ratio (WER). The WER factor is equal to 1.0 unless an approved WER study has been conducted by a permittee for a specific point source. The WER study shall be conducted in accordance with the "Interim Guidance on Determination and Use of Water-Effect Ratios for Metals (EPA-823-B-94-001), February 22, 1994," or upon approval by the department, the "Streamlined Water-Effect Ratio Procedure for Discharges of Copper (EPA-822-R-01-005), March 2001," which are hereby adopted by reference.

The copper Biotic Ligand Model (BLM) may be used as an alternative to the copper criteria in Table 1. The copper BLM is found in the document "Aquatic Life Ambient Freshwater Quality Criteria - Copper 2007 Revision (EPA-822-R-07-001), February 2007," which is hereby adopted by reference.

- (o) The acute and chronic criteria listed in Table 1 are calculated using Aluminum Criteria Calculator V2.0 (Excel) as described in "Final Aquatic Life Ambient Water Quality Criteria for Aluminum 2018 (EPA-822-R-18-001),

December 2018.” The criteria were calculated using the lowest tenth percentile of individual model outputs using spatially and temporally representative model inputs from across the state. Site-specific criteria shall also be developed using this approach and the most recent version of the calculator.

(p) The criteria are expressed as dissolved concentration.

(q) The silver criteria listed in Table 1 are based on a hardness of 200 mg/l (as CaCO<sub>3</sub> (mg/l)). Numerical criteria (µg/l) for silver are a function of hardness (CaCO<sub>3</sub> (mg/l)) using the following equation:  

$$\text{Acute } 0.85 \times e^{(1.72 \ln(\text{Hardness}) - 6.59)}$$

(r) The criteria are expressed as the bioavailable portion of aluminum.

**TABLE 2. Criteria for Dissolved Oxygen**

*(all values expressed in milligrams per liter)*

|                                                             | B(CW1) | B(CW2) | B(WW-1) | B(WW-2) | B(WW-3) | B(LW) |
|-------------------------------------------------------------|--------|--------|---------|---------|---------|-------|
| Minimum value for at least 16 hours of every 24-hour period | 7.0    | 7.0    | 5.0     | 5.0     | 5.0     | 5.0*  |
| Minimum value at any time during every 24-hour period       | 5.0    | 5.0    | 5.0     | 4.0     | 4.0     | 5.0*  |

*\*applies only to the upper layer of stratification in lakes*

**TABLE 3a. Acute Criterion for Ammonia in Iowa Streams**

| Acute Criterion, mg/l as N<br>(or Criterion Maximum Concentration, CMC) |                                            |                       |

#### VOLUNTEER MONITORING DATA REQUIREMENTS

**567—61.10(455B) Purpose.** The department uses water quality monitoring data for a number of purposes, including determining compliance with effluent limits for operation permits issued under 567—Chapter 64. The department also uses water quality monitoring data to determine the relative health of a water body by comparing monitoring data to the appropriate water quality standards established in 567—Chapter 61, a process known as water body assessments. Water body assessments are performed to prepare the biennial water quality report required under Section 305(b) of the Act and the list of impaired waters under Section 303(d) of the Act.

Iowa Code sections 455B.193 to 455B.195 require that credible data, as defined in Iowa Code section 455B.171, be used for the purpose of preparing Section 303(d) lists and other water quality program functions. Data provided by a volunteer are not considered credible data unless provided by a qualified volunteer. The purpose of this chapter is to establish minimum requirements for data produced by volunteers to meet the credible data and qualified volunteer requirements.

**567—61.11(455B) Monitoring plan required.** Volunteer water quality monitoring data submitted to the department must have been produced in accordance with a department-approved volunteer water quality monitoring plan before the data may be used for any of the purposes listed in Iowa Code section 455B.194. Approval of a plan will establish qualified volunteer status for the personnel identified in the plan for those monitoring activities covered under the plan.

**61.11(1) Submittal of the plan.** Prior to initiation of volunteer water quality monitoring activities intended to produce credible data, a water quality monitoring plan must be submitted to the department for review and approval. The plan must be submitted to the Volunteer Monitoring Coordinator, Department of Natural Resources, Wallace State Office Building, Des Moines, Iowa 50319, a minimum of 90 days before planned initiation of volunteer monitoring activities. A letter transmitting the plan must specifically request formal review and approval of the plan and identify a contact person. Volunteer monitors are encouraged to communicate with the department and to attend volunteer monitoring training sessions prior to formal submittal of a plan.

**61.11(2) Content of the plan.** A volunteer monitoring plan must contain, at a minimum, the following to be considered an acceptable volunteer monitoring plan:

- a. A statement of the intent of the monitoring effort.
- b. The name(s) of the person or persons that will be involved in data collection or analysis, the specific responsibilities of each person or group of people, and the general qualifications of the volunteers to carry out those responsibilities. For groups, such as educational institutions, it will be acceptable to identify the persons involved by general description (e.g., tenth grade biology class) with the exception of persons in responsible charge.
- c. The name(s) of the person or persons that will oversee the monitoring plan, ensure that quality assurance and control objectives are being met, and certify the data. The person or persons in responsible charge must have training commensurate with the level of expertise to ensure that credible data is being generated.
- d. The duration of the volunteer monitoring effort. In general, the department will not approve plans of greater than three years' duration unless a longer duration is justified.
- e. Location and frequency of sample collection.
- f. Methods of data collection and analysis.
- g. Record keeping and data reporting procedures.

**61.11(3) Department review of the plan.** The department will review monitoring plans and normally approve or disapprove the plan within 90 days of receipt. The department will work with the contact person identified in the plan to make any necessary changes prior to taking formal action. The department will use guidelines contained in the publications EPA Requirements for Quality Assurance Project Plans (EPA QA/R-5, 2001) and Volunteer Monitor's Guide to Quality Assurance Project Plans (1966, EPA 841-B-96-003) or equivalent updates to determine if the plans provide adequate quality assurance and quality control

measures. Approval or disapproval of the plan will be in the form of a letter and approval may include conditions or limitations.

**61.11(4) *Changes in monitoring plans.*** The department must approve any changes to an approved monitoring plan. Data collected under a modified plan will not be considered credible data until such time as the department has approved the modifications. Modifications to an approved plan should be submitted at the earliest possible time to avoid interruptions in data collection and to ensure continuity of data.

**61.11(5) *Appeal of disapproval.*** If a monitoring plan submitted for approval is disapproved, the decision may be appealed by filing an appeal with the director within 30 days of disapproval. The form of the notice of appeal and appeal procedures are governed by 567—Chapter 7.

**567—61.12(455B) Use of volunteer monitoring data.** Data produced under an approved water quality monitoring plan will be considered credible data for the purposes listed in Iowa Code section 455B.194 if the following conditions are met.

**61.12(1) *Data submittal.*** A qualified volunteer monitor or qualified volunteer monitoring group must specifically request that data produced under an approved volunteer monitoring plan be considered credible data. A letter identifying the specific data must be submitted along with a certification from the volunteer or the person in responsible charge for volunteer groups that the data, to the best of the volunteer's or responsible person's knowledge, was produced in accordance with the approved volunteer monitoring plan. The department shall provide a standard format on the IOWATER website for submittal of qualified volunteer data and related information. The department encourages volunteers to enter monitoring data on the IOWATER volunteer monitoring database maintained by the department, but doing so does not constitute submittal to or acceptance of the data by the department for uses requiring credible data. Volunteer data shall be labeled as such in any departmental reports, websites, or databases.

**61.12(2) *Department review of submitted data.*** The department must review and approve the submitted data. The person submitting the data will be informed of the department's decision either to accept or reject the data. The department will attempt to resolve any apparent inconsistencies or questionable values in the submitted data prior to making a final decision.

**567—61.13(455B) Department audits of volunteer monitoring activities.** The department shall conduct field audits of a statistically valid and representative sample of volunteer data collection and analysis procedures to ensure compliance with an approved plan and may conduct confirmatory monitoring tests. Volunteers shall be informed of any audit results and be provided with an opportunity to address any concerns to the extent possible. The department reserves the right to rescind approval of an approved plan if it finds substantial problems that cannot be addressed in a timely manner to ensure the quality of the data being produced.

These rules are intended to implement Iowa Code chapter 455B, division III, part 1.

◇ Two or more ARCs

<sup>1</sup> February 16, 2011, effective date of 61.2(2)“g”(8) delayed 70 days by the Administrative Rules Review Committee at its meeting held February 11, 2011.

CHAPTER 62  
EFFLUENT AND PRETREATMENT STANDARDS:  
OTHER EFFLUENT LIMITATIONS OR PROHIBITIONS  
[Prior to 7/1/83, DEQ Ch 17]  
[Prior to 12/3/86, Water, Air and Waste Management[900]]

Chapter rescission date pursuant to Iowa Code section 17A.7: 6/18/30

**567—62.1(455B) Prohibited discharges.**

**62.1(1)** The discharge of any pollutant from a point source into a navigable water is prohibited unless authorized by an NPDES permit or by a permit issued pursuant to Section 404 of the CWA and certified pursuant to 567—subrule 61.2(6).

**62.1(2)** The prohibitions in 40 CFR §122.4 are adopted by reference.

**62.1(3)** The following discharges are prohibited:

*a.* The discharge of wastewater into a POTW or a semipublic sewage disposal system (DS) in volumes or quantities in excess of those to which a significant industrial user is committed in either a treatment agreement described in 567—subrule 60.3(3) or a local control mechanism (in the case of a POTW with an approved pretreatment program); and

*b.* Discharge of the pollutants listed in 40 CFR §403.5(b) to a POTW, a semipublic sewage DS, or a PSDS.

**62.1(4)** Waste in such volumes or quantities as to exceed the design capacity of the treatment works, cause interference or pass through, or reduce the effluent quality below that specified in the operation permit of the treatment works is considered to be a waste that interferes with the operation or performance of a POTW or a semipublic sewage DS and are prohibited.

[ARC 9204C, IAB 5/14/25, effective 6/18/25]

**567—62.2(455B) Secondary treatment information: effluent standards for POTWs and semipublic sewage DSs.**

**62.2(1)** *General.* This subrule describes the minimum level of effluent quality attainable by secondary treatment in terms of CBOD<sub>5</sub>; suspended solids (SS), the pollutant parameter total suspended solids; and pH. The pollutant measurement CBOD<sub>5</sub> is used in lieu of the pollutant measurement BOD<sub>5</sub>, as noted in 40 CFR §133.102(a)(4). All requirements for each pollutant measurement shall be achieved by POTWs and semipublic sewage DSs except as provided for in 62.2(2) and 62.2(3).

*a.* CBOD<sub>5</sub>, as noted in 40 CFR §133.102(a)(4). The 30-day average percent removal shall not be less than 85 percent, and the percent removal shall be calculated by adding five units to the effluent CBOD<sub>5</sub> monitoring data and comparing that value to the influent BOD<sub>5</sub> monitoring data. Site-specific information on the relationship between BOD<sub>5</sub> and CBOD<sub>5</sub> shall be used in lieu of the five-unit relationship if such information is available.

*b.* SS, as noted in 40 CFR §133.102(b).

*c.* pH, as noted in 40 CFR §133.102(c).

**62.2(2)** *Special considerations.*

*a.* *Combined sewers and percent removal.* 40 CFR §133.103(a) is adopted by reference.

*b.* *Industrial wastes and POTWs; standard secondary adjustment.* 40 CFR §133.103(b) is adopted by reference.

*c.* *Waste stabilization lagoons.* Secondary treatment standards for waste stabilization lagoons are the same as those found in 62.2(1) concerning secondary treatment with the exception of the SS standards, which are as follows:

(1) The 30-day average shall not exceed 80 mg/l.

(2) The 7-day average shall not exceed 120 mg/l.

*d.* *Less concentrated influent wastewater for separate and combined sewers; lower percent removal or mass loading limit.* 40 CFR §133.103(d) and (e) are adopted by reference.

*e.* *Upgraded facilities designed to operate in a split flow mode.*

(1) The department may substitute either a lower percent removal requirement or a mass loading limit for the percent removal requirements in 62.2(1), provided that the treatment works is designed to split part of the primary treated wastewater flow around the secondary treatment unit(s). The design to accommodate split flow must be approved by the department and consistent with applicable design standards for wastewater treatment facilities. Paragraph 62.2(2) “d” applies to facilities considered under this subrule. This subrule shall not be considered for facilities eligible for treatment equivalent to secondary treatment under 62.2(3).

(2) Any applicant requesting a permit limit adjustment pursuant to this subrule must include as part of the request an analysis of the infiltration and inflow (I/I) sources in the system and a plan for the elimination of all inflow sources such as roof drains, manholes, and storm sewer interconnections. Infiltration sources that can be economically eliminated or minimized shall be corrected.

f. *Dilution.* Nothing in this subrule or any other department rule shall be construed to encourage dilution of sewage as a means of complying with secondary treatment effluent standards. Reasonable efforts to prevent and abate infiltration of groundwater into sewers, and prevention or removal of any significant source of inflow, are required of all persons responsible for facilities subject to these standards.

**62.2(3) *Treatment equivalent to secondary treatment.*** 40 CFR §133.105 is adopted by reference. Treatment works shall be eligible for consideration of effluent limitations described for treatment equivalent to secondary treatment in accordance with 40 CFR §133.101(g). The pollutant measurement CBOD<sub>5</sub> will be used in lieu of the pollutant measurement BOD<sub>5</sub>, as noted in 40 CFR §133.105(e).

[ARC 9204C, IAB 5/14/25, effective 6/18/25]

#### **567—62.3(455B) Federal standards and effluent limitations.**

**62.3(1) *Federal effluent and pretreatment standards.*** The following are adopted by reference: 40 CFR Part 125, Subparts H, I, and J, and 40 CFR Parts 401 through 471.

**62.3(2) *Federal toxic pollutant effluent standards.*** 40 CFR Part 129 is adopted by reference.

**62.3(3) *Effluent limitations and pretreatment requirements for sources for which there are no federal effluent or pretreatment standards.*** For discharges of pollutants from sources that are not subject to the federal effluent standards adopted by reference in 62.3(1), the department shall establish effluent limitations, pretreatment requirements, or both, that represent the best professional judgment for pollutant reduction, consistent with the CWA and Iowa Code chapter 455B.

**62.3(4) *Effluent limitations less stringent than the effluent limitation guidelines.*** 40 CFR Part 125 Subpart D is adopted by reference.

[ARC 9204C, IAB 5/14/25, effective 6/18/25]

#### **567—62.4(455B) Effluent limitations or pretreatment requirements more stringent than the effluent or pretreatment standards.**

**62.4(1) *Effluent limitations necessary to meet water quality standards (WQSs).*** No effluent, alone or in combination with the effluent of other sources, shall cause a violation of any applicable WQS. When it is found that a discharge that would comply with applicable effluent standards or effluent limitations in this chapter would cause a violation of WQSs, the discharge will be required to meet the water quality-based effluent limits (WQBELs) necessary to achieve the applicable WQSs as established in 567—Chapter 61. WQBELs shall be derived from a wasteload allocation (WLA) calculated for the discharge, as described in the Iowa Wasteload Allocation Procedure (WLAP) (Nov. 11, 2020), or a WLA calculated for a TMDL, whichever is more stringent, except that the daily sample maximum criteria for *E. coli* set forth in 567—Chapter 61 shall not be used as an end-of-pipe permit limitation.

**62.4(2) *Pretreatment requirements more stringent than categorical standards.*** The department or POTW may impose pretreatment requirements more stringent than the applicable categorical standards in 62.3(1) when more stringent requirements are necessary to prevent violations of WQSs, pass through, acute worker health or safety problems, or interference (including inhibiting or disrupting sludge use and disposal practices).

**62.4(3) *Effluent limitations for pollutants not covered by effluent or categorical standards.*** When a pollutant is not otherwise regulated under rules 567—62.2(455B) and 567—62.3(455B), effluent limits or pretreatment requirements may be imposed on a case-by-case basis.

*a.* Effluent limits shall be based on the effect of the pollutant in water and the feasibility and reasonableness of treating the pollutant.

*b.* Pretreatment requirements shall be based on the effect of the pollutant in water, the effect on the receiving treatment works (including pass through, inhibition, worker safety, and sludge disposal), and the feasibility and reasonableness of treating the pollutant.

[ARC 9204C, IAB 5/14/25, effective 6/18/25]

**567—62.5(455B) Effluent reuse.**

**62.5(1)** *Manner of reuse.* Treated final effluent may be reused in a manner noted in this rule or as specified in an NPDES permit.

**62.5(2)** *Reuse for golf course irrigation.* Treated final effluent may be reused for golf course irrigation if one of the conditions described in 62.5(2) “a” and all of the conditions in 62.5(2) “b” are met.

*a.* The treated final effluent must meet one of the following conditions:

(1) A minimum total residual chlorine (TRC) level of 0.5 mg/l must be maintained at a minimum of 15 minutes’ contact time of chlorine to wastewater prior to the irrigation of the golf course with treatment plant effluent; or

(2) Disinfected effluent shall be held in a retention pond with a detention time of at least 20 days prior to reuse as irrigation on a golf course. For this purpose, effluent may be disinfected using any common treatment technology, and either an existing pond or a pond constructed specifically for effluent retention may be used.

*b.* A golf course utilizing treated final effluent shall take all of the following actions:

(1) Clearly state on all scorecards that treated final effluent is used for golf course irrigation and oral contact with golf balls and tees should be avoided;

(2) Post signs that warn against consumption of water at all water hazards;

(3) Color code, label, or tag all piping and sprinklers associated with the distribution or transmission of the treated final effluent to clearly warn against the consumptive use of the contents; and

(4) Restrict public access to any area of the golf course where spraying is being conducted.

[ARC 9204C, IAB 5/14/25, effective 6/18/25]

These rules are intended to implement Iowa Code chapter 455B, subchapter III, part 1.

CHAPTER 63  
MONITORING, ANALYTICAL AND REPORTING REQUIREMENTS  
[Prior to 7/1/83, DEQ Ch 18]  
[Prior to 12/3/86, Water, Air and Waste Management[900]]

Chapter rescission date pursuant to Iowa Code section 17A.7: 6/18/30

**567—63.1(455B) Guidelines establishing test procedures for the analysis of pollutants.** Only the procedures prescribed in this chapter shall be used to perform the measurements indicated in an application for an operation permit submitted to the department, a report required to be submitted by the terms of an operation permit, and a certification issued by the department pursuant to Section 401 of the CWA.

**63.1(1) *Identification of test methods, application for alternative test methods, and method modifications.***

*a.* Laboratories shall use methods promulgated or approved by the EPA or by the department in accordance with 567—subrule 83.5(1).

*b.* All parameters for which testing is required by a wastewater discharge permit, permit application, or administrative order, except operational performance testing, must be analyzed using one of the following:

- (1) An approved method specified in 40 CFR §136.3;
- (2) An alternative method that has been previously approved pursuant to 40 CFR §136.4 or 136.5; or
- (3) A method identified by the department when no approved method is specified for the parameter in 40 CFR Part 136.

*c.* Applications for alternative test procedures shall follow the requirements of 40 CFR §136.4 or 136.5.

*d.* Method modifications shall follow the requirements of 40 CFR §136.6.

**63.1(2) *Containers, preservation techniques and holding times.*** All samples collected in accordance with the self-monitoring requirements defined in an operation permit shall comply with the container, preservation techniques, and holding time requirements as specified in 40 CFR §136.3, Table II (Required Containers, Preservation Techniques, and Holding Times). Sample preservation should be performed immediately upon collection, if feasible.

**63.1(3)** All laboratories conducting analyses required by this chapter must be certified in accordance with 567—Chapter 83. Routine on-site monitoring for pH, temperature, dissolved oxygen, total residual chlorine (TRC), other pollutants that must be analyzed immediately upon sample collection, settleable solids, physical measurements such as flow and cell depth, and operational monitoring tests specified in 63.3(4) are excluded from this requirement.

**63.1(4)** All instrumentation used for conducting any analyses required by this chapter must be properly calibrated according to the manufacturer's instructions.

[ARC 9205C, IAB 5/14/25, effective 6/18/25]

**567—63.2(455B) Monitoring activities and records.** Permittees shall maintain records of all information resulting from any monitoring activities required in an operation permit and from any operational performance monitoring.

**63.2(1)** Samples and measurements taken for the purpose of monitoring shall be representative of the monitored activity, in accordance with 40 CFR §122.41(j)(1).

**63.2(2)** Permittees shall retain, for a minimum of three years, all paper and electronic records of monitoring activities and results in accordance with 40 CFR §122.41(j)(2).

**63.2(3)** Records of monitoring activities and results shall include the information specified in 40 CFR §122.41(j)(3).

[ARC 9205C, IAB 5/14/25, effective 6/18/25]

**567—63.3(455B) Minimum self-monitoring requirements in permits.**

**63.3(1) *Organic waste dischargers.*** The minimum self-monitoring requirements to be incorporated in operation permits for facilities discharging organic wastes shall be the appropriate requirements in Tables

I and II of this chapter. Additional monitoring may be specified in operation permits in accordance with 63.3(5).

**63.3(2) *Inorganic waste dischargers.*** The self-monitoring requirements to be incorporated in operation permits for facilities discharging inorganic wastes shall be determined on a case-by-case evaluation of the impact of the discharge on the receiving stream, toxic or deleterious effects of wastewaters, complexity of the treatment process, history of noncompliance or any other factor which requires strict operational control to meet the effluent limitations of the permit, as described in the Supporting Document for Permit Monitoring Frequency Determination, March 2022, hereafter referred to as the Supporting Document, located on the department's website. Grab samples shall be taken in accordance with 567—63 Table I (455B) Superscript 4, and composite samples shall be taken in accordance with 567—63 Table I (455B) Superscript 4a or 4c.

**63.3(3) *Significant industrial users (SIUs) of publicly owned treatment works (POTWs).*** Monitoring for SIUs shall be determined as described in the Supporting Document, located on the department's website. Monitoring results shall be submitted to the department in accordance with the reporting requirements in the operation permit. The monitoring program of a POTW with a department-approved pretreatment program may be used in lieu of the Supporting Document.

**63.3(4) *Operational performance monitoring.*** Operational performance monitoring for treatment unit process control shall be conducted to ensure that a facility is properly operated in accordance with its design. The results of any operational performance monitoring need not be reported to the department but shall be maintained in accordance with rule 567—63.2(455B), and shall be submitted to the department upon request. Additional operational performance monitoring may be specified in operation permits in accordance with 63.3(5). The results of operational performance monitoring specified in an operation permit shall be submitted to the department in accordance with the permit requirements.

**63.3(5) *Additional monitoring.***

*a.* Additional monitoring may be specified in operation permits in accordance with this subrule, as follows:

- (1) For facilities discharging organic wastes;
- (2) As operational performance monitoring; or
- (3) For the purposes of whole effluent toxicity (WET) testing.

*b.* Additional monitoring requirements in operation permits shall be based on a case-by-case evaluation of the impact of the discharge on the receiving stream, toxic or deleterious effects of wastewaters, industrial contribution to the system, complexity of the treatment process, history of noncompliance or any other factor which requires strict operational control to meet the effluent limitations of the permit, as described in the Supporting Document.

**63.3(6) *Modification of minimum monitoring requirements.*** Monitoring requirements may be modified or reduced at the director's discretion or when requested by the permittee, in accordance with 567—paragraph 60.3(6) "e."

[ARC 9205C, IAB 5/14/25, effective 6/18/25]

## **567—63.4(455B) Whole effluent toxicity (WET) testing requirements in permits.**

**63.4(1) *WET testing.***

*a.* All major municipal and industrial dischargers shall conduct WET testing. Additional toxicity monitoring may be specified in operation permits for major or minor facilities in accordance with 63.3(5).

*b.* All dischargers required to conduct WET tests shall conduct, at a minimum, one valid WET test annually. The testing requirements will be placed in the operation permit for each discharger required to conduct this testing. A "valid WET test" is one that meets the testing requirements in 63.4(2) "a."

*c.* Any WET test completed by the department or other agency and conducted according to the procedures stated or referenced in this rule may be used to determine compliance with an operation permit.

**63.4(2) *Testing procedures.***

*a.* All WET tests shall be conducted as follows:

- (1) Use a 24-hour composite sample of the effluent collected at the location stated in the operation permit;
- (2) Commence within 36 hours of sample collection;

(3) Use the test methods referenced in 40 CFR Part 136 and protocols described in the EPA document EPA-821-R-02-012, Methods for Measuring the Acute Toxicity of Effluents and Receiving Waters to Freshwater and Marine Organisms, 5th edition, October 2002;

(4) Use the water flea (*Ceriodaphnia dubia*) and the fathead minnow (*Pimephales promelas*);

(5) Be conducted as static pass/fail;

(6) Include the following for each organism: a 100 percent culture water control series, a 100 percent effluent series, and any additional dilution series specified in the operation permit;

(7) Last for 48 hours, at which time the mortality will be determined for all tests; and

(8) Be conducted by a laboratory certified in Iowa.

b. All WET test results, including results of any tests performed at a greater frequency than required in the operation permit, shall be submitted to the department within 30 days of test completion.

**63.4(3) Positive result.** If there is a positive toxicity test result in the diluted effluent sample from a valid WET test, the following requirements apply unless the exception in 63.4(3)“d” is applicable. For the purposes of this rule, “positive toxicity test result” means a statistically significant difference of mortality rate between the control and the diluted effluent test.

a. At a minimum, the discharger shall conduct quarterly WET tests until three successive tests are determined not to be positive, after which the toxicity testing shall be resumed as specified in the operation permit.

b. If the discharger has two successive positive valid diluted WET test results or three positive test results out of five valid diluted tests, the discharger shall conduct a toxicity reduction evaluation (TRE). A TRE is a stepwise process, similar to that found in EPA Document 600/2-88/062, that combines effluent toxicity tests and analysis of the chemical characteristics of the effluent to determine the cause of the effluent toxicity or the treatment methods that will reduce the effluent toxicity, or both.

c. The discharger may be required to conduct instream monitoring or other analyses in conjunction with the TRE. If at any time during the course of conducting a TRE there are three consecutive follow-up toxicity test results for the diluted sample which are not positive, the discharger will be considered as in compliance and work on the TRE may cease. WET testing shall then resume as specified in the operation permit. Nothing in these rules shall preclude the department from taking enforcement action beyond that described in these rules.

d. When the pretest chemical analysis for un-ionized ammonia nitrogen (NH<sub>3</sub>-N) or TRC on the diluted effluent sample exceeds the concentrations given below, a positive test result is likely to have been caused by high concentrations of un-ionized NH<sub>3</sub>-N or TRC, and the test result will not be used to determine if follow-up testing is needed.

(1) Un-ionized NH<sub>3</sub>-N—0.9 mg/l

(2) TRC—0.1 mg/l

[ARC 9205C, IAB 5/14/25, effective 6/18/25]

#### **567—63.5(455B) Self-monitoring and reporting for animal feeding operations.**

**63.5(1)** The following self-monitoring requirements may be imposed on an animal feeding operation in any operation permit issued for such an operation.

a. Measurement of liquid level in a waste storage facility on a periodic basis.

b. Measurement of daily precipitation, as appropriate.

c. Sampling and analysis of groundwater as necessary to determine effects of wastewater application.

d. Other measurements necessary to evaluate the adequacy of a waste disposal system.

**63.5(2)** Reports of the self-monitoring results shall be submitted to the appropriate regional department field office (hereafter referred to as FO) quarterly. The quarterly reports shall cover the periods January through March, April through June, July through September, and October through December. The quarterly report for each period shall be submitted by the tenth day of the month following the quarter being reported.

[ARC 9205C, IAB 5/14/25, effective 6/18/25]

**567—63.6(455B) Bypasses and upsets.**

**63.6(1) *Prohibition.*** Bypasses from any portion of a treatment facility or from a sanitary sewer collection system designed to carry only sewage are prohibited. The department may not assess a penalty against a permittee for a bypass if the permittee has complied with all of the following:

- a. The bypass was unavoidable to prevent loss of life, personal injury, or severe property damage;
- b. There were no feasible alternatives to the bypass, such as the use of auxiliary treatment facilities, retention of untreated wastes, or maintenance during normal periods of equipment downtime. This condition is not satisfied if adequate backup equipment should have been installed in the exercise of reasonable engineering judgment to prevent a bypass which occurred during normal periods of equipment downtime or preventive maintenance; and
- c. The permittee submitted the information required in 63.6(2), 63.6(3), and 63.6(5).

**63.6(2) *Request for anticipated bypass.*** Except for bypasses that occur as a result of mechanical failure or acts beyond the control of the owner or operator of a waste disposal system (unanticipated bypasses), the owner or operator shall obtain written permission from the department prior to any discharge of sewage or wastes from a waste disposal system not authorized by a discharge permit. The director may approve an anticipated bypass after considering its adverse effects if the director determines that it will meet the conditions in 63.6(1).

- a. The request for a bypass shall be submitted in writing to the appropriate FO at least ten days prior to the expected date of the event.
- b. The request shall include all of the following:
  - (1) The reason for the bypass;
  - (2) The date and time the bypass will begin;
  - (3) The expected duration of the bypass;
  - (4) An estimate of the amount of untreated or partially treated sewage or wastewater that will be discharged;
  - (5) The location of the bypass;
  - (6) The name of any body of surface water that will be affected by the bypass; and
  - (7) Any actions the owner or operator proposes to take to mitigate the effects of the bypass upon the receiving stream or other surface water.

**63.6(3) *Notification of unanticipated bypass or upset and public notices (PNs).*** In the event that a bypass or upset occurs without prior notice having been provided pursuant to 63.6(2) or as a result of mechanical failure or acts beyond the control of the owner or operator, the owner or operator of the treatment facility or collection system shall notify the department by telephone as soon as possible but not later than 24 hours after the onset or discovery.

a. Notification shall be made by contacting the appropriate FO. After-hours notification may be made by calling the Department of Natural Resources emergency response hotline at 515.725.8694.

b. Notification shall include information on as many items listed in 63.6(3)“d”(1) through 63.6(3)“d”(6) as available information will allow.

c. Upon notification, the department shall determine if a PN for an unanticipated bypass is necessary. If the department determines that a PN is necessary, the owner or operator of the treatment facility or the collection system shall prepare a PN.

d. A written submission describing the bypass shall also be provided to the appropriate FO within five days of the time the permittee becomes aware of the bypass. The written submission shall contain the following:

- (1) The reason for the bypass, including the amount and duration of any rainfall event that may have contributed to the bypass;
- (2) The date and time of onset or discovery of the bypass;
- (3) The duration of the bypass;
- (4) An estimate of the amount of untreated or partially treated sewage or wastewater that was discharged;
- (5) The location of the bypass; and
- (6) The name of any body of surface water that was affected by the bypass.

**63.6(4) *Monitoring, disinfection, and cleanup.*** The owner or operator of the treatment facility or collection system shall perform any additional monitoring, sampling, or analysis of the bypass or upset requested by the FO and shall comply with department instructions intended to minimize the effect of a bypass or upset on the receiving water of the state. In addition, the department may require the following:

- a. Temporary disinfection, depending on the volume and duration of the bypass, the classification of the stream affected by the bypass, and the time of year during which the bypass occurs;
- b. Cleanup of any debris and waste materials deposited in the area affected by the bypass; or
- c. Lime application to the ground surface or disinfection of the affected area with chlorine solution.

**63.6(5) *Reporting of subsequent findings and additional information requested by the department.*** All subsequent findings and laboratory results concerning a bypass shall be submitted in writing to the appropriate FO as soon as they become available. Any additional information requested by the department concerning the steps taken to minimize the effects of a bypass shall be submitted within 30 days of the request.

**63.6(6) *Upset.*** 40 CFR §122.41(n) is adopted by reference.

[ARC 9205C, IAB 5/14/25, effective 6/18/25]

**567—63.7(455B) Submission of operation records.**

**63.7(1) *Electronic reporting.***

a. Except as provided in this rule and 63.3(4) and 63.5(2), operation records required by NPDES permits shall be submitted electronically to the department within 15 days following the close of the reporting period specified in 63.7(5) and in accordance with monitoring requirements derived from this chapter and incorporated in the NPDES permit.

b. Operation records required by operation permits shall be submitted to the department within 15 days following the close of the reporting period specified in 63.7(5) and in accordance with monitoring requirements derived from this chapter and incorporated in the operation permit.

**63.7(2) *Temporary or permanent paper submittal of operation records.*** Upon satisfaction of the following criteria and written approval from the department, temporary or permanent paper submittal of operation records may be allowed in lieu of electronic reporting.

a. *Written request for paper submittal.*

(1) To obtain an approval for temporary or permanent paper submittal of operation records, a permittee must submit a paper copy of a written request to the department's NPDES section. The written request for paper submittal must include all of the following:

1. The facility name;
2. The individual NPDES permit number or GP authorization number;
3. The facility address;
4. The owner's name and contact information;
5. The name and contact information of the person submitting operation records (if different than the owner); and
6. The reason for the request, including a justification of why electronic submission is not feasible at this time.

(2) Requests for paper submittal that do not contain all of the above information will not be considered. Electronic (email) requests for paper submittal will not be considered.

b. *Temporary paper submittal.*

(1) The department will approve or deny a request for temporary paper submittal of operation records within 60 days of receipt. Paper submittal requests shall be approved or denied at the director's discretion.

(2) All approvals for temporary paper submittal will expire five years from department approval. After an approval for temporary paper submittal expires, the permittee must submit all operation records electronically, unless another approval is obtained.

(3) Approved temporary paper submittals are nontransferable.

c. *Permanent paper submittal.*

(1) The department will approve or deny a request for permanent paper submittal of operation records within 60 days of receipt. Permanent paper submittal approvals shall only be granted to facilities and entities owned or operated by members of religious communities that choose not to use certain modern

technologies (e.g., computers, electricity). Permanent approvals for paper submittal shall not be granted to any other facilities or entities.

(2) Approved permanent paper submittals are nontransferable.

*d. Paper copies of operation records.* All permittees who have received temporary or permanent paper submittal approvals must submit paper copies of all operation records to the department within 15 days following the close of the reporting period specified in 63.7(5) and in accordance with monitoring requirements derived from this chapter and incorporated in the NPDES permit.

**63.7(3) *Electronic reporting pursuant to NPDES general permits (GPs).*** Both electronic and paper reporting options are available to permittees covered under GP No. 5. Paper operation records are accepted under GP No. 4.

**63.7(4) *Episodic paper submittal of operation records.*** In accordance with this subrule, episodic paper submittal of operation records may be allowed in lieu of electronic reporting. The department shall provide notice, individually or through means of mass communication, regarding when episodic paper submittal is allowed, the facilities and entities that qualify for episodic paper submittal, and the likely duration of episodic paper submittal. The department shall determine if and when episodic paper submittal is warranted.

*a. Episodic paper submittal is only allowed under the following circumstances:*

(1) Large-scale emergencies involving catastrophic circumstances beyond permittee control, such as forces of nature (e.g., hurricanes, floods, fires, earthquakes) or other national disasters.

(2) Prolonged electronic reporting system outages (i.e., outages longer than 96 hours).

*b. Permittees are not required to request episodic paper submittal. If the department determines that episodic paper submittal is warranted, a permittee shall submit paper copies of all operation records to the department within 15 days following the close of the reporting period specified in 63.7(5) and in accordance with monitoring requirements derived from this chapter and incorporated in the NPDES permit.*

*c. Episodic paper submittal is not transferable and cannot last more than 60 days.*

**63.7(5) *Submission frequency.*** Except as provided in 63.3(4) and 63.5(2), or as specified in an NPDES GP issued in accordance with 567—subrule 60.4(2), operation records required by these rules shall be submitted at monthly intervals. The department may vary the submission frequency in certain cases for only non-NPDES permits. Variation from the monthly interval shall be made only under such conditions as the department may prescribe in writing to the permittee.

[ARC 9205C, IAB 5/14/25, effective 6/18/25]

#### **567—63.8(455B) Operation records; content, forms, certification, and signature.**

**63.8(1) *Content.*** Operation records shall include the results of all monitoring specified in or authorized by this chapter or incorporated in the operation permit. The results of any additional monitoring for parameters included in the operation permit performed at the compliance monitoring point and analyzed according to 40 CFR Part 136 shall be included in the calculation and reporting of any data submitted in accordance with this chapter and the operation permit.

**63.8(2) *Forms.*** Operation record forms shall be those provided by the department unless a permittee has obtained department approval to use an alternative reporting form. Properly completed reporting forms and all attachments shall be submitted in accordance with department instructions.

**63.8(3) *Certification and signatory requirements.*** All operation records required by these rules shall include certification that attests that all information contained therein is representative and accurate. Each operation record, including those for operation permits, shall be signed in accordance with 40 CFR §122.22. For electronic submissions of operation records, a signed paper copy of the record that was submitted electronically must be maintained at the facility for a minimum of three years.

[ARC 9205C, IAB 5/14/25, effective 6/18/25]

#### **567—63.9(455B) Other reporting and notice.**

**63.9(1) *Twenty-four-hour reporting.*** Pursuant to 40 CFR §122.41(l)(6), all permittees shall report any permit noncompliance that may endanger human health or the environment. Information shall be provided orally to the appropriate FO within 24 hours from the time the permittee becomes aware of the

circumstances. In addition, a written submission containing the information required in 40 CFR §122.41(l)(6)(i) must be provided to the appropriate FO within five days of the occurrence.

**63.9(2) *Planned changes.*** Pursuant to 40 CFR §122.41(l)(1), a permittee shall give notice to the appropriate FO 30 days prior to any planned physical alterations or additions to the permitted facility.

**63.9(3) *Anticipated noncompliance.*** Pursuant to 40 CFR §122.41(l)(2), a permittee shall give advance notice to the appropriate FO of any activity which may result in noncompliance with permit requirements.

**63.9(4) *Other noncompliance.*** Pursuant to 40 CFR §122.41(l)(7), a permittee shall provide a written description of all instances of noncompliance not reported under 63.9(1) or 567—subrule 60.7(4) at the time operation records are submitted. The written description shall contain the information required in 40 CFR §122.41(l)(6)(i).

**63.9(5) *Notice exemption.*** Notice under this subrule is only required when previous notice has not been given to any other section of the department.

**63.9(6) *Other information.*** Pursuant to 40 CFR §122.41(l)(8), if a permittee becomes aware that it failed to submit any relevant facts in any report to the director, the permittee shall promptly submit such facts or information.

**63.9(7) *Applicability.*** The other reporting and notice requirements in this rule apply to all NPDES permits and apply as specified in operation permits.

[ARC 9205C, IAB 5/14/25, effective 6/18/25]

**567—63.10(455B) Sampling procedures for monitoring wells.** The following steps shall be taken prior to monitoring well sampling.

**63.10(1)** Measure depth from top of well head casing to water table.

**63.10(2)** Calculate quantity of water to be flushed from well using the formula:

Gallons to be pumped =  $0.221 d^2 h$ , where:

$d$  = well diameter in inches

$h$  = depth in feet of standing water in well prior to pumping

**63.10(3)** Pump well.

**63.10(4)** Measure depth from well head casing to water table after pumping.

**63.10(5)** Wait for well to recharge to or near static water level prior to sampling.

[ARC 9205C, IAB 5/14/25, effective 6/18/25]

**Table I — Minimum Self-Monitoring in Permits for Organic Waste Dischargers  
Controlled Discharge Wastewater Treatment Plants**

| Wastewater<br>Parameter                           | Sampling <sup>5</sup><br>Location | Sample Type <sup>4</sup> | Frequency by PE <sup>1,5,6</sup>                  |                       |                       |                        |
|---------------------------------------------------|-----------------------------------|--------------------------|---------------------------------------------------|-----------------------|-----------------------|------------------------|
|                                                   |                                   |                          | <100                                              | 101-500               | 501-1,000             | >1,001                 |

- 1 - The PE (population equivalent) shall be computed on the basis of the original engineering design criteria for the facility and any modifications thereof. Where such design criteria are not available, the PE shall be computed using 0.167 pounds of BOD<sub>5</sub> per capita per day.
- 2 - Facilities serving a PE less than 100 are not required to provide continuous flow measurement but are required to provide manual flow measurement at the specified frequency. Facilities serving a PE greater than 100 must provide continuous flow measurement of the raw waste but need only provide manual flow measurement of the final effluent. Acceptable flow measurement and recording techniques shall be those described in the Iowa Wastewater Facilities Design Standards, effective June 18, 2025.
- 3 - The sampling that is required at least two weeks prior to lagoon drawdown (pre-discharge sampling) shall be collected at a point near the outlet structure and analyzed at least two weeks prior to an anticipated discharge to demonstrate that the wastewater is of such quality to meet the effluent limitations in the permit. The CBOD<sub>5</sub> and TSS results must be compared with the 30-day average effluent limits. If the results are less than the 30-day average limits, the permittee may isolate the final cell and draw down the lagoon cell. If the pre-discharge sample results exceed the 30-day average effluent limits for either CBOD<sub>5</sub> or TSS, the permittee must contact the appropriate FO for guidance before beginning to discharge.
- 4 - Sample types are defined as follows:
 

“Grab Sample” means a representative, discrete portion of sewage, industrial waste, other waste, surface water or groundwater taken without regard to flow rate.

“24-Hour Composite” means:

  - a. A sample made by collecting a minimum of six grab samples taken four hours apart and combined in proportion to the flow rate at the time each grab sample was collected, unless otherwise noted in
  - b. Generally, grab samples should be collected at 8 a.m., 12 p.m. (noon), 4 p.m., 8 p.m., 12 a.m. (midnight), and 4 a.m. on weekdays (Monday through Friday) unless local conditions indicate another more appropriate time for sample collection.
  - b. For a POTW with an SIU, a sample made by collecting a minimum of 12 grab samples taken two hours apart and combined in proportion to the flow rate at the time each grab sample was collected. Generally, grab samples should be collected at 8 a.m., 10 a.m., 12 p.m. (noon), 2 p.m., 4 p.m., 6 p.m., 8 p.m., 10 p.m., 12 a.m. (midnight), 2 a.m., 4 a.m., and 6 a.m. on weekdays (Monday through Friday) unless local conditions indicate another more appropriate time for sample collection.
  - c. An automatic composite sampling device may also be used for collection of flow-proportioned or time-proportioned composite samples.

- 5 - Raw wastewater samples shall be taken continuously (year-round) at the specified frequency. Final effluent wastewater samples shall be taken only during the drawdown period. The first final effluent sample shall be taken the third day after the drawdown begins, and subsequent samples shall be taken at the specified frequencies. For final effluent samples that are required to be taken twice during drawdown, the first sample shall be taken the third day after the drawdown begins, and the second sample shall be taken between three and five days before the drawdown ends.
- 6 - If a facility has a PE greater than 3,000 or an SIU, additional monitoring may be required.
- 7 - One-cell controlled discharge lagoon facilities with a PE less than 100 must perform final effluent sampling for CBOD<sub>5</sub> and TSS twice during drawdown in accordance with superscript #5.
- 8 - pH can be monitored using electrometric measurement or an automated electrode, pursuant to 40 CFR Part 136.
- 9 - Cell Depth monitoring must be conducted year-round (not exclusively during drawdown periods). It may be applied to lagoon cells at continuous discharge wastewater treatment facilities on a case-by-case basis.
- 10 - TRC monitoring is only required for facilities with TRC effluent limitations.

**Table II — Minimum Self-Monitoring in Permits for Organic Waste Dischargers  
Continuous Discharge Wastewater Treatment Plants**

| Wastewater Parameter                                | Sampling Location | Sample Type <sup>1,11</sup> | Frequency by PE <sup>1,6</sup> |                       |                       |                       |                       |                       |

| Total Residual Chlorine (TRC) <sup>13</sup>         | Final             | Grab                        | 1/Week                         | 1/Week                | 2/Week                | 2/Week                | 3/Week                | 5/Week                |

- 1 - See Superscript #1, Table I.
- 2 - See Superscript #2, Table I. Both raw and final flow monitoring may be required if the raw and final wastewater flows may be different for any reason.
- 3 - See Superscript #4, Table I.
- 4 - Analysis is required only when the facility discharges directly to a stream designated as Class A1, A2, or A3 in 567—Chapter 61 or there is a reasonable potential for the discharge to affect a stream designated as Class A1, A2, or A3.
- 5 - The frequency of sample collection and analysis shall be increased by 1/week according to the following: 15,001 to 30,000 – 2/week; 30,001 to 45,000 – 3/week; 45,001 to 75,000 – 4/week; > 75,001– 5/week.
- 6 - The requirements for SIUs shall be those specified in the permit for final effluent monitoring.
- 7 - Bacteria Monitoring. All facilities must collect and analyze a minimum of five *E. coli* samples in one calendar month during each three-month period (quarter) during the appropriate recreation season associated with the receiving stream designation as specified in 567—subrule 61.3(3). For sampling required during the recreational season, March 15 to November 15, the three-month periods are March through May, June through August, and September through November. For year-round sampling, the three-month periods are January through March, April through June, July through September, and October through December. For each three-month period, the operator must take five samples during one calendar month, resulting in 15 samples in one year for sampling required during the recreation season and 20 samples per year for sampling required year-round. The following requirements apply to the individual samples collected in one calendar month:
  - a. Samples must be spaced over one calendar month.

- b. No more than one sample can be collected on any one day.
- c. There must be a minimum of 48 hours between each sample.
- d. No more than two samples may be collected in a period of seven consecutive days.

The geometric mean must be calculated using all valid sample results collected during a month. The geometric mean formula is as follows: Geometric Mean = (Sample one × Sample two × Sample three × Sample four × Sample five...Sample N)<sup>1/N</sup>, which is the N<sup>th</sup> root of the result of the multiplication of all of the sample results where N = the number of samples. If a sample result is a less than value, the value reported by the lab without the less than sign shall be used in the geometric mean calculation.

- 8 - Additional TKN monitoring may be required if the facility has one or more significant industrial users or has effluent ammonia violations.
- 9 - Total nitrogen (as N) is defined as TKN (as N) plus nitrate (as N) plus nitrite (as N). Nitrate + nitrite can be analyzed together or separately. Total phosphorus shall be reported as P. Analyses must be performed by a laboratory certified in Iowa.
- 10 - NH<sub>3</sub>-N monitoring is only required for facilities with NH<sub>3</sub>-N effluent limitations.
- 11 - For aerated lagoons, 24-hour composite samples are not required on the final effluent; grab samples are acceptable.
- 12 - See Superscript #8, Table I.
- 13 - See Superscript #10, Table I.

These rules are intended to implement Iowa Code section 455B.173.

CHAPTER 64  
WASTEWATER CONSTRUCTION AND OPERATION PERMITS  
[Prior to 7/1/83, DEQ Ch 19]  
[Prior to 12/3/86, Water, Air and Waste Management[900]]  
Rescinded **ARC 9203C**, IAB 5/14/25, effective 6/18/25

CHAPTER 65  
ANIMAL FEEDING OPERATIONS  
[Prior to 7/1/83, DEQ Ch 20]  
[Prior to 12/3/86, Water, Air and Waste Management[900]]

Chapter exempt from chapter rescission pursuant to Iowa Code section 17A.7

DIVISION I  
GENERAL PROVISIONS

The provisions in Division I apply to all confinement feeding operations, open feedlot operations, animal truck washes, dry bedded confinement feeding operations, and associated manure and waste storage structures, unless otherwise noted in this chapter.

The following acronyms will be used throughout this chapter:

“AFO” means animal feeding operation.

“CAFO” means concentrated animal feeding operation.

“MMP” means manure management plan.

“NMP” means nutrient management plan.

“NPDES” means National Pollutant Discharge Elimination System.

**567—65.1(455B,459,459A,459B) Definitions and incorporation by reference.** In addition to the definitions in Iowa Code sections 455B.101, 455B.171, 459.102, 459A.102, and 459B.102 and in 567—Chapter 60, the following definitions shall apply to this chapter:

**65.1(1) Definitions.**

“*Abandoned AFO structure*” means the AFO structure has been razed, removed from the site of an AFO, filled in with earth, or converted to uses other than an AFO structure so that it cannot be used as an AFO structure without significant reconstruction.

“*Adjacent*” for open feedlot operation. Two or more open feedlot operations are defined as adjacent if both of the following occur:

1. At least one open feedlot operation structure is constructed on or after July 17, 2002; and
2. An open feedlot operation structure that is part of one open feedlot operation is separated by less than 1,250 feet from an open feedlot operation structure that is part of the other open feedlot operation.

“*Adjacent—air quality*” for confinement feeding operations means, for the purpose of determining separation distance requirements pursuant to rule 567—65.106(455B,459,459B), that two or more confinement feeding operations are adjacent if they have AFO structures that are separated at their closest points by less than the following:

1. 1,250 feet for a confinement feeding operation having an animal unit capacity of less than 1,250 animal units for swine maintained as part of a farrowing and gestating operation, less than 2,700 animal units for swine maintained as part of a farrow-to-finish operation, less than 4,000 animal units for cattle maintained as part of a cattle operation, or less than 3,000 animal units for any other confinement feeding operation, or for a confinement feeding operation consisting of dry bedded confinement feeding operation structures.
2. 1,500 feet for a confinement feeding operation having an animal unit capacity of 1,250 or more but less than 2,000 animal units for swine maintained as part of a swine farrowing and gestating operation, 2,700 or more but less than 5,400 animal units for swine maintained as part of a farrow-to-finish operation, 4,000 or more but less than 6,500 animal units for cattle maintained as part of a cattle operation, or for any other confinement feeding operation having an animal unit capacity of 3,000 or more but less than 5,000 animal units.
3. 2,500 feet for a confinement feeding operation having an animal unit capacity of 2,000 or more animal units for swine maintained as part of a swine farrowing and gestating operation, 5,400 or more animal units for swine maintained as part of a farrow-to-finish operation, or 6,500 or more animal units for

cattle maintained as part of a cattle operation, or for any other confinement feeding operation with 5,000 or more animal units.

The distances in paragraphs “1” to “3” above shall only be used to determine that two or more confinement feeding operations are adjacent if at least one confinement feeding operation structure was constructed on or after March 21, 1996.

To determine if two or more confinement feeding operations are adjacent, for the purpose of determining the separation distance requirements, the animal unit capacity of each individual operation shall be used. If two or more confinement feeding operations do not have the same animal unit capacity, the greater animal unit capacity shall be used to determine the separation distance.

Dry manure that is stockpiled within a distance of 1,250 feet from another stockpile shall be considered part of the same stockpile.

“*Adjacent—water quality*” for confinement feeding operations means, for the purpose of determining the construction permit requirements pursuant to rule 567—65.103(455B,459,459B) and MMP requirements pursuant to rule 567—65.110(455B,459,459B), that two or more confinement feeding operations are adjacent if they have confinement feeding operation structures that are separated at their closest points by less than the following:

1. 1,250 feet for confinement feeding operations having a combined animal unit capacity of less than 1,000 animal units.

2. 2,500 feet for confinement feeding operations having a combined animal unit capacity of 1,000 or more animal units.

3. The distances in paragraphs “1” and “2” above shall only be used to determine that two or more confinement feeding operations are adjacent if at least one confinement feeding operation structure is constructed or expanded on or after May 21, 1998.

“*Aerobic structure*” means an AFO structure other than an egg washwater storage structure which relies on aerobic bacterial action which is maintained by the utilization of air or oxygen and which includes aeration equipment to digest organic matter. Aeration equipment shall be used and shall be capable of providing oxygen at a rate sufficient to maintain an average of 2 milligrams per liter dissolved oxygen concentration in the upper 30 percent of the depth of manure in the structure at all times.

“*AFO structure*” means a confinement building, manure storage structure, dry bedded confinement feeding operation structure, or egg washwater storage structure.

“*Agricultural drainage well*” means a vertical opening to an aquifer or permeable substratum which is constructed by any means including but not limited to drilling, driving, digging, coring, augering, jetting, or washing and which is capable of intercepting or receiving surface or subsurface drainage water from land directly or by a drainage system.

“*Agricultural drainage well area*” means an area of land where surface or subsurface water drains into an agricultural drainage well directly or through a drainage system connecting to the agricultural drainage well.

“*Alluvial aquifer area*” means an area underlaid by sand or gravel aquifers situated beneath floodplains along stream valleys and includes alluvial deposits associated with stream terraces and benches, contiguous windblown sand deposits, and glacial outwash deposits.

“*Alluvial soils*” means soils formed in materials deposited by moving water.

“*Alternative technology settled open feedlot effluent control system*” or “*AT system*” means use of an open feedlot effluent control technology other than a conventional runoff containment system to control and dispose of settled open feedlot effluent.

“*Anaerobic digester system*” or “*digester*” means a manure storage structure that is covered if the primary function of the manure storage structure is to process manure by employing environmental conditions including bacteria to break down organic matter in the absence of oxygen, and the structure is used for producing, collecting, and utilizing a biogas.

“*Anaerobic lagoon*” means an unformed manure storage structure if the primary function of the structure is to store and stabilize manure, the structure is designed to receive manure on a regular basis, and the structure’s design waste loading rates provide that the predominant biological activity is anaerobic. An anaerobic lagoon does not include the following:

1. A runoff control basin or a settled open feedlot effluent basin that collects and stores only precipitation-induced runoff from an open feedlot operation.

2. An anaerobic treatment system that includes collection and treatment facilities for all off gases.

*“Animal”* means cattle, swine, horses, sheep, chickens, turkeys, goats, fish, or ducks.

*“Animal capacity”* means the maximum number of animals that the owner or operator will confine in an AFO at any one time. The animal capacity shall be what is currently approved or permitted on the site and is listed in the MMP or NMP, unless a portion of the facility has been properly closed or taken out of operation through the small AFO election as provided in paragraph 65.110(1) “f.” In a confinement feeding operation, the animal capacity of all confinement buildings will be included in the determination of the animal capacity of the operation, unless the building has been abandoned, in accordance with the definition of “abandoned AFO structure.”

*“Animal feeding operation”* or *“AFO”* means a lot, yard, corral, building, or other area in which animals are confined and fed and maintained for 45 days or more in any 12-month period, and all structures used for the storage of manure from animals in the operation. Except as required for an NPDES permit required pursuant to the Act, an AFO does not include a livestock market. Open feedlot operations and confinement feeding operations are considered to be separate AFOs.

*“Animal truck wash effluent”* means a combination of manure, washwater-induced runoff, or other runoff derived from an animal truck wash facility, which may include solids.

*“Animal truck wash effluent structure”* means an impoundment that is part of an animal truck wash facility, if the primary function of the impoundment is to collect and store animal truck wash effluent.

*“Animal truck wash facility”* means an operation engaged solely in washing single-unit trucks, truck-tractors, semitrailers, or trailers used to transport animals. An animal truck wash facility is considered to be part of an AFO if the animal truck wash facility and the AFO are under common ownership or management and the animal truck wash facility is located within 1,250 feet of the AFO.

*“Animal unit”* means a unit of measurement based upon the product of multiplying the number of animals of each category by a special equivalency factor, as follows:

|                                                                           |         |
|---------------------------------------------------------------------------|---------|
| 1. Slaughter and feeder cattle . . . . .                                  | 1.00    |
| 2. Immature dairy cattle . . . . .                                        | 1.00    |
| 3. Mature dairy cattle . . . . .                                          | 1.400   |
| 4. Butcher or breeding swine weighing more than 55 pounds . . . . .       | 0.400   |
| 5. Swine weighing 15 pounds or more but not more than 55 pounds . . . . . | 0.100   |
| 6. Sheep or lambs . . . . .                                               | 0.100   |
| 7. Goats . . . . .                                                        | 0.100   |
| 8. Horses . . . . .                                                       | 2.00    |
| 9. Turkeys weighing 7 pounds or more . . . . .                            | 0.018   |
| 10. Turkeys weighing less than 7 pounds . . . . .                         | 0.0085  |
| 11. Broiler or layer chickens weighing 3 pounds or more . . . . .         | 0.010   |
| 12. Broiler or layer chickens weighing less than 3 pounds . . . . .       | 0.0025  |
| 13. Ducks . . . . .                                                       | 0.040   |
| 14. Fish weighing 25 grams or more. . . . .                               | 0.001   |
| 15. Fish weighing less than 25 grams. . . . .                             | 0.00006 |

*“Animal unit capacity”* means a measurement used to determine the maximum number of animal units that may be maintained as part of an AFO at any one time, including as provided in Iowa Code sections 459.201, 459.301, and 459A.103. For dry bedded confinement feeding operations, “animal unit capacity” means the maximum number of animal units that the owner or operator confines in a dry bedded confinement feeding operation at any one time, including the animal unit capacity of all dry bedded confinement feeding operation buildings that are used to house cattle or swine in the dry bedded confinement feeding operation. For purposes of determining whether an open feedlot operation must obtain

an NPDES permit, the animal unit capacity of the AFO shall include the animal unit capacities of both the open feedlot operation and any adjacent confinement feeding operation if all of the following occur:

1. The animals in the open feedlot operation and any adjacent confinement feeding operation are all in the same category of animals as used in the definitions of “large CAFO” and “medium CAFO” in 40 CFR Part 122;
2. The closest open feedlot operation structure is separated by less than 1,250 feet from the closest confinement feeding operation structure; and
3. The open feedlot operation and the confinement feeding operation are under common ownership or management.

*“Animal weight capacity”* means the sum of the average weight of all animals in a confinement feeding operation when the operation is at full animal capacity. For confinement feeding operations with only one species, the animal weight capacity is the product of multiplying the animal capacity by the average weight during a production cycle. For operations with more than one species, the animal weight capacity of the operation is the sum of the animal weight capacities for all species. This definition applies to confinement feeding operations constructed prior to March 1, 2003.

*“Applicant”* means the person applying for a construction permit or an NPDES permit for an AFO.

*“Bedding”* means crop, vegetation, sand, or forage residue or similar materials placed in a dry bedded confinement building for the care of animals.

*“Business”* means a commercial enterprise.

*“Cemetery”* means a space held for the purpose of permanent burial, entombment or interment of human remains that is owned or managed by a political subdivision or private entity or a cemetery regulated pursuant to Iowa Code chapter 523I. A cemetery does not include a pioneer cemetery as defined by Iowa Code section 331.325.

*“Church”* means a religious institution.

*“Commercial enterprise”* means a building which is used as a part of a business that manufactures goods, delivers services, or sells goods or services, which is customarily and regularly used by the general public during the entire calendar year and which is connected to electric, water, and sewer systems. A commercial enterprise does not include a farm operation.

*“Commercial manure service”* means a sole proprietor or business association engaged in the business of transporting, handling, storing, or applying manure for a fee.

*“Commercial manure service representative”* means a manager, employee, agent, or contractor of a commercial manure service, if the person is engaged in transporting, handling, storing, or applying manure on behalf of the service.

*“Common management”* means significant control by an individual of the management of the day-to-day operations of each of two or more AFOs. “Common management” does not include control over a contract livestock facility by a contractor as defined in Iowa Code section 202.1.

*“Common ownership”* for confinement feeding operations means the ownership of a confinement feeding operation as a sole proprietor, or a 10 percent or more ownership interest held by a person, in each of two or more confinement feeding operations as a joint tenant, tenant in common, shareholder, partner, member, beneficiary, or other equity interest holder. The ownership interest is a common ownership interest when it is held directly, indirectly through a spouse or dependent child, or both. The following exceptions shall apply to this definition:

1. For a confinement feeding operation structure constructed before June 19, 2024, that has not been expanded, “common ownership” means the ownership of a confinement feeding operation as a sole proprietor, or a majority ownership interest held by a person, in each of two or more confinement feeding operations as a joint tenant, tenant in common, shareholder, partner, member, beneficiary, or other equity interest holder. The majority ownership interest is a common ownership interest when it is held directly, indirectly through a spouse or dependent child, or both. This exception shall not apply to a confinement feeding structure or operation expanded after June 19, 2024; instead, the 10 percent or more ownership interest standard shall apply.

2. This definition shall not apply to a dry bedded confinement feeding operation that is subject to the common ownership requirements in Iowa Code section 459B.103(3)“a”(3) nor to an open feedlot operation as defined in this rule.

“Common ownership” for open feedlot operations means to hold an interest in each of two or more open feedlot operations as any of the following:

1. A sole proprietor;
2. A joint tenant or tenant in common; or
3. A holder of a majority equity interest in a business association as defined in Iowa Code section 202B.102, including as a shareholder, partner, member, beneficiary, or other equity interest holder.

An interest in an open feedlot operation under paragraph “2” or “3” is a common ownership interest when it is held directly or indirectly through a spouse or dependent child, or both.

“*Complete application*” means an application that is substantially complete and approvable when all necessary questions on the application forms have been completed, the application is signed and all applicable portions of the application, including the application form, required attachments, and application fees, have been submitted.

“*Concentrated AFO*” or “*CAFO*” means an AFO that is a designated CAFO, or that is defined as a large CAFO or a medium CAFO as defined in 40 CFR 122.23(b).

“*Confinement feeding operation*” means an AFO in which animals are confined to areas that are totally roofed and includes an AFO that is not an open feedlot operation as defined in this chapter.

1. For purposes of water quality regulation, Iowa Code section 459.301 provides that two or more AFOs under common ownership or management are deemed to be a single AFO if they are adjacent or utilize a common area or system for manure disposal. For purposes of the air quality-related separation distances in Iowa Code section 459.202, Iowa Code section 459.201 provides that two or more AFOs under common ownership or management are deemed to be a single AFO if they are adjacent or utilize a common system for manure storage. The distinction is due to regulation of AFOs for water quality purposes under the Act. 40 CFR 122.23 sets out the requirements for an AFO and requires that two or more AFOs under common ownership be considered a single operation if they adjoin each other or if they use a common area or system for disposal of wastes. However, this federal regulation does not control regulation of AFOs for the purposes of the separation distances in Iowa Code section 459.202, and therefore the definition is not required by federal law to include common areas for manure disposal.

2. To determine if two or more AFOs are deemed to be one AFO, the first test is whether the AFOs are under common ownership or management. If they are not under common ownership or management, they are not one AFO. For purposes of water quality regulation, the second test is whether the two AFOs are adjacent or utilize a common area or system for manure disposal. If the two operations are not adjacent and do not use a common area or system for manure disposal, they are not one AFO. For purposes of the air quality-related separation distances in Iowa Code section 459.202, the second test is whether the two AFOs are adjacent or utilize a common system for manure storage. If the two operations are not adjacent and do not use the same system for manure storage, they are not one AFO.

3. A common area or system for manure disposal includes but is not limited to use of the same manure storage structure, confinement feeding operation structure, egg washwater storage structure, stockpile, permanent manure transfer piping system or center pivot irrigation system. A common area or system for manure disposal does not include manure application fields included in a manure management plan or anaerobic digester system.

“*Confinement feeding operation building*” or “*confinement building*” means a building used in conjunction with a confinement feeding operation to house animals.

“*Confinement feeding operation structure*” means an AFO structure that is part of a confinement feeding operation.

“*Confinement site*” means a site where there is located a manure storage structure which is part of a confinement feeding operation, other than a SAFO.

“*Confinement site manure applicator*” means a person, other than a commercial manure service or a commercial manure service representative, who applies manure on land if the manure originates from a manure storage structure.

*“Construction approval letter”* means a written document of the department to acknowledge that the preconstruction submittal requirements of rule 567—65.104(455B,459,459B) have been met for a confinement feeding operation that is not required to obtain a construction permit pursuant to rule 567—65.103(455B,459,459B).

*“Construction design statement”* means a document required to be submitted by a confinement feeding operation prior to constructing a formed manure storage structure, other than a SAFO, but that does not meet the threshold engineering requirements.

*“Construction permit”* means a written approval of the department to construct, modify or alter the use of an AFO structure as required by rules 567—65.103(455B,459,459B) and 567—65.203(455B,459A).

*“Controlling interest”* means ownership of a confinement feeding operation as a sole proprietor or a majority ownership interest held by a person in a confinement feeding operation as a joint tenant, tenant in common, shareholder, partner, member, beneficiary, or other equity interest holder. The majority ownership interest is a controlling interest when it is held directly, indirectly through a spouse or dependent child, or both. The majority ownership interest must be a voting interest or otherwise control management of the confinement feeding operation.

*“Covered”* means organic or inorganic material, placed upon an AFO structure used to store manure, which significantly reduces the exchange of gases between the stored manure and the outside air. Organic materials include but are not limited to a layer of chopped straw, other crop residue, or a naturally occurring crust on the surface of the stored manure. Inorganic materials include but are not limited to wood, steel, aluminum, rubber, plastic, or Styrofoam. The materials shall shield at least 90 percent of the surface area of the stored manure from the outside air. Cover shall include an organic or inorganic material which current scientific research shows reduces detectable odor by at least 75 percent. A formed manure storage structure directly beneath a floor where animals are housed in a confinement feeding operation is deemed to be covered.

*“Critical public area”* means land that is owned or managed by the federal government, by the department, or by a political subdivision and that has unique scenic, cultural, archaeological, scientific, or historic significance or contains a rare or valuable ecological system. Critical public areas include:

1. State wildlife and waterfowl refuges listed in 571—subrules 52.1(2) and 52.1(3);
2. Recreation areas, state parks, state parks managed by another governmental agency, and state preserves as listed in rule 571—61.2(461A);
3. County parks and recreation areas as provided in subrule 65.1(2);
4. National wildlife refuges listed as follows: Union Slough National Wildlife Refuge, DeSoto National Wildlife Refuge, Boyer Chute National Wildlife Refuge, Upper Mississippi River National Wildlife and Fish Refuge, Driftless Area National Wildlife Refuge, Neal Smith National Wildlife Refuge, and Port Louisa National Wildlife Refuge;
5. National monuments and national historic sites listed as follows: Effigy Mounds National Monument and Herbert Hoover National Historic Site;
6. Parks in Iowa that are under the federal jurisdiction listed with the United States Army Corps of Engineers as provided in subrule 65.1(2).

*“Cropland”* means any land suitable for use in agricultural production including but not limited to feed, grain and seed crops, fruits, vegetables, forages, sod, trees, grassland, pasture and other similar crops.

*“Deep well”* means a well located and constructed in such a manner that there is a continuous layer of low permeability soil or rock at least 5 feet thick located at least 25 feet below the normal ground surface and above the aquifer from which water is to be drawn.

*“Designated area”* means a known sinkhole, abandoned well, unplugged agricultural drainage well, agricultural drainage well cistern, agricultural drainage well surface tile inlet, drinking water well, designated wetland, or water source. “Designated area” does not include a terrace tile inlet or surface tile inlet other than an agricultural drainage well surface tile inlet.

*“Designated CAFO”* means an AFO that has been designated as a CAFO pursuant to rule 567—65.201(455B,459A).

*“Designated wetland”* means land designated as a protected wetland by the United States Department of the Interior or the department, including but not limited to a protected wetland as defined in Iowa Code

section 456B.1, if the land is owned and managed by the federal government or the department. However, a designated wetland does not include land where an agricultural drainage well has been plugged causing a temporary wetland or land within a drainage district or levee district. Designated wetlands in the state are listed in the department's "Designated Wetlands in Iowa" (more information is contained in subrule 65.1(2), incorporation by reference).

*"Discontinued AFO"* means an AFO whose structures have been abandoned or whose use has been discontinued as evidenced by the removal of all animals and the owner or operator has no immediate plans to repopulate.

*"Discontinued AFO structure"* means an AFO structure that has been abandoned or whose use has been discontinued as evidenced by the removal of all animals from the structure and the owner or operator has no immediate plans to repopulate.

*"Document"* means any form required to be processed by the department under this chapter regulating AFOs, including but not limited to applications or related materials for permits as provided in Iowa Code section 459.303, MMPs as provided in Iowa Code section 459.312, comment or evaluation by a county board of supervisors considering an application for a construction permit, the department's analysis of the application including using and responding to a master matrix pursuant to Iowa Code section 459.304, and notices required under those sections.

*"Dry bedded confinement feeding operation"* means a confinement feeding operation in which cattle or swine are confined to areas which are totally roofed and in which all manure is stored as dry bedded manure. Unless specifically stated otherwise, all requirements in Divisions I and II of this chapter do apply to dry bedded confinement feeding operations.

*"Dry bedded confinement feeding operation structure"* means a dry bedded confinement feeding operation building or a dry bedded manure storage structure.

*"Dry bedded manure"* means manure from cattle or swine that meets all of the following requirements:

1. The manure does not flow perceptibly under pressure.
2. The manure is not capable of being transported through a mechanical pumping device designed to move a liquid.
3. The manure contains bedding.

*"Dry bedded manure confinement feeding operation building"* or *"building"* means a building used in conjunction with a confinement feeding operation to house cattle or swine and in which any manure from the animals is stored as dry bedded manure.

*"Dry bedded manure storage structure"* means a covered or uncovered structure, other than a building, used to store dry bedded manure originating from a confinement feeding operation.

*"Dry manure"* means manure that meets all of the following conditions:

1. The manure does not flow perceptibly under pressure.
2. The manure is not capable of being transported through a mechanical pumping device designed to move a liquid.
3. The constituent molecules of the manure do not flow freely among themselves but may show a tendency to separate under stress.

*"Dry manure"* includes manure marketed as a bulk dry animal nutrient product that is stored 1,250 feet or less from the confinement animal feeding structure from which it originated.

*"Earthen manure storage basin"* means an earthen cavity, either covered or uncovered, that, on a regular basis, receives manure discharges from a confinement feeding operation if accumulated manure from the basin is completely removed at least once each year.

*"Earthen waste slurry storage basin"* means an uncovered and exclusively earthen cavity that, on a regular basis, receives manure discharges from a confinement AFO if accumulated manure from the basin is completely removed at least twice each year and that was issued a permit, constructed or expanded on or after July 1, 1990, but prior to May 31, 1995.

*"Educational institution"* means a building in which an organized course of study or training is offered to students enrolled in kindergarten through grade 12 and served by local school districts, accredited or approved nonpublic schools, area education agencies, community colleges, institutions of higher education under the control of the state board of regents, and accredited independent colleges and universities.

*“Egg washwater storage structure”* means an aerobic or anaerobic structure used to store the wastewater resulting from the washing and in-shell packaging of eggs. It does not include a structure also used as a manure storage structure.

*“Enforcement action”* means an action against a person with a controlling interest in a confinement feeding operation initiated by the department or the attorney general to enforce the provisions of Iowa Code chapter 459 or 459B or rules adopted pursuant to either chapter. An enforcement action begins when the attorney general institutes proceedings in district court pursuant to Iowa Code section 455B.112. An enforcement action is pending until final resolution of the action by satisfaction of a court order, for which all judicial appeal rights are exhausted, expired, or waived.

*“Family member”* means a person related to another person as parent, grandparent, child, grandchild, sibling, or a spouse of such related person.

*“Feed storage runoff basin”* means a covered or uncovered impoundment with the primary function to collect and store runoff from a feed storage area.

*“Formed animal truck wash effluent structure”* means a covered or uncovered impoundment used to store effluent from an animal truck wash facility, which has walls and a floor constructed of concrete, concrete block, wood, steel, or similar materials.

*“Formed manure storage structure”* means a covered or uncovered impoundment used to store manure from an AFO, which has walls and a floor constructed of concrete, concrete block, wood, steel, or similar materials. Subject to department approval, similar materials may include but are not limited to plastic, rubber, fiberglass, or other synthetic materials. Materials used in a formed manure storage structure shall have the structural integrity to withstand expected internal and external load pressures.

*“Formed settled open feedlot effluent basin”* means a settled open feedlot effluent basin which has walls and a floor constructed of concrete, concrete block, wood, steel, or similar materials. Similar materials may include but are not limited to plastic, rubber, fiberglass, or other synthetic materials. Materials used in a formed settled open feedlot effluent basin shall have the structural integrity to withstand expected internal and external load pressures.

*“Freeboard”* means the difference in elevation between the liquid level and the confinement feeding operation structure’s overflow level.

*“Frozen ground”* means soil that is impenetrable due to frozen soil moisture but does not include soil that is only frozen to a depth of two inches or less.

*“Grassed waterway”* means a natural or constructed channel that is shaped or graded to required dimensions and established in suitable vegetation for the stable conveyance of runoff.

*“Highly erodible land”* means a field that has one-third or more of its acres or 50 acres, whichever is less, with soils that have an erodibility index of eight or more, as determined by rules promulgated by the United States Department of Agriculture.

*“Human sanitary waste”* means wastewater derived from domestic uses including bathroom and laundry facilities generating wastewater from toilets, baths, showers, lavatories and clothes washing.

*“Incidental”* means a duty which is secondary or subordinate to a primary job or function.

*“Incorporation”* means a soil tillage operation following the surface application of manure which mixes the manure into the upper four inches or more of soil.

*“Indemnity fund”* means the livestock remediation fund created in Iowa Code section 459.501.

*“Injection”* means the application of manure into the soil surface using equipment that discharges it beneath the surface.

*“Interest”* means ownership of a confinement feeding operation as a sole proprietor or a 10 percent or more ownership interest held by a person in a confinement feeding operation as a joint tenant, tenant in common, shareholder, partner, member, beneficiary, or other equity interest holder. The ownership interest is an interest when it is held directly, indirectly through a spouse or dependent child, or both.

*“Karst terrain”* means land having karst formations that exhibit surface and subterranean features of a type produced by the dissolution of limestone, dolomite, or other soluble rock and characterized by closed depressions, sinkholes, or caves.

*“Known sinkhole”* means a sinkhole that has been included in the department’s sinkhole coverage and displayed in the AFO Siting Atlas or a sinkhole known to the applicant.

*“Liquid manure”* means manure that meets all of the following requirements:

1. The manure flows perceptibly under pressure.
2. The manure is capable of being transported through a mechanical pumping device designated to move a liquid.
3. The constituent molecules of the liquid manure flow freely among themselves and show a tendency to separate under stress.

Liquid manure that is frozen or partially frozen is included in this definition.

*“Livestock market”* means any place where animals are assembled from two or more sources for public auction, private sale, or on a commission basis, which is under state or federal supervision, including a livestock sale barn or auction market, if such animals are kept for ten days or less.

*“Long-term stockpile location”* means an area where a person stockpiles manure for more than a total of six months in any two-year period.

*“Low-pressure irrigation system”* means spray irrigation equipment that discharges manure from a maximum height of nine feet in a downward direction and that utilizes spray nozzles that discharge manure at a maximum pressure of 25 pounds per square inch.

*“Major water source”* means a water source that is a lake, reservoir, river or stream located within the territorial limits of the state, or any marginal river area adjacent to the state, if the water source is capable of supporting a floating vessel capable of carrying one or more persons during a total of a six-month period in one out of ten years, excluding periods of flooding. Major water sources in the state are listed in Table 1 and Table 2 at [iowadnr.gov/afo/rules](http://iowadnr.gov/afo/rules) (more information is contained in subrule 65.1(2), incorporation by reference).

*“Manager”* means a person who is actively involved in the operation of the commercial manure service and makes management decisions in the operation of the service.

*“Man-made manure drainage system”* means a drainage ditch, flushing system, or other drainage device which was constructed by human beings and is used for the purpose of transporting manure.

*“Manure”* means animal excreta or other commonly associated wastes of animals including but not limited to bedding, litter, or feed losses. Manure does not include wastewater resulting from the washing and in-shell packaging of eggs. For the purposes of NPDES permitting, “manure” includes manure, bedding, compost and raw materials or other materials commingled with manure or set aside for disposal. If a manure storage structure or animal truck wash effluent structure contains both manure from an AFO and animal truck wash effluent from an animal truck wash facility, the effluent shall be deemed to be manure.

*“Manure storage structure”* means a formed manure storage structure, an unformed manure storage structure, digester, or a dry bedded manure storage structure. A manure storage structure does not include the following: (1) egg washwater storage structure, (2) areas of a confinement building where no manure is stored, and (3) areas of a confinement building where the animals have direct contact with the manure and the manure is removed regularly during the production cycle or at the conclusion of the production cycle (referred to as the “animal production area”). An animal truck wash effluent structure may be the same as a manure storage structure that is part of the confinement feeding operation, so long as the primary function of such impoundment is to collect and store both effluent from the animal truck wash facility and manure from the confinement feeding operation.

*“NPDES permit”* means a written permit of the department, pursuant to the National Pollutant Discharge Elimination System (NPDES) program, to authorize and regulate the operation of a CAFO.

*“NRCS”* means United States Department of Agriculture Natural Resources Conservation Service.

*“Nutrient management plan”* or *“NMP”* means a plan that provides for the management of manure, process wastewater, settled open feedlot effluent, settleable solids, open feedlot effluent, animal truck wash effluent, including the application of effluent, as provided in rule 567—65.209(455B,459A).

*“One hundred year floodplain”* means the land adjacent to a major water source, if there is at least a 1 percent chance that the land will be inundated in any one year. In making the calculations, the department shall consider available maps or data compiled by the Federal Emergency Management Agency.

*“Open feedlot”* means a lot, yard, corral, building, or other area used to house animals in conjunction with an open feedlot operation.

*“Open feedlot effluent”* means a combination of manure, precipitation-induced runoff, or other runoff from an open feedlot before its settleable solids have been removed. If an open feedlot operation structure or animal truck wash effluent structure contains effluent from both an open feedlot operation and an animal truck wash facility, the animal truck wash effluent shall be deemed to be open feedlot effluent.

*“Open feedlot effluent basin”* means an open feedlot basin that does not settle solids before the effluent goes to the basin.

*“Open feedlot operation”* means an unroofed or partially roofed AFO if crop, vegetation, or forage growth or residue is not maintained as part of the AFO during the period that animals are confined in the AFO. “Open feedlot operation” includes a “partially roofed AFO” as defined in this rule. Iowa Code section 459A.103 provides that two or more open feedlot operations under common ownership or management are deemed to be a single open feedlot operation if they are adjacent or utilize a common area or system for open feedlot effluent disposal. To determine if two or more open feedlot operations are deemed to be one open feedlot operation, the first test is whether the open feedlot operations are under common ownership or management. If they are not under common ownership or management, they are not one open feedlot operation. The second test is whether the two open feedlot operations are adjacent or utilize a common area or system for open feedlot effluent disposal. If the two operations are not adjacent and do not use a common area or system for open feedlot effluent disposal, they are not one open feedlot operation.

*“Open feedlot operation structure”* means an open feedlot, an open feedlot effluent basin, a settled open feedlot effluent basin, a solids settling facility, or an AT system. “Open feedlot operation structure” does not include a manure storage structure as defined in Iowa Code section 459.102.

*“Owner”* means a person who has legal or equitable title to the property where the AFO is located or a person who has legal or equitable title to the AFO structures. “Owner” does not include a person who has a lease to use the land where the AFO is located or to use the AFO structures.

*“Partially roofed AFO”* means an AFO in which the animals are confined under a roof and there exists unroofed areas located on the perimeter of the roofed structure, where the animals have unrestricted access at all times. The square footage of the unroofed area shall be at least 10 percent of the square footage of the attached roofed production area. Openings or vents in the roofed portion shall not be included in the 10 percent unroofed calculation.

*“Permanent vegetation cover”* means land that is maintained in perennial vegetative cover consisting of grasses, legumes, or both, and includes but is not limited to pastures, grasslands or forages.

*“Process wastewater”* means water directly or indirectly used in the operation of the AFO for any or all of the following: spillage or overflow from animal or poultry watering systems; washing, cleaning, or flushing of pens, barns, manure pits, or other AFO facilities; direct contact swimming, washing, or spray cooling of animals; or dust control. Process wastewater also includes any water which comes into contact with any raw materials, products, or byproducts, including manure, litter, feed, milk, eggs or bedding.

*“Production area”* means that part of an AFO that includes the area in which animals are confined, the manure storage area, the raw materials storage area, egg washing and egg processing facilities, and the waste containment areas. The area in which animals are confined includes but is not limited to open lots, housed lots, feedlots, stall barns, free stall barns, milk rooms, milking centers, cow yards, barnyards, medication pens, walkers, animal walkways, confinement houses, and stables. The manure storage area includes but is not limited to lagoons, solids settling facilities, settled open feedlot effluent basins, storage sheds, stockpiles, under house or pit storages, liquid impoundments, static piles, and composting piles. The raw materials storage area includes but is not limited to feed silos, silage bunkers, and bedding materials. The waste containment area includes but is not limited to settling basins and areas within berms and diversions that separate uncontaminated storm water. Also included in the definition of production area is any area used in the storage, handling, treatment, or disposal of mortalities.

*“Professional engineer”* or *“PE”* means a person engaged in the practice of engineering as defined in Iowa Code section 542B.2 who is issued a certificate of licensure as a PE pursuant to Iowa Code section 542B.17.

*“Public thoroughfare”* means a road, street, or bridge that is constructed or maintained by the state or a political subdivision.

*“Public use area”* means that portion of land owned by the United States, the state, or a political subdivision with facilities that attract the public to congregate and remain in the area for significant periods of time. Facilities include but are not limited to picnic grounds, campgrounds, cemeteries, lodges and cabins, shelter houses, playground equipment, swimming beaches at lakes, and fishing docks, fishing houses, fishing jetties or fishing piers at lakes. It does not include a highway, road right-of-way, parking areas, recreational trails or other areas where the public passes through but does not congregate or remain in the area for significant periods of time.

*“Public water supply”* (also referred to as a system or a water system) means a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days out of the year. Such term includes (1) any collection, treatment, storage, and distribution facilities under control of the supplier of water and used primarily in connection with such system, and (2) any collection (including wells) or pretreatment storage facilities not under such control that are used primarily in connection with such system. A public water supply system is either a “community water system” or a “noncommunity water system.”

*“Q100,”* as defined in rule 567—70.2(455B,481A), means a flood having a 1 percent chance of being equaled or exceeded in any one year as determined by the department.

*“Qualified confinement feeding operation”* means a confinement feeding operation that has an animal unit capacity of:

1. 5,333 or more for animals other than swine as part of a farrowing and gestating operation or farrow-to-finish operation or cattle as part of a cattle operation.
2. 2,500 or more for a swine farrowing and gestating operation, not including replacement breeding swine if the following apply:
  - The replacement breeding swine are raised at the confinement feeding operation; and
  - The replacement breeding swine are used in the farrowing and gestation operation.
3. 5,400 or more for a swine farrow-to-finish operation.
4. 8,500 or more for a confinement feeding operation maintaining cattle.

*“Qualified stockpile cover”* means a barrier impermeable to precipitation that is used to protect a stockpile from precipitation.

*“Qualified stockpile structure”* means a building or roofed structure that is all of the following:

1. Impermeable to precipitation.
2. Constructed using wood, steel, aluminum, vinyl, plastic, or other similar materials.
3. Constructed with walls or other means to prevent precipitation-induced surface runoff from contacting the stockpile.

*“Release”* means an actual, imminent or probable discharge of manure, process wastewater, open feedlot effluent, settled open feedlot effluent, or settleable solids from an AFO or animal truck wash facility to surface water, groundwater, drainage tile line or intake or to a designated area resulting from storing, handling, transporting or land-applying manure, process wastewater, open feedlot effluent, settled open feedlot effluent, or settleable solids.

*“Religious institution”* means a building in which an active congregation is devoted to worship.

*“Research college”* means an accredited public or private college or university, including but not limited to a university under control of the state board of regents as provided in Iowa Code chapter 262, or a community college under the jurisdiction of a board of directors for a merged area as provided in Iowa Code chapter 260C, if the college or university performs research or experimental activities regarding animal agriculture or agronomy.

*“Residence”* means a house or other building, including all structures attached to the building, not owned by the owner of the AFO that meets all of the following criteria at the location of the intended residence:

1. Used as a place of habitation for humans on a permanent and frequent basis.
2. Not readily mobile.

3. Connected to a permanent source of electricity, a permanent private water supply or a public water supply system and a permanent domestic sewage disposal system including a private, semipublic or public sewage disposal system.

4. Assessed and taxed as real property.

If a house or other building has not been occupied by humans for more than six months in the last two years, or if a house or other building has been constructed or moved to its current location within the past six months, the owner of the intended residence has the burden of proving that the house or other building is a residence. Paragraph “3” shall not apply to a house or other building inhabited by persons who are exempt from the compulsory education standards of Iowa Code section 299.24 and whose religious principles or tenets prohibit the use of the utilities listed.

“*Restricted spray irrigation equipment*” means spray irrigation equipment that disperses manure through an orifice at a rate of 80 pounds per square inch or more.

“*School*” means an educational institution.

“*Seasonal high-water table*” means the part of the soil profile closest to the soil surface that becomes saturated (usually in the spring) as observed in a monitoring well or determined by recognition of soil redoxomorphic features.

NOTE: “*Redoxomorphic features*” refers to the gleying or mottling or both that occur under saturated conditions within the soil profile.

“*Secondary containment barrier*” means a structure used to retain accidental manure overflow from a manure storage structure.

“*Settleable solids,*” “*scraped solids,*” or “*solids*” means that portion of the effluent that meets all the following requirements:

1. The solids do not flow perceptibly under pressure.
2. The solids are not capable of being transported through a mechanical pumping device designed to move a liquid.
3. The constituent molecules of the solids do not flow freely among themselves but do show the tendency to separate under stress.

“*Settled open feedlot effluent*” means a combination of manure, precipitation-induced runoff, or other runoff originating from an open feedlot operation after its settleable solids have been removed.

“*Settled open feedlot effluent basin*” or “*runoff control basin*” means a covered or uncovered impoundment that is part of an open feedlot operation, if the primary function of the impoundment is to collect and store settled open feedlot effluent. An animal truck wash facility may be part of an open feedlot operation. An animal truck wash effluent structure may be the same as a settled open feedlot effluent basin that is part of the open feedlot operation, so long as the primary function of such impoundment is to collect and store effluent from both the animal truck wash facility and the open feedlot operation.

“*Shallow well*” means a well located and constructed in such a manner that there is not a continuous layer of low permeability soil or rock (or equivalent retarding mechanism acceptable to the department) at least 5 feet thick, the top of which is located at least 25 feet below the normal ground surface and above the aquifer from which water is to be drawn.

“*Sinkhole*” means any closed depression that was caused by the dissolution or collapse of subterranean materials in a carbonate formation or in gypsum or rock salt deposits through which water may drain to the local groundwater system. Such depressions may or may not be open to the surface at times. Intermittently, sinkholes may hold water forming a pond.

“*Small AFO*” or “*SAFO*” means an AFO that has an animal unit capacity of 500 or fewer animal units.

“*Small animal truck wash facility*” means an animal truck wash facility, if all of the following apply:

1. The animal truck wash facility and all single-unit trucks, truck-tractors, semitrailers, or trailers that are washed at the facility are owned by the same person; and
2. The average total per-day volume of washwater used by the animal truck wash facility does not exceed 2,000 gallons as calculated on a monthly basis.

“*Snow-covered ground*” means soil covered by one inch or more of snow or soil covered by one-half inch or more of ice.

*“Solids settling facility”* means a basin, terrace, diversion, or other structure or solids removal method that is part of an open feedlot operation and which is designed and operated to remove settleable solids from open feedlot effluent. A “solids settling facility” does not include a basin, terrace, diversion, or other structure or solids removal method that retains the liquid portion of open feedlot effluent for more than seven consecutive days following a precipitation event.

*“Spray irrigation equipment”* means mechanical equipment used for the aerial application of manure, if the equipment receives manure from a manure storage structure during application via a pipe or hose connected to the structure, and includes a type of equipment customarily used for aerial application of water to aid the growing of general farm crops.

*“Stockpile”* means dry manure or dry bedded manure originating from a confinement feeding operation that is stored at a particular location outside a confinement feeding operation building or a manure storage structure. For open feedlot operations and animal truck washes, “stockpile” means any accumulation of manure, scraped solids, settleable solids or combination of manure and solids located outside of the open feedlot or animal truck wash facility or outside of an area that drains to an open feedlot or animal truck wash facility, where the scraped manure or solids are stored for less than six months.

*“Stockpile dry bedded manure”* means to store dry bedded manure outside a dry bedded manure confinement feeding operation building or a dry bedded manure storage structure.

*“Stockpile dry manure”* means to create or add to a dry manure stockpile.

*“Surface water drain tile intake”* means an opening to a drain tile, including intake pipes and French drains, which allows surface water to enter the drain tile without filtration through the soil profile.

*“Swine farrow-to-finish operation”* means a confinement feeding operation in which porcine animals are produced and in which a primary portion of the phases of the production cycle is conducted at one confinement feeding operation. Phases of the production cycle include but are not limited to gestation, farrowing, growing and finishing. At a minimum, farrowing, growing, and finishing shall be conducted at the operation with a majority of the pigs farrowed at the site finished to market weight in order to qualify as a farrow-to-finish operation.

*“Threshold requirements for an engineer”* means the limits, pursuant to Iowa Code section 459.303, that require that the design of a formed manure storage structure or egg washwater storage structure be prepared and signed by a PE licensed in the state of Iowa or by an engineer working for the NRCS. A confinement feeding operation that utilizes a formed manure storage structure meets threshold requirements for an engineer if any of the following apply:

1. A confinement feeding operation with an animal unit capacity of 1,250 or more animal units for swine maintained as part of a swine farrowing and gestating operation.
2. A confinement feeding operation with an animal unit capacity of 2,750 or more animal units for swine maintained as part of a swine farrow-to-finish operation.
3. A confinement feeding operation with an animal unit capacity of 4,000 or more animal units for cattle maintained as part of a cattle operation.
4. Any other confinement feeding operation with an animal unit capacity of 3,000 or more animal units.

*“Unformed animal truck wash effluent structure”* means a covered or uncovered impoundment used to store animal truck wash effluent, other than a formed animal truck wash effluent structure.

*“Unformed manure storage structure”* means a covered or uncovered impoundment used to store manure, other than a formed manure storage structure, which includes an anaerobic lagoon, aerobic structure, or earthen manure storage basin.

*“Unformed settled open feedlot effluent basin”* means a settled open feedlot effluent basin, other than a formed settled open feedlot effluent basin.

*“Vegetative infiltration basin”* or *“VIB”* means an open feedlot operation structure in which settled open feedlot effluent is discharged into a relatively flat basin area which is bermed to prevent entry or discharge of surface water flows and is planted to permanent vegetation. An extensive tile system installed at a depth of three to five feet is used to collect infiltrated settled open feedlot effluent from the VIB and discharge it into a VTA for further treatment. As opposed to wetlands, which are designed to maintain a permanent water level, a VIB is designed to maximize water infiltration into the soil and thus normally

will have standing water for only short periods of time. Removal of settleable solids is required prior to discharge of open feedlot effluent into the VIB. Soil suitability is essential to ensure adequate filtration and treatment of pollutants. Periodic harvesting of vegetation is required.

“*Vegetative treatment area*” or “*VTA*” means an open feedlot operation structure in which settled open feedlot effluent is discharged into areas that are level in one dimension and have a slight slope (less than 5 percent) in the other dimension and are planted to relatively dense permanent vegetation. Settled open feedlot effluent must be discharged evenly across the top width of the VTA and allowed to slowly flow downslope through the VTA. Level spreaders or other practices may be required to maintain even flow throughout the length of the VTA. Management to maintain a dense vegetation cover is required, as is periodic harvesting of vegetation.

“*Water of the state*” means any stream, lake, pond, marsh, watercourse, waterway, well, spring, reservoir, aquifer, irrigation system, drainage system, and any other body or accumulation of water, surface or underground, natural or artificial, public or private, that are contained within, flow through or border upon the state or any portion thereof.

“*Water source*” means a lake, river, reservoir, creek, stream, ditch, or other body of water or channel having definite banks and a bed with water flow, except lakes or ponds without outlet to which only one landowner is riparian.

“*Water well*” means an excavation that is drilled, cored, augered, washed, driven, dug, jetted, or otherwise constructed for the purpose of exploring for groundwater, monitoring groundwater, utilizing the geothermal properties of the ground, or extracting water from or injecting water into the aquifer. “*Water well*” does not include an open ditch or drain tiles or an excavation made for obtaining or prospecting for oil, natural gas, minerals, or products mined or quarried.

“*Wetted perimeter*” means the outside edge of land where the direct discharge of manure occurs from spray irrigation equipment.

**65.1(2) *Incorporation by reference.*** The text of the following incorporated materials is not included in this chapter. The materials are provided at [www.iowadnr.gov/environmental-protection/animal-feeding-operations/afo-rules-regulations](http://www.iowadnr.gov/environmental-protection/animal-feeding-operations/afo-rules-regulations). The materials listed below are hereby made a part of this chapter. For material subject to change, only the specific version specified in this subrule is incorporated. Any amendment or revision to a reference document is not incorporated until this subrule has been amended to specify the new version.

a. “*Act*” means the federal Water Pollution Control Act, also known as the Clean Water Act, as defined by 40 CFR 403.3 as amended through July 19, 2023;

b. “*AFO Siting Atlas*” means an online mapping tool to assist in determining compliance of potential building sites to meet regulatory requirements. The AFO Siting Atlas is located on the department’s website, and the regulatory layers are effective as of June 19, 2024. Any changes to the regulatory layers of the AFO Siting Atlas shall be done through rulemaking. Regulatory layers include: karst, one hundred year floodplains in major water sources, and sinkholes;

c. “*CFR*” or “*Code of Federal Regulations*” means the federal administrative rules adopted by the United States as amended through July 19, 2023;

d. County Parks and Recreation Areas listed in Iowa’s County Conservation System Guide to Outdoor Adventure – effective June 19, 2024;

e. Parks in Iowa under the federal jurisdiction of the United States Army Corps of Engineers listed on the United States Army Corps of Engineers’ website – effective June 19, 2024;

f. Designated Wetlands in Iowa – effective August 23, 2006;

g. Emergency spill line telephone number is 515.725.8694 – effective January 1, 2023;

h. Appendix A: Open feedlot effluent control alternatives for open feedlot operations – effective December 14, 2016;

i. Appendix B: Master matrix – effective March 1, 2003;

j. Appendix C: Design specifications—formed manure storage structures – effective March 24, 2004;

k. Table 1: Major water sources—Rivers and Streams – effective December 14, 2016;

l. Table 2: Major water sources—Lakes – effective December 14, 2016;

- m.* Table 3: Annual pounds of nitrogen per space of capacity – effective September 15, 2010;
  - n.* Table 4: Crop nitrogen usage rate factors – effective December 14, 2016;
  - o.* Table 5: Manure production per space of capacity – effective September 15, 2010;
  - p.* Table 6: Required separation distances for confinement feeding operations construction on or after March 1, 2003—swine, sheep, horses, poultry, and beef and dairy cattle – effective September 15, 2010;
  - q.* Table 6a: Required separation distances for confinement feeding operations constructed on or after January 1, 1999, but prior to March 1, 2003—swine, sheep, horses and poultry – effective September 15, 2010;
  - r.* Table 6b: Required separation distances for confinement feeding operations constructed on or after January 1, 1999, but prior to March 1, 2003—beef and dairy cattle – effective September 15, 2010;
  - s.* Table 6c: Required separation distances for confinement feeding operations constructed prior to January 1, 1999—swine, sheep, horses and poultry – effective September 15, 2010;
  - t.* Table 6d: Required separation distances for confinement feeding operations constructed prior to January 1, 1999—beef and dairy cattle – effective September 15, 2010;
  - u.* Table 7: Required separation distances for open feedlot operations, stockpiles from open feedlot operations, stockpiles from dry manure confinement operations and stockpiles from dry bedded confinement operations – effective September 15, 2010;
  - v.* Table 8: Summary of credit for mechanical aeration – effective September 15, 2010;
  - w.* List of high-quality water resources in 567—Chapter 61 – effective January 1, 2001;
  - x.* NRCS Iowa Technical Note No. 25 Iowa Phosphorus Index – published March 2024;
  - y.* Iowa State University Extension and Outreach publication PM 1688, “A General Guide for Crop Nutrient and Limestone Recommendations in Iowa” – published February 2023;
  - z.* Iowa State University Extension and Outreach publication PMR 1003, “Using Manure Nutrients for Crop Production” – published April 2023;
  - aa.* Iowa State University Extension and Outreach publication AE 3550, “How to Sample Manure for Nutrient Analysis” – published January 2021; and
  - bb.* Iowa State University Extension and Outreach publication CROP 31-8, “Take a Good Soil Sample to Help Make Good Fertilization Decisions” – published December 2016.
  - cc.* NRCS Iowa Agronomy Technical Note No. 29 Dominant Critical Area – published April 2024.
- [ARC 7965C, IAB 5/15/24, effective 6/19/24; Editorial change: IAC Supplement 8/6/25]

**567—65.2(455B,459,459A,459B) Reporting of releases.** A release, as defined in rule 567—65.1(455B,459,459A,459B), shall be reported to the department as provided in this subrule. This rule does not apply to land application of manure in compliance with these rules.

**65.2(1) Notification.** A person storing, handling, transporting, or land-applying manure from an AFO or animal truck wash facility who becomes aware of a release shall notify the department of the occurrence of release as soon as possible but not later than six hours after the onset or discovery of the release by contacting the department’s spill line. The local police department or the office of the sheriff of the affected county shall also be contacted within the same time period if the spill involves a public roadway and public safety could be threatened. Reports made pursuant to this rule shall be confirmed in writing as provided in paragraph 65.2(1)“c.”

**65.2(2) Verbal report.** The verbal report of such a release should provide information on as many items listed in paragraph 65.2(1)“c” as available information will allow.

**65.2(3) Written report.** The written report of a release shall be submitted at the request of the department within 30 days after the verbal report of the release and contain at a minimum the following information:

- a.* The approximate location of the alleged release (including at a minimum the quarter-quarter section, township and county in which the release occurred or was discovered).
- b.* The time and date of onset of the alleged release, if known, and the time and date of the discovery of the alleged release.
- c.* The time and date of the verbal report to the department of the alleged release.
- d.* The name, mailing address and telephone number of the person reporting the alleged release.

- e. The name, mailing address and telephone number of any other person with knowledge of the event who can be contacted for further information.
- f. The source of the manure allegedly released (e.g., formed storage, earthen storage) and the form of the manure or process water released.
- g. The estimated or known volume of manure allegedly released.
- h. The weather conditions at the time of the onset or discovery of the alleged release.
- i. If known, the circumstances under which the alleged release occurred or exists (e.g., overflow, storage structure breach, equipment malfunction or breakdown, land runoff).
- j. The approximate location of the nearest stream or other water body that is or could be impacted by the alleged release and the approximate location to the alleged release of any known tile intakes or tile lines that could be a direct conveyance to a surface water or groundwater.
- k. A description of any containment or remedial measures taken to minimize the impact of the alleged release.
- l. Any information that may assist the department in evaluating the alleged release.

**65.2(4) *Reporting of subsequent findings.*** All subsequent findings and laboratory results should be reported and submitted in writing to the department as soon as they become available.

[ARC 7965C, IAB 5/15/24, effective 6/19/24]

**567—65.3(455B,459,459A,459B) CAFOs and NPDES permits.** Iowa Code sections 459B.306 and 459.311(2) require a confinement feeding operation and Iowa Code section 459A.401(2) requires an open feedlot operation that is a CAFO as defined in 40 CFR 122.23(b) to comply with applicable NPDES permit requirements pursuant to rules adopted by the commission. The following regulations are adopted by reference:

1. 40 CFR 122.21, application for a permit.
2. 40 CFR 122.23, CAFOs.
3. 40 CFR 122.42(e), additional conditions applicable to specified categories of NPDES permits.
4. 40 CFR 122.63(h), minor modification of permits.
5. 40 CFR Part 412, CAFO point source category.

[ARC 7965C, IAB 5/15/24, effective 6/19/24]

**567—65.4(455B,459,459A,459B) Complaint investigations.** Complaints of violations of Iowa Code chapters 455B, 459, 459A and 459B and this rule, which are received by the department or are forwarded to the department by a county, following a county board of supervisors' determination that a complainant's allegation constitutes a violation, shall be investigated by the department if it is determined that the complaint is legally sufficient and an investigation is justified.

**65.4(1)** If after evaluating a complaint to determine whether the allegation may constitute a violation, without investigating whether the facts supporting the allegation related to violations of the Iowa Code or this chapter are true or untrue, the county board of supervisors shall forward its finding to the department director.

**65.4(2)** A complaint is legally sufficient if it contains adequate information to investigate the complaint and if the allegation constitutes a violation, without investigating whether the facts supporting the allegation are true or untrue, of rules adopted by the department; Iowa Code chapters 455B, 459, 459A and 459B or environmental standards in regulations subject to federal law and enforced by the department.

**65.4(3)** The department in its discretion shall determine the urgency of the investigation, and the time and resources required to complete the investigation, based upon the circumstances of the case, including the severity of the threat to the quality of surface water or groundwater.

**65.4(4)** The department shall notify the complainant and the alleged violator if an investigation is not conducted specifying the reason for the decision not to investigate.

**65.4(5)** The department will notify the county board of supervisors where the violation is alleged to have occurred before doing a site investigation unless the department determines that a clear, present and impending danger to the public health or environment requires immediate action.

**65.4(6)** The county board of supervisors may designate a county employee to accompany the department on the investigation of any site as a result of a complaint.

**65.4(7)** A county employee accompanying the department on a site investigation has the same right of access to the site as the department official conducting the investigation during the period that the county designee accompanies the department official. The county shall not have access to records required in subrule 65.111(9).

**65.4(8)** Upon completion of an investigation, the department shall notify the complainant of the results of the investigation, including any anticipated, pending or complete enforcement action arising from the investigation. The department shall deliver a copy of the notice to the AFO or animal truck wash facility that is the subject of the complaint, any alleged violators if different from the AFO or animal truck wash facility and the county board of supervisors of the county where the violation is alleged to have occurred.

**65.4(9)** When a person who is a department official, an agent of the department, or a person accompanying the department official or agent enters the premises of an AFO or animal truck wash facility, both of the following shall apply:

*a.* The person may enter at any reasonable time in and upon any private or public property to investigate any actual or possible violation of this chapter or the rules or standards adopted under this chapter. However, the owner or person in charge shall be notified.

(1) If the owner or occupant of any property refuses admittance to the operation, or if prior to such refusal the director demonstrates the necessity for a warrant, the director may make application under oath or affirmation to the district court of the county in which the property is located for the issuance of a search warrant.

(2) In the application, the director shall state that an inspection of the premises is mandated by the laws of this state or that a search of certain premises, areas, or things designated in the application may result in evidence tending to reveal the existence of violations of public health, safety, or welfare requirements imposed by statutes, rules or ordinances established by the state or a political subdivision thereof. The application shall describe the area, premises, or thing to be searched; give the date of the last inspection if known; give the date and time of the proposed inspection; declare the need for such inspection; recite that notice of desire to make an inspection has been given to affected persons and that admission was refused if that be the fact; and state that the inspection has no purpose other than to carry out the purpose of the statute, ordinance, or regulation pursuant to which inspection is to be made. If an item of property is sought by the director, it shall be identified in the application.

(3) If the court is satisfied from the examination of the applicant, and of other witnesses, if any, and of the allegations of the application of the existence of the grounds of the application, or that there is probable cause to believe their existence, the court may issue such search warrant.

(4) In making inspections and searches pursuant to the authority of this rule, the director must execute the warrant:

1. Within ten days after its date.
2. In a reasonable manner, and any property seized shall be treated in accordance with the provisions of Iowa Code chapters 808, 809, and 809A.
3. Subject to any restrictions imposed by the statute, ordinance or regulation pursuant to which inspection is made.

*b.* The person shall comply with standard biosecurity requirements customarily required by the AFO or animal truck wash facility which are necessary in order to control the spread of disease among an animal population.

[ARC 7965C, IAB 5/15/24, effective 6/19/24]

**567—65.5(455B,459,459A,459B) Transfer of legal responsibilities or title.** If title or legal responsibility for a permitted AFO or an animal truck wash facility is transferred, the person to whom title or legal responsibility is transferred shall be subject to all terms and conditions of the construction permit and these rules. The person to whom the construction permit was issued and the person to whom title or legal responsibility is transferred shall notify the department, in writing, of the transfer of legal responsibility or title of the operation within 30 days of the transfer. Within 30 days of receiving a written request from the department, the person to whom legal responsibility is transferred shall submit to the department all information needed to modify the construction permit to reflect the transfer of legal responsibility. A person

who has been classified as a habitual violator under Iowa Code section 459.604 shall not acquire legal responsibility or a controlling interest to any additional permitted confinement feeding operations for the period that the person is classified as a habitual violator.

[ARC 7965C, IAB 5/15/24, effective 6/19/24]

**567—65.6(455B,459,459A,459B) Construction.** For purposes of these rules:

**65.6(1)** Construction of an AFO structure, open feedlot operation structure, or animal truck effluent structure begins or an AFO structure, open feedlot operation structure, or animal truck wash effluent structure is constructed when any of the following occurs:

*a.* Excavation for a proposed AFO structure, open feedlot operation structure, or animal truck wash effluent structure; excavation for footings; or filling or compacting of the soil or soil amendments for a proposed AFO structure, open feedlot operation structure, or animal truck wash effluent structure.

*b.* Installation of forms for concrete for an AFO structure, open feedlot operation structure, or animal truck wash effluent structure.

*c.* Installation of piping for movement of manure within, from or between AFO structures, open feedlot operation structures, or animal truck wash effluent structures.

**65.6(2)** Construction does not begin upon occurrence of any of the following:

*a.* Removal of trees, brush, or other vegetative growth.

*b.* Construction of driveways or roads.

*c.* General earth moving for leveling at the site.

*d.* Installation of temporary utility services.

*e.* Installation of temporary or permanent groundwater lowering tiles.

**65.6(3)** Prohibition on construction for confinement feeding operations.

*a.* A person shall not construct or expand an AFO structure that is part of a confinement feeding operation, if the person is either of the following:

(1) A party to a pending action for a violation of this chapter concerning a confinement feeding operation in which the person has a controlling interest and the action is commenced in district court by the attorney general.

(2) A habitual violator.

*b.* A person shall not construct or expand a confinement feeding operation structure for five years after the date of the last violation committed by a person or a confinement feeding operation in which the person holds a controlling interest during which the person or operation was classified as a habitual violator under Iowa Code sections 459.317 and 459.604.

*c.* Paragraphs 65.6(3)“*a*” and “*b*” shall not prohibit a person from completing the construction or expansion of an AFO structure, if either of the following applies:

(1) The person has an unexpired permit for the construction or expansion of the AFO structure.

(2) The person is not required to obtain a permit for the construction or expansion of the AFO structure.

*d.* A person shall not construct or expand an unformed manure storage structure within an agricultural drainage well area as specified in Iowa Code sections 459.310 and 460.205.

[ARC 7965C, IAB 5/15/24, effective 6/19/24]

**567—65.7(455B,459,459A,459B) Karst terrain.** Except as provided for in subrules 65.7(4) and 65.7(5), the provisions of this rule shall apply to the following structures: (1) confinement feeding operation structures at confinement feeding operations with over 500 animal units, (2) settled open feedlot effluent basins at open feedlot operations requiring a construction permit, (3) egg washwater structures, (4) AT systems, and (5) animal truck wash effluent structures.

**65.7(1)** *Karst terrain submittal requirements.* Prior to beginning construction of a structure identified in the introductory paragraph of this rule, the person planning the construction shall determine whether the proposed structure will be located in potential “karst terrain,” as defined in subrule 65.1(1). The AFO Siting Atlas shall be used to determine if the proposed structure is in potential karst terrain. The results of the karst terrain determination shall be submitted to the department according to the following:

a. If the proposed structure is not in potential karst terrain, the person planning the construction shall submit a printed map from the AFO Siting Atlas indicating the location of the structure, with the potential karst layer turned on, with the construction permit application documents or with the construction design statement if a construction permit is not required.

b. If the proposed formed manure storage structure is located in potential karst terrain, a PE licensed in Iowa, an NRCS-qualified staff person or a qualified organization shall submit a soil report, based on the results from soil corings, test pits or acceptable well log data, describing the subsurface materials and vertical separation distance from the bottom of the proposed structure to the underlying limestone, dolomite or soluble rock. A minimum of two soil corings spaced equally within the structure or two test pits located within five feet of the outside of the structure are required if acceptable well log data is not available. The soil corings shall be taken to a minimum depth of seven feet below the bottom elevation of the proposed structure or into bedrock, whichever is shallower. Any limestone, dolomite, or soluble bedrock in the corings or test pits shall be considered the bedrock surface rather than augur refusal. After the soil exploration is complete, each coring or test pit shall be properly plugged with concrete grout, bentonite or similar materials, and completion of this activity shall be documented in the soil report. If a 25-foot vertical separation distance can be maintained between the bottom of the proposed formed manure storage structure and limestone, dolomite, or other soluble rock, then the structure is not considered to be in karst terrain.

**65.7(2)** *Construction standards for formed manure storage structures.* A formed manure storage structure shall be constructed in accordance with the minimum concrete standards set forth in subrule 65.108(10) or Iowa Code section 459.307 if the structure is not constructed of concrete. No intact or weathered bedrock, including sandstone, shale, limestone, dolomite, or soluble rock, shall be removed or excavated during the construction of a storage structure.

**65.7(3)** *Vertical separation distance requirements for formed manure storage structures.* Except as provided for in subrule 65.7(5) related to the construction of a dry bedded confinement feeding operation structure, in addition to the concrete standards set forth in subrule 65.108(10) or Iowa Code section 459.307 if not constructed of concrete, a person constructing a formed manure storage structure on karst terrain shall comply with the following:

a. A minimum five-foot layer of low permeability soil ( $1 \times 10^{-6}$  cm/sec) or rock between the bottom of a formed manure storage structure and limestone, dolomite, or other soluble rock is required if the formed manure storage structure is not designed by a PE or NRCS-qualified staff person.

b. If the vertical separation distance between the bottom of the proposed formed manure storage structure and limestone, dolomite, or other soluble rock is less than five feet, the structure shall be designed and sealed by a PE or NRCS-qualified staff person who certifies the structural integrity of the structure. A two-foot-thick layer of compacted clay liner material shall be constructed underneath the floor of the formed manure storage structure. However, it is recommended that any formed manure storage structure be constructed aboveground if the vertical separation distance between the bottom of the structure and the limestone, dolomite, or other soluble rock is less than five feet.

c. Groundwater monitoring shall be performed as specified by the department.

d. Backfilling shall not start until the floor slats have been placed or permanent bracing has been installed and grouted and shall be performed with material free of vegetation, large rocks, or debris.

**65.7(4)** *Unformed manure storage structures.* The construction of unformed manure storage structures, including unformed manure storage structures at SAFOs, is prohibited in karst terrain or an area that drains into a known sinkhole. In potential karst, at least one coring shall be taken to a minimum depth of 25 feet below the bottom elevation of the proposed unformed manure storage structure or into bedrock, whichever is shallower. If a 25-foot vertical separation distance can be maintained between the bottom of the unformed manure storage structure and limestone, dolomite, or other soluble rock, then the structure is not considered to be in karst terrain. No intact or weathered bedrock, including sandstone, shale, limestone, dolomite, or soluble rock, shall be removed or excavated during the construction of a manure storage structure.

**65.7(5)** *Dry bedded confinement feeding operation structure.* A person constructing any dry bedded confinement feeding operation structure, including structures at SAFOs, on karst terrain shall comply with all of the following:

a. The person must construct the structure at a location where there is a vertical separation distance of at least five feet between the bottom of the floor of the structure and the underlying limestone, dolomite, or other soluble rock in karst terrain or the underlying sand and gravel aquifer in an alluvial aquifer area.

b. The person must construct the structure with a floor consisting of reinforced concrete at least five inches thick.

[ARC 7965C, IAB 5/15/24, effective 6/19/24]

**567—65.8(455B,459,459A,459B) Karst terrain—stockpile requirements.** The provisions of this rule shall apply to locations at confinement feeding operations where dry manure or dry bedded manure is stockpiled.

**65.8(1) Karst terrain submittal requirements.** Prior to stockpiling dry manure or dry bedded manure, the person planning to stockpile shall determine whether the proposed stockpile location will be located in potential “karst terrain,” as defined in subrule 65.1(1). The AFO Siting Atlas shall be used to determine if the proposed stockpile location is in potential karst terrain. The results of the karst terrain determination shall be submitted to the department according to the following:

a. If the proposed stockpile location is not in potential karst terrain, the person planning the stockpiling shall submit a printed map from the AFO Siting Atlas indicating the location of the stockpile location, with the potential karst layer turned on, to the department.

b. If the proposed stockpile is located in potential karst terrain, a PE licensed in Iowa, NRCS-qualified staff person or a qualified organization shall submit a soil report to the department, based on the results from soil corings, test pits or acceptable well log data, describing the subsurface materials and vertical separation distance from the proposed bottom of the stockpile to the underlying limestone, dolomite or soluble rock. A minimum of two soil corings spaced equally within the stockpile location or two test pits located within five feet of the outside of the stockpile location are required if acceptable well log data is not available. The soil corings shall be taken to a minimum depth of 25 feet below the bottom elevation of the proposed stockpile or into bedrock, whichever is shallower. After the soil exploration is complete, each coring or test pit shall be properly plugged with concrete grout, bentonite or similar materials and completion of this activity shall be documented in the soil report. If a 25-foot vertical separation distance can be maintained between the bottom of the proposed stockpile and limestone, dolomite, or other soluble rock, then the structure is not considered to be in karst terrain.

**65.8(2) Dry manure stockpiling.** A person shall comply with all of the following when stockpiling dry manure on karst terrain:

a. Maintain a minimum five-foot vertical separation distance between the bottom of the stockpile and the underlying limestone, dolomite, or other soluble rock.

b. A person who stockpiles dry manure for more than 15 days shall use any of the following:

(1) A qualified stockpile structure; or

(2) A qualified stockpile cover. However, a person shall not stockpile dry manure using a qualified stockpile cover at a long-term stockpile location unless the stockpile is located on a reinforced concrete slab at least five inches thick.

**65.8(3) Dry bedded manure stockpiling.** A person shall comply with all of the following when stockpiling dry bedded manure on karst terrain or above an alluvial aquifer:

a. Maintain a minimum five-foot vertical separation distance between the bottom of the stockpile and the underlying limestone, dolomite, or other soluble rock in karst terrain or the underlying sand and gravel aquifer in an alluvial aquifer area.

b. Stockpiles shall be placed on a reinforced concrete slab that is a minimum of five inches thick.

[ARC 7965C, IAB 5/15/24, effective 6/19/24]

**567—65.9(455B,459,459A,459B) Floodplains.** The provisions of this rule shall apply to the following structures: (1) confinement feeding operation structures, (2) settled open feedlot effluent basins at open feedlot operations requiring a construction permit, (3) egg washwater structures, (4) AT systems, and (5) animal truck wash effluent structures.

**65.9(1) Floodplains.** A person shall not construct a manure storage structure in the one hundred year floodplain of a major water source. The one hundred year floodplain of major water source designations

are included on the AFO Siting Atlas. For construction of facilities located in the counties that do not have a Federal Emergency Management Agency (FEMA) flood insurance rate map (FIRM), which are Black Hawk, Johnson, Louisa, Winneshiek, and Woodbury, a person shall have the ability to contest the one hundred year floodplain determination by supplying supporting documents to the department for further evaluation. Placing fill material on floodplain land to elevate the land above the one hundred year flood elevation will not be considered as removing the land from the one hundred year floodplain for the purpose of this subrule. Even if the proposed location of the manure storage structure is not on the one hundred year floodplain of a major water source, the site may be on the floodplain of a nonmajor water source and the department may require a floodplain development permit pursuant to 567—Chapters 70 through 76 if the drainage area of the nonmajor water source adjacent to the proposed structure is greater than ten square miles in a rural location or two square miles in an urban location. The proposed construction can be screened through the department's online floodplain database siting tool.

**65.9(2) *Flooding protection.*** A confinement feeding operation or open feedlot structure proposed to be constructed on land that would be inundated by Q100 shall meet requirements as specified in 567—Chapters 70 through 76, unless otherwise prohibited according to subrule 65.9(1).

**65.9(3) *Submittal requirements.*** The person planning the construction shall submit a printed map from the AFO Siting Atlas indicating the location of the structure, with the one hundred year floodplain layer turned on, with the construction permit application documents or with the construction design statement if a construction permit is not required.

**65.9(4) *Exemptions to prohibition on one hundred year floodplain construction and separation distance requirements from water sources, major water sources, known sinkholes, agricultural drainage wells, designated wetlands confinement structures and animal truck wash effluent structures.*** As specified in Iowa Code sections 459.310(4) and 459A.404(3), a separation distance required in subrules 65.106(3) and 65.106(4) or the prohibition against construction of a confinement feeding operation structure on a one hundred year floodplain as provided in subrule 65.9(1) shall not apply to a confinement feeding operation or animal truck wash that includes a confinement feeding operation structure or animal truck wash effluent structure that was constructed prior to March 1, 2003, if any of the following apply:

*a.* One or more unformed manure storage structures or animal truck wash effluent structures that are part of the confinement feeding operation or animal truck wash are replaced with one or more formed manure storage structures or formed animal truck wash effluent structures on or after April 28, 2003, and all of the following apply:

(1) The animal weight capacity or animal unit capacity, whichever is applicable, is not increased for that portion of the confinement feeding operation or animal truck wash that utilizes all replacement formed manure storage structures or animal truck wash effluent structures.

(2) The use of each replaced unformed manure storage structure is discontinued within one year after the construction of the replacement formed manure storage structure or formed animal truck wash effluent structure.

(3) The capacity of all replacement formed manure storage structures or animal truck wash effluent structures does not exceed the amount required to store manure produced by that portion of the confinement feeding operation or animal truck wash utilizing the replacement formed manure storage structures or animal truck wash effluent structures during any 18-month period.

(4) No portion of the replacement formed manure storage structure or animal truck wash effluent structure is closer to the location or object from which separation is required under subrules 65.106(3) and 65.106(4) than any other confinement feeding operation structure or animal truck wash effluent structure which is part of the operation.

(5) The replacement formed manure storage structure or animal truck wash effluent structure meets or exceeds the requirements of Iowa Code section 459.307 and subrule 65.108(10).

*b.* A replacement formed manure storage structure that is part of the confinement feeding operation or animal truck wash is constructed on or after April 28, 2003, if it complies with the following provisions:

(1) The replacement formed manure storage structure or animal truck wash effluent structure replaces the confinement feeding operation or animal truck wash's existing manure storage and handling facilities.

(2) The replacement formed manure storage structure or animal truck wash effluent structure complies with standards adopted pursuant to Iowa Code section 459.307 and subrule 65.108(10).

(3) The replacement formed manure storage structure or animal truck wash effluent structure more likely than not provides a higher degree of environmental protection than the confinement feeding operation or animal truck wash's existing manure storage and handling facilities. If the formed manure storage structure or animal truck wash effluent structure will replace any existing manure storage structure or animal truck wash effluent structure, the department shall require that the replaced manure storage structure or animal truck wash effluent structure be properly closed.

[ARC 7965C, IAB 5/15/24, effective 6/19/24]

**567—65.10 to 65.99** Reserved.

## DIVISION II

### CONFINEMENT FEEDING OPERATIONS AND DRY BEDDED CONFINEMENT FEEDING OPERATIONS

**567—65.100(455B,459,459B) Minimum manure control requirements.** Confinement feeding operations shall be constructed, managed and maintained to meet the minimum manure control requirements stated in subrules 65.100(1) to 65.100(6). A release shall be reported to the department as provided in subrule 65.2(1). Dry manure stockpiling requirements are stated in subrule 65.100(7). Dry bedded manure stockpiling requirements are stated in subrule 65.100(8).

**65.100(1)** The minimum level of manure control for a confinement feeding operation shall be the retention of all manure produced in the confinement enclosures between periods of manure application and as specified in this rule. In no case shall manure from a confinement feeding operation be discharged directly into a water of the state or into a tile line that discharges to waters of the state.

*a.* Control of manure from confinement feeding operations may be accomplished through use of manure storage structures or other manure control methods. Sufficient capacity shall be provided in the manure storage structure to store all manure between periods of manure application. A confinement feeding operation, other than a SAFO, that is constructed or expanded on or after July 1, 2009, shall not surface-apply liquid manure on frozen or snow-covered ground when there is an emergency, as described in subrule 65.101(4), unless the operation has a minimum of 180 days of manure storage capacity. Additional capacity shall be provided if precipitation, manure or wastes from other sources can enter the manure storage structure.

*b.* Manure shall be removed from the control facilities as necessary to prevent overflow or discharge of manure from the facilities. Manure stored in unformed manure storage structures or unformed egg washwater storage structures shall be removed from the structures as necessary to maintain a minimum of two feet of freeboard in the structure, unless a greater level of freeboard is required to maintain the structural integrity of the structure or prevent manure overflow. Manure stored in unroofed formed manure storage structures or formed egg washwater storage structures shall be removed from the structures as necessary to maintain a minimum of one foot of freeboard in the structure unless a greater level of freeboard is required to maintain the structural integrity of the structure or prevent manure overflow.

*c.* To ensure that adequate capacity exists in the manure storage structure to retain all manure produced during periods when manure application cannot be conducted (due to inclement weather conditions, lack of available land disposal areas, or other factors), the manure shall be removed from the manure storage structure as needed prior to these periods.

*d.* Dry manure or dry bedded manure originating at a confinement feeding operation may be retained as a stockpile so long as the stockpiled dry manure or dry bedded manure meets the following:

(1) Dry manure stockpiling requirements provided in subrule 65.100(7) or dry bedded manure stockpiling requirements provided in subrule 65.100(8).

(2) Applicable NPDES requirements pursuant to the Act.

(3) The dry manure or dry bedded manure is removed from the stockpile and applied in accordance with rule 567—56.101(459,459B) within six months after the dry manure or dry bedded manure is first stockpiled.

(4) Dry manure stockpiles are not required to meet the requirements in subparagraphs 65.100(1) “d” (1) to 65.100(1) “d” (3) above if the dry manure originates from a confinement feeding operation that was constructed prior to January 1, 2006, unless any of the following apply:

1. The confinement feeding operation is expanded after January 1, 2006.
2. Dry manure is stockpiled in violation of subrule 65.100(1).
3. Precipitation-induced runoff from the stockpile has drained off the property.

**65.100(2)** If site topography, operation procedures, experience, or other factors indicate that a greater or lesser level of manure control than that specified in subrule 65.100(1) is required to provide an adequate level of water pollution control for a specific AFO, the department may establish different minimum manure control requirements for that operation.

**65.100(3)** In lieu of using the manure control methods specified in subrule 65.100(1), the department may allow the use of manure treatment or other methods of manure control if it determines that an adequate level of manure control will result.

**65.100(4)** No direct discharge shall be allowed from an AFO into a publicly owned lake, a sinkhole, or an agricultural drainage well.

**65.100(5)** All manure removed from an AFO or its manure control facilities shall be land-applied in a manner that will not cause surface or groundwater pollution. Application in accordance with the provisions of state law and this chapter shall be deemed as compliance with this requirement.

**65.100(6)** As soon as practical but not later than six months after the use of an AFO is discontinued, all manure shall be removed from the discontinued AFO and its manure control facilities and be land applied.

**65.100(7)** Dry manure stockpiling requirements for a confinement feeding operation.

*a. Requirements for terrain, other than karst terrain.* Dry manure stockpiled on terrain, other than karst terrain, for more than 15 consecutive days shall comply with either of the following:

(1) Dry manure shall be stockpiled using any of the following:

1. A qualified stockpile structure; or
2. A qualified stockpile cover. Long-term stockpiles utilizing a qualified stockpile cover shall be placed on a constructed impervious base that can support the load of the equipment used under all weather conditions. The coefficient of permeability of the impervious base shall be less than  $1 \times 10^{-7}$  cm/sec (0.00028 feet/day). Permeability results shall be submitted to the department prior to use of the stockpile site.

(2) A stockpile inspection statement shall be delivered to the department as follows:

1. The department must receive the statement by the fifteenth day of each month.
2. The stockpile inspection statement shall provide the location of the stockpile and document the results of an inspection conducted during the previous month. The inspection must evaluate whether precipitation-induced runoff is draining away from the stockpile and, if so, describe actions taken to prevent the runoff. If an inspection by the department documents that precipitation-induced runoff is draining away from a stockpile, the dry manure must be immediately removed from the stockpile or comply with all directives of the department to prevent the runoff.

3. The stockpile inspection statement must be in writing and may be on a form prescribed by the department.

*b. Dry manure stockpile siting prohibitions.*

(1) Grassed waterway. A stockpile or stockpile structure shall not be placed in a grassed waterway.

(2) Sloping land. A stockpile or stockpile structure shall not be placed on land having a slope of more than 3 percent, unless the dry manure is stockpiled using methods, structures, or practices that contain the stockpile, including but not limited to silt fences, temporary earthen berms, or other effective measures, and that prevent or diminish precipitation-induced runoff from the stockpile.

**65.100(8)** Prohibitions and siting restrictions for dry bedded manure stockpiling requirements for a dry bedded confinement feeding operation.

*a. Prohibition in a grassed waterway.* A stockpile or stockpile structure shall not be placed in a grassed waterway, where water pools on the soil surface, or in any location where surface water will enter the stockpile.

b. Siting restrictions. A stockpile or stockpile structure shall not be placed on land having a slope of more than 3 percent, unless the dry manure or dry bedded manure is stockpiled using methods, structures, or practices that contain the stockpile, including but not limited to hay bales, silt fences, temporary earthen berms, or other effective measures that prevent or diminish precipitation-induced runoff from the stockpile. A stockpile or stockpile structure located in karst terrain must comply with the karst requirements in subrule 65.8(3).

[ARC 7965C, IAB 5/15/24, effective 6/19/24]

**567—65.101(455B,459,459B) Requirements for land application of manure from a confinement feeding operation.**

**65.101(1)** *General requirements for application rates and practices for confinement feeding operations.*

a. For manure originating from an anaerobic lagoon or aerobic structure, application rates and practices shall be used to minimize groundwater or surface water pollution resulting from application, including pollution caused by runoff or other manure flow resulting from precipitation events. In determining appropriate application rates and practices, the person land-applying the manure shall consider the site conditions at the time of application including anticipated precipitation and other weather factors, field residue and tillage, site topography, the existence and depth of known or suspected tile lines in the application field, and crop and soil conditions, including a good-faith estimate of the available water-holding capacity given precipitation events, the predominant soil types in the application field and planned manure application rate.

b. Spray irrigation equipment shall be operated in a manner and with an application rate and timing that does not cause runoff of the manure onto the property adjoining the property where the spray irrigation equipment is being operated.

c. For manure from an earthen waste slurry storage basin, earthen manure storage basin, or formed manure storage structure, restricted spray irrigation equipment shall not be used unless the manure has been diluted with surface water or groundwater to a ratio of at least 15 parts water to 1 part manure. Emergency use of spray irrigation equipment without dilution shall be allowed to minimize the impact of a release as approved by the department.

**65.101(2)** *Separation distance requirements for land application of manure.* Land application of manure shall be separated from objects and locations as specified in this subrule.

a. For liquid manure from a confinement feeding operation, the required separation distance from a residence not owned by the titleholder of the land, a business, a church, a school, or a public use area is 750 feet, as specified in Iowa Code section 459.204. The separation distance for application of manure by spray irrigation equipment shall be measured from the actual wetted perimeter and the closest point of the residence, business, church, school, or public use area.

b. The separation distance specified in paragraph 65.101(2)“a” shall not apply if any of the following apply:

(1) The liquid manure is injected into the soil or incorporated within the soil not later than 24 hours after the original application.

(2) The titleholder of the land benefitting from the separation distance requirement executes a written waiver with the titleholder of the land where the manure is applied.

(3) The liquid manure originates from a SAFO.

(4) The liquid manure is applied by low-pressure spray irrigation equipment pursuant to paragraph 65.101(2)“a.”

c. Separation distance for spray irrigation from property boundary line. Spray irrigation equipment shall be set up to provide for a minimum distance of 100 feet between the wetted perimeter as specified in the spray irrigation equipment manufacturer’s specifications and the boundary line of the property where the equipment is being operated. The actual wetted perimeter, as determined by wind speed and direction and other operating conditions, shall not exceed the boundary line of the property where the equipment is being operated. For property that includes a road right-of-way, railroad right-of-way or an access easement, the property boundary line shall be the boundary line of the right-of-way or easement.

d. Distance from structures for low-pressure irrigation systems. Low-pressure irrigation systems shall have a minimum separation distance of 250 feet between the actual wetted perimeter and the closest point of a residence, a business, church, school or public use area.

e. Waivers. Waivers to paragraph 65.101(2)“c” may be granted by the department if sufficient and proposed alternative information is provided to substantiate the need and propriety for such action. Waivers may be granted on a temporary or permanent basis. The request for a waiver shall be in writing and include information regarding:

(1) The type of manure storage structure from which the manure will be applied by spray irrigation equipment.

(2) The spray irrigation equipment to be used in the application of manure.

(3) Other information as the department may request.

f. Agricultural drainage wells. Manure shall not be applied by spray irrigation equipment on land located within an agricultural drainage well area.

g. Designated areas. A person shall not apply manure on land within 200 feet from a designated area or in the case of a high-quality water resource, within 800 feet, unless one of the following applies:

(1) The manure is land-applied by injection or incorporation on the same date as the manure was land-applied.

(2) An area of permanent vegetation cover, including filter strips and riparian forest buffers, exists for 50 feet surrounding the designated area other than an unplugged agricultural drainage well or surface intake to an unplugged agricultural drainage well, and the area of permanent vegetation cover is not subject to manure application.

h. Setback requirements for confinement feeding operations with NPDES permits. For confinement feeding operations with NPDES permits, the following is adopted by reference: 40 CFR 412.4(a), (b) and (c)(5).

**65.101(3) Surface application of liquid manure on frozen or snow-covered ground.** A person who applies liquid manure on frozen or snow-covered ground shall comply with applicable NPDES permit requirements pursuant to the Act and also shall comply with the following requirements:

a. *Snow-covered ground.* During the period beginning December 21 and ending April 1, a person may apply liquid manure originating from a manure storage structure that is part of a confinement feeding operation on snow-covered ground only when there is an emergency.

b. *Frozen ground.* During the period beginning February 1 and ending April 1, a person may apply liquid manure originating from a manure storage structure that is part of a confinement feeding operation on frozen ground only when there is an emergency.

c. *What constitutes an emergency.* For the purposes of this subrule, an emergency application is only allowed when there is an immediate need to apply manure to comply with the manure retention requirement of subrule 65.100(1) due to unforeseen circumstances affecting the storage of the liquid manure. The unforeseen circumstances must be beyond the control of the owner of the confinement feeding operation, including but not limited to natural disaster, unusual weather conditions, or equipment or structural failure. The authorization to apply liquid manure pursuant to this subrule does not apply to either of the following:

(1) An immediate need to apply manure in order to comply with the manure retention requirement of subrule 65.100(1) caused by the improper design or management of the manure storage structure, including but not limited to a failure to properly account for the volume of the manure to be stored. Based on the restrictions described in paragraphs 65.101(3)“a” and “b” and the possibility that the ground could be snow-covered and frozen for the entire period of December 21 to April 1, an operation should not plan to apply liquid manure during that time period. Confinement feeding operations with manure storage structures constructed after May 26, 2009, and without alternatives to manure application must have sufficient storage capacity to retain manure generated from December 21 to April 1 under normal circumstances in order to properly account for the volume of manure to be stored. For confinement feeding operations that have no manure storage structures constructed after May 26, 2009, the department will accept insufficient manure storage capacity as a reason for emergency application in the notification required in subrule 65.101(3).

(2) Liquid manure originating from a confinement feeding operation constructed or expanded on or after July 1, 2009, if the confinement feeding operation has a capacity to store manure for less than 180 days.

*d. Procedure for emergency application.* A person who is authorized to apply liquid manure on snow-covered ground or frozen ground when there is an emergency shall comply with all of the following:

(1) The person must notify the appropriate department field office by telephone prior to the application. The department will not consider the notification complete unless the owner's name, facility name, facility ID number, reason for emergency application, application date, estimated number of gallons of manure to be applied, and application fields as listed in the MMP are given. In cases where the emergency is not easily confirmed by weather reports, the owner must make documentation of the emergency available to the field office upon request.

(2) The liquid manure must be applied on land identified for such application in the current MMP maintained by the owner of the confinement feeding operation as required in subrule 65.111(7). The land must be identified in the current MMP prior to the application, and that change must also be reflected in the next annual update or complete MMP submitted to the department and county boards of supervisors following the application as required in paragraph 65.110(3) "b."

(3) The liquid manure must be applied on a field with a phosphorus index rating of 2 or less.

(4) Any surface water drain tile intake that is on land in the owner's MMP and located downgradient of the application must be temporarily blocked beginning not later than the time that the liquid manure is first applied and ending not earlier than two weeks after the completion of the application.

(5) Additional measures to contain runoff may be necessary in order to prevent violation of federal effluent standards in subrule 62.4(12).

*e. Exceptions.* Paragraphs 65.101(3) "a" through "d" do not apply to any of the following:

(1) The application of liquid manure originating from a SAFO.

(2) The application of liquid manure injected or incorporated into the soil on the same date.

[ARC 7965C, IAB 5/15/24, effective 6/19/24]

#### **567—65.102(455B,459,459B) Departmental evaluation.**

**65.102(1)** The department may evaluate any AFO to determine if any of the following conditions exist:

*a.* Manure from the operation is being discharged into a water of the state and the operation is not providing the applicable minimum level of manure control as specified in subrule 65.100(1);

*b.* Manure from the operation is causing or may reasonably be expected to cause pollution of a water of the state; or

*c.* Manure from the operation is causing or may reasonably be expected to cause a violation of state water quality standards.

**65.102(2)** If departmental evaluation determines that any of the conditions listed in subrule 65.102(1) exist, the operation shall institute necessary remedial actions to eliminate the conditions if the operation receives a written notification from the department of the need to correct the conditions. This subrule shall apply to all permitted and unpermitted AFOs, regardless of animal capacity.

[ARC 7965C, IAB 5/15/24, effective 6/19/24]

**567—65.103(455B,459,459B) Construction permits—required approvals and permits.** A person required to obtain a construction permit pursuant to subrule 65.103(1) or a construction approval letter pursuant to subrule 65.103(7) shall not begin construction, expansion or modification of a confinement feeding operation structure until the department issues a construction permit or a construction approval letter for a proposed or existing confinement feeding operation. In addition, the owner of a SAFO with formed manure storage structures who is not required to obtain a construction permit pursuant to subrule 65.103(1) or a construction approval letter pursuant to subrule 65.103(7) shall comply with the applicable construction approval requirements pursuant to subrule 65.103(8).

**65.103(1)** *Confinement feeding operations required to obtain a construction permit prior to any of the following.* Except as provided in subrule 65.103(2), a confinement feeding operation shall obtain a construction permit prior to any of the following:

- a. Constructing or installing a confinement building that uses an unformed manure storage structure or constructing, installing or modifying an unformed manure storage structure.
- b. Constructing or installing a confinement building that uses a formed manure storage structure or constructing, installing or modifying a formed manure storage structure if, after construction, installation or modification, the animal unit capacity of the operation is 1,000 animal units or more. This paragraph also applies to confinement feeding operations that store manure exclusively in a dry form.
- c. Initiating a change, even if no construction of, or physical alteration to, an unformed manure storage structure is necessary, that would result in an increase in the volume of manure or a modification in the manner in which manure is stored in any unformed manure storage structure. Increases in the volume of manure due to an increase in animal capacity, animal weight capacity or animal unit capacity up to the limits specified in a previously issued construction permit do not require a new construction permit.
- d. Initiating a change, even if no construction of or physical alteration to, a formed manure storage structure is necessary, that would result in an increase in the volume of manure or a modification in the manner in which manure is stored in a formed manure storage structure if, after the change, the animal unit capacity of the operation is 1,000 animal units or more. Increases in the volume of manure due to an increase in animal capacity, animal weight capacity or animal unit capacity up to the limits specified in a previously issued construction permit do not require a new construction permit.
- e. Purchasing or acquiring an adjacent animal feeding confinement operation if after acquisition the animal unit capacity of the combined operation is 1,000 animal units or more. The construction permit application must be submitted within 60 days of the acquisition or purchase.
- f. Constructing or modifying an egg washwater storage structure or a confinement building at a confinement feeding operation that includes an egg washwater storage structure.
- g. Initiating a change, even if no construction of, or physical alteration to, an egg washwater storage structure is necessary, that would result in an increase in the volume of egg washwater or a modification in the manner in which egg washwater is stored. Increases in the volume of egg washwater due to an increase in animal capacity, animal weight capacity or animal unit capacity up to the limits specified in a previously issued construction permit do not require a new construction permit.
- h. Repopulating a confinement feeding operation that had been a discontinued AFO for 24 months or more and if any of the following apply:
  - (1) The confinement feeding operation uses an unformed manure storage structure or egg washwater storage structure;
  - (2) The confinement feeding operation includes only confinement buildings and formed manure storage structures and has an animal unit capacity of 1,000 animal units or more.
- i. Installing a permanent manure transfer piping system, unless the department determines that a construction permit is not required.
- j. Initiating a remedial change, upgrade, replacement or construction when directed by the department as a result of departmental evaluation pursuant to rule 567—65.102(455B,459,459B) or as required by an administrative order or court order pursuant to Iowa Code section 455B.112 or 455B.175. Repairs to a confinement building or additions such as fans, slats, gates, roofs, or covers do not require a construction permit. In some instances, the department may determine that a construction permit is not required to increase the volume of manure or egg washwater or a modification in the manner in which manure or egg washwater is stored if the increase or modification is deemed insignificant. Plans for repairs or modifications to a manure storage structure shall be submitted to the department to determine if a permit is required.

**65.103(2)** *Confinement feeding operations not required to obtain a construction permit.*

- a. A construction permit shall not be required for a formed manure storage structure or for a confinement building that uses a formed manure storage structure in conjunction with a SAFO. However, this paragraph shall not apply to a SAFO that uses an unformed manure storage structure.
- b. A construction permit shall not be required for a confinement feeding operation structure related to research activities and experiments performed under the authority and regulations of a research college.
- c. A construction permit is not required to construct a formed manure storage structure at a confinement feeding operation having an animal unit capacity of more than 500 but less than 1,000 animal

units; however, a construction approval letter is required from the department pursuant to subrule 65.103(8) and rule 567—65.104(455B,459,459B).

*d.* A construction permit is not required for a confinement feeding operation that exclusively confines fish and elects to comply with the permitting requirements of Iowa Code section 455B.183.

**65.103(3)** *Operations that shall not be issued construction permits.*

*a.* The department shall not issue a construction permit to a person if an enforcement action by the department, relating to a violation of this chapter concerning a confinement feeding operation in which the person has an interest, is pending.

*b.* The department shall not issue a construction permit to a person for five years after the date of the last violation committed by a person or confinement feeding operation in which the person holds a controlling interest during which the person or operation was classified as a habitual violator under Iowa Code sections 459.317 and 459.604.

*c.* The department shall not issue a construction permit to expand or modify a confinement feeding operation for 120 days after completion of the last construction or modification at the operation, if a permit was not required for the last construction or modification.

**65.103(4)** *Construction permit application plan review criteria.* Review of plans and specifications submitted with a construction permit application shall be conducted to determine the potential of the proposed manure control system to achieve the level of manure control being required of the confinement feeding operation. In conducting this review, applicable criteria contained in federal law, state law, these rules, NRCS design standards and specifications unless inconsistent with federal or state law or these rules, and U.S. Department of Commerce precipitation data shall be used. If the proposed facility plans are not adequately covered by these criteria, applicable criteria contained in current technical literature shall be used.

**65.103(5)** *Expiration of construction permits.* A construction permit shall expire if construction, as defined in rule 567—65.6(455B,459,459A,459B), is not begun within one year and completed within four years of the date of issuance. The director may grant an extension of time to begin or complete construction if it is necessary or justified, upon showing of such necessity or justification to the director, unless a person who has an interest in the proposed operation is the subject of a pending enforcement action or a person who has a controlling interest in the proposed operation has been classified as a habitual violator. If a permitted site has not completed all proposed permitted structures within the four-year limit, then the approved animal unit capacity in the construction permit shall be lowered to be equal to what was constructed and the department shall issue a construction permit amendment for what was constructed. Once all permitted construction has been completed, no amendments for new construction may be issued even though the four-year period has not expired. A new construction permit must be issued for the new proposed construction.

**65.103(6)** *Revocation of construction permits.* The department may revoke a construction permit or refuse to renew a permit expiring according to subrule 65.103(5) if it determines that the operation of the confinement feeding operation constitutes a clear, present and impending danger to public health or the environment.

**65.103(7)** *Confinement feeding operations required to obtain a construction approval letter.* A person planning to construct a confinement feeding operation, other than a SAFO as defined in rule 567—65.1(455B,459,459A,459B) or other than an operation required to obtain a construction permit pursuant to subrule 65.103(1), shall obtain from the department a construction approval letter as provided in subrule 65.104(2) prior to beginning construction of a formed manure storage structure or a confinement building. The construction approval letter shall expire if construction, as defined in subrule 65.6(1), is not begun within one year and completed within four years of the date of the construction approval letter.

**65.103(8)** *SAFOs.* The following requirements apply to SAFOs:

*a.* A construction permit shall not be required for a SAFO utilizing a formed manure storage structure; however, a construction permit is required for any unformed manure storage structures utilized at a SAFO.

*b.* If a SAFO cannot meet the required separation distance provided in Iowa Code section 459.310(1), a SAFO must comply with secondary containment barrier design in accordance with subrule 65.104(5).

c. A SAFO must comply with drain tile removal requirements if the SAFO utilizes an unformed manure storage structure in accordance with subrule 65.108(1).

d. SAFO confinement structures must comply with applicable separation distance requirements in rule 567—65.106(455B,459,459B).

**65.103(9) *Compliance with permit conditions.*** A person who constructs, modifies or expands a confinement feeding operation structure pursuant to a construction permit shall comply with all terms and conditions of the construction permit.

[ARC 7965C, IAB 5/15/24, effective 6/19/24]

**567—65.104(455B,459,459B) Preconstruction submittal requirements.** Prior to beginning construction, expansion or modification of a confinement feeding operation structure, a person shall obtain from the department a construction permit pursuant to subrule 65.103(1), a construction approval letter pursuant to subrule 65.103(7) or approval of a secondary containment barrier design pursuant to subrule 65.104(5), according to procedures established in this rule.

**65.104(1) *Construction permit application.*** Application for a construction permit for a confinement feeding operation shall be made on a form provided by the department. The application shall include all of the information required in the form. At the time the department receives a complete application, the department shall make a determination regarding the approval or denial of the permit in accordance with subrule 65.105(5). A construction permit application for a confinement feeding operation shall be filed as instructed on the form and shall include the following:

a. The name of the applicant and the name of the confinement feeding operation, including mailing address and telephone number.

b. The name of the current landowner or the proposed landowner of the land where the confinement feeding operation will be located.

c. The contact person for the confinement feeding operation, including mailing address and telephone number.

d. The location of the confinement feeding operation.

e. Whether the application is for the expansion of an existing operation or the construction of a proposed confinement feeding operation, and the date when it was first constructed if an existing operation.

f. The animal unit capacity by animal species of the current confinement feeding operation to be expanded, if applicable, and of the proposed confinement feeding operation. If the confinement feeding operation includes a confinement feeding operation structure that was constructed prior to March 1, 2003, the animal weight capacity by animal species of the current confinement feeding operation to be expanded, if applicable, and of the proposed confinement feeding operation shall also be included.

g. Engineering documents. A confinement feeding operation that utilizes an unformed manure storage structure, an egg washwater storage structure or a formed manure storage structure at an operation that meets the threshold requirements for an engineer as defined in rule 567—65.1(455B,459,459A,459B) shall include an engineering report, construction plans and specifications. The engineering report, construction plans and specifications must be prepared and signed by a licensed PE or by an NRCS-qualified staff person, must detail the proposed structures, and must include a statement certifying that the manure storage structure complies with the requirements of Iowa Code chapter 459. In addition, a qualified soils or groundwater professional, licensed PE or NRCS-qualified staff person shall submit a hydrogeologic report on soil corings in the area of the unformed manure storage structure or egg washwater storage structure as described in subrules 65.108(5) and 65.108(9).

h. Construction design statement or PE design certification. A confinement feeding operation that uses a formed manure storage structure and that is below the threshold requirements for an engineer as defined in rule 567—65.1(455B,459,459A,459B) shall submit a construction design statement pursuant to subrule 65.104(3) or a PE design certification pursuant to subrule 65.104(4). All elevations shall be in NAV 88 datum for sites with alluvial soils or floodplain requirements.

i. Payment to the department of the indemnity fund fee as required in Iowa Code section 459.502.

j. If the construction permit application is for three or more confinement feeding operation structures, a drainage tile certification shall be submitted as follows:

(1) If the application is for an unformed manure storage structure, an egg washwater storage structure or a formed manure storage structure that meets the threshold requirements for an engineer as defined in rule 567—65.1(455B,459,459A,459B), a licensed PE shall certify that either the construction of the structure will not impede the drainage through established drainage tile lines which cross property boundary lines or that if the drainage is impeded during construction, the drainage tile will be rerouted to reestablish the drainage prior to operation of the structure.

(2) If the application is for a formed manure storage structure that does not meet the threshold engineering requirements, a drainage tile certification shall be submitted as part of the construction design statement pursuant to subrule 65.104(3) or as part of the PE design certification pursuant to subrule 65.104(4).

k. Information (e.g., maps, drawings, aerial photos) that clearly shows the proposed location of the confinement feeding operation structures; any existing confinement feeding operation structures; any locations or objects from which a separation distance is required by Iowa Code sections 459.202, 459.203 and 459.310; and that the structures will meet all applicable separation distances. If applicable, a copy of a recorded separation distance waiver, pursuant to paragraph 65.107(1) “b,” must be included with the application. Also, if applicable, a secondary containment barrier design, pursuant to subrules 65.104(5) and 65.107(7), shall be included.

l. The names of all parties with an interest or controlling interest in the confinement feeding operation who also have an interest or controlling interest in at least one other confinement feeding operation in Iowa, and the names and locations of such other operations; for a partnership or corporation owning the confinement feeding operation, a list of all members and their percentage of ownership in the partnership or corporation.

m. Copies of the MMP pursuant to rule 567—65.110(455B,459,459B).

n. A construction permit application fee of \$250 and the MMP filing fee of \$250 as required in subrule 65.110(7).

o. A copy of the AFO Siting Atlas indicating the location of the proposed structure, with the one hundred year floodplain and karst layers included.

p. A copy of any master matrix evaluation provided to the county.

q. A livestock odor mitigation evaluation certificate issued by Iowa State University as provided in Iowa Code section 266.49. The applicant is not required to submit the certificate if any of the following apply:

(1) The confinement feeding operation is twice the minimum separation distance required from the nearest object or location from which a separation distance is required pursuant to Iowa Code section 459.202 on the date of the application, not including a public thoroughfare.

(2) The owner of each object or location that is less than twice the minimum separation distance required pursuant to Iowa Code section 459.202 from the confinement feeding operation on the date of the application, other than a public thoroughfare, executes a document consenting to the construction.

(3) The applicant submits a document swearing that Iowa State University has failed to furnish a certificate to the applicant within 45 days after the applicant requested Iowa State University to conduct a livestock odor mitigation evaluation as provided in Iowa Code section 266.49.

(4) The application is for a permit to expand a confinement feeding operation, if the confinement feeding operation was first constructed before January 1, 2009.

(5) Iowa State University does not provide for a livestock odor mitigation evaluation effort as provided in Iowa Code section 266.49, for any reason, including because funding is not available.

r. Documentation that copies of all the construction permit application documents have been provided to the county board of supervisors or county auditor in the county where the operation or structure subject to the permit is to be located, and documentation of the date received by the county.

**65.104(2) Construction approval letter.**

a. A confinement feeding operation that, pursuant to subrule 65.103(7), is required to obtain a construction approval letter as defined in rule 567—65.1(455B,459,459A,459B), but that is not required to obtain a construction permit pursuant to subrule 65.103(1), shall file with the department, at least 30 days prior to the date the proposed construction is scheduled to begin, all of the following:

(1) A construction design statement pursuant to subrule 65.104(3). In lieu of a construction design statement, a PE design certification pursuant to subrule 65.104(4) may be submitted.

(2) A copy of the MMP pursuant to rule 567—65.110(455B,459,459B).

(3) Information (e.g., maps, drawings, aerial photos) that clearly shows the intended location of the confinement feeding operation structures and animal weight capacities of any other confinement feeding operations within a distance of 2,500 feet in which the owner has an ownership interest or which the owner manages.

(4) A fee of \$250 for filing an MMP pursuant to subrule 65.110(7) and a manure storage indemnity fee pursuant to subrule 65.110(6).

(5) Documentation that the board of supervisors or auditor of the county where the confinement feeding operation structure is proposed to be located received a copy of the MMP.

b. After submission of items in subparagraphs 65.104(2)“a”(1) through 65.104(2)“a”(5) and prior to issuance of the construction approval letter, the confinement feeding operation may make nonsubstantial revisions to the items and maintain the date construction is scheduled to begin.

**65.104(3) Construction design statement.** Prior to beginning construction of a formed manure storage structure, a person planning construction at a confinement feeding operation, other than a SAFO, that is below the threshold requirements for an engineer as defined in rule 567—65.1(455B,459,459A,459B) shall file with the department a construction design statement, as follows:

a. A confinement feeding operation with an animal unit capacity of more than 500 but less than 1,000 animal units that is required to obtain a construction approval letter from the department pursuant to subrule 65.103(7) but that is not required to obtain a construction permit pursuant to subrule 65.103(1) shall file with the department a construction design statement, as required in subrule 65.104(2). Within 30 days after the filing of a construction design statement, the department may issue a construction approval letter as defined in rule 567—65.1(455B,459,459A,459B) if the proposed formed manure storage structure meets the requirements of this chapter.

b. A confinement feeding operation that has an animal unit capacity of 1,000 animal units or more but that is below the threshold requirements for an engineer as defined in rule 567—65.1(455B,459,459A,459B) shall file a construction design statement as part of the construction permit application and as required in subrule 65.104(1).

c. The construction design statement shall be filed on a form provided by the department and shall include all of the following:

(1) The name of the person planning construction at the confinement feeding operation, the name of the confinement feeding operation, the location of the proposed formed manure storage structure, a detailed description of the type of confinement feeding operation structure being proposed, the dimensions of the structure, and whether the structure will be constructed of reinforced concrete or steel.

(2) An MMP pursuant to rule 567—65.110(455B,459,459B).

(3) A certification signed by the person responsible for constructing the formed manure storage structure that the proposed formed manure storage structure will be constructed according to the minimum concrete standards set forth in subrule 65.108(10). Otherwise, if the formed manure storage structure is to be constructed of steel, including a Slurrystore® tank, a certification signed by the person responsible for constructing the formed manure storage structure that the proposed formed manure storage structure will be constructed according to the requirements of Iowa Code chapter 459 and this chapter.

(4) If the confinement feeding operation is also required to obtain a construction permit at a confinement feeding operation proposing three or more confinement feeding operation structures, the construction design statement shall include a drainage tile certification signed by the person responsible for constructing or excavating the formed manure storage structure, shall certify that construction will not impede established existing drainage, and shall verify that if existing drainage tiles are found, corrective actions will be implemented to immediately reestablish existing drainage.

d. The following operations are not required to file a construction design statement with the department:

(1) A SAFO that constructs a formed manure storage structure.

(2) A confinement feeding operation that submits a PE design certification pursuant to this subrule.

(3) A confinement feeding operation that meets or exceeds threshold requirements for an engineer as defined in rule 567—65.1(455B,459,459A,459B).

(4) A confinement feeding operation that utilizes an unformed manure storage structure or an egg washwater storage structure.

**65.104(4) *PE design certification.*** In lieu of a construction design statement prior to beginning construction of a formed manure storage structure, a confinement feeding operation, other than a SAFO, that is below the threshold requirements for an engineer pursuant to rule 567—65.1(455B,459,459A,459B) may file with the department a PE design certification and design plans signed by a PE licensed in the state of Iowa or an NRCS-qualified staff person. The PE design certification shall be site-specific and shall be filed on a form provided by the department as follows:

*a.* A confinement feeding operation with an animal unit capacity of more than 500 but less than 1,000 animal units that is not required to obtain a construction permit pursuant to subrule 65.103(1) shall file with the department, at least 30 days before beginning construction of a formed manure storage structure, the PE design certification as required in subrule 65.104(2). Within 30 days after the filing of a PE design certification, the department may issue a construction approval letter if the proposed formed manure storage structure meets the requirements of this chapter.

*b.* A confinement feeding operation with an animal unit capacity of 1,000 animal units or more that is required to obtain a construction permit pursuant to subrule 65.103(1) but that is below the threshold requirements for an engineer pursuant to rule 567—65.1(455B,459,459A,459B) shall file with the department the PE design certification as part of the construction permit application and as required in subrule 65.104(1).

**65.104(5) *Secondary containment barrier design submittal requirements.*** The design for a secondary containment barrier to qualify any confinement feeding operation for the separation distance exemption provision in subrule 65.107(7) shall be filed with the department for approval prior to beginning construction of a formed manure storage structure that is part of a SAFO, shall accompany the construction design statement pursuant to subrule 65.104(2) if a construction permit is not required, or shall be filed as part of the construction permit application pursuant to subrule 65.104(1). The secondary containment barrier shall meet the design standards of subrule 65.108(11) and shall be prepared according to the following:

*a.* If a manure storage structure stores liquid or semiliquid manure, the secondary containment barrier design shall include engineering drawings prepared and signed by a PE licensed in the state of Iowa or an NRCS-qualified staff person. For purposes of this subrule only, “semiliquid manure” means manure that contains a percentage of dry matter that results in manure too solid for pumping but too liquid for stacking.

*b.* If the manure storage structure will store only dry manure or dry bedded manure, the owner or a representative of a confinement feeding operation may submit to the department detailed drawings of the design for a secondary containment barrier.

[ARC 7965C, IAB 5/15/24, effective 6/19/24]

### **567—65.105(455B,459,459B) Construction permit application review process, site inspections and complaint investigations.**

**65.105(1) *Delivery of application to county.*** The applicant for a construction permit for a confinement feeding operation or related AFO structure shall deliver in person or by certified mail a copy of the permit application and MMP to the county board of supervisors of the county where the confinement feeding operation or related AFO structure is proposed to be constructed. Receipt of the application and MMP by the county auditor or other county official or employee designated by the county board of supervisors is deemed receipt of the application and MMP by the county board of supervisors. Documentation of the delivery or mailing of the permit application and MMP shall be forwarded to the department.

**65.105(2) *Public notice and county comment.***

*a. Public notice.* The county board of supervisors shall publish a notice that the board has received the construction permit application in a newspaper having general circulation in the county. The county board shall publish the notice as soon as possible but no later than 14 days after receiving instructions from the department that a complete application has been received. The notice shall include all of the following:

(1) The name of the person applying to receive the construction permit;

- (2) The name of the township where the confinement feeding operation structure is to be constructed;
- (3) Each type of confinement feeding operation structure proposed to be constructed;
- (4) The animal unit capacity of the confinement feeding operation if the construction permit were to be approved;
- (5) The time when and the place where the application may be examined as provided in Iowa Code section 22.2;
- (6) Procedures for providing public comments to the board as provided by the board.

The county shall submit to the department, within 30 days of receipt of the construction permit application, proof of publication to verify that the county provided public notice as required in this paragraph.

*b. County comment.* Regardless of whether the county board of supervisors has adopted a construction evaluation resolution, the board may submit to the department comments by the board and the public regarding compliance of the construction permit application and MMP with the requirements in this chapter and Iowa Code chapter 459 for obtaining a construction permit. Comments may include but are not limited to the following:

- (1) The existence of an object or location not included in the construction permit application that benefits from a separation distance requirement as provided in Iowa Code section 459.202 or 459.310.
- (2) The suitability of soils and the hydrology of the site where construction or expansion of a confinement feeding operation or related AFO structure is proposed.
- (3) The availability of land for the application of manure originating from the confinement feeding operation.
- (4) Whether the construction or expansion of a proposed AFO structure will impede drainage through established tile lines, laterals, or other improvements which are constructed to facilitate the drainage of land not owned by the person applying for the construction permit.

**65.105(3) Master matrix.** A county board of supervisors may adopt a construction evaluation resolution relating to the construction of a confinement feeding operation structure. The board must submit such resolution to the director of the department for filing. Adoption and filing of a construction evaluation resolution authorizes a county board of supervisors to conduct an evaluation of a construction permit application using the master matrix as follows:

*a. Enrollment periods.*

- (1) The county board of supervisors must file an adopted construction evaluation resolution with the department between January 1 and January 31 of each year to evaluate construction permit applications received by the department between February 1 of that year and January 31 of the following year.
- (2) Filed construction evaluation resolutions shall remain in effect until the applicable enrollment period expires or until such time as the county board of supervisors files with the department a resolution rescinding the construction evaluation resolution, whichever is earlier.
- (3) Filing of an adopted construction evaluation resolution requires a county board of supervisors to conduct an evaluation of a construction permit application using the master matrix. However, if the board fails to submit an adopted recommendation to the department or fails to comply with the evaluation requirements in paragraph 65.105(3)“b,” the department shall disregard any adopted recommendation from that board until the board timely submits a new construction evaluation resolution.

*b. Use of the master matrix.* If a county board of supervisors has adopted and filed with the department a construction evaluation resolution, as provided in paragraph 65.105(3)“a,” the board shall evaluate all construction permit applications filed during the applicable period using the master matrix as follows:

- (1) In completing the master matrix, the board shall not score criteria on a selective basis. The board must score all criteria that are part of the master matrix according to the terms and conditions relating to construction as specified in the application or commitments for manure management that are to be incorporated into an MMP as provided in Iowa Code section 459.312.
- (2) The board shall include with the adopted recommendation a copy of the master matrix analysis, calculations, and scoring for the application. The board’s adopted recommendation submitted to the department may be based on the master matrix or on comments received by the board. The adopted

recommendation shall include the specific reasons and any supporting documentation for the decision to recommend approval or disapproval of the application.

(3) The board shall not use the master matrix to evaluate a construction permit application for the construction or expansion of a confinement feeding operation structure if the construction or expansion is for expansion of a confinement feeding operation that includes a confinement feeding operation structure constructed prior to April 1, 2002, and, after the expansion of the confinement feeding operation, its animal unit capacity is 1,666 animal units or less. The board may still submit comments regarding the application.

**65.105(4)** *Inspection of proposed construction site.* The department may conduct an inspection of the site on which construction of the confinement feeding operation is proposed after providing a minimum of 24 hours' notice to the construction permit applicant or sooner with the consent of the applicant. If the county in which the proposed facility is located has adopted and submitted a construction evaluation resolution pursuant to subrule 65.105(3) and has not failed subsequently to submit an adopted recommendation, the county may designate a county employee to accompany a department official during the site inspection. In such cases, the department shall notify the county board of supervisors or county designee at least three days prior to conducting an inspection of the site where construction of the confinement feeding operation is proposed. The county designee shall have the same right to access to the site's real estate on which construction of the confinement feeding operation is proposed as the departmental official conducting the inspection during the period that the county designee accompanies the departmental official. The departmental official and the county designee shall comply with standard biosecurity requirements customarily required by the owner of the confinement feeding operation that are necessary in order to control the spread of disease among an animal population.

**65.105(5)** *Determination by the department.* The department must receive the county board of supervisors' comments or evaluation for approval or disapproval of an application for a construction permit not later than 30 days following the applicant's delivery of a complete application to the department. Regardless of whether the department receives comments or an evaluation by a county board of supervisors, the department must render a determination or a preliminary determination to approve or disapprove an application for a construction permit within 60 days following the applicant's delivery of a complete application to the department. However, the applicant may deliver a notice requesting a continuance. Upon receipt of a notice, the time required for the county or department to act upon the application shall be suspended for the period provided in the notice but for not more than 30 days after the department's receipt of the notice. The applicant may submit more than one notice. However, the department may terminate an application if no action is required by the department for one year following delivery of the application to the board. The department may also provide for a continuance when it considers the application. The department shall provide notice to the applicant and the board of the continuance. The time required for the department to act upon the application shall be suspended for the period provided in the notice but for not more than 30 days. However, the department shall not provide for more than one continuance. If review of the application is delayed because the application is incomplete, and the applicant fails to supply requested information within a reasonable time prior to the deadline for action on the application, the permit may be denied and a new application will be required if the applicant wishes to proceed. The department will approve or disapprove an application as follows:

*a.* If the county board of supervisors does not submit a construction evaluation resolution to the department, fails to submit an adopted recommendation, submits only comments, or fails to submit comments, the department shall approve the application if the application meets the requirements of this chapter and Iowa Code chapters 455B, 459, 459A and 459B. The department will disapprove the application if it does not meet such requirements.

*b.* If the board of supervisors for the county in which the confinement feeding operation is proposed to be constructed has filed a county construction evaluation resolution and submits an adopted recommendation to approve the construction permit application, which may be based on a satisfactory rating produced by the master matrix, to the department, the department shall preliminarily approve an application for a construction permit if the department determines that the application meets the requirements of this chapter and Iowa Code chapters 455B, 459, 459A and 459B. The department shall preliminarily disapprove an application that does not satisfy the requirements of this chapter and Iowa

Code chapters 455B, 459, 459A and 459B regardless of the adopted recommendation of the board of supervisors. The department shall consider any timely filed comments made by the board as provided in this subrule to determine if an application meets the requirements of this chapter and Iowa Code chapters 455B, 459, 459A and 459B.

c. If the board submits to the department an adopted recommendation to disapprove an application for a construction permit that is based on a rating produced by the master matrix, the department shall first determine if the application meets the requirements of this chapter and Iowa Code chapters 455B, 459, 459A and 459B. The department shall preliminarily disapprove an application that does not satisfy the requirements of this chapter and Iowa Code chapters 455B, 459, 459A and 459B, regardless of any result produced by using the master matrix. If the application meets the requirements of this chapter and Iowa Code chapters 455B, 459, 459A and 459B, the department shall conduct an independent evaluation of the application using the master matrix. The department shall preliminarily approve the application if it achieves a satisfactory rating according to the department's evaluation. The department shall preliminarily disapprove the application if it produces an unsatisfactory rating regardless of whether the application satisfies the requirements of this chapter and Iowa Code chapters 455B, 459, 459A and 459B. The department shall consider any timely filed comments made by the board as provided in this subrule to determine if an application meets the requirements of this chapter and Iowa Code chapters 455B, 459, 459A and 459B.

**65.105(6)** *Departmental notification of permit application decision.* Within three days following the department's determination or preliminary determination to approve or disapprove the application for a construction permit, the department shall deliver a notice of the decision to the applicant.

a. If the county board of supervisors has submitted to the department an adopted recommendation for the approval or disapproval of a construction permit application, the department shall notify the board of the department's preliminary decision to approve or disapprove the application at the same time. For a preliminary decision to approve an application, the notice shall consist of a copy of the draft construction permit. For a preliminary decision to disapprove an application, the notice shall consist of a copy of the department's letter of preliminary denial. The preliminary decision to approve or disapprove an application becomes final without further proceedings if neither the county board of supervisors nor the applicant demands a hearing before the commission or appeals pursuant to subrules 65.105(7) and 65.105(8).

b. If the county board of supervisors has not submitted to the department an adopted recommendation for the approval or disapproval of a construction permit application, the department notice shall include the construction permit or letter of denial. The applicant may appeal the permit or denial as provided in subrule 65.105(8).

**65.105(7)** *County board of supervisors' demand for hearing.*

a. A county board of supervisors that has submitted an adopted recommendation to the department may contest the department's preliminary decision to approve or disapprove an application for permit by filing a written intent to demand a hearing and a demand for a hearing before the commission. The intent to demand a hearing shall be sent to the director of the department and must be postmarked no later than 14 days following the board's receipt of the department's notice of preliminary decision. The demand for hearing shall be sent to the director of the department and must be postmarked no later than 30 days following the board's receipt of the department's notice of preliminary decision. A county board of supervisors that has submitted an adopted recommendation to the department may waive the right to file a demand for hearing following the receipt of the department's notice of preliminary decision by filing a written notice of waiver with the department.

b. The demand for hearing shall include a statement setting forth all of the county board of supervisors' reasons why the application for a permit should be approved or disapproved, including legal briefs and all supporting documentation, and a further statement indicating whether an oral presentation before the commission is requested.

**65.105(8)** *Applicant's demand for hearing.* The applicant may contest the department's preliminary decision to approve or disapprove an application for permit by filing a written intent to demand a hearing and a demand for a hearing. The applicant may elect, as part of the written demand for hearing, to have the hearing conducted before the commission pursuant to paragraph 65.105(8) "a" or before an administrative

law judge pursuant to paragraph 65.105(8)“b.” If no such election is made, the demand for hearing shall be considered to be a request for hearing before the commission. If both the applicant and the county board of supervisors are contesting the department’s preliminary decision, the applicant may request that the commission conduct the hearing on a consolidated basis.

*a. Applicant demand for hearing before the commission.* The intent to demand a hearing shall be sent to the director of the department and must be postmarked no later than 14 days following the board’s receipt of the department’s notice of preliminary decision. The demand for hearing shall be sent to the director of the department and must be postmarked no later than 30 days following the applicant’s receipt of the department’s notice of preliminary decision. If the county board of supervisors has filed a demand for hearing, the times for facsimile notification and filing a demand for hearing are extended an additional three business days. It is the responsibility of the applicant to communicate with the department to determine if a county demand for hearing has been filed. The demand for hearing shall include a statement setting forth all of the applicant’s reasons why the application for permit should be approved or disapproved, including legal briefs and all supporting documentation, and a further statement indicating whether an oral presentation before the commission is requested.

*b. Applicant contested case appeal before an administrative law judge.* The applicant may contest the department’s preliminary decision to approve or disapprove an application according to the contested case procedures set forth in 561—Chapter 7; however, if the county board of supervisors has demanded a hearing pursuant to subrule 65.105(7), the applicant shall provide facsimile notification to the department within the time frame set forth in paragraph 65.105(7)“a” that the applicant intends to contest the department’s preliminary decision according to contested case procedures. In that event, the applicant may request that the hearings be consolidated and conducted as a contested case.

**65.105(9) Hearing and decision by the commission.**

*a. Hearing before the commission.*

(1) All hearings before the commission requested pursuant to subrules 65.105(7) and 65.105(8) shall be handled as other agency action and not as a contested case.

(2) Upon receipt of a timely demand for a hearing before the commission pursuant to subrules 65.105(7) or 65.105(8), the director shall set a hearing during a regular meeting of the commission scheduled no more than 35 days from the date the director receives the first such request. However, if the next regular meeting of the commission will take place more than 35 days after receipt of the demand for hearing, the director shall schedule a special in-person meeting or an electronic meeting of the commission pursuant to Iowa Code section 21.8.

(3) No later than five days from the date the director receives a demand for hearing, the director shall post on the department’s website the demand for hearing and associated documents, letters notifying the parties of the hearing date, and the department’s complete file on the application under review. The director shall provide hard copies of these documents to members of the commission as requested by each member. The director shall contact the applicant and the county board of supervisors and provide copies of documents they request.

(4) No later than 15 days from the date set for hearing, the applicant, the county board of supervisors and the department shall, if any chooses to do so, send one copy of a reply brief to respond to issues raised in the demand for hearing and any supporting documentation to the department. The director shall post the briefs and associated written documents on the department’s website and provide hard copies to members of the commission as requested by each member. No further briefs or documents shall be permitted except upon request and permission of the commission.

(5) No later than 15 days from the date set for hearing, any person may submit written material for the commission to review. Whether such material is accepted into the record will be the decision of the chairperson of the commission depending on whether the chairperson deems it relevant to the appeal.

(6) The commission shall use the following hearing procedures:

1. All written material accepted by the chairperson of the commission for inclusion in the record at the hearing shall be marked as coming from the person or entity presenting the document.
2. Objections to submitted written material shall be noted for the record.

3. Oral participation before the commission shall be limited to time periods specified by the chairperson of the commission and, unless otherwise determined by the commission, to presentations by representatives for the applicant, the county board of supervisors and the department and by technical consultants or experts designated by the commission. Representatives of the department shall not advocate for either the county board of supervisors or the applicant but may summarize the basis for the department's preliminary decision and respond to questions by members of the commission.

4. Members of the commission, and the commission's legal counsel, may ask questions of the representatives for the applicant, the county board of supervisors and the department and of technical consultants or experts designated by the commission. The members and counsel may also ask questions of any other person or entity appearing or in attendance at the hearing. Representatives for the applicant and the county board of supervisors may ask questions of technical consultants or experts designated by the commission. No other persons or entities may ask questions of anyone making a presentation or comment at the hearing except upon request and permission by the chairperson of the commission.

(7) The commission shall use the following hearing format:

1. Announcement by the chairperson of the commission of the permit application under review.
2. Receipt into the hearing record of the demand or demands for hearing, a copy of the department's complete file on the application under review and the briefs and written documents previously provided by the applicant and county board of supervisors pursuant to subparagraph 65.105(9) "a"(4).
3. Oral presentation, if any, by the applicant if that party timely requested the hearing. If the applicant did not timely request the hearing, then the county board of supervisors shall make the first presentation.
4. Oral presentation, if any, by the applicant or county board of supervisors, whichever party did not have the opportunity to make the first presentation.
5. Oral presentation, if any, by the department.
6. Oral presentation, if any, by technical consultants or experts designated by the commission to assist in its establishment of a record at the hearing. No later than seven days prior to the hearing, the commission shall notify the applicant and the board of the names, addresses and professional capacity of any such technical experts or consultants.
7. Discussion by the commission, motion and final decision on whether the application for permit is approved or disapproved.

(8) Only the issues submitted by the parties in the demand for hearing and responses shall be considered by the commission as a basis for its decision.

*b. Decision by the commission.* The decision by the commission shall be stated on the record and shall be final agency action pursuant to Iowa Code chapter 17A. If the commission reverses or modifies the department's decision, the department shall issue the appropriate permit or letter of denial to the applicant. The letter of decision shall contain the reasons for the action regarding the permit.

[ARC 7965C, IAB 5/15/24, effective 6/19/24]

**567—65.106(455B,459,459B) Confinement feeding operation and stockpile separation distance requirements.** All confinement feeding operation structures, stockpiles and qualified stockpile structures shall be separated from locations and objects as specified in this rule regardless of whether a construction permit is required. The separation distance requirements of this rule shall apply to all confinement feeding operation structures, unless specifically stated otherwise. If two or more confinement feeding operations are considered one operation as provided in rule 567—65.1(455B,459,459A,459B), definitions of "adjacent—air quality" and "adjacent—water quality," the combined animal unit capacities of the individual operations shall be used for the purpose of determining the required separation. Exemptions to the following requirements are allowed to the extent provided in rule 567—65.107(455B,459,459B).

**65.106(1) Separation distance from residences, businesses, churches, schools and public use areas for new confinement feeding operations.** Separation from residences, businesses, churches, schools and public use areas shall be as specified in Iowa Code section 459.202 and summarized in Table 6 located at [iowadnr.gov/afo/rules](http://iowadnr.gov/afo/rules). The residence, business, church, school or public use area must exist at the time an applicant submits an application for a construction permit to the department, at the time an MMP or construction design statement is filed with the department if a construction permit is not required, or at

the time construction of the confinement feeding operation structure begins if a construction permit or construction approval letter is not required.

**65.106(2)** *Separation distance from residences, businesses, churches, schools and public use areas for the expansion of prior constructed operations.* Except as provided in rule 567—65.107(455B,459,459B) or as specified in Iowa Code section 459.203, an existing confinement feeding operation may be expanded if any of the following applies:

a. For a confinement feeding operation constructed prior to January 1, 1999, any construction or expansion of a confinement feeding operation structure complies with the distance requirements applying to that structure as provided in Iowa Code sections 459.202(1) and 459.202(3) and summarized in Tables 6c (for swine, sheep, horses and poultry) and 6d (for beef and dairy cattle) located at [iowadnr.gov/afo/rules](http://iowadnr.gov/afo/rules).

b. For a confinement feeding operation constructed on or after January 1, 1999, but prior to March 1, 2003, any construction or expansion of a confinement feeding operation structure complies with the distance requirements applying to that structure as provided in Iowa Code sections 459.202(2) and 459.202(3) and summarized in Tables 6a (for swine, sheep, horses and poultry) and 6b (for beef and dairy cattle) located at [iowadnr.gov/afo/rules](http://iowadnr.gov/afo/rules).

c. For a confinement feeding operation constructed on or after March 1, 2003, any construction or expansion of a confinement feeding operation structure complies with the distance requirements applying to that structure as provided in Iowa Code sections 459.202(4) and 459.202(5) and summarized in Table 6 located at [iowadnr.gov/afo/rules](http://iowadnr.gov/afo/rules).

**65.106(3)** *Separation distance from water sources, major water sources, known sinkholes and agricultural drainage wells.* Separation distances specified in this subrule shall apply to any confinement feeding operation structure, including a SAFO. Separation distances from any confinement feeding operation structure to surface intakes, wellheads or cisterns of agricultural drainage wells, known sinkholes, water sources and major water sources shall be as specified in Iowa Code section 459.310 and summarized in Tables 6 to 6d located at [iowadnr.gov/afo/rules](http://iowadnr.gov/afo/rules). For the required separation distance to a major water source to apply, the major water source must be included in Table 1 located at [iowadnr.gov/afo/rules](http://iowadnr.gov/afo/rules) at the time an applicant submits an application for a construction permit to the department, at the time an MMP or construction design statement is filed with the department if a construction permit is not required, or at the time construction of the AFO structure if a construction permit, MMP or construction design statement is not required.

**65.106(4)** *Separation distance from designated wetlands.* Separation distances specified in this subrule shall apply to any confinement feeding operation structure, including a SAFO. A confinement feeding operation structure shall not be constructed closer than 2,500 feet away from a “designated wetland” as defined and referenced in rule 567—65.1(455B,459,459A,459B). This requirement shall not apply to a confinement feeding operation structure if any of the following occur before the wetland is included in “Designated Wetlands in Iowa”:

a. The confinement feeding operation structure already exists. This exemption also applies to additional confinement feeding operation structures constructed at the site of such an existing confinement feeding operation structure after a wetland is included in “Designated Wetlands in Iowa.”

b. Construction of a confinement feeding operation structure has begun as provided in subrule 65.6(1).

c. An application for a permit to construct a confinement feeding operation structure has been submitted to the department.

d. An MMP concerning a proposed confinement feeding operation structure for which a construction permit is not required has been submitted to the department.

**65.106(5)** *Separation distance from water wells.* For a confinement feeding operation structure constructed after March 20, 1996, the separation distance to water wells shall be as specified in Tables 6 to 6d located at [iowadnr.gov/afo/rules](http://iowadnr.gov/afo/rules).

**65.106(6)** *Separation distance from public thoroughfares.* A confinement feeding operation structure shall not be constructed or expanded within 100 feet from the right-of-way or a public easement of a public thoroughfare.

**65.106(7)** *Stockpile and qualified stockpile structures—separation distance from residences.* A stockpile or qualified stockpile structure shall not be placed closer than 1,250 feet from a residence not owned by the titleholder of the land where the stockpile is located, a commercial enterprise, a bona fide religious institution, an educational institution, or a public use area.

**65.106(8)** *Stockpile and qualified stockpile structures—separation distance from tile inlets, designated areas, high-quality water resources, agricultural drainage wells and known sinkholes.* A stockpile or qualified stockpile structure shall not be placed within the following distances from any of the following:

*a.* A terrace tile inlet or surface tile inlet, 200 feet, unless the dry manure is stockpiled in a manner that does not allow precipitation-induced runoff to drain from the stockpile to the terrace tile inlet or surface tile inlet. A terrace tile inlet or surface tile inlet does not include a tile inlet that is not directly connected to a tile line that discharges directly into a water of the state.

*b.* Designated area, 400 feet. However, an increased separation distance of 800 feet shall apply to all of the following:

- (1) A high-quality water resource.
- (2) An agricultural drainage well (400 feet for dry bedded manure).
- (3) A known sinkhole (400 feet for dry bedded manure).

*c.* Paragraph 65.106(8)“b” does not apply if dry manure is stockpiled in a manner that does not allow precipitation-induced runoff to drain from the stockpile to the designated area.

**65.106(9)** *Measurement of separation distances.* Except as provided in paragraph 65.106(9)“f,” the distance between confinement feeding operation structures and locations or objects from which separation is required shall be measured horizontally by standard survey methods between the closest point of the location or object (not a property line) and the closest point of the confinement feeding operation structure. The department may require that a separation distance be measured and certified by a licensed land surveyor, a PE licensed in the state of Iowa, or an NRCS-qualified staff person in cases where the department cannot confirm a separation distance. For purposes of this subrule, structure shall not include areas that do not house animals or store manure or litter.

*a.* Measurement to an unformed manure storage structure shall be to the point of maximum allowable level of manure pursuant to paragraph 65.100(1)“b.”

*b.* Measurement to a public use area shall be to the facilities that attract the public to congregate and remain in the area for significant periods of time, not to the property line.

*c.* Measurement to a major water source or water source shall be to the top of the bank of the stream channel of a river or stream or the ordinary high-water mark of a lake, reservoir or designated wetland.

*d.* Measurement to a public thoroughfare shall be to the closest point of the right-of-way.

*e.* The separation distance for a confinement feeding operation structure qualifying for the exemption to separation distances under paragraphs 65.107(4)“b” and “c” shall be measured from the closest point of the confinement feeding operation structure.

*f.* Measurement to a cemetery shall be to the closest point of its property line.

*g.* Measurement to a stockpile shall be to the closest point of the stockpile.

[ARC 7965C, IAB 5/15/24, effective 6/19/24]

**567—65.107(455B,459,459B) Exemptions to confinement feeding operation and stockpile separation distance requirements and prohibition of construction on the one hundred year floodplain.**

**65.107(1)** *Exemptions to separation distance requirements from a residence, business, church, school and public use area.* As specified in Iowa Code section 459.205, the separation distances required from residences, businesses, churches, schools and public use areas specified in Iowa Code sections 459.202 and 459.204B and required in subrules 65.106(1), 65.106(2), and 65.106(7), including Tables 6 to 6d located at [iowadnr.gov/afo/rules](http://iowadnr.gov/afo/rules), shall not apply to the following:

*a.* A confinement feeding operation structure, other than an unformed manure storage structure, if the structure is part of a SAFO or if the stockpile consists of dry manure originating from a SAFO.

*b.* A confinement feeding operation structure that is constructed or expanded, if the titleholder of the land benefiting from the distance separation requirement executes a written waiver with the titleholder of the land where the structure, stockpile or qualified stockpile structure is located, under such terms

and conditions that the parties negotiate. The waiver shall be specific to the construction or expansion project for which it is submitted. The waiver may include specific language to include future projects or expansions. The written waiver becomes effective only upon the recording of the waiver in the office of the recorder of deeds of the county in which the benefited land is located. The benefited land is the land upon which is located the residence, business, church, school or public use area from which separation is required. The filed waiver shall preclude enforcement by the department of the separation distance requirements of Iowa Code section 459.202. A copy of the recorded waiver shall be submitted with the construction design statement pursuant to subrule 65.104(2) if a construction permit is not required or as part of the construction permit application documents pursuant to subrule 65.104(1).

c. A confinement feeding operation structure that is constructed or expanded closer than the separation distances required in subrule 65.106(1) and 65.106(2), including Tables 6 to 6d located at [iowadnr.gov/afo/rules](http://iowadnr.gov/afo/rules), if the residence, business, church or school was constructed or expanded after the date that the confinement feeding operation commenced operating or if the boundaries of the public use area or the city expanded after the date that the confinement feeding operation commenced operating. A confinement feeding operation commences operating when it is first occupied by animals. A change in ownership or expansion of the confinement feeding operation does not change the date the operation commenced operating.

d. The stockpile consists of dry manure originating exclusively from a confinement feeding operation that was constructed before January 1, 2006, unless the confinement feeding operation is expanded after that date.

**65.107(2)** *Exemptions to separation distance requirements from public thoroughfares.* As specified in Iowa Code section 459.205, the separation required from public thoroughfares specified in Iowa Code section 459.202 and summarized in Tables 6 to 6d located at [iowadnr.gov/afo/rules](http://iowadnr.gov/afo/rules) shall not apply to any of the following:

a. A confinement building or a formed manure storage structure that is part of a SAFO. However, the exemptions of this subrule shall not apply if the confinement feeding operation structure is an unformed manure storage structure.

b. If the state or a political subdivision constructing or maintaining the public thoroughfare executes a written waiver with the titleholder of the land where the confinement feeding operation structure is located. The written waiver becomes effective only upon the recording of the waiver in the office of the recorder of deeds of the county in which the benefited land is located. The recorded waiver shall be submitted with the construction design statement pursuant to subrule 65.104(2) if a construction permit is not required, or as part of the construction permit application documents pursuant to subrule 65.104(1).

**65.107(3)** *Exemptions to separation distance requirements for prior constructed operations and for operations that expand based on prior separation distance requirements.* As specified in Iowa Code section 459.203, a confinement feeding operation constructed or expanded prior to the date that a distance requirement became effective under Iowa Code section 459.202 and that does not comply with the statute's distance requirement may continue to operate regardless of the distance requirement and may expand as provided in subrule 65.106(2).

**65.107(4)** *Exemptions to separation distance requirements for prior constructed operations that expand and cannot comply with prior separation distance requirements.* As specified in Iowa Code section 459.203, a confinement feeding operation constructed or expanded prior to the date that a distance requirement became effective under Iowa Code section 459.202 and that does not comply with the distance requirements established in rule 567—65.106(455B,459,459B) and the exemption in subrule 65.107(3) may be expanded if all of the following apply to the expansion:

a. No portion of the confinement feeding operation after expansion is closer than before expansion to a location or object for which separation is required in Iowa Code section 459.202.

b. For a confinement feeding operation that includes a confinement feeding operation structure constructed prior to March 1, 2003, the animal weight capacity of the confinement feeding operation as expanded is not more than the lesser of the following:

(1) Double its animal weight capacity on the following dates:

1. May 31, 1995, for a confinement feeding operation that includes a confinement feeding operation structure constructed prior to January 1, 1999.

2. January 1, 1999, for a confinement feeding operation that only includes a confinement feeding operation structure constructed on or after January 1, 1999, but does include a confinement feeding operation structure constructed prior to March 1, 2003.

(2) Either of the following:

1. An animal weight capacity of 625,000 pounds for animals other than cattle.

2. An animal weight capacity of 1,600,000 pounds for cattle.

c. For a confinement feeding operation that does not include a confinement feeding operation structure constructed prior to March 1, 2003, the animal unit capacity of the confinement feeding operation as expanded is not more than the lesser of the following:

(1) Double its animal unit capacity on March 1, 2003.

(2) 1,000 animal units.

**65.107(5)** *Exemptions to separation distance requirements for prior constructed operations that replace an unformed manure storage structure.* As specified in Iowa Code section 459.203, a confinement feeding operation that includes a confinement feeding operation structure that is constructed prior to March 1, 2003, may be expanded by replacing one or more unformed manure storage structures with one or more formed manure storage structures if all of the following apply:

a. The animal weight capacity or animal unit capacity, whichever is applicable, is not increased for that portion of the confinement feeding operation that utilizes all replacement formed manure storage structures.

b. Use of each replaced unformed manure storage structure is discontinued within one year after the construction of the replacement formed manure storage structure.

c. The capacity of all replacement formed manure storage structures does not exceed the amount required to store manure produced by that portion of the confinement feeding operation utilizing the formed manure storage structures during any 14-month period.

d. No portion of the replacement formed manure storage structure is closer to an object or location for which separation is required under Iowa Code section 459.202 than any other confinement feeding operation structure that is part of the operation.

**65.107(6)** *Exemption to separation distance requirements from cemeteries.* As specified in Iowa Code section 459.205, the separation distance required between a confinement feeding operation structure and a cemetery shall not apply if the confinement feeding operation structure was constructed or expanded prior to January 1, 1999.

**65.107(7)** *Exemptions to separation distance requirements from water sources, major water sources, known sinkholes, agricultural drainage wells and designated wetlands and secondary containment.* As specified in Iowa Code section 459.310(3), the separation distance required from surface intakes, wellheads or cisterns of agricultural drainage wells, known sinkholes, water sources, major water sources and designated wetlands, specified in Iowa Code section 459.310 and summarized in Tables 6 to 6d located at [iowadnr.gov/afo/rules](http://iowadnr.gov/afo/rules), shall not apply to a farm pond or privately owned lake as defined in Iowa Code section 462A.2, or to a confinement building, a manure storage structure or an egg washwater storage structure constructed with a secondary containment barrier according to subrule 65.108(11). To qualify for this separation distance exemption, the design of the secondary containment barrier shall be filed in accordance with subrule 65.104(5) prior to beginning construction of the confinement feeding operation structure.

**65.107(8)** *Exemptions to prohibition on one hundred year floodplain construction and separation distance requirements from water sources, major water sources, known sinkholes, agricultural drainage wells and designated wetlands—replacement formed manure storage structures.* As specified in Iowa Code section 459.310(4), a separation distance required in subrules 65.106(3) and 65.106(4) or the prohibition against construction of a confinement feeding operation structure on a one hundred year floodplain as provided in subrule 65.9(1) shall not apply to a confinement feeding operation that includes a confinement feeding operation structure that was constructed prior to March 1, 2003, if any of the following apply:

*a.* One or more unformed manure storage structures that are part of the confinement feeding operation are replaced with one or more formed manure storage structures on or after April 28, 2003, and all of the following apply:

(1) The animal weight capacity or animal unit capacity, whichever is applicable, is not increased for that portion of the confinement feeding operation that utilizes all replacement formed manure storage structures.

(2) The use of each replaced unformed manure storage structure is discontinued within one year after the construction of the replacement formed manure storage structure.

(3) The capacity of all replacement formed manure storage structures does not exceed the amount required to store manure produced by that portion of the confinement feeding operation utilizing the replacement formed manure storage structures during any 18-month period.

(4) No portion of the replacement formed manure storage structure is closer to the location or object from which separation is required under subrules 65.106(3) and 65.106(4) than any other confinement feeding operation structure that is part of the operation.

(5) The replacement formed manure storage structure meets or exceeds the requirements of Iowa Code section 459.307 and subrule 65.108(10).

*b.* A replacement formed manure storage structure that is part of the confinement feeding operation is constructed on or after April 28, 2003, pursuant to a waiver granted by the department. In granting the waiver, the department shall make a finding of all of the following:

(1) The replacement formed manure storage structure replaces the confinement feeding operation's existing manure storage and handling facilities.

(2) The replacement formed manure storage structure complies with standards adopted pursuant to Iowa Code section 459.307 and subrule 65.108(10).

(3) The replacement formed manure storage structure more likely than not provides a higher degree of environmental protection than the confinement feeding operation's existing manure storage and handling facilities. If the formed manure storage structure will replace any existing manure storage structure, the department shall, as a condition of granting the waiver, require that the replaced manure storage structure be properly closed.

[ARC 7965C, IAB 5/15/24, effective 6/19/24]

**567—65.108(455B,459,459B) Manure storage structure design requirements.** The requirements in this rule apply to all confinement feeding operation structures unless specifically stated otherwise.

**65.108(1) Drainage tile removal for new construction of a manure storage structure.** Prior to constructing a manure storage structure, other than storage of manure in an exclusively dry form, the site for the AFO structure shall be investigated for drainage tile lines as provided in this subrule. All applicable records of known drainage tiles shall be examined for the existence of drainage tile lines.

*a.* An inspection trench of at least ten inches wide shall be dug around the structure to a depth of at least 6 feet below the original grade and within 25 feet of the proposed outside of the toe of the berm prior to excavation for an unformed manure storage structure.

*b.* Drainage tile lines discovered during the tile inspection of an unformed manure storage structure shall be removed and rerouted in or in an area outside the inspection trench. All tiles within the inspection trench perimeter shall be removed or completely plugged with concrete, grout or similar materials. Drainage tile lines installed at the time of construction to lower the groundwater may remain in place as long as they are outside of the proposed toe of berm.

*c.* The applicant for a construction permit for a formed manure storage structure shall investigate for tile lines during excavation for the structure. Drainage tile lines discovered upgrade from the structure shall be rerouted around the formed manure storage structure to continue the flow of drainage. All other drainage tile lines discovered shall be rerouted, capped, or plugged with concrete, Portland cement concrete grout or similar materials. Drainage tile lines installed at the time of construction to lower a groundwater table may remain where located even if located under the floor; however, the tile lines must be tied into the perimeter drain tile.

*d.* Other proven methods approved by the department may be utilized to discover drainage tile lines.

e. The requirements of this subrule do not apply if sufficient information is provided that allows the department to conclude that the location does not have a history of drainage tile.

**65.108(2) *Drainage tile removal around an existing manure storage structure.*** The owner of an aerobic structure, anaerobic lagoon or earthen manure storage basin or earthen waste slurry storage basin, other than an egg washwater storage structure, that is part of a confinement feeding operation with a construction permit granted before March 20, 1996, but after December 31, 1992, shall inspect for drainage tile lines as provided in this subrule, and all applicable records of known drainage tiles shall be examined. The owner of an aerobic structure, anaerobic lagoon, earthen manure storage basin or earthen waste slurry storage basin, other than an egg washwater storage structure, that is part of a confinement feeding operation with a construction permit granted before January 1, 1993, but after May 31, 1985, shall inspect for drainage tiles as provided in this subrule, and all applicable records of known drainage tiles shall be examined. Drainage tile lines shall not be installed within the separation distance provided in paragraph 65.108(1) "b" once the basin has been constructed.

a. Inspection shall be by digging an inspection trench of at least ten inches wide around the structure to a depth of at least 6 feet from the original grade and within 25 feet from the outside edge of the berm. The owner first shall inspect the area where trenching is to occur and manure management records to determine if there is any evidence of leakage and, if so, shall contact the department for further instructions as to proper inspection procedures. The owner of a confinement feeding operation shall either obtain permission from an adjoining property owner or trench up to the boundary line of the property if the distance of 25 feet would require the inspection trench to go onto the adjoining property.

b. The owner of the confinement feeding operation may utilize other proven methods approved by the department to discover drainage tile lines.

c. The drainage tile lines discovered near an aerobic structure, anaerobic lagoon, earthen manure storage basin or earthen waste slurry storage basin, other than an egg washwater storage structure, shall be removed within 25 feet of the outside edge of the berm. Drainage tile lines discovered upgrate from the aerobic structure, anaerobic lagoon or earthen manure storage basin shall be rerouted within 25 feet from the berm to continue the flow of drainage. All other drainage tile lines discovered shall be rerouted, capped, plugged with concrete, or Portland cement concrete grout or similar materials, or reconnected to upgrate tile lines. Drainage tile lines that were installed at the time of construction to lower a groundwater table may either be avoided if the location is known or may remain at the location if discovered.

d. The owner of an aerobic structure, anaerobic lagoon, earthen manure storage structure or an earthen waste slurry storage basin with a tile drainage system to artificially lower the groundwater table shall have a device to allow monitoring of the water in the drainage tile lines that lower the groundwater table and to allow shutoff of the drainage tile lines if the drainage tile lines do not have a surface outlet accessible on the property where the aerobic structure, anaerobic lagoon, earthen manure storage basin or earthen waste slurry storage basin is located.

e. If the owner of the confinement feeding operation discovers drainage tile that projects underneath the berm, the owner shall follow one of the following options:

(1) Contact the department to obtain permission to remove the drainage tile under the berm. The manure in the structure must be lowered to a point below the depth of the tile prior to removing the drainage tile from under the berm. Prior to using the structure, a new percolation test must be submitted to the department and approval received from the department.

(2) Grout the length of the tile under the berm to the extent possible. The material used to grout shall include concrete, Portland cement concrete grout or similar materials.

f. A waiver to this subrule may be granted by the director if sufficient information is provided that the location does not have a history of drainage tile.

g. A written record describing the actions taken to determine the existence of tile lines, the findings, and actions taken to comply with this subrule shall be prepared and maintained as part of the MMP records.

**65.108(3) *Earthen waste slurry storage basins.*** An earthen waste slurry storage basin shall have accumulated manure removed at least twice each year, unless there is sufficient basin capacity to allow removal of manure once each year and maintain freeboard as determined pursuant to paragraph 65.100(1) "b."

**65.108(4)** *Earthen manure storage basins.* An earthen manure storage basin shall have accumulated manure removed at least once each year. An earthen manure storage basin constructed after June 19, 2024, must have enough manure storage capacity for eight months. An earthen manure storage basin may have enough manure storage capacity to contain the manure from the confinement feeding operation for up to 14 months and maintain freeboard as determined pursuant to paragraph 65.100(1) "b."

**65.108(5)** *Soil testing for earthen structures.* Applicants for construction permits for earthen manure storage structures shall submit soils information according to this subrule for the site of the proposed structure. All subsurface soil classification shall be based on American Society for Testing and Materials Designations D 2487-06, effective May 1, 2006, or D 2488-06, effective November 1, 2006. Soil corings shall be taken to determine subsurface soil characteristics and groundwater elevation and direction of flow of the proposed site for an anaerobic lagoon, aerobic structure, earthen egg washwater storage structure, or earthen manure storage basin. Soil corings shall be conducted by a qualified person normally engaged in soil testing activities. Data from the soil corings shall be submitted with a construction permit application and shall include a description of the geologic units encountered; a discussion of the effects of the soil and groundwater elevation and direction of flow on the construction and operation of the anaerobic lagoon, aerobic structure, earthen egg washwater storage structure, or earthen manure storage basin and a discussion that addresses the suitability of the proposed structure at the site. All soil corings shall be taken by a method that identifies the continuous soil profile and does not result in the mixing of soil layers. The number and location of the soil corings will vary on a case-by-case basis as determined by the designing engineer and accepted by the department. The following are minimum requirements:

*a.* A minimum of four soil corings reflecting the continuous soil profile is required for each anaerobic lagoon, aerobic structure, earthen egg washwater storage structure, or earthen manure storage basin. Corings which are intended to represent soil conditions at the corner of the structure must be located within 50 feet of the bottom edge of the structure and spaced so that one coring is as close as possible to each corner. Should there be no bottom corners, corings shall be equally spaced around the structure to obtain representative soil information for the site. An additional coring will be required if necessary to ensure that one coring is at the deepest point of excavation. For an anaerobic lagoon, aerobic structure, earthen egg washwater storage structure, or earthen manure storage basin larger than four acres water surface area, one additional coring per acre is required for each acre above four acres surface area.

*b.* All corings shall be taken to a minimum depth of ten feet below the bottom elevation of the anaerobic lagoon, aerobic structure, earthen egg washwater storage structure, or earthen manure storage basin.

*c.* At least one coring shall be taken to a minimum depth of 25 feet below the bottom elevation of the anaerobic lagoon, aerobic structure, earthen egg washwater storage structure, or earthen manure storage basin or into bedrock, whichever is shallower.

*d.* Upon abandonment of the soil core holes, all soil core holes including those developed as temporary water level monitoring wells shall be plugged with concrete, Portland cement concrete grout, bentonite, or similar materials.

**65.108(6)** *Hydrology.*

*a.* *Groundwater table.* A minimum separation of four feet between the top of the liner for any unformed manure storage structure or earthen egg washwater storage structure and the groundwater table is recommended; however, in no case shall the top of the liner for an unformed manure storage structure or earthen egg washwater storage structure be below the groundwater table. If the groundwater table is less than two feet below the top of the liner for an unformed manure storage structure or earthen egg washwater storage structure, the unformed manure storage structure or earthen egg washwater storage structure shall be provided with a synthetic liner as described in paragraph 65.108(8) "f."

*b.* *Permanent artificial lowering of groundwater table.*

(1) Unformed manure storage structures. The groundwater table around an unformed manure storage structure or earthen egg washwater storage structure may be artificially lowered to levels required in paragraph 65.108(6) "a" by using a gravity flow tile drainage system or other permanent nonmechanical system for artificial lowering of the groundwater table. Detailed engineering and soil drainage information shall be provided with a construction permit application for an unformed manure storage structure or

earthen egg washwater storage structure if a drainage system for artificially lowering the groundwater table will be installed. The level to which the groundwater table will be lowered will be considered to represent the seasonal high-water table. If a drainage tile around the perimeter of the basin is installed a minimum of two feet below the top of the basin liner to artificially lower the seasonal high-water table, the top of the basin's liner may be a maximum of four feet below the seasonal high-water table which existed prior to installation of the perimeter tile system. Drainage tile lines shall be installed between the outside of the proposed toe of the berm and within 25 feet of the outside of the toe of the berm. Drainage tile lines shall be placed in a vertical trench and encased in granular material which extends upward to the level of the seasonal high-water table which existed prior to installation of the perimeter tile system. A device to allow monitoring of the water in the drainage tile lines installed to lower the groundwater table and a device to allow shutoff of the drainage tile lines shall be installed if the drainage tile lines do not have a surface outlet accessible on the property where the unformed manure storage structure is located.

(2) Formed manure storage structures. For a formed manure storage structure or a formed egg washwater storage structure, partially or completely constructed below the normal soil surface, a perimeter tile drainage system or other permanent system for artificial lowering of groundwater levels shall be installed around the structure if the groundwater table is above the bottom of the structure. The perimeter tile shall include a sample port to allow monitoring of the water in the drainage tile lines and a device to allow shutoff of the drainage tile lines if the drainage tile lines do not have a surface outlet accessible on the property where the formed manure storage structure is located or if the perimeter tile is connected to an existing tile. The perimeter tile may be tied into the monitoring port or a sump; however, there shall be a permanent automatic pump installed.

c. *Determination of groundwater table.* For purposes of this rule, groundwater table is the seasonal high-water table determined by a licensed PE, a groundwater professional certified pursuant to 567—Chapter 134, or qualified staff from the department or NRCS. If a construction permit is required, the department must approve the groundwater table determination.

(1) Current groundwater levels shall be measured using at least one of the following for either formed or unformed manure storage structures:

1. Temporary monitoring wells. A minimum of three temporary monitoring wells shall be installed. The top of the well screen shall be within five feet of the ground surface. Each well shall be extended to at least two feet below the bottom of the liner of an unformed manure storage structure or to at least two feet below the footings of a formed manure storage structure.

- Unformed manure storage structures. For an unformed manure storage structure, each monitoring well may be installed in the existing core holes resulting from the corings required in subrule 65.108(5).

- Formed manure storage structures. For a formed manure storage structure, at least three temporary monitoring wells shall be installed as close as possible to three corners of the structure, with one of the wells close to the corner of deepest excavation. If the formed manure storage structure is circular, the three monitoring wells shall be equally spaced and one well shall be placed at the point of deepest excavation.

2. Test pits. The department may allow use of test pits in lieu of temporary monitoring wells if seasonal variation in climatic patterns, soil and geologic conditions prevent accurate determination of the seasonal high-water table or prior to the construction of an unformed manure storage structure liner to ensure that the required separation distance to the groundwater table is being met. The bottom of each test pit shall be at least two feet below the floor of the manure storage structure or egg washwater storage structure. Each pit shall be allowed to remain open and unaltered for a minimum of seven days for viewing by the department or NRCS-qualified staff person for the determination of soil characteristics and related groundwater influence. Adequate protection (temporary berms and covers) shall be provided to prevent surface runoff from entering the test pits. One test pit shall be located in each corner and one in the center of the proposed manure control structure, unless otherwise specified by the department. Test pits shall be backfilled and compacted to achieve the seepage loss as outlined in subrule 65.108(7). A description of the materials present in the test pit shall be documented by all of the following:

- Digital photos;
- Description of soils including mottling;
- Construction specifications; and

- Weather conditions both prior to and during the period in which test pits are open.

(2) The seasonal high-water table shall be determined by measuring the groundwater level in the temporary monitoring wells not earlier than seven days following installation and shall include consideration of NRCS soil survey information, soil characteristics such as color and mottling, other existing water table data, and other pertinent information. If a drainage system for artificially lowering the groundwater table will be installed in accordance with the requirements of paragraph 65.108(6) "b," the level to which the groundwater table will be lowered will be considered to represent the seasonal high-water table.

**65.108(7)** *Seals for unformed manure storage structures and unformed egg washwater storage structures.* An unformed manure storage structure or egg washwater storage structure shall be sealed such that seepage loss through the seal shall not exceed 1/16 inch per day at the design depth of the structure. Following construction of the structure, the results of a testing program that indicates the adequacy of the seal shall be provided to that department in writing prior to start-up of a permitted operation.

**65.108(8)** *Unformed manure storage structure and unformed egg washwater storage structure liner design and construction standards.* An unformed manure storage structure or unformed egg washwater storage structure that receives a construction permit after January 21, 1998, shall comply with the following minimum standards in addition to subrule 65.108(7).

a. If the location of the proposed unformed manure storage structure or unformed egg washwater storage structure contains suitable materials as determined by the soil corings taken pursuant to subrule 65.108(5), those materials shall be compacted to establish a minimum of a 12-inch liner. A minimum initial overexcavation of six inches of material shall be required. The underlying material shall be scarified, reworked and compacted to a depth of six inches. The overexcavated materials shall be replaced and compacted.

b. If the location of the proposed unformed manure storage structure or unformed egg washwater storage structure does not contain suitable materials as determined by the soil corings taken pursuant to subrule 65.108(5), suitable materials shall be obtained from another location approved by the department and shall be compacted to establish a minimum of a 24-inch liner.

c. Where sand seams, gravel seams, organic soils or other materials that are not suitable are encountered during excavation, the area where they are discovered shall be overexcavated a minimum of 24 inches and replaced with suitable materials and compacted.

d. All loose lift material must be placed in lifts of nine inches or less and compacted. The material shall be compacted at or above optimum moisture content and meet a minimum of 95 percent of the maximum density as determined by the Standard Proctor test after compaction.

e. For purposes of this rule, suitable materials means soil, soil combinations or other similar material that is capable of meeting the permeability and compaction requirements. Sand seams, gravel seams, organic soils or other materials generally not suitable for unformed manure storage structure or unformed egg washwater storage structure construction are not considered suitable liner materials.

f. As an alternative to the above standards, a synthetic liner may be used. If the use of a synthetic liner is planned for an unformed manure storage structure or unformed egg washwater storage structure, the permit application shall outline how the site will be prepared for placement of the liner, the physical, chemical, and other pertinent properties of the proposed liner, and information on the procedures to be used in liner installation and maintenance. In reviewing permit applications that involve use of synthetic liners, the department will consider relevant synthetic liner standards adopted by industry, governmental agencies, and professional organizations as well as technical information provided by liner manufacturers and others.

g. For berm erosion control, the following requirements apply to unformed manure storage structures and unformed egg washwater storage structures constructed after May 12, 1999:

(1) Concrete, riprap, synthetic liners or similar erosion control materials or measures shall be used on the berm surface below pipes where manure will enter the structure.

(2) Concrete, riprap, synthetic liners or similar erosion control materials or measures of sufficient thickness and area to accommodate manure removal equipment and to protect the integrity of the liner shall be placed at all locations on the berm, side slopes, and base of the structure where agitation or pumping may cause damage to the liner.

- (3) Erosion control materials or measures shall be used at the corners of the structure.
- (4) To control erosion, perennial (grass) vegetation must be maintained on the outer, top and inner dikes up to the two-foot freeboard level of the unformed storage structure or earthen egg washwater storage structure, unless covered by concrete, riprap, synthetic liners or similar erosion control materials or measures.
- (5) The owner of a confinement feeding operation with an unformed manure storage structure or an unformed egg washwater storage structure shall inspect the structure berms at least semiannually for evidence of erosion. Erosion problems found that may impact either structural stability or liner integrity shall be corrected in a timely manner.
  - h.* After May 29, 1997, a person shall not construct a new or expand an existing unformed manure storage structure or an unformed egg washwater storage structure within an agricultural drainage well area.
  - i.* The top width of any dike shall be a minimum of ten feet wide. The interior and exterior dike slopes shall not be steeper than three feet horizontal to one foot vertical.

**65.108(9) Anaerobic lagoon design standards.** An anaerobic lagoon shall meet the requirements of this subrule.

*a. General.*

- (1) Depth. Liquid depth shall be at least 8 feet, but 15 to 20 feet is preferred if soil and other site conditions allow.
- (2) Inlet. One subsurface inlet at the center of the lagoon or dual (subsurface and surface) inlets are preferred to increase dispersion. If a center inlet is not provided, the inlet structure shall be located at the center of the longest side of the anaerobic lagoon.
- (3) Shape. Long, narrow anaerobic lagoon shapes decrease manure dispersion and should be avoided. Anaerobic lagoons with a length-to-width ratio of greater than 3:1 shall not be allowed.
- (4) Aeration. Aeration shall be treatment as an “add-on process” and shall not eliminate the need for compliance with all anaerobic lagoon criteria contained in these rules.
- (5) Manure loading frequency. The anaerobic lagoon shall be loaded with manure and dilution water at least once per week.
- (6) Design procedure. Total anaerobic lagoon volume shall be determined by summation of minimum stabilization volume; minimum dilution volume (not less than 50 percent of minimum stabilization volume); manure storage between periods of disposal; and storage for eight inches of precipitation.
- (7) Manure storage period. Annual or more frequent manure removal from the anaerobic lagoon, preferably prior to May 1 or after September 15 of the given year, shall be practiced to minimize odor production. Design manure storage volume between disposal periods shall not exceed the volume required to store 14 months’ manure production. Manure storage volume shall be calculated based on the manure production values found in Table 5 located at [iowadnr.gov/afo/rules](http://iowadnr.gov/afo/rules).

*b. Minimum stabilization volume and loading rate.*

- (1) For all animal species other than beef cattle, there shall be 1,000 cubic feet minimum design volume for each 5 pounds of volatile solids produced per day if the volatile solids produced per day are 6,000 pounds or fewer and for each 4 pounds if the volatile solids produced per day are more than 6,000 pounds. For beef cattle, there shall be 1,000 cubic feet minimum design volume for each 10 pounds of volatile solids produced per day.
- (2) In Lyon, Sioux, Plymouth, Woodbury, Osceola, Dickinson, Emmet, Kossuth, O’Brien, Clay, Palo Alto, Cherokee, Buena Vista, Pocahontas, Humboldt, Ida, Sac, Calhoun, and Webster Counties for all animal species other than beef there shall be 1,000 cubic feet minimum design volume for each 4.5 pounds of volatile solids per day if the volatile solids produced per day are 6,000 pounds or fewer. However, if a water analysis as required in subparagraph 65.108(9)“c”(2) below indicates that the sulfate level is below 500 milligrams per liter, then the rate is 1,000 cubic feet for each 5.0 pounds of volatile solids per day.
- (3) Credit shall be given for removal of volatile solids from the manure stream prior to discharge to the lagoon. The credit shall be in the form of an adjustment to the volatile solids produced per day. The adjustments shall be at the rate of 0.5 pound for each pound of volatile solids removed. For example, if a swine facility produces 7,000 pounds of volatile solids per day, and if 2,000 pounds of volatile solids per day are removed, the volatile solids produced per day would be reduced by 1,000 pounds, leaving an

adjusted pounds of volatile solids produced per day of 6,000 pounds (for which the loading rate would be 5 pounds according to subparagraph 65.108(9)“b”(1) above).

(4) Credit shall be given for mechanical aeration if the upper one-third of the lagoon volume is mixed by the aeration equipment and if at least 50 percent of the oxygen requirement of the manure is supplied by the aeration equipment. The credit shall be in the form of an increase in the maximum loading rate (which is the equivalent of a decrease in the minimum design volume) in accordance with Table 8 located at [iowadnr.gov/afo/rules](http://iowadnr.gov/afo/rules).

(5) If a credit for solids removal is given in accordance with subparagraph 65.108(9)“b”(3) above, the credit for qualified aeration shall still be given. The applicant shall submit evidence of the five-day biochemical oxygen demand (BOD5) of the manure after the solids removal so that the aeration credit can be calculated based on an adjustment rate of 0.5 pound for each pound of solids removed.

(6) American Society of Agricultural and Biological Engineers standards, “Manure Production and Characteristics,” D384.2, effective March 2005, or Midwest Plan Service-18, Table 2-1, effective January 2004, shall be used in determining the BOD5 production and volatile solid production of various animal species.

*c. Water supply.*

(1) The source of the dilution water discharged to the anaerobic lagoon shall be identified.

(2) The sulfate concentration of the dilution water to be discharged to the anaerobic lagoon shall be identified. The sulfate concentration shall be determined by standard methods as defined in rule 567—60.2(455B).

(3) A description of available water supplies shall be provided to prove that adequate water is available for dilution. It is recommended that, if the sulfate concentration exceeds 250 mg/l, then an alternate supply of water for dilution should be sought.

*d. Initial lagoon loading.* Prior to the discharge of any manure to the anaerobic lagoon, the lagoon shall be filled to a minimum of 50 percent of its minimum stabilization volume with fresh water.

*e. Lagoon manure and water management during operation.* Following initial loading, the manure and water content of the anaerobic lagoon shall be managed according to either of the following:

(1) For single-cell lagoons or multicell lagoons without a site-specific lagoon operation plan. The total volume of fresh water for dilution added to the lagoon annually shall equal one-half the minimum stabilization volume. At all times, the amount of fresh water added to the lagoon shall equal or exceed the amount of manure discharged to the lagoon.

(2) For a two- or three-cell anaerobic lagoon. The manure and water content of the anaerobic lagoon may be managed in accordance with a site-specific lagoon operation plan approved by the department. The lagoon operation plan must describe in detail the operational procedures and monitoring program to be followed to ensure proper operation of the lagoon. Operational procedures shall include identifying the amounts and frequencies of planned additions of manure, fresh water and recycle water, and amount and frequencies of planned removal of solids and liquids. Monitoring information shall include locations and intervals of sampling, specific tests to be performed, and test parameter values used to indicate proper lagoon operation. As a minimum, annual sampling and testing of the first lagoon cell for electrical conductivity and either chemical oxygen demand (COD) or total ammonia (NH<sub>3</sub> + NH<sub>4</sub>) shall be required.

*f. Manure removal.* If the anaerobic lagoon is to be dewatered once a year, manure should be removed to approximate the annual manure volume generated plus the dilution water used. If the anaerobic lagoon is to be dewatered more frequently, the anaerobic lagoon liquid level should be managed to maintain adequate freeboard.

**65.108(10)** *Concrete standards.*

*a.* A formed manure storage structure that is constructed of concrete on or after March 24, 2004, and that is part of a confinement feeding operation other than a SAFO shall meet the following minimum design and concrete standards and be designed by either of the two methods listed below:

(1) Design of a formed manure storage structure prepared and sealed by a PE or an NRCS engineer shall be in accordance with the American Concrete Institute (ACI) Building Code ACI 318-19, effective May 3, 2019, ACI 360R-10, effective April 2010, or ACI 350-20, effective November 6, 2020; Portland Cement Association (PCA) publication EB075, effective April 19, 2021, or PCA EB001.16, effective

September 2016; or Midwest Plan Service (MWPS) publication MWPS-36 2nd Edition, effective 2005, or MWPS TR-9, effective 1999, and shall also meet the minimum design and concrete standards in paragraph 65.108(10) "b."

(2) If a formed manure storage structure is not designed by a PE or NRCS engineer, the design and specifications shall be in conformance with MWPS-36 2nd Edition (for a belowground rectangular tank), with MWPS TR-9 (for a circular tank) or in accordance with Appendix C located at [iowadnr.gov/afo/rules](http://iowadnr.gov/afo/rules) (for a belowground, laterally braced rectangular tank). A formed manure storage structure with a depth greater than 12 feet shall be designed by a PE or NRCS engineer.

b. Formed manure storage structures used to store liquid manure, dry manure or dry bedded manure shall meet all of the following minimum requirements:

(1) All concrete shall have the following minimum as-placed compressive strengths and shall meet American Society for Testing and Materials (ASTM) standard ASTM C 94-18, effective December 15, 2018:

1. 4,000 pounds per square inch (psi) for walls, floors, beams, columns and pumpouts;
2. 3,000 psi for the footings.

The average concrete strength by testing shall not be below design strength. No single test result shall be more than 500 psi less than the minimum compressive strength.

(2) Cementitious materials shall consist of Portland cement conforming to ASTM C 150, effective July 1, 2022. Aggregates shall conform to ASTM C 33-18, effective March 15, 2018. Blended cements in conformance with ASTM C 595, effective December 15, 2008, are allowed only for concrete placed between March 15 and October 15. Portland-pozzolan cement or Portland blast furnace slag blended cements shall contain at least 75 percent, by mass, of Portland cement.

(3) All concrete placed for walls shall be consolidated or vibrated, by manual or mechanical means, or a combination, in a manner that meets ACI 309R, effective January 2005.

(4) All steel rebar used shall be a minimum of grade 40 steel. All rebar, with the exception of rebar dowels connecting the walls to the floor or footings, shall be secured and tied in place prior to the placing of concrete.

(5) Waterstops shall be installed in all areas where fresh concrete meets hardened concrete. Waterstops shall be made of plastic, rolled bentonite or similar materials approved by the department. Only embedded waterstops are allowed in vertical joints. Adhesive or self-sticking waterstops shall not be used on vertical joints.

(6) The finished subgrade of a formed manure storage structure shall be graded and compacted to provide a uniform and level base and shall be free of vegetation, manure and debris. For the purpose of this subrule, "uniform" means a finished subgrade with similar soils.

(7) When the groundwater table, as determined in paragraph 65.108(6) "c" is above the bottom of the formed manure storage structure, a drain tile shall be installed along the footings to artificially lower the groundwater table pursuant to paragraph 65.108(6) "b." The drain tile shall be placed within three feet of the footings as indicated in Appendix C, Figure C-1, located at [iowadnr.gov/afo/rules](http://iowadnr.gov/afo/rules), and shall be covered with a minimum of two inches of gravel, granular material, fabric or a combination of these materials to prevent plugging the drain tile.

(8) All floor slabs shall be a minimum of five inches thick and have minimum primary reinforcement using one of the following methods:

1. Grade 40 #4 steel rebar, placed at a maximum of 18 inches on center each way in a single mat. Floor slab reinforcement shall be located in the middle of the thickness of the floor slab.

2. Glass fiber-reinforced polymer (GFRP) rebar, fiber-reinforced polymer (FRP) rebar or composite rebar may be used in floor slabs only and shall conform to ACI 440.11.22, effective September 2, 2022, and Table 3 of ASTM 7957, effective February 1, 2022. Supporting documentation shall be submitted for nonsteel rebar demonstrating the equivalency to #4 steel rebar at 18 inches on center each way. GFRP rebar shall not be manufactured using a polyester-based resin system per ASTM D7957 and shall meet the additional following ASTM D7957 parameters:

- Mean Tensile Modulus of Elasticity.....>6,500,000 psi (44,800 MPa)
- Guaranteed Bond Strength.....>1,100 psi (7.6 MPa)

3. Fiber-reinforced concrete (FRC) may be used in floor slabs only and shall conform to the requirements of ASTM C1116/C1116M Type I (steel FRC) and Type III (synthetic FRC), effective September 1, 2023. FRC shall provide a minimum average equivalent strength ratio (Re3) of 30 percent when tested in accordance with ASTM C1812/1812M, effective December 15, 2022.

4. Fiber mesh shall not be substituted for primary reinforcement.

5. Nondestructive methods to verify the floor slab thickness may be required by the department. The results shall indicate that at least 95 percent of the floor slab area meets the minimum required thickness. In no case shall the floor slab thickness be less than four and one-half inches.

(9) The footing or the area where the floor comes in contact with the walls and columns shall have a thickness equal to the wall thickness, but in no case be less than eight inches, and the width shall be at least twice the thickness of the footing. All exterior walls shall have footings below the frostline. Tolerances shall not exceed negative one-half inch of the minimum footing dimensions.

(10) The vertical steel of all walls shall be extended into the footing and be bent at 90° or a separate dowel shall be installed as a #4 rebar that is bent at 90° with at least 20 inches of rebar in the wall and extended into the footing within 3 inches of the bottom of the footing and extended at least 3 inches horizontally, as indicated in Appendix C, Figure C-1, located at [iowadnr.gov/afo/rules](http://iowadnr.gov/afo/rules). As an alternative to the 90° bend, the dowel may be extended at least 12 inches into the footing, with a minimum concrete cover of 3 inches at the bottom. Dowel spacing (bend or extended) shall be the same as the spacing for the vertical rebar. In lieu of dowels, mechanical means or alternate methods may be used as anchorage of interior walls to footings.

(11) All footings, slabs, and walls shall be formed with rigid forming systems and shall not be earth-formed. Form ties shall be nonremovable to provide a liquid-tight structure. No conduits or pipes shall be installed through an outside wall below the maximum liquid level of the structure.

(12) All wall reinforcement shall be placed so as to have a rebar cover of two inches from the inside face of the wall for a belowground manure storage structure. Vertical wall reinforcement should be placed closest to the inside face. Rebar placement shall not exceed tolerances specified in ACI 318-19.

(13) All construction joints in exterior walls shall be constructed to prevent discontinuity of steel and have properly spliced rebar placed through the joint.

(14) All concrete shall be cured for at least seven days after placing, in a manner which meets ACI 308R-16, effective May 2016, by maintaining adequate moisture or preventing evaporation. Proper curing shall be done by ponding, spraying or fogging water; by using a curing compound that meets ASTM C 309, effective August 22, 2019; or by using wet burlap, plastic sheets or similar materials.

(15) Backfilling of the walls shall not start until the floor slabs or permanent bracing has been installed and grouted. Backfilling shall be performed with material free of vegetation, large rocks or debris.

(16) If air temperature is below 40 degrees Fahrenheit, the ACI Standard 306R-16, "Recommended Practice for Cold Weather Concreting," effective September 2016, should be followed. If ready-mix concrete temperature is above 90 degrees Fahrenheit, the ACI Standard 305R-20, "Recommended Practice for Hot Weather Concreting," effective date September 2020, should be followed.

c. Formed manure storage structures constructed of steel or pre-cast concrete shall be designed by a PE and certified by the PE and the manufacturer's representative that the structure was built in accordance with the manufacturer's requirements.

**65.108(11)** *Secondary containment barriers for manure storage structures.* Secondary containment barriers used to qualify any confinement feeding operation for the exemption provision in subrule 65.107(7) shall be filed with the department according to subrule 65.104(5) and shall meet the following design standards:

a. A secondary containment barrier shall consist of a structure surrounding or downslope of a manure storage structure and shall be designed according to either of the following:

(1) If the manure storage structure is used to store liquid or semiliquid manure, the secondary containment barrier shall be designed to contain 120 percent of the volume of manure stored above the manure storage structure's final grade or 50 percent of the volume of manure stored belowground or partially belowground, whichever is greater. Engineering drawings prepared by a PE licensed in Iowa or an NRCS-qualified staff person must be submitted according to procedures set forth in subrule 65.104(5) and

must show compliance with subrule 65.108(11). If the containment barrier does not surround the manure storage structure, upland drainage must be diverted. For purposes of this subrule only, semiliquid manure means manure that contains a percentage of dry matter that results in manure too solid for pumping but too liquid for stacking.

(2) If the manure storage structure is used for the storage of only dry manure or dry bedded manure, the secondary containment barrier shall be designed to contain at least 10 percent of the volume of manure stored. Detailed drawings prepared by the owner or a representative must be submitted according to procedures set forth in subrule 65.104(5) and must show compliance with subrule 65.108(1). If the containment barrier does not surround the manure storage structure, upland drainage must be diverted. Any dry manure retained by the secondary containment barrier shall be removed and properly disposed of within 14 days.

b. The barrier may be constructed of earth, concrete, or a combination of both. If a relief outlet or valve is installed, the relief outlet or valve shall remain closed. Any accumulated liquid due to an overflow shall be land-applied as stated in the operation's MMP.

c. The base shall slope to a collecting area where storm water can be pumped out. If storm water is contaminated with manure, it shall be land-applied at normal fertilizer application rates in compliance with rule 567—65.101(455B,459,459B).

d. Secondary containment barriers constructed entirely or partially of earth shall comply with the following requirements:

(1) The soil surface, including dike, shall be constructed to prevent downward water movement at rates greater than  $1 \times 10^{-6}$  cm/sec and shall be maintained to prevent downward water movement at rates greater than  $1 \times 10^{-5}$  cm/sec.

(2) Dikes shall not be steeper than 45 degrees and shall be protected against erosion. If the slope is 19 degrees or less, grass can be sufficient protection, provided it does not interfere with the required soil seal.

(3) The top width of the dike shall be no less than three feet.

e. Secondary containment barriers constructed of concrete shall be watertight and comply with the following requirements:

(1) The base of the containment structure shall be designed to support the manure storage structure and its contents.

(2) The concrete shall be routinely inspected for cracks, which shall be repaired with a suitable sealant.

f. Nothing shall be stored within a secondary containment barrier, including but not limited to machinery or feedstock.

**65.108(12) *Human sanitary waste.*** Human sanitary waste shall not be discharged to a manure storage structure or egg washwater storage structure.

**65.108(13) *Requirements for qualified operations.*** A confinement feeding operation that meets the definition of a qualified operation shall only use an aerobic structure for manure storage and treatment. This requirement does not apply to the following types of confinement feeding operations: (1) one that only handles dry manure; (2) an egg washwater storage structure; (3) a confinement feeding operation that was constructed before May 31, 1995, and does not expand; or (4) a confinement feeding operation that processes manure using an anaerobic digester system.

**65.108(14) *Aboveground formed manure storage structures with external outlet or inlet below the liquid level.*** A formed manure storage structure that is constructed to allow the storage of manure wholly or partially above ground and that has an external outlet or inlet below the liquid level shall have all of the following:

a. Two or more shutoff valves on any external outlet or inlet below the liquid level. At least one shutoff valve shall be located inside the structure and be operable if the external valve becomes inoperable or broken off. Alternative options may be considered by the department.

b. All external outlets or inlets below the liquid level shall be barricaded, encased in concrete, or otherwise protected to minimize accidental destruction.

c. Construction shall comply with the manufacturer's requirements.

d. An emergency response plan for retaining manure at the site and cleanup if the manure storage structure fails or there is any other type of accidental discharge. The plan shall consist of telephone numbers to comply with subrule 65.2(1) and a list of contractors, equipment, equipment technical support, and alternative manure storage or land application sites that can be used during inclement weather.

[ARC 7965C, IAB 5/15/24, effective 6/19/24]

**567—65.109(455B,459,459B) Construction certification.** A confinement feeding operation that obtains a construction permit after March 20, 1996, shall submit to the department a construction certification according to the following:

**65.109(1)** For a confinement feeding operation that is below the threshold requirements for an engineer prior to using a permitted confinement feeding operation structure, the person responsible for constructing a formed manure storage structure or the permittee shall submit to the department a construction certification, as specified in the construction permit.

**65.109(2)** For a confinement feeding operation that uses an unformed manure storage structure or an egg washwater storage structure, or an operation that meets or exceeds the threshold requirements for an engineer, a certification from a licensed PE that the confinement feeding operation structure was:

a. Constructed in accordance with the design plan. Any changes to the approved plans must first be authorized by the department and must include a certification that the proposed changes are consistent with the standards of these rules or statute;

b. Supervised by the licensed PE or a designee of the PE during critical points of the construction. A designee shall not be the permittee, the owner of the confinement feeding operation, a direct employee of the permittee or owner, or the contractor or an employee of the contractor;

c. Inspected by the licensed PE after completion of construction and before commencement of operation; and

d. Constructed in accordance with the drainage tile removal standards of subrule 65.108(1) and including a report of the findings and actions taken to comply with subrule 65.108(1).

[ARC 7965C, IAB 5/15/24, effective 6/19/24]

**567—65.110(455B,459,459B) Manure management plan (MMP) requirements.**

**65.110(1)** In accordance with Iowa Code section 459.312, the following persons are required to submit MMPs to the department, including an original MMP and an updated MMP, as required by this rule:

a. An applicant for a construction permit for a confinement feeding operation. However, an MMP shall not be required of an applicant for an egg washwater storage structure or for a SAFO.

b. The owner of a confinement feeding operation, other than a SAFO, if one of the following applies:

(1) The confinement feeding operation was constructed or expanded after May 31, 1985, regardless of whether the confinement feeding operation structure was required to have a construction permit.

(2) The owner constructs a manure storage structure, regardless of whether the person is required to be issued a permit for the construction pursuant to Iowa Code section 459.303 or whether the person has submitted a prior MMP. If the new manure storage structure does not result in an increase in manure volume for the confinement feeding operation and there is no change in animal category for determining animal units, then a new MMP is not required to be submitted.

c. A person who applies manure in Iowa that was produced in a confinement feeding operation, other than a small operation, located outside of Iowa.

d. A new owner of a confinement feeding operation may apply manure under the most recent owner's MMP until the new owner develops and submits an original MMP. The new owner must develop and submit an original MMP within 60 days after acquiring the operation.

e. Exceptions.

(1) A research college is exempt from this subrule and the MMP requirements of rule 567—65.111(455B,459,459B) for research activities and experiments performed under the authority of the research college and related to confinement feeding operations.

(2) An AFO otherwise required to submit an updated MMP and pay an annual compliance fee may make an election to be considered a SAFO for purposes of filing updated MMPs and annual compliance fees if the confinement feeding operation maintains an animal unit capacity of 500 or fewer animal units.

The election shall automatically terminate when more than 500 animal units are housed at the confinement feeding operation at any one time. If the confinement feeding operation exceeds more than 500 animal units, an MMP shall be submitted.

**65.110(2)** The owner of a proposed confinement feeding operation who is not required to obtain a construction permit pursuant to subrule 65.103(1) but who is required to file an MMP pursuant to paragraph 65.110(1)“b” shall file a construction design statement and provide the information required in subrule 65.104(2), including the confinement feeding operation’s MMP, to the department at least 30 days before the construction of an AFO structure begins, as defined in subrules 65.6(1) and 65.6(2).

**65.110(3)** Scope of MMP; updated plans; annual compliance fee.

a. Each confinement feeding operation required to submit an MMP shall be covered by a separate MMP.

b. The owner of a confinement feeding operation who is required to submit an MMP under this rule shall submit an updated MMP on an annual basis to the department. The updated MMP may be submitted by hard copy or by electronic submittal. The updated plan must reflect all amendments made during the period of time since the previous MMP submission.

(1) If the plan is submitted by hard copy, the submittal process shall be as follows: The owner of the AFO shall also submit the updated MMP on an annual basis to the board of supervisors of each county where the confinement feeding operation is located and to the board of supervisors of each county where manure from the confinement feeding operation is land-applied. If the owner of the AFO has not previously submitted an MMP to the board of supervisors of each county where the confinement feeding operation is located and each county where manure is land-applied, the owner must submit a complete MMP to each required county. The county auditor or other county official or employee designated by the county board of supervisors may accept the updated plan on behalf of the board. The updated plan shall include documentation that the county board of supervisors or other designated county official or employee received the MMP update.

(2) If the plan is submitted electronically, the submittal process shall be as follows: The owner of the AFO shall submit the updated MMP to the department through the department’s electronic web application. Once the submittal has been completed, the department shall provide electronic access of the updated MMP to the board of supervisors of each county where the confinement feeding operation is located and each county where manure is land-applied.

(3) The department will stagger the dates by which the updated MMPs are due and will notify each confinement feeding operation owner of the date on which the updated MMP is due. To satisfy the requirements of an updated MMP, an owner of a confinement feeding operation must submit one of the following:

1. A complete MMP;
2. A department-approved document stating that the MMP submitted in the prior year has not changed; or
3. A department-approved document listing all the changes made since the previous MMP was submitted and approved.

c. An annual compliance fee of \$0.15 per animal unit at the AFO shall accompany an annual MMP update submitted to the department for approval. The annual compliance fee is based on the animal unit capacity of the confinement feeding operation stated in the updated annual MMP submission. If the person submitting the MMP is a contract producer, as provided in Iowa Code chapter 202, the active contractor shall pay the annual compliance fee.

**65.110(4)** The department shall review and approve or disapprove all complete MMPs within 60 days of the date they are received.

**65.110(5)** Manure shall not be removed from a manure storage structure which is part of a confinement feeding operation required to submit an MMP until the department has approved the plan. Manure shall be applied in compliance with rule 567—65.100(455B,459,459B).

**65.110(6)** Manure storage indemnity fee. All persons required to submit an MMP to the department shall also pay to the department an indemnity fee as required in Iowa Code section 459.503 except those operations constructed prior to May 31, 1995, which were not required to obtain a construction permit.

**65.110(7)** Filing fee. Any person submitting an original MMP must also pay to the department an MMP filing fee of \$250. This fee shall be included with each original MMP being submitted. If the confinement feeding operation is required to obtain a construction permit and to submit an original MMP as part of the construction permit requirements, the applicant must pay the MMP filing fee together with the construction permit application fee, which total \$500.

[ARC 7965C, IAB 5/15/24, effective 6/19/24]

**567—65.111(455B,459,459B) MMP content requirements.** All MMPs are to be submitted on forms or electronically as prescribed by the department. The plans shall include all of the information specified in Iowa Code section 459.312 and as described below.

**65.111(1) General.**

a. A confinement feeding operation that is required to submit an MMP to the department shall not apply manure in excess of the nitrogen use levels necessary to obtain optimum crop yields. A confinement feeding operation shall not apply manure in excess of the rates determined in conjunction with the phosphorus index. Information to complete the required calculations may be obtained from the tables in this chapter, actual testing samples or from other credible sources reviewed and approved by the department including but not limited to Iowa State University, the United States Department of Agriculture (USDA), a licensed PE, or an individual certified as a crop consultant under the American Registry of Certified Professionals in Agronomy, Crops, and Soils program, the Certified Crop Advisors program, or the Registry of Environmental and Agricultural Professionals program.

b. MMPs shall include all of the following:

(1) The name of the owner and the name of the confinement feeding operation, including mailing address and telephone number.

(2) The name of the contact person for the confinement feeding operation, including mailing address and telephone number.

(3) The location of the confinement feeding operation identified by county, township, section,  $\frac{1}{4}$  section and, if available, the 911 address.

(4) The animal unit capacity of the confinement feeding operation and, if applicable, the animal weight capacity.

c. A person who submits an MMP shall include a phosphorus index as part of the MMP as required in subrule 65.111(12).

d. A new owner of a confinement feeding operation may apply manure under the most recent owner's MMP until the new owner develops and submits an original MMP. The new owner must develop and submit an original MMP within 60 days after acquiring the confinement feeding operation.

e. A research college is exempt from this subrule for research activities and experiments performed under the authority of the research college and related to confinement feeding operations.

**65.111(2) MMP contents.** Confinement feeding operations that will not sell all of their manure shall submit the following for that portion of the manure which will not be sold:

a. The name of the owner and the name of the confinement feeding operation, including mailing address and telephone number.

b. The name of the contact person for the confinement feeding operation, including mailing address and telephone number.

c. The location of the confinement feeding operation identified by county, township, section,  $\frac{1}{4}$  section and, if available, the 911 address.

d. An estimate of the nitrogen and phosphorus concentration of the manure and estimate of annual manure production.

e. Application rate calculations based on regulations in subrule 65.111(12).

f. The location of manure application.

g. Soil loss calculations using methods specified for Iowa phosphorus index.

h. A phosphorus index of each field in the MMP, as defined in paragraph 65.111(12)“a,” including the factors used in the calculation. A copy of the NRCS phosphorus index detailed report shall satisfy the requirement to include the factors used in the calculation.

**65.111(3)** *Estimate of manure concentration and production.* An MMP must include an estimate of nitrogen and phosphorus concentration and an estimate of annual manure production by one of the following methods.

- a. Table values in Table 4 located at [iowadnr.gov/afo/rules](http://iowadnr.gov/afo/rules) or other credible sources.
- b. Actual concentration and production values from the operation or a similar operation. If an actual sample is used to represent the nutrient content of manure, the sample shall be taken in accordance with Iowa State University Extension and Outreach publication AE 3550, "How to Sample Manure for Nutrient Analysis." The department may require documentation of the manure sampling protocol or take a split sample to verify the nutrient content of the operation's manure. If actual nitrogen and phosphorus are used for concentration in the MMP, actual manure production must also be used. Any sample used to estimate the concentration of manure must be less than four years old.

**65.111(4)** *Optimum crop yield and crop schedule.*

a. To determine the optimum crop yield, the applicant may either exclude the lowest crop yield for the period of the crop schedule in the determination or allow for a crop yield increase of 10 percent. In using these methods, adjustment to update yield averages to current yield levels may be made if it can be shown that the available yield data is not representative of current yields. The optimum crop yield shall be determined using any of the following methods for the cropland where the manure is to be applied:

(1) Soil survey interpretation record. The plan shall include a map showing soil map units for the fields where manure will be applied. The optimum crop yield for each field shall be determined by using the weighted average of the soil interpretation record yields for the soils on the cropland where the manure is to be applied. Soil interpretation records from NRCS shall be used to determine yields based on soil map units.

(2) USDA county crop yields. The plan shall use the county yield data from the USDA Iowa Agricultural Statistics Service.

(3) Proven yield methods. Proven yield methods may only be used if a minimum of the most recent three years of yield data for the crop is used. These yields can be proven on a field-by-field or farm-by-farm basis. To be considered a farm-by-farm basis, the fields must be owned, rented or leased for crop production by the person required to keep records pursuant to subrule 65.111(8) or included in a manure application agreement in that person's MMP. Crop disaster years may be excluded when there is a 30 percent or more reduction in yield for a particular field or farm from the average yield over the most recent five years. Excluded years shall be replaced by the most recent nondisaster years. Proven yield data used to determine application rates shall be maintained with the current MMP. Any of the following proven yield methods may be used:

1. Proven yields for USDA Farm Service Agency. The plan shall use proven yield data or verified yield data for Farm Service Agency programs.

2. Proven yields for multiperil crop insurance. Yields established for the purpose of purchasing multiperil crop insurance shall be used as proven yield data.

3. Proven yields from other methods. The plan shall use the proven yield data and indicate the method used in determining the proven yield.

b. Crop schedule. Crop schedules shall include the name and total acres of the planned crop on a field-by-field or farm-by-farm basis where manure application will be made. A map may be used to indicate crop schedules by field or farm. The planned crop schedule shall name the crop(s) planned to be grown for the length of the crop rotation beginning with the crop planned or actually grown during the year this plan is submitted or the first year manure will be applied. The confinement feeding operation owner shall not be penalized for exceeding the nitrogen or phosphorus application rate for an unplanned crop if crop schedules are altered because of weather, farm program changes, market factor changes, or other unforeseeable circumstances. However, the penalty preclusion in the previous sentence does not apply to a confinement feeding operation owner subject to the NPDES permit program.

**65.111(5)** *Location of manure application.*

a. The MMP shall identify each field where the manure will be applied, the number of acres that will be available for the application of manure from the confinement feeding operation, and the basis under which the land is available.

b. A copy of each written agreement executed with the owner of the land where manure will be applied shall be maintained with the current MMP. The written agreement shall indicate the number of acres on which manure from the confinement feeding operation may be applied and the length of the agreement. A written agreement is not required if the land is owned or rented for crop production by the owner of the confinement feeding operation. Owners of dry bedded confinement feeding operations required to have an MMP may execute a written agreement with the landowner or the person renting the land for crop production where the dry bedded manure will be applied.

**65.111(6)** *Soil loss calculations for phosphorus index.* The MMP shall indicate for each field in the plan the crop rotation, tillage practices and supporting practices used to calculate sheet and rill erosion for the phosphorus index. A copy of an NRCS RUSLE2 erosion calculation record shall satisfy this requirement. The plan shall also identify the highly erodible cropland where manure will be applied.

**65.111(7)** *Current MMP.* The owner of a confinement feeding operation who is required to submit an MMP shall maintain a current MMP at the site of the confinement feeding operation or at a residence or office of the owner or operator of the operation within 30 miles of the site. The MMP may be an electronic or hard copy. The MMP should include completed manure sales forms if the manure is sold. If manure management practices change, a person required to submit an MMP shall make appropriate changes consistent with this chapter. If values other than the standard table values are used for MMP calculations, the source of the values used shall be identified.

**65.111(8)** *Recordkeeping.* Records shall be maintained by the owner of a confinement feeding operation who is required to submit an MMP. Records shall be maintained for five years following the year of application or for the length of the crop rotation, whichever is greater. Records shall be maintained at the site of the confinement feeding operation or at a residence or office of the owner or operator of the facility within 30 miles of the site. Electronic records are acceptable in lieu of paper records at the facility or the office. Records to demonstrate compliance with the MMP shall include the following:

- a. Factors used to calculate the manure application rate:
  - (1) Optimum yield for the planned crop.
  - (2) Types of nitrogen credits and amounts.
  - (3) Remaining crop nitrogen needed.
  - (4) Nitrogen and phosphorus concentration and first-year nitrogen availability of the manure. If an actual sample is used, documentation shall be provided.
- b. If phosphorus-based application rates are used, the following shall be included:
  - (1) Crop rotation.
  - (2) Phosphorus removed by crop harvest of that crop rotation.
- c. Maximum allowable manure application rate.
- d. Actual manure application information:
  - (1) Methods of application when manure from the confinement feeding operation was applied.
  - (2) Date(s) when the manure from the confinement feeding operation was applied.
  - (3) Location of the field where the manure from the confinement feeding operation was applied, including the number of acres.
  - (4) The manure application rate.
- e. The date(s) and application rate(s) of commercial nitrogen and phosphorus on fields that received manure. However, if the date and application rate information is for fields that are not owned for crop production or that are not rented or leased for crop production by the person required to keep records pursuant to this subrule, an enforcement action for noncompliance with an MMP or the requirements of this subrule shall not be pursued against the person required to keep records pursuant to this subrule or against any other person who relied on the date and application rate in records required to be kept pursuant to this subrule, unless that person knew or should have known that nitrogen or phosphorus would be applied in excess of maximum levels set forth in paragraph 65.111(1) "a." If manure is applied to fields not owned, rented or leased for crop production by the person required to keep records pursuant to this subrule, that person shall obtain from the person who owns, rents or leases those fields a statement specifying the planned commercial nitrogen and phosphorus fertilizer rates to be applied to each field receiving the manure.

- f.* A copy of the current soil test lab results for each field in the MMP.
- g.* For sales of manure under paragraph 65.111(15) “*b*,” recordkeeping requirements of subparagraph 65.111(15) “*b*”(7) shall be followed.

- h.* The name and certification number of the certified manure applicator.

**65.111(9) *Record inspection.*** The department may inspect a confinement feeding operation at any time during normal working hours and may inspect the MMP and any records required to be maintained. As required in Iowa Code section 459.312(12), Iowa Code chapter 22 shall not apply to the records which shall be kept confidential by the department and its agents and employees. The contents of the records are not subject to disclosure except as follows:

- a.* Upon waiver by the owner of the confinement feeding operation.
- b.* In an action or administrative proceeding commenced under this chapter. Any hearing related to the action or proceeding shall be closed.
- c.* When required by subpoena or court order.

**65.111(10) *Enforcement action.*** An owner required to provide the department an MMP pursuant to this rule who fails to provide the department an MMP or who is found in violation of the terms and conditions of the MMP shall not be subject to an enforcement action other than assessment of a civil penalty pursuant to Iowa Code section 455B.191.

**65.111(11) *Soil sampling requirements for fields where the phosphorus index must be used.*** Soil samples shall be obtained from each field in the MMP, and the soil samples shall be four years old or less. Each soil sample shall be analyzed for phosphorus and pH. The soil sampling protocol shall meet all of the following requirements:

- a.* Acceptable soil sampling strategies include but are not limited to grid sampling, management zone sampling, and soil type sampling. Procedural details can be taken from Iowa State University Extension and Outreach publication CROP 31-8, “Take a Good Soil Sample to Help Make Good Fertilization Decisions,” NCR-13 Report 348, “Soil Sampling for Variable-Rate Fertilizer and Lime Application,” effective January 1, 2001, or other credible soil sampling publications.
- b.* Each soil sample must be a composite of at least ten soil cores from the sampling area, with each core containing soil from the top six inches of the soil profile.
- c.* Each soil sample shall represent no more than ten acres. For fields less than or equal to 15 acres, only one soil sample is necessary.
- d.* Soil analysis must be performed by a lab enrolled in the Iowa department of agriculture and land stewardship (IDALS) soil testing certification program.
- e.* The soil phosphorus test method must be an appropriate method for use with the phosphorus index. If soil pH is greater than or equal to 7.4, soil phosphorus data from the Bray-1 extraction method is not acceptable for use with the phosphorus index.
- f.* If manure is applied as phosphorus-based rates within soil sampling periods, each soil sample may represent up to 20 acres for the next required soil sampling.

**65.111(12) *Use of the phosphorus index.*** Manure application rates shall be determined in conjunction with the use of the Iowa Phosphorus Index as specified by NRCS Iowa Technical Note No. 25 Iowa Phosphorus Index.

- a.* When sheet and rill erosion is calculated for the Iowa Phosphorus Index, the soil map unit used for the calculation shall be the predominant soil map unit of the steepest slope class that comprises at least 10 percent of the total field area. For fields less than 25 acres in size, the predominant soil map unit of the steepest slope class that comprises at least 20 percent of the total field area shall be used. In all MMPs submitted to the department for approval, the soil map unit used for the sheet and rill erosion calculation will be consistent with NRCS Iowa Agronomy Technical Note No. 29 Dominant Critical Area. For the calculations of ephemeral gullies, the provisions of NRCS Iowa Technical Note No. 25 Iowa Phosphorus Index with in-field measurement or estimates from review of at least four aerial photographs shall be used. If aerial photographs are used for the evaluation, aerial photography from the spring prior to crop canopy or fall after harvest must be included in the evaluation when available.

- b.* When sheet and rill erosion is calculated for the phosphorus index, the soil map unit used for the calculation shall be the predominant highly erodible soil map unit when planning for a highly erodible

field and the predominant non-highly erodible soil map unit when planning for a non-highly erodible field. For the calculations of ephemeral gullies, the provisions of NRCS Iowa Technical Note No. 25 Iowa Phosphorus Index shall be used with: (1) supporting documents and spreadsheets or (2) aerial photographs from at least four separate years, with at least one of the photographs being from the most vulnerable time of the year.

c. The average (arithmetic mean) soil phosphorus concentration of a field shall be used in the phosphorus index.

d. Soil phosphorus concentration data is considered valid for use in the phosphorus index if the data is four years old or less and meets the requirements of subrule 65.111(11).

e. For an original MMP, previous soil sampling data that does not meet the requirements of subrule 65.111(11) may be used in the phosphorus index if the data is four years old or less. In the case of fields for which soil sampling data is used that does not meet the requirements of subrule 65.111(11), the fields must be soil-sampled according to the requirements of subrule 65.111(11) no more than one year after the original MMP is approved and an updated original MMP shall be submitted with the results of the new samples at the time of the next MMP update.

f. The following are the manure application rate requirements for fields that are assigned the phosphorus index site vulnerability ratings below as determined by the NRCS Iowa Technical Note No. 25 Iowa Phosphorus Index to the NRCS 590 standard rounded to the nearest one-hundredth:

(1) Very Low or Low (0-2). Manure shall not be applied in excess of a nitrogen-based rate in accordance with subrule 65.111(13).

(2) Medium (>2-5). Manure shall not be applied (1) in excess of two times the phosphorus removed with crop harvest over the period of the crop rotation or (2) to exceed the nitrogen-based rate of the planned crop receiving the particular manure application.

(3) High or Very High (>5). Manure shall not be applied on a field with a rating greater than 5.

g. Additional commercial fertilizer may be applied as follows on fields receiving manure:

(1) Phosphorus fertilizer may be applied in addition to phosphorus provided by the manure up to amounts recommended by soil tests and Iowa State University Extension and Outreach publication PM 1688, "A General Guide for Crop Nutrient and Limestone Recommendations in Iowa."

(2) Nitrogen fertilizer may be applied in addition to nitrogen provided by the manure to meet the remaining nitrogen need of the crop as calculated in the current MMP. Additional nitrogen fertilizer may be applied up to the amounts indicated by soil test nitrogen results or crop nitrogen test results as necessary to obtain the optimum crop yield.

h. Updating the phosphorus index.

(1) When any inputs to the phosphorus index change, an operation shall recalculate the phosphorus index and adjust the application rates if necessary.

(2) If additional land becomes available for manure application, the phosphorus index shall be calculated to determine the manure application rate before manure is applied.

(3) An operation must submit a complete MMP using a new phosphorus index, including soil sampling as required in subrule 65.111(11), for each field in the MMP a minimum of once every four years.

**65.111(13) Requirements for application of a nitrogen-based manure rate to a field.**

a. Nitrogen-based application rates shall be based on the total nitrogen content of the manure unless the calculations are submitted to show that nitrogen crop usage rates based on plant-available nitrogen have not been exceeded for the crop schedule submitted.

b. The correction factor for nitrogen losses shall be determined for the method of application by the following or from other credible sources for nitrogen volatilization correction factors.

|                                                                |      |
|----------------------------------------------------------------|------|
| Knifed in or soil injection of liquids                         | 0.98 |
| Surface-apply liquid or dry with incorporation within 24 hours | 0.95 |
| Surface-apply liquid or dry with incorporation after 24 hours  | 0.80 |
| Surface-apply liquids with no incorporation                    | 0.75 |
| Surface-apply dry with no incorporation                        | 0.70 |
| Irrigated liquids with no incorporation                        | 0.60 |

c. Nitrogen-based applications rates shall be based on the optimum crop yields as determined in subrule 65.111(4) and crop nitrogen usage rate factor values in Table 4 located at [iowadnr.gov/afo/rules](http://iowadnr.gov/afo/rules) or other credible sources. The calculations of manure applied from the facility must account for fertilizer from all other manure and nonmanure sources. Liquid manure applied to land that is currently planted to soybeans or to land where the current crop has been harvested and that will be planted to soybeans the next crop season shall not exceed 100 pounds of available nitrogen per acre. Further, the 100-pounds-per-acre application limitation in the previous sentence does not apply on or after June 1 of each year; in that event, subrule 65.111(4) and Table 4 would apply as provided in the first sentence of this paragraph.

d. A nitrogen-based manure rate shall account for legume production in the year prior to growing corn or other grass crops and shall account for any planned commercial fertilizer application.

**65.111(14)** *Requirements for application of a phosphorus-based manure rate to a field.*

a. Phosphorus removal by harvest for each crop in the crop schedule shall be determined using the optimum crop yield as determined in subrule 65.111(4) and phosphorus removal rates of the harvested crop from Table 4a located at [iowadnr.gov/afo/rules](http://iowadnr.gov/afo/rules) or other credible sources. Phosphorus crop removal shall be determined by multiplying optimum crop yield by the phosphorus removal rate of the harvested crop.

b. Phosphorus removal by the crop schedule shall be determined by summing the phosphorus crop removal values determined in paragraph 65.111(14) "a" for each crop in the crop schedule.

c. The phosphorus applied over the duration of the crop schedule shall be less than or equal to the phosphorus removed with harvest during that crop schedule as calculated in paragraph 65.111(14) "b" unless additional phosphorus is recommended by soil tests and Iowa State University Extension and Outreach publication PM 1688, "A General Guide for Crop Nutrient and Limestone Recommendations in Iowa."

d. Additional requirements for phosphorus-based rates.

(1) No single manure application shall exceed the nitrogen-based rate of the planned crop receiving the particular manure application.

(2) No single manure application shall exceed the rate that applies to the expected amount of phosphorus removed with harvest by the next four anticipated crops in the crop schedule.

e. If the actual crop schedule differs from the planned crop schedule, then any surplus or deficit of phosphorus shall be accounted for in the subsequent manure application.

f. Phosphorus in manure should be considered 100 percent available unless soil phosphorus concentrations are below optimum levels for crop production. If soil phosphorus concentrations are below optimum levels for crop production phosphorus availability, values suggested in Iowa State University Extension and Outreach publication PMR 1003, "Using Manure Nutrients for Crop Production" or other credible sources shall be used.

**65.111(15)** *MMPs for sales of manure.* Selling manure means the transfer of ownership of the manure for monetary or other valuable consideration. Selling manure does not include a transaction where the consideration is the value of the manure or where an easement, lease or other agreement granting the right to use the land only for manure application is executed.

a. Confinement feeding operations that will sell dry manure as a commercial fertilizer or soil conditioner regulated by IDALS under Iowa Code chapter 200 or bulk dry manure animal nutrient product regulated by IDALS under Iowa Code chapter 200A shall submit a copy of their site-specific IDALS license or documentation that manure will be sold pursuant to Iowa Code chapter 200 or 200A, along with the department-approved MMP form for sales of dry manure. Operations completely covered by this paragraph are not required to meet other MMP requirements in this rule.

b. A confinement feeding operation not fully covered by paragraph 65.111(15) "a" that has an established practice of selling manure, or a confinement feeding operation that contains an animal species for which selling manure is a common practice, shall submit an MMP that includes the following:

(1) An estimate of the number of acres required for manure application calculated by one of the following methods:

1. Dividing the total phosphorus (as  $P_2O_5$ ) available to be applied from the confinement feeding operation by the corn crop removal of phosphorus. The corn crop removal of phosphorus may be estimated

by using the phosphorus removal rate in Table 4a located at [iowadnr.gov/afo/rules](http://iowadnr.gov/afo/rules) and an estimate of the optimum crop yield for the property in the vicinity of the operation.

2. Totaling the quantity of manure that can be applied to each available field based on application rates determined in conjunction with the phosphorus index in accordance with subrule 65.111(12), and ensuring that the total quantity that can be applied is equal to or exceeds the manure annually generated at the operation.

(2) The total nitrogen available to be applied from the confinement feeding operation.

(3) The total phosphorus (as  $P_2O_5$ ) available to be applied from the confinement feeding operation if the phosphorus index is required in accordance with paragraph 65.111(1)“c.”

(4) An estimate of the annual animal production and manure volume or weight produced.

(5) A manure sales form. If manure will be sold, the manure sales form shall include the following information:

1. A place for the name and address of the buyer of the manure.

2. A place for the quantity of manure purchased.

3. The planned crop schedule and optimum crop yields.

4. A place for the manure application methods and the timing of manure application.

5. A place for the location of the field, including the number of acres where the manure will be applied.

6. A place for the manure application rate.

7. A place for a phosphorus index of each field receiving manure, as defined in paragraph 65.111(12)“a,” including the factors used in the calculation. A copy of the NRCS phosphorus index detailed report shall satisfy the requirement to include the factors used in the calculation.

(6) Statements of intent if the manure will be sold. The number of acres indicated in the statements of intent shall be sufficient according to the MMP to apply the manure from the confinement feeding operation. The permit holder for an existing confinement feeding operation with a construction permit may submit past records of manure sales instead of statements of intent. The statements of intent shall include the following information:

1. The name and address of the person signing the statement.

2. A statement indicating the intent of the person to purchase the confinement feeding operation’s manure.

3. The location of the farm where the manure can be applied, including the total number of acres available for manure application.

4. The signature of the person who may purchase the confinement feeding operation’s manure.

(7) The owner shall maintain in the owner’s records a current MMP and copies of all of the manure sales forms, the sales forms must be completed and signed by each buyer of the manure and the applicant, and the copies must be maintained in the owner’s records for three years after each sale. The owner shall maintain in the owner’s records copies of all of the manure sales forms for five years after each sale. An owner of a confinement feeding operation shall not be required to maintain current statements of intent as part of the MMP.

[ARC 7965C, IAB 5/15/24, effective 6/19/24]

#### **567—65.112(455B,459,459B) Manure applicators certification.**

**65.112(1) Certification.** A commercial manure service or a commercial manure service representative shall not transport, handle, store or apply dry or liquid manure to land unless the person is certified. A confinement site manure applicator shall not apply dry or liquid manure to land unless the person is certified. A person is not required to be certified as a confinement site manure applicator if the person applies manure that originates from a manure storage structure that is part of a SAFO. Certification of a commercial manure service representative under this rule will also satisfy the commercial license requirement under 567—Chapter 68 only as it applies to manure removal and application. Each person who operates a manure applying vehicle or equipment must be certified individually except as allowed in subrule 65.112(7).

**65.112(2) Fees.**

*a. Commercial manure service.* The fee for a new or renewed certification of a service is \$200. The commercial manure service shall designate one manager for the service and shall provide the department with documentation of the designation.

*b. Commercial manure service representative.* The fee for a new or renewed representative certification is \$75. The manager of a commercial manure service must be certified as a commercial manure service representative but is exempt from paying the \$75 certification fee.

*c. Confinement site manure applicator.* The fee for a new or renewed certification is \$100. However, the fee is not required if all of the following apply:

(1) The person indicates that the person is a family member as defined in this chapter by submitting a completed form provided by the department;

(2) The person is certified as a confinement site manure applicator within one year of the date another family member was certified or whose certification as a confinement site manure applicator was renewed;

(3) The other family member certified as a confinement site manure applicator has paid the certification fee.

*d. Educational fee.* Commercial manure service representatives, managers and confinement site manure applicators shall pay an educational fee to be determined annually by the department.

*e. Late fee.* Renewal applications received after March 1 require that an additional \$12.50 fee be paid before the certification is renewed. An application is considered to be received on the date it is postmarked.

*f. Duplicate certificate.* The fee for a duplicate certificate is \$15.

**65.112(3) Certification requirements.** To be certified by the department as a commercial manure service, a commercial manure service representative or a confinement site manure applicator, a person must do all of the following:

*a.* Apply for certification on a form provided by the department.

*b.* Pay the required fees set forth in subrule 65.112(2).

*c.* Pass the examination given by the department or, in lieu of the examination, attend continuing instruction courses as described in subrule 65.112(6).

**65.112(4) Certification term, renewal and grace period.**

*a. Certification term.* Certification for a commercial manure service and commercial manure service representative shall be for a period of one year and shall expire on March 1 of each year. Certification for a confinement site manure applicator shall be for a period of three years and shall expire on December 31 of the third year.

*b. Renewal.* Application for renewal of a commercial manure service certification or a commercial manure service representative certification must be received by the department no later than March 1 of the year the certification expires. Application for renewal of a confinement site manure applicator certification must be received by the department or postmarked no later than March 1 after the year the certification expires. Application shall be on forms provided by the department and shall include:

(1) Certification renewal and educational fees.

(2) A passing grade on the certification examination or proof of attending the required hours of continuing instructional courses.

*c. Substitution of employees.* If a commercial manure service pays the certification fee for a representative, the service may substitute representatives. The substituted representative must be certified pursuant to subrule 65.112(3). The service shall provide documentation to the department, on forms provided by the department, that the substitution is valid.

*d. Grace period.* Except as provided in this paragraph, a commercial manure service, a commercial manure service representative or a confinement site manure applicator may not continue to apply manure after expiration of a certificate. A confinement site manure applicator may continue to apply manure until March 1 following the year the certification expires, provided a complete renewal application, as provided in paragraph 65.112(4)“b,” is postmarked or received by the department prior to March 1. Commercial manure services and representatives must submit an application for certification renewal by March 1 of each year.

**65.112(5) Examinations.**

a. A person wishing to take the examination required to become a certified commercial manure service representative or certified confinement site manure applicator may request an appointment. The applicant must have a photo identification card at the time of taking the examination.

b. If a person fails the examination, the person may retake the examination but not on the same business day.

c. Upon written request by an applicant, the director will consider the presentation of an oral examination on an individual basis when the applicant has failed the written examination at least twice and the applicant has shown difficulty in reading or understanding written questions but may be able to respond to oral questioning.

**65.112(6)** *Continuing instruction courses in lieu of examination.*

a. To establish or maintain certification, between March 1 and March 1 of the next year, a commercial manure service representative must each year either pass an examination or attend three hours of continuing instructional courses.

b. To establish or maintain certification, a confinement site manure applicator must either pass an examination every three years or attend two hours of continuing instructional courses each year. A confinement site manure applicator who chooses to attend instructional courses but fails to attend instructional courses each year must pass an examination as provided in subrule 65.112(5) to maintain certification.

**65.112(7)** *Exemption from certification.*

a. Certification as a commercial manure service representative is not required of a person who is any of the following:

- (1) Actively engaged in farming and who trades work with another such person.
- (2) Employed by a person actively engaged in farming not solely as a manure applicator but who applies manure as an incidental part of the person's general duties.
- (3) Engaged in applying manure as an incidental part of a custom farming operation.
- (4) Engaged in applying manure as an incidental part of the person's duties.
- (5) Applying, transporting, handling or storing manure within a period of 30 days from the date of initial employment as a commercial manure service representative if the person applying the manure is acting under direct instructions and control of a certified commercial manure service representative who is physically present at the manure application site by being in sight or immediate communication distance of the supervised person where the certified commercial service representative can communicate with the supervised person at all times. If the prospective employee was previously certified for a commercial manure service, the 30-day exemption does not apply.
- (6) Employed by a research college to apply manure from AFOs that are part of the research activities or experiments of the research college.

b. Certification as a confinement site manure applicator is not required of a person who is either of the following:

- (1) A part-time employee or family member of a confinement site manure applicator and is acting under direct instruction and control of a certified confinement site manure applicator who is physically present at the manure application site by being in sight or hearing distance of the supervised person where the certified confinement site manure applicator can physically observe and communicate with the supervised person at all times.
- (2) Employed by a research college to apply manure from an AFO that is part of the research activities or experiments of the research college.

**65.112(8)** *Obligations.* Certified commercial manure services have the following obligations:

- a. Maintain the following records of manure disposal operations for a period of three years:
  - (1) A copy of instructions for manure application provided by the owner of the AFO.
  - (2) Dates that manure was applied or sold.
  - (3) The manure application rate.
  - (4) Location of fields where manure was applied.
- b. Comply with the provisions of the MMP prepared for the confinement feeding operation and the requirements of rules 567—65.100(455B,459,459B) and 567—65.101(455B,459,459B). If an MMP does

not exist, the requirements of rules 567—65.100(455B,459,459B) and 567—65.101(455B,459,459B) must still be met.

c. Any tanks or equipment used for hauling manure shall not be used for hauling hazardous or toxic wastes, as defined in 567—Chapter 131, or other wastes detrimental to land application and shall not be used in a manner that would contaminate a potable water supply or endanger the food chain or public health.

d. Pumps and associated piping on manure handling equipment shall be installed with watertight connections to prevent leakage.

e. Any vehicle used by a certified commercial manure service or commercial manure service representative to transport manure on a public road shall display the certification number of the commercial manure service with three-inch or larger letters and numbers on the side of the tank or vehicle. The name and address of the certified commercial manure service representative designated as the manager shall also be prominently displayed on the side of the tank or vehicle.

f. Direct connection shall not be made between a potable water source and the tank or equipment on the vehicle.

**65.112(9)** *Discipline of certified applicators.*

a. Disciplinary action may be taken against a certified commercial manure service, a commercial manure service representative or a confinement site manure applicator on any of the following grounds:

(1) Violation of state law or rules applicable to a certified commercial manure service, a commercial manure service representative, or a confinement site manure applicator or the handling or application of manure.

(2) Failure to maintain required records of manure application or other reports required by this rule.

(3) Knowingly making any false statement, representation, or certification on any application, record, report or document required to be maintained or submitted under any applicable permit or rule of the department.

b. Disciplinary sanctions allowable are:

(1) Revocation of a certificate.

(2) Probation under specified conditions relevant to the specific grounds for disciplinary action. Additional training or reexamination may be required as a condition of probation.

c. The procedure for discipline is as follows:

(1) The director shall initiate disciplinary action.

(2) Written notice shall be given to an applicator against whom disciplinary action is being considered. The notice shall state the informal and formal procedures available for determining the matter. The applicator shall be given 20 days to present any relevant facts and indicate the person's position in the matter and to indicate whether informal resolution of the matter may be reached.

(3) An applicator who receives notice shall communicate verbally or in writing or in person with the director, and efforts shall be made to clarify the respective positions of the applicator and director.

(4) Failure to communicate facts and position relevant to the matter by the required date may be considered when determining appropriate disciplinary action.

(5) If agreement as to appropriate disciplinary sanction, if any, can be reached with the applicator and the director, a written stipulation and settlement between the department and the applicator shall be entered. The stipulation and settlement shall recite the basic facts and violations alleged, any facts brought forth by the applicator, and the reasons for the particular sanctions imposed.

(6) If an agreement as to appropriate disciplinary action, if any, cannot be reached, the director may initiate formal hearing procedures. Notice and formal hearing shall be in accordance with 561—Chapter 7 related to contested and certain other cases pertaining to license discipline.

**65.112(10)** *Revocation of certificates.*

a. Upon revocation of a certificate, application for commercial manure service representative or confinement site applicator certification may be allowed after two years from the date of revocation. Any such applicant must successfully complete an examination and be certified in the same manner as a new applicant.

b. Upon revocation of a certificate, application for a commercial manure service certification may be allowed after three years from the date of revocation. Any such applicant must successfully complete an examination and be certified in the same manner as a new applicant.

**65.112(11) *Record inspection.*** The department may inspect, with reasonable notice, the records maintained by a commercial manure service. If the records are for an operation required to maintain records to demonstrate compliance with an MMP, the confidentiality provisions of subrule 65.111(9) and Iowa Code section 459.312 shall extend to the records maintained by the commercial manure service.

[ARC 7965C, IAB 5/15/24, effective 6/19/24]

**567—65.113(455B,459,459B) Livestock remediation fund.** The livestock remediation fund created in Iowa Code section 459.501 will be administered by the department. Moneys in the fund shall be used for the exclusive purpose of administration of the fund and the cleanup of eligible facilities at confinement feeding operation sites.

**65.113(1) *Eligible facility site.*** The site of a confinement feeding operation that contains one or more AFO structures is an eligible site for reimbursement of cleanup costs if one of the following conditions exists:

a. A county has acquired title to real estate containing the confinement feeding operation following nonpayment of taxes and the site includes a manure storage structure that contains stored manure or site contamination originating from the confinement feeding operation.

b. A county or the department determines that the confinement feeding operation has caused a clear, present and impending danger to the public health or environment.

**65.113(2) *Site cleanup.*** Site cleanup includes the removal and land application or disposal of manure from an eligible facility site according to manure management procedures approved by the department. Cleanup may include remediation of documented contamination that originates from the confinement feeding operation. Cleanup may also include demolishing and disposing of AFO structures if their existence or further use would contribute to further environmental contamination and their removal is included in a cleanup plan approved by the department. Buildings and equipment must be demolished or disposed of according to rules adopted by the department in 567—Chapter 101 that apply to the disposal of farm buildings or equipment by an individual or business organization.

**65.113(3) *Claims against the fund.*** Claims for cleanup costs may be made by a county that has acquired real estate containing an eligible facility site pursuant to a tax deed. A county claim shall be signed by the chairperson of the county board of supervisors. Cleanup may be initiated by the department or may be authorized by the department based on a claim by a county.

a. *Advance notice of claim.* Prior to or after acquiring a tax deed to an eligible facility site, a county shall notify the department in writing of the existence of the facility and the title acquisition. The county shall request in this notice that the department evaluate the site to determine whether the department will order or initiate cleanup pursuant to its authority under Iowa Code chapter 455B.

b. *Emergency cleanup condition.* If a county determines that there exists at a confinement feeding operation site a clear, present and impending danger to the public health or environment, the county shall notify the department of the condition. The danger should be documented as to its presence and the necessity to avoid delay due to its increasing threat. If no cleanup action is initiated by the department within 24 hours after being notified of an emergency condition requiring cleanup, the county may provide cleanup and submit a claim against the fund.

**65.113(4) *Contents of a claim against the fund.***

a. A county claim against the fund for an eligible site acquired by a county following nonpayment of taxes shall be submitted to the department for approval prior to the cleanup action and shall contain the following information:

(1) A copy of the advance notice of claim as described in paragraph 65.113(3)“a.”

(2) A copy of a bid by a qualified person, other than a governmental entity, to perform a site cleanup. The bid shall include a summary of the qualifications of the bidder including but not limited to prior experience in removal of hazardous substances or manure, experience in construction of confinement feeding operation facilities or manure storage structures, equipment available for conducting the cleanup, or any other qualifications bearing on the ability of the bidder to remove manure from a site. The bid must

reference complying with a cleanup plan. The bid shall include a certification that the bidder has liability insurance in an amount not less than \$1 million.

(3) A copy of the tax deed to the real estate containing the eligible facility site.

(4) Name and address, if known, of the former owner(s) of the site. The claim shall also include a description of any efforts to contact the former owner regarding the removal of manure and any other necessary cleanup at the site.

(5) A response to the request in the advance notice described in paragraph 65.113(3)“a” that the department will not initiate cleanup action at the site, or that 60 days have passed from the advance notice and request.

(6) A proposed cleanup plan describing all necessary activity including manure to be removed, application rates and sites, any planned remediation of site contamination, and any structure demolition and justification.

b. A county claim against the fund for an emergency cleanup condition may be submitted following the cleanup and shall contain the following information:

(1) A copy of a bid as described in subparagraph 65.113(4)“a”(2).

(2) Name and address of the owner(s), or former owner(s), of the site or any other person who may be liable for causing the condition.

(3) Information on the response from the department to the notice given as described in paragraph 65.113(3)“b,” or, if none was received, documentation of the time notice was given to the department.

(4) A cleanup plan or description of the cleanup activities performed.

**65.113(5) *Department processing of claims against the fund.***

a. Processing of claims. The department will process claims in the order they are received.

b. The cleanup plan will be reviewed for acceptability to accomplish necessary actions according to subrule 65.113(2).

c. Review of bid. Upon receipt of a claim, the department will review the bid accompanying the claim. The department may consult with any person in reviewing the bid. Consideration will be given to the experience of the bidder, the bid amount, and the work required to perform the cleanup plan. If the department is satisfied that the bidder is qualified to perform the cleanup and costs are reasonable, the department will provide written approval to the county within 60 days from the date of receipt of the claim.

d. Obtaining a lower bid. If the department determines that it should seek a lower bid to perform the cleanup, it may obtain the names of qualified persons who may be eligible to perform the cleanup. One or more of those persons will be contacted and invited to view the site and submit a bid for the cleanup. If a lower bid is not received, the original bid may be accepted. If a bid is lower than the original bid submitted by the county, the department will notify the county that it should proceed to contract with that bidder to perform the cleanup.

**65.113(6) *Certificate of completion.*** Upon completion of the cleanup, the county shall submit a certificate of completion to the department. The certificate of completion shall indicate that the manure has been properly land-applied according to the cleanup plan and that any site contamination identified in the approved cleanup plan has been remediated and any approved structure demolition has been performed.

**65.113(7) *Payment of claims.*** Upon receipt of the certificate of completion, the department shall promptly authorize payment of the claim as previously approved. Payments will be made for claims in the order of receipt of certificates of completion.

**65.113(8) *Subrogation.*** The fund is subrogated to all county rights regarding any claim submitted or paid as provided in Iowa Code section 459.505.

[ARC 7965C, IAB 5/15/24, effective 6/19/24]

**567—65.114(455B,459,459B) Validity of rules.** If any part of these rules is declared unconstitutional or invalid for any reason, the remainder of said rules shall not be affected thereby and shall remain in full force and effect, and to that end, these rules are declared to be severable.

[ARC 7965C, IAB 5/15/24, effective 6/19/24]

**567—65.115 to 65.199** Reserved.

DIVISION III  
OPEN FEEDLOT OPERATIONS

**567—65.200(455B,459A) Minimum open feedlot effluent control requirements.** An open feedlot operation shall provide for the management of manure, process wastewater, settled open feedlot effluent, settleable solids, scraped solids, and open feedlot effluent by using an open feedlot control method as provided in subrules 65.200(1) through 65.200(8). A release shall be reported to the department as provided in subrule 65.2(1).

**65.200(1)** All settleable solids from open feedlot effluent shall be removed prior to discharge into a water of the state.

*a.* The settleable solids shall be removed by use of a solids settling facility. The construction of a solids settling facility is not required where existing site conditions provide for removal of settleable solids prior to discharge into a water of the state.

*b.* The removal of settleable solids shall be deemed to have occurred when the velocity of flow of the open feedlot effluent has been reduced to less than one-half foot per second for a minimum of five minutes. A solids settling facility shall have sufficient capacity to store settleable solids between periods of land application and to provide required flow-velocity reduction for open feedlot effluent flow volumes resulting from a precipitation event of less intensity than a ten-year, one-hour frequency event. A solids settling facility that receives open feedlot effluent shall provide a minimum of one square foot of surface area for each eight cubic feet of open feedlot effluent per hour resulting from a ten-year, one-hour frequency precipitation event.

**65.200(2)** This subrule shall apply to an open feedlot operation which has obtained an NPDES permit pursuant to rule 567—65.3(455B,459,459A,459B) or 567—65.201(455B,459A).

*a.* An open feedlot operation may discharge manure, process wastewater, settled open feedlot effluent, settleable solids, or open feedlot effluent into any waters of the United States due to a precipitation event, if the open feedlot operation is designed, constructed, operated, and maintained to comply with the requirements of subrule 62.4(12) and 40 CFR Part 412.

*b.* If the open feedlot operation is designed, constructed, and operated in accordance with the requirements of subrule 2.4(12) and in accordance with any of the manure control alternatives listed in Appendix A located at [iowadnr.gov/afo/rules](http://iowadnr.gov/afo/rules) or the AT system requirements in rule 567—65.207(455B,459A), the operation shall be considered to be in compliance with this rule, unless a discharge from the operation causes a violation of state water quality standards. If water quality standards violations occur, the department may impose additional open feedlot effluent control requirements upon the operation, as specified in subrule 65.200(3).

**65.200(3)** An open feedlot operation that has an animal unit capacity of 1,000 animal units or more, or an open feedlot operation that is a large CAFO, a medium CAFO, or a designated CAFO, shall not discharge manure, process wastewater, settled open feedlot effluent, settleable solids or open feedlot effluent from an open feedlot operation structure or production area into any waters of the United States, unless the discharge is pursuant to an NPDES permit. The control of manure, process wastewater, settled open feedlot effluent, settleable solids or open feedlot effluent originating from the open feedlot operation may be accomplished by the use of a solids settling facility, settled open feedlot effluent basin, AT system, or any other open feedlot effluent control structure or practice approved by the department. The department may require the diversion of surface drainage prior to contact with an open feedlot operation structure. Settleable solids shall be settled from open feedlot effluent before the effluent enters a settled open feedlot effluent basin or AT system.

**65.200(4)** Alternative control practices. If, because of topography or other factors related to the site of an open feedlot operation, it is economically or physically impractical to comply with open feedlot effluent control requirements using an open feedlot control method in subrule 65.200(4), the department shall allow an open feedlot operation covered by the NPDES permit application requirements of rule 567—65.3(455B,459,459A,459B) or 567—65.201(455B,459A) to use other open feedlot effluent control practices, provided the open feedlot operation satisfactorily demonstrates by appropriate methods that those

practices will provide an equivalent level of open feedlot effluent control. Demonstration of equivalent performance must include the submission of computer modeling results that compares the predicted performance of the proposed system with that of a conventional runoff containment system over the same period. The specific requirements that must be met for an open feedlot operation to qualify for use of an AT system and the information that must be submitted to the department are outlined in rule 567—65.207(455B,459A). Design requirements have been established for a stand-alone VTA. If other AT systems are developed that meet the equivalent performance standard established under EPA's CAFO rules, the department will consider their acceptance on a case-by-case basis.

**65.200(5)** No direct discharge of open feedlot effluent shall be allowed from an open feedlot operation into a publicly owned lake, a known sinkhole, or an agricultural drainage well.

**65.200(6)** Land application.

*a. General requirements.* Open feedlot effluent shall be land-applied in a manner that will not cause pollution of surface water or groundwater. Application in accordance with the provisions of state law and the rules in this chapter shall be deemed as compliance with this requirement.

*b. Designated areas.* A person shall not apply manure on land within 200 feet from a designated area or, in the case of a high-quality water resource, within 800 feet, unless one of the following applies:

(1) The manure is land-applied by injection or incorporation on the same date as the manure was land-applied.

(2) An area of permanent vegetation cover, including filter strips and riparian forest buffers, exists for 50 feet surrounding the designated area other than an unplugged agricultural drainage well or surface intake to an unplugged agricultural drainage well, and the area of permanent vegetation cover is not subject to manure application.

*c. CAFOs.*

(1) Land application discharges from a CAFO are subject to NPDES permit requirements. The discharge of manure, process wastewater, settled open feedlot effluent, settleable solids and open feedlot effluent to waters of the United States from a CAFO as a result of the application of that manure, process wastewater, settled open feedlot effluent, settleable solids and open feedlot effluent by the CAFO to land areas under its control is a discharge from that CAFO subject to NPDES permit requirements, except where the discharge is an agricultural storm water discharge as provided in 33 U.S.C. 1362(14). For the purpose of this paragraph, where the manure, process wastewater, settled open feedlot effluent, settleable solids or open feedlot effluent has been applied in accordance with site-specific nutrient management practices that ensure appropriate agricultural utilization of the nutrients in the manure, process wastewater, settled open feedlot effluent, settleable solids and open feedlot effluent as specified in subrule 65.209(8), a precipitation-related discharge of manure, process wastewater, settled open feedlot effluent, settleable solids and open feedlot effluent from land areas under the control of a CAFO is an agricultural storm water discharge.

(2) Setback requirements for open feedlot operations with NPDES permits. For open feedlot operations with NPDES permits, the following is adopted by reference: 40 CFR 412.4(a), (b) and (c)(5).

**65.200(7)** The owner of an open feedlot operation who discontinues the use of the operation shall remove and land-apply in accordance with state law all manure, process wastewater and open feedlot effluent from the open feedlot operation structures as soon as practical but not later than six months following the date the open feedlot operation is discontinued. The owner of a CAFO shall maintain compliance with all requirements in the CAFO's NPDES permit until all manure, process wastewater and open feedlot effluent has been removed and land applied pursuant to the CAFO's NMP, and the NPDES permit has been terminated in accordance with subrule 65.202(9).

**65.200(8)** Stockpiling of scraped solids and settleable solids. Stockpiles of solids scraped from open feedlot operations and stockpiles of settleable solids shall comply with the following requirements:

*a.* Stockpiles must be land-applied in accordance with subrule 65.200(6) as soon as possible but not later than six months after they are established.

*b.* Stockpiles shall not be located within 400 feet from a designated area or, in the case of a high-quality water resource, within 800 feet.

c. Stockpiles shall not be located in grassed waterways or areas where water ponds or has concentrated flow.

d. Stockpiles shall not be located within 200 feet of a terrace tile inlet or surface tile inlet or known sinkhole unless the stockpile is located so that any runoff from the stockpile will not reach the inlet or sinkhole.

e. Stockpiles shall not be located on land having a slope of more than 3 percent unless methods, structures or practices are implemented to contain the stockpiled solids, including but not limited to hay bales, silt fences, temporary earthen berms, or other effective measures, and to prevent or diminish precipitation-induced runoff from the stockpiled solids.

[ARC 7965C, IAB 5/15/24, effective 6/19/24]

**567—65.201(455B,459A) Departmental evaluation; CAFO designation; remedial actions.**

**65.201(1)** The department may evaluate any AFO that is not defined as a large or medium CAFO, and designate it as a CAFO if, after an on-site inspection, it is determined to be a significant contributor of manure or process wastewater to waters of the United States. In making this determination, the department shall consider the following factors:

a. The size of the operation and the amount of manure or process wastewater reaching waters of the United States;

b. The location of the operation relative to waters of the United States;

c. The means of conveyance of manure or process wastewater to waters of the United States;

d. The slope, vegetation, rainfall, and other factors affecting the likelihood or frequency of discharge of manure or process wastewater into waters of the United States; and

e. Other relevant factors.

**65.201(2)** No AFO with an animal capacity less than that specified for a medium CAFO shall be designated as a CAFO unless manure or process wastewater from the operation is discharged into a water of the United States:

a. Through a manmade ditch, flushing system, or other similar manmade device; or

b. That originates outside of and passes over, across or through the facility or otherwise comes into direct contact with animals confined in the operation.

**65.201(3)** The owner or operator of a designated CAFO shall apply for an NPDES permit no later than 90 days after receiving written notice of the designation.

**65.201(4)** If departmental evaluation determines that any of the conditions listed in paragraph 65.201(4) “a,” “b,” or “c” exist, the open feedlot operation shall institute necessary remedial actions within a time specified by the department to eliminate the conditions warranting the determination, if the operation receives a written notification from the department of the need to correct the conditions.

a. Settled open feedlot effluent, settleable solids from the open feedlot operation, or open feedlot effluent is being discharged into a water of the state and the operation is not providing the applicable minimum level of manure control as specified in rule 567—65.200(455B,459A);

b. Settled open feedlot effluent, settleable solids from the open feedlot operation, or open feedlot effluent is causing or may reasonably be expected to cause pollution of a water of the state; or

c. Settled open feedlot effluent, settleable solids from the open feedlot operation, or open feedlot effluent is causing or may reasonably be expected to cause a violation of state water quality standards.

[ARC 7965C, IAB 5/15/24, effective 6/19/24]

**567—65.202(455B,459A) NPDES permits.**

**65.202(1)** *Existing AFOs not holding an NPDES permit.* AFOs in existence prior to April 14, 2003, that were defined as CAFOs under rules that were in effect prior to April 14, 2003, but that have not obtained a permit, should have applied for an NPDES permit by April 14, 2003. AFOs in existence on April 14, 2003, that were not defined as CAFOs under rules that were in effect prior to April 14, 2003, shall apply for an NPDES permit no later than July 31, 2007.

**65.202(2)** *Expansion or modification of existing AFOs.* A person intending to expand or modify an existing AFO that, upon completion of the expansion or modification, will be defined as a CAFO and if the operation discharges pollutants to waters of the United States shall apply for an NPDES permit at least

90 days prior to the scheduled expansion or modification. Operation of the expanded portion of the facility shall not begin until an NPDES permit has been issued.

**65.202(3) *New AFOs.*** A person intending to construct a new AFO after July 22, 1987, or resuming a discontinued operation after 24 months or more, upon resumption or completion, will be defined as a CAFO and if the operation discharges pollutants to waters of the United States shall apply for an NPDES permit at least 180 days prior to the date operation of the animal feeding facility is scheduled. Operation of the facility shall not begin until an NPDES permit has been issued.

**65.202(4) *Permits required as a result of departmental designation.*** An AFO that is required to apply for an NPDES permit as a result of departmental designation (in accordance with the provisions of rule 567—65.201(455B,459A)) shall apply for an NPDES permit within 90 days of receiving written notification of the need to obtain a permit. Once application has been made, the AFO is authorized to continue to operate without a permit until the application has either been approved or disapproved by the department, provided that the owner or operator has submitted all requested information and promptly taken all steps necessary to obtain coverage.

**65.202(5) *Application forms and requirements.*** An application for an NPDES permit shall be made on a form provided by the department. The application shall be complete and shall contain information required by the department. Applications shall include an NMP as required in rule 567—65.209(455B,459A). Applications involving AT systems shall include results of predictive computer modeling as required by subrule 65.207(6). The application shall be signed and certified by the person who is legally responsible for the AFO and its associated manure or process wastewater control system.

**65.202(6) *Compliance schedule.*** When necessary to comply with a standard that must be met at a future date, an NPDES permit shall include a schedule for modification of the permitted facility to meet the standard. The schedule shall not relieve the permittee of the duty to obtain a construction permit pursuant to rule 567—65.203(455B,459A).

**65.202(7) *Permit conditions.*** NPDES permits shall contain conditions required by 40 CFR 122.41, monitoring conditions required by 40 CFR 122.48, and conditions considered necessary by the department to ensure compliance with all applicable rules of the department; to ensure that the production area and land application areas are operated and maintained as required by Iowa law; to protect the public health and beneficial uses of waters of the United States; and to prevent water pollution from manure storage or application operations. Any more stringent conditions of Iowa Code chapter 459A, subrule 62.4(12), and this chapter that apply to AFOs shall govern. For CAFOs that maintain cattle, swine, or poultry, the following applicable conditions shall be included:

*a. NMP.* Open feedlot CAFOs shall comply with the requirements of rule 567—65.209(455B,459A) and any additional NMP requirements for CAFOs in these rules. CAFOs that seek to obtain coverage under an NPDES permit shall have an NMP developed and implemented upon the date of permit coverage.

*b. Inspections and recordkeeping.*

(1) Visual inspections. Routine visual inspections of the CAFO production area must be conducted, and at a minimum, the following must be included:

1. Weekly inspections of all storm water diversion, runoff diversion structures, and devices channeling contaminated storm water to the open feedlot operation structure.

2. Daily inspection of water lines, including drinking water or cooling water lines.

(2) Corrective actions. Any deficiencies found as a result of the inspections required in subparagraph 65.202(7)“b”(1) or as a result of the liquid level reporting required in paragraph 65.202(7)“e” must be corrected as soon as possible.

(3) The following records must be maintained on site for a period of five years from the date they are created and must be made available to the department upon request:

1. Records documenting the inspections required in subparagraph 65.202(7)“b”(1).

2. Records of weekly liquid level observations as required in paragraph 65.202(7)“e.”

3. Records documenting any actions taken to correct deficiencies as required in subparagraph 65.202(7)“b”(2).

*c. Transfer of manure, process wastewater, settled open feedlot effluent, settleable solids, or open feedlot effluent.* Prior to transferring manure, process wastewater, settled open feedlot effluent, settleable

solids or open feedlot effluent to other persons, a CAFO must provide the recipient of the manure, process wastewater, settled open feedlot effluent, settleable solids or open feedlot effluent with the most current nutrient analysis. A CAFO must retain for five years records of the date, recipient name and address, nutrient analysis and approximate amount of manure, process wastewater, settled open feedlot effluent, settleable solids or open feedlot effluent transferred to another person.

*d. Minimum monitoring requirements for AT systems.* Monitoring is required for the entire operational life of the AT system. The department may reduce or revise monitoring requirements after the first five years of system operation. During the first five years of operation of an AT system, the following minimum monitoring will be required:

(1) Discharge monitoring. An effluent collection point must be established at the outlet of the AT system, and the flow volume recorded and an effluent sample collected on each day a discharge from the AT system occurs. Discharge samples must be submitted to a certified laboratory and analyzed for: total Kjeldahl N, NH<sub>4</sub> N, total P, COD, total suspended solids, and chloride.

(2) Discharge monitoring—tile lines. If the AT system includes a perforated tile system installed under any VTA berms to enhance infiltration within the VTA, water samples shall be collected from a sampling point located downgradient of the VTA on each individual tile line or combination of tile lines on the following schedule: one sample shall be taken from each sampling point in March or April of each year when the tile system is flowing and the level of flow in the tile system recorded at the time of sampling. If there is no discharge from the tile line at a time that meets these requirements, documentation on appropriate department forms can be substituted for the sample and analysis. Collected samples shall be submitted to a certified laboratory and analyzed for Ortho-phosphate as P.

(3) Groundwater monitoring. A minimum of two groundwater monitoring wells or piezometers (one upgradient and one downgradient) must be established at each AT system. Additional wells or piezometers may be required if the department determines they are necessary to adequately assess the impacts the AT system is having on groundwater. Samples must be collected from these wells in March or April of each year and analyzed for NH<sub>4</sub> N, NO<sub>3</sub> N, Ortho phosphate as P, and chloride.

(4) Soil sampling. Both shallow and deep soil sampling is required in the VTAs of an AT system.

1. Shallow soil sampling shall be conducted prior to initial discharge of open feedlot effluent into the AT system and repeated annually. Within the VTA, a minimum of three sampling locations shall be established at the entrance to each VTA to be sampled. The three sampling locations shall be spread evenly across the entrances to adequately monitor the effluent application onto the VTAs. Samples shall be collected in the spring. Each sample shall be taken to a depth of six inches and analyzed for pH and P using the Mehlich-3 method.

2. Deep soil sampling shall be conducted prior to initial discharge of open feedlot effluent into the AT system and repeated every five years prior to the submission of an application for an NPDES permit renewal. A minimum of two sampling sites shall be established within each VTA to be sampled, one located where runoff enters the VTA, generally the same location as the shallow soil sampling location, and one where runoff is discharged from the VTA. Soil samples shall be taken from these sites to a depth of four feet, with separate samples taken to represent the 0 to 6-inch depth, the 6- to 12-inch depth, and in one-foot increments thereafter. All samples shall be analyzed for NO<sub>3</sub> N, NH<sub>4</sub> N, pH, and P by the Mehlich-3 method.

If the length of effluent flow through the VTA exceeds 400 feet, an additional soil sample representing the zero to six-inch depth should be taken for each additional 200 feet of VTA length. Samples shall be analyzed for NO<sub>3</sub> N, NH<sub>4</sub> N, pH, and P by the Mehlich-3 method.

*e. Quarterly reporting requirements for large CAFOs with outside liquid impoundments.* A permittee with outside liquid impoundments must submit quarterly reports by April 10, July 10, October 10, and January 10, following the respective calendar quarters; documenting daily precipitation; weekly impoundment liquid levels; volume of liquid removed from the impoundments; and the date, time, duration, and estimated volume of any overflow. Liquid levels must be obtained by observing a depth marker that clearly indicates the minimum capacity necessary to contain the runoff and direct precipitation of the 25-year, 24-hour precipitation event.

*f. Annual reporting requirements for all CAFOs with systems other than AT systems.* Permittees with systems other than an AT system must submit an annual report to the department by January 10 of the following year. The annual report must include:

- (1) The number and type of animals in the open feedlot operation;
- (2) Estimated amount of manure, process wastewater, settled open feedlot effluent, settleable solids, or open feedlot effluent generated by the CAFO in the previous 12 months (tons/gallons);
- (3) Estimated amount of total manure transferred to other persons by the CAFO in the previous 12 months (tons/gallons);
- (4) Total number of acres for land application covered by the NMP and the total number of acres under control of the CAFO that were used for land application of manure in the previous 12 months;
- (5) Summary of all manure, process wastewater, settled open feedlot effluent, settleable solids, or open feedlot effluent discharges from the production area that have occurred in the previous 12 months, including date, time, and approximate volume;
- (6) A statement indicating whether the current version of the CAFO's NMP was developed or approved by a certified nutrient management planner;
- (7) Actual crops planted and actual yield for the preceding 12 months; and
- (8) Results of all samples of manure, litter and process wastewater for nitrogen and phosphorus content for manure, litter and process wastewater that was land-applied.

*g. Quarterly reporting requirements for CAFOs with AT systems.* A permittee with an AT system must submit quarterly reports by April 10, July 10, October 10, and January 10, following the respective calendar quarters. The quarterly reports shall provide all of the following information:

- (1) Daily precipitation.
- (2) Dates on which manure, process wastewater, settled open feedlot effluent, open feedlot effluent, or settleable solids were removed from the production area and estimated amounts of manure, process wastewater, settled open feedlot effluent, settleable solids, or open feedlot effluent removed (tons/gallons).
- (3) Dates on which discharges from the production area or the AT system occurred and the estimated duration and volume of discharge on each discharge date.
- (4) Results of laboratory analyses of discharge samples for each date a discharge from the production area or the AT system occurred. If the results of laboratory analyses are not available by the due date of the quarterly report, the results shall be provided with the following quarter's report.

*h. Annual reporting requirements for CAFOs with AT systems.* A permittee shall submit an annual report by January 10 of the following year. The annual report must include all of the following:

- (1) The number and type of animals in the open feedlot operation.
- (2) Estimated amount of total manure, process wastewater, settled open feedlot effluent, settleable solids, or open feedlot effluent generated by the CAFO in the previous 12 months (tons/gallons).
- (3) Estimated amount of total manure, process wastewater, settled open feedlot effluent, settleable solids, or open feedlot effluent transferred to other persons by the CAFO in the previous 12 months (tons/gallons).
- (4) Total number of acres for land application covered by the NMP and the total number of acres under control of the CAFO that were used for land application of manure, process wastewater, settled open feedlot effluent, settleable solids, or open feedlot effluent in the previous 12 months.
- (5) Summary of all manure, process wastewater, settled open feedlot effluent, settleable solids, or open feedlot effluent discharges from the production area or AT system that have occurred in the previous 12 months, including date, time, and approximate volume.
- (6) Harvest dates and estimated amounts of forage removed from the AT system during the previous 12 months.
- (7) Results of soil and groundwater monitoring well sampling within the AT system during the previous 12 months.
- (8) A statement indicating whether the current version of the CAFO's NMP was developed or approved by a certified nutrient management planner.

**65.202(8)** *NPDES permit renewal.*

*a. General requirements.* An NPDES permit may be granted for any period of time not to exceed five years. An application for renewal of an NPDES permit must be submitted to the department at least 180 days prior to the date the permit expires. Each permit to be renewed shall be subject to the rules of the department in effect at the time of renewal. A permitted AFO that ceases to be a CAFO will be exempted from the need to retain an NPDES permit if the permittee can demonstrate to the satisfaction of the department that there is no remaining potential for a discharge of manure that was generated while the operation was a CAFO, other than agricultural storm water from land application areas.

*b. Permits involving use of AT systems.*

(1) Renewal of a permit involving use of an AT system is contingent upon proper operation and maintenance of the AT system, submittal of all required records and reports, and demonstration that the AT system is providing an equivalent level of performance to that achieved by a containment system that is designed and operated as required by statute, subrule 62.4(12) and this division of this chapter.

(2) If departmental review of an AT system indicates the system is not meeting the equivalent performance standard, the permittee may either be required to make needed system modifications to enable compliance with this standard or be required to install a conventional runoff containment system. Open feedlot operations found to be in compliance with the equivalent performance standard will be issued a five-year NPDES permit that allows continued use of the AT system.

**65.202(9)** *Permit amendment, revocation, and reissuance or termination.* The department may amend, revoke and reissue or terminate in whole or part any NPDES permit for cause, either at the request of any interested person, including the permittee, or upon the director's initiative. Any more stringent requirement pursuant to 40 CFR 122.62, 122.63 or 122.64 shall control. All requests shall be in writing and shall contain reasons for the request. Cause for permit amendment, revocation and reissuance, or termination may include but is not limited to the following:

- a.* Violation of any term or condition of the permit.
- b.* Obtaining a permit by misrepresentation of fact or failure to disclose fully all material facts.
- c.* A change in any condition that requires either a temporary or permanent reduction or elimination of the permitted discharge.
- d.* Failure to retain, make available, or submit the records and information that the department requires in order to ensure compliance with the operation and discharge conditions of the permit.
- e.* Failure to provide all required application material or appropriate fees.
- f.* A determination by the department that the continued operation of a CAFO constitutes a clear, present and impending danger to public health or the environment.

[ARC 7965C, IAB 5/15/24, effective 6/19/24]

#### **567—65.203(455B,459A) Construction permits.**

**65.203(1)** *Open feedlot operations required to obtain a construction permit.* An open feedlot operation must obtain a construction permit prior to any of the following:

- a.* Constructing or expanding a settled open feedlot effluent basin or AT system or installing a settled open feedlot effluent transfer piping system if the open feedlot operation is required to be issued an NPDES permit.
- b.* Increasing the animal unit capacity of the open feedlot operation to more than the animal unit capacity approved by the department in a previous construction permit.
- c.* Increasing the volume of settled open feedlot effluent, settleable solids or open feedlot effluent stored at the open feedlot operation to more than the volume approved by the department in a previous construction permit.
- d.* Repopulating the open feedlot operation if it was discontinued for 24 months or more and the animal unit capacity will be 1,000 animal units or more.

**65.203(2)** *When a construction permit is not required.*

*a. Research colleges.* A construction permit is not required for construction of a settled open feedlot effluent basin or AT system if the basin or system is part of an open feedlot operation that is owned by a research college conducting research activities as provided in Iowa Code section 459A.105.

*b. Solids settling facilities.* If only solids settling facilities are being constructed, a construction permit is not required. If solids settling facilities are proposed as part of a project that includes facilities

that require a construction permit, then the proposed solids settling facilities are subject to a construction permit.

**65.203(3)** *Applications that cannot be approved.* The department shall not approve an application for a construction permit unless the applicant submits all of the following:

- a. An NMP as provided in rule 567—65.209(455B,459A).
- b. An engineering report, construction plans, and specifications prepared by a PE or an NRCS-qualified staff person certifying that the design of the settled open feedlot effluent basin or AT system complies with the construction design standards required in this division.

**65.203(4)** *Plan review criteria; time for approval or disapproval.*

a. *Plan review criteria.* Review of plans and specifications shall be conducted by the department to determine the potential of the settled open feedlot effluent basin or AT system to achieve the level of control being required of the open feedlot operation. Applicable criteria contained in federal law, state law, these rules, NRCS design standards and specifications, unless inconsistent with federal or state law or these rules, and United States Department of Commerce precipitation data will be used in the review of large CAFOs. If the proposed facility plans are not adequately covered by these criteria, applicable criteria contained in current technical literature shall be used. Medium CAFOs and designated CAFOs shall be evaluated using the department's professional judgment.

b. *Time for approval or disapproval.* The department shall approve or disapprove an application for a construction permit within 60 days after receiving the permit application. However, the applicant may deliver a notice requesting a continuance. Upon receipt of a notice, the time required for the department to act upon the application shall be suspended for the period provided in the notice but for not more than 30 days after the department's receipt of the notice. The applicant may submit more than one notice. If review of the application is delayed because the application is incomplete, and the applicant fails to supply requested information within a reasonable time prior to the deadline for action on the application, the permit may be denied and a new application will be required if the applicant wishes to proceed. The department may also provide for a continuance when it considers the application. The department shall provide notice to the applicant of the continuance. The time required for the department to act upon the application shall be suspended for the period provided in the notice but for not more than 30 days. However, the department shall not provide for more than one continuance.

**65.203(5)** *Expiration of construction permits.* The construction permit shall expire if construction, as defined in rule 567—65.6(455B,459,459A,459B), is not begun within one year and completed within three years of the date of issuance. The director may grant an extension of time to begin or complete construction if it is necessary or justified, upon showing of such necessity or justification to the director.

**65.203(6)** *Revocation of construction permits.* The department may suspend or revoke a construction permit, modify the terms or conditions of a construction permit, or refuse to renew a permit expiring according to subrule 65.203(5) if it determines that the operation of the open feedlot operation constitutes a clear, present and impending danger to public health or the environment.

**65.203(7)** *Permit prior to construction.* An applicant for a construction permit shall notify the department prior to the start of construction for any open feedlot operation structure not required to be covered by a construction permit. The applicant shall not begin construction of a settled open feedlot effluent basin or AT system, or begin installation of a settled open feedlot effluent transfer piping system, until the person has been granted a permit for the construction by the department.

[ARC 7965C, IAB 5/15/24, effective 6/19/24]

**567—65.204(455B,459A) Construction permit application.** An open feedlot operation required to obtain a construction permit in accordance with the provisions of subrule 65.203(1) shall apply for a construction permit at least 90 days before the date that construction, installation, or modification is scheduled to start.

**65.204(1)** *Conceptual design.* Prior to submitting an application for a construction permit, the applicant may submit a conceptual design and site investigation report to the department for review and comment.

**65.204(2)** *Application for a construction permit for an open feedlot operation* shall be made on a form provided by the department. The application shall include all of the information necessary to enable the department to determine the potential of the proposed settled open feedlot effluent basin or AT system to

achieve the level of control required of the open feedlot operation. A construction permit application shall include the following:

- a. The name of the owner of the open feedlot operation and the name of the open feedlot operation, including the owner's mailing address and telephone number.
- b. The name of the contact person for the open feedlot operation, including the person's mailing address and telephone number.
- c. The location of the open feedlot operation.
- d. A statement providing that the application is for any of the following:
  - (1) The construction or expansion of a settled open feedlot effluent basin or AT system for an existing open feedlot operation that is not expanding;
  - (2) The construction or expansion of a settled open feedlot effluent basin or AT system for an existing open feedlot operation that is expanding;
  - (3) The construction of a settled open feedlot effluent basin or AT system for a proposed new open feedlot operation.
- e. The animal unit capacity for each animal species in the open feedlot operation before and after the proposed construction.
- f. An engineering report, construction plans and specifications prepared by a PE or by an NRCS-qualified staff person for the settled open feedlot effluent basin or AT system.
- g. A report on the soil and hydrogeologic information for the site, as described in subrules 65.206(2) and 65.207(4).
- h. Information including but not limited to maps, drawings and aerial photos that clearly show the location of all the following:
  - (1) The open feedlot operation and all existing and proposed settled open feedlot effluent basins or AT systems, clean water diversions, and other pertinent features or structures.
  - (2) Any other open feedlot operation under common ownership or common management and located within 1,250 feet of the open feedlot operation.
  - (3) Any public water supply system as defined in Iowa Code section 455B.171 or drinking water well that is located less than the distance from the open feedlot operation required by rule 567—65.205(455B,459A). Information shall also be provided as to whether the proposed settled open feedlot effluent basin or AT system will meet all applicable separation distances.

[ARC 7965C, IAB 5/15/24, effective 6/19/24]

**567—65.205(455B,459A) Water well separation distances for open feedlot operations.**

**65.205(1)** *Unformed settled open feedlot effluent basins.* Unformed settled open feedlot effluent basins shall be separated from water wells as follows:

- a. *Public wells.* 1,000 feet from shallow wells and 400 feet from deep wells;
- b. *Private wells.* 400 feet from both shallow wells and deep wells.

**65.205(2)** *Open feedlots, solids settling facilities, formed settled open feedlot effluent basins, feed storage runoff control structures and AT systems.* Open feedlots, solids settling facilities, formed settled open feedlot effluent basins, feed storage runoff control structures and AT systems shall be separated from water wells as follows: for both public wells and private wells, 200 feet from shallow wells and 100 feet from deep wells.

[ARC 7965C, IAB 5/15/24, effective 6/19/24]

**567—65.206(455B,459A) Settled open feedlot effluent basins—investigation, design and construction requirements.** A settled open feedlot effluent basin required to be constructed pursuant to a construction permit issued pursuant to Iowa Code section 459A.205 shall meet the design and construction requirements set forth in this rule.

**65.206(1)** *Drainage tile investigation and removal.* Prior to constructing a settled open feedlot effluent basin, the site for the basin shall be investigated for drainage tile lines as provided in this subrule. All applicable records of known drainage tiles shall be examined for the existence of drainage tile lines. Prior to the excavation for an unformed manure storage structure, an inspection trench of at least ten inches wide shall be dug around the structure to a depth of at least 6 feet below the original grade and within 25

feet of the proposed outside of the toe of the berm. Drainage tile lines discovered during the tile inspection of a settled open feedlot effluent basin shall be removed and rerouted in the inspection trench or in an area outside of the inspection trench. All tiles within the inspection trench perimeter shall be removed or completely plugged with concrete, grout or similar materials. Drainage tile lines installed at the time of construction to lower the groundwater may remain in place as long as they are outside of the proposed toe of the berm.

**65.206(2) *Soils and hydrogeologic report.*** A settled open feedlot effluent basin required to be constructed pursuant to a construction permit issued pursuant to rule 567—65.203(455B,459A) shall meet design standards as required by a soils and hydrogeologic report. The report shall be submitted with the construction permit application as provided in rule 567—65.204(455B,459A). The report shall include all of the following:

*a.* A description of the steps taken to determine the soils and hydrogeologic conditions at the proposed construction site, a description of the geologic units encountered, and a description of the effects of the soil and groundwater elevation and direction of flow on the construction and operation of the basin.

*b.* The subsurface soil classification of the site. A subsurface soil classification shall be based on ASTM international designation D 2487-06 or D 2488-06.

*c.* The results of a soils investigation conducted at a minimum of three locations within the area of the basin reflecting the continuous soil profile existing within the area of the basin. The soils investigation results shall be used in determining subsurface soil characteristics and groundwater elevation and direction of flow at the proposed site. The soils investigation shall be conducted and utilized as follows:

(1) By a qualified person ordinarily engaged in the practice of performing soils investigations.

(2) At locations that reflect the continuous soil profile conditions existing within the area of the proposed basin, including conditions found near the corners and the deepest point of the proposed basin. The soils investigation shall be conducted to a minimum depth of ten feet below the proposed bottom elevation of the basin.

(3) By methods that identify the continuous soil profile and do not result in mixing of soil layers. Soil corings using hollow stem augers and other suitable methods that do not result in soil layer mixing may be used.

(4) Soil corings may be used to determine current groundwater levels by completing the corings as temporary monitoring wells as provided in subparagraph 65.206(3)“a”(1) and measuring the water levels in these wells no earlier than seven days after installation as provided in subparagraph 65.206(3)“a”(2).

(5) Upon abandonment of soil core holes, all soil core holes including those developed as temporary water level monitoring wells shall be plugged with concrete, Portland cement concrete grout, bentonite, or similar materials.

(6) If excavation methods are used in conducting the soils investigation, upon closure these excavations must be filled with suitable materials and adequately compacted to ensure they will not compromise the integrity of the basin liner.

**65.206(3) *Hydrology.***

*a.* For purposes of this rule, groundwater table is the seasonal high-water table determined by a PE, a groundwater professional certified pursuant to 567—Chapter 134, or qualified staff from the department or NRCS. If a construction permit is required, the department must approve the groundwater table determination.

(1) Current groundwater levels shall be measured as provided in this subparagraph for either a formed settled open feedlot effluent basin or an unformed settled open feedlot effluent basin. Three temporary monitoring wells shall be developed according to paragraph 65.108(6)“c.” The top of the well screen shall be within five feet of the ground surface. Each well shall be extended to at least two feet below the proposed top of the liner of an unformed settled open feedlot effluent basin, or to at least two feet below the proposed bottom of the footings of a formed settled open feedlot effluent basin. In addition, the wells must be installed as follows:

1. Unformed basins. For an unformed settled open feedlot effluent basin, the monitoring wells may be installed in the soil core holes developed as part of conducting the soils investigation required in paragraph 65.206(2)“c.”

2. Formed basins. For a formed settled open feedlot effluent basin, at least three temporary monitoring wells shall be installed as close as possible to three corners of the structure, with one of the wells close to the corner of deepest excavation. If the formed settled open feedlot effluent basin is circular, the three monitoring wells shall be equally spaced and one well shall be placed at the point of deepest excavation.

(2) The seasonal high-water table shall be determined by considering all relevant data, including the groundwater levels measured in the temporary monitoring wells not earlier than seven days following installation, NRCS soil survey information, soil characteristics such as color and mottling, other existing water table data, and other pertinent information. If a drainage system for artificially lowering the groundwater table will be installed in accordance with the requirements of paragraph 65.206(3)“c,” the level to which the groundwater table will be lowered will be considered to represent the seasonal high-water table.

b. The settled open feedlot effluent basin shall be constructed with a minimum separation of two feet between the top of the liner of the basin and the seasonal high-water table.

c. If a drainage tile line around the perimeter of the basin is installed a minimum of two feet below the top of the basin liner to artificially lower the seasonal high-water table, the top of the basin’s liner may be a maximum of four feet below the seasonal high-water table which existed prior to installation of the perimeter tile system. The seasonal high-water table may be artificially lowered by gravity flow tile lines or other similar system. However, the following shall apply:

(1) Except as provided in subparagraph 65.206(3)“b”(2), an open feedlot operation shall not use a nongravity mechanical system that uses pumping equipment.

(2) If the open feedlot operation was constructed before July 1, 2005, the operation may continue to use its existing nongravity mechanical system that uses pumping equipment or it may construct a new nongravity mechanical system that uses pumping equipment. However, an open feedlot operation that expands the area of its open feedlot on or after April 1, 2011, shall not use a nongravity mechanical system that uses pumping equipment.

(3) Drainage tile lines may be installed to artificially lower the seasonal high-water table at a settled open feedlot effluent basin, if all of the following conditions are satisfied:

1. A device to allow monitoring of the water in the drainage tile lines and a device to allow shutoff of the flow in the drainage tile lines are installed, if the drainage tile lines do not have a surface outlet accessible on the property where the settled open feedlot effluent basin is located.

2. Drainage tile lines are installed horizontally within 25 feet away from the outside toe of the berm of the settled open feedlot effluent basin. Drainage tile lines shall be placed in a vertical trench and encased in granular material that extends upward to the level of the seasonal high-water table which existed prior to installation of the perimeter tile system.

d. Open feedlot operation structures exceeding storage capacity or dam height thresholds may be required to obtain department permits, as specified in rule 567—71.3(455B) and 567—Chapter 73.

**65.206(4) *Liner design and construction.*** The liner of a settled open feedlot effluent basin shall comply with all of the following:

a. The liner shall be constructed to have a percolation rate that shall not exceed one-sixteenth inch per day at the design depth of the basin as determined by percolation tests conducted by the PE. If a clay soil liner is used, the liner shall be constructed with a minimum thickness of 12 inches or the minimum thickness necessary to comply with the percolation rate in this paragraph, whichever is greater.

b. The liner shall be constructed to have a percolation rate that shall not exceed one-sixteenth inch per day at the design depth of the basin. The design of the liner will specify a moisture content, compaction requirement, and liner thickness that will comply with the maximum allowable percolation requirement, and will be based on moisture content and percentage of maximum density as determined by a standard 5-point proctor test performed in accordance with ASTM D698 (Method A), effective November 11, 1991. The liner thickness will be based on laboratory tests of the compacted material, with a minimum liner thickness of 12 inches. Appropriate field or laboratory testing during construction shall be provided to verify the design requirements are met.

**65.206(5) *Berm erosion inspection and repair.*** The owner of an open feedlot operation using a settled open feedlot effluent basin shall inspect the berms of the basin at least semiannually for evidence of erosion. If the inspection reveals erosion which may impact the basin's structural stability or the integrity of the basin's liner, the owner shall repair the berms.

**65.206(6) *Unformed basins containing confinement manure and open feedlot effluent.*** Unformed basins containing confinement manure and open feedlot effluent shall meet the confinement construction standards and separation distance requirements provided in Division II of this chapter. The unformed basin design shall ensure adequate storage for the annual manure generation of confinement animals, the annual runoff from the open feedlot portion, including the basin surface area, and the open feedlot runoff resulting from the 25-year, 24-hour precipitation event below the two-foot freeboard level.

**65.206(7) *Settled open feedlot effluent basin (SOFEB) design and operation requirements.***

- a. All SOFEBs shall have a minimum ten-foot wide top of dike.
- b. All SOFEBs shall have a minimum three-foot horizontal to one-foot vertical interior and exterior side slopes.
- c. All SOFEBs shall have depth markers installed labeling each foot of depth and critical pumping depths noted according to the designed operating system.
- d. All SOFEBs shall be designed using the latest available NOAA Atlas 14 Volume 8 Version 2, effective 2013, rainfall data for the county where the SOFEB is located. NOAA data can be obtained from the National Weather Service website.

[ARC 7965C, IAB 5/15/24, effective 6/19/24]

**567—65.207(455B,459A) AT systems—design requirements.**

**65.207(1) *Containment volume.***

a. Adequate capacity must be provided within the AT system or within the solids settling facility for the open feedlot operation to contain expected open feedlot effluent from November 1 to March 30 or to hold the precipitation event as required by paragraph 65.200(2) "a," whichever is greater. Controls on the solids settling facility or the AT system shall prevent release of collected open feedlot effluent to waters of the United States during the period from November 1 to March 30.

b. If the containment volume required in paragraph 65.207(1) "a" is provided in an open feedlot operation structure whose primary purpose is to remove settleable solids from open feedlot effluent prior to discharge into an AT system, the basin shall not be required to comply with the liner design and construction requirements of subrule 65.206(4), provided the basin does not retain collected open feedlot effluent for more than seven consecutive days following a precipitation event during the period from March 30 to November 1.

**65.207(2) *Solids settling.*** Settleable solids shall be removed from open feedlot effluent prior to discharge of the effluent into an AT system. Solids settling shall be conducted in conformance with the requirements of paragraph 65.200(1) "b."

**65.207(3) *Drainage tile investigation and removal.*** Prior to constructing an AT system, the owner of the open feedlot operation shall investigate the site for the AT system for drainage tile lines. The investigation shall be made by digging a core trench to a depth of at least six feet from ground level at the projected center of the berm of the AT system. A written record of the investigation shall be submitted as part of the construction certification required in rule 567—65.208(455B,459A). If a drainage tile line is discovered, one of the following solutions shall be implemented:

a. The drainage tile line shall be rerouted around the perimeter of the AT system at a distance of least 25 feet horizontally separated from the toe of the outside berm of the AT system. For an area of the system where there is not a berm, the drainage tile line shall be rerouted at least 50 feet horizontally separated from the edge of the system.

b. The drainage tile line shall be replaced with a nonperforated tile line under the AT system. The nonperforated tile line shall be continuous and without connecting joints. There must be a minimum of three feet of separation between the nonperforated tile line and the soil surface of the AT system.

**65.207(4) *Soils and hydrogeologic report.*** An AT system constructed pursuant to a construction permit issued pursuant to rule 567—65.203(455B,459A) shall meet design standards as required by a

soils and hydrogeologic report. The report shall be submitted with the construction permit application as provided in rule 567—65.204(455B, 459A). The report shall include all of the following:

a. A description of the steps taken to determine the soils and hydrogeologic conditions at the proposed construction site, a description of the geologic units encountered, and a description of the effects of the soil and groundwater elevation and direction of flow on the construction and operation of the AT system.

b. Subsurface soil classification of the site. A subsurface soil classification shall be based on ASTM international designation D 2487-06 or D 2488-06.

c. The results of a soils investigation conducted at a minimum of three locations within the area of the proposed AT system for AT systems of five acres or less, with one additional soils investigation site utilized for each additional three acres of surface area or fraction thereof. The soils investigation results shall be used in determining subsurface soil characteristics and groundwater elevation and direction of flow at the proposed AT system site. The soils investigation shall be conducted and utilized as follows:

(1) By a qualified person ordinarily engaged in the practice of performing soils investigations.

(2) At locations that reflect the continuous soil profile conditions existing within the area of the proposed AT system. The soils investigation shall be conducted to a minimum depth of ten feet below the elevation of the soil surface of the proposed AT system.

(3) By methods that identify the continuous soil profile and do not result in mixing of soil layers. Investigation methods may include soil corings using hollow stem augers, soil test pits, or other suitable methods that do not result in soil layer mixing.

(4) Soil core holes may be used to determine current groundwater levels by completing the core holes as temporary monitoring wells and measuring the water levels in these wells not earlier than seven days after installation.

(5) Upon abandonment of the soil core holes, all soil core holes, including those developed as temporary water level monitoring wells, shall be plugged with concrete, Portland cement concrete grout, bentonite, or similar materials.

(6) If soil test pits or other excavation methods are used in conducting the soils investigation, upon closure these excavations must be filled with suitable materials and adequately compacted to ensure they will not compromise the integrity of the AT system.

**65.207(5) Hydrology—groundwater table.** For purposes of this rule, groundwater table is the seasonal high-water table determined by a PE, a groundwater professional certified pursuant to 567—Chapter 134, or qualified staff from the department or NRCS. If a construction permit is required, the department must approve the groundwater table determination.

a. *Groundwater level measurements.* Groundwater levels shall be measured using at least one of the following methods:

(1) Temporary monitoring wells. Three temporary monitoring wells shall be developed to a minimum of ten feet below the surface of the proposed AT system and constructed in accordance with requirements of paragraph 65.109(6)“c.” The top of the well screen shall be within five feet of the ground surface. These monitoring wells may be installed in the soil core holes developed as part of conducting the soils investigation required in paragraph 65.207(4)“c.”

(2) Test pits. Test pits may be used in lieu of temporary monitoring wells to determine the seasonal high-water table or prior to the construction of an AT system to ensure the required separation distance to the seasonal high-water table is being met. The bottom of each pit shall be a minimum of five feet below the proposed surface of the AT system. However, if the test pit is also being used to conduct the soils investigation required in paragraph 65.207(4)“c,” the bottom of the pit shall be a minimum of ten feet below the surface of the proposed AT system. Each pit shall be allowed to remain open and unaltered for a minimum of seven days for viewing by the department or an NRCS-qualified staff person. Adequate protection (temporary berms and covers) shall be provided to prevent surface runoff from entering the test pits. Test pits shall be located as needed to provide an accurate assessment of soil materials and seasonal high groundwater levels throughout the area of the proposed AT system. A description of the materials present in the test pit shall be documented by all of the following:

1. Digital photos;

2. Description of soils including mottling;
3. Weather conditions both prior to and during the period in which test pits are open.
- b. *Determination of seasonal high-water table.* The seasonal high-water table shall be determined by considering all relevant data, including the groundwater levels measured in the temporary monitoring wells or test pits not earlier than seven days following installation, NRCS soil survey information, soil characteristics such as color and mottling found in soil cores and test pits, other existing water table data, and other pertinent information. If a drainage system for artificially lowering the groundwater table will be installed, the level to which the groundwater table will be lowered will be considered to represent the seasonal high-water table.
- c. *Seasonal high-water table.* The seasonal high-water table shall be a minimum of four feet below the finished grade of a VTA.

**65.207(6) Stand-alone VTA.**

a. *Computer modeling.* Results of predictive computer modeling for the proposed alternative technology system shall be used to determine suitability of the proposed site for the system and to predict performance of the alternative technology system as compared to the use of a 25-year, 24-hour runoff containment system, over a 25-year period. A summary of the computer modeling results shall be approved and provided to the department.

b. *Size.* The computer model used to determine whether the proposed AT system will meet the equivalent performance standard shall also be used to establish the minimum required size of the VTA. However, in no case shall the size of the VTA be less than the following:

(1) 100 percent of the total drainage area (feedlot and other) served if the soil permeability is from six-tenths of an inch to two inches per hour.

(2) 200 percent of the total drainage area (feedlot and other) served if the soil permeability is from two-tenths to six-tenths of an inch per hour.

c. *Slope.* The constructed VTA shall be level in one dimension and have a slight slope (maximum of 5 percent) in the other dimension.

d. *Berming.* The VTA must be bermed to prevent inflow of surface water from outside areas.

e. *Spreaders.* Settled open feedlot effluent must be discharged evenly across the top width of the VTA and allowed to slowly flow downslope through the VTA. Level spreaders, at a maximum six inches tall, or other practices may be required to maintain uniform flow of settled open feedlot effluent across the width of the VTA as flow moves downslope through the VTA.

f. *Soil permeability.* Soil permeability within the VTA must be from two-tenths to two inches per hour throughout the soil profile to a depth of five feet. Soil permeability must be verified by conducting on-site or laboratory soil permeability testing.

g. *Groundwater lowering system.* The seasonal high-water table within the VTA must be capable of being lowered to a depth of four to five feet with a perimeter tile system installed outside of the VTA. Design information must be provided that demonstrates the adequacy of the proposed groundwater lowering system. The tile system must satisfy the following requirements:

(1) If the tile system does not have a surface outlet accessible on the property where the AT system is located, a device to allow monitoring of the water in the tile system and a device to allow shutoff of the flow in the tile system must be installed.

(2) Tile lines in the system must be installed horizontally at least 25 feet away from the outside toe of the berm of the VTA.

h. *Tile system to enhance infiltration within the VTA.* A tile system may be installed at the perimeter of the VTA cells to enhance infiltration within the VTA. The tile system must satisfy the following requirements:

(1) Tile lines shall be installed at the centerline of the berms of the VTA cells.

(2) The tile lines shall be constructed such that no settled open feedlot effluent can enter the lines except through infiltration through the soil profile.

(3) A shutoff valve and sampling point located downslope of the VTA cell shall be provided for each individual tile line. However, if multiple tile lines are brought together into a common tile line, a single shutoff valve and sampling point may be utilized.

(4) Monitoring of the tile lines must be conducted in accordance with the requirements of subparagraph 65.202(7)“d”(2).

i. *Depth to sands, gravels, or glacial outwash.* A VTA is not allowed if the depth to sands, gravels, or glacial outwash is less than six feet. A soils investigation that documents sands found are in isolated sand lenses that will not have a significant impact on subsurface water flow or groundwater quality shall not prohibit use of the site.

j. *Depth to bedrock.* A minimum of ten feet of overburden or loose material must exist between the surface of the constructed VTA and underground bedrock.

k. *Flooding.* The VTA must be constructed in areas that are not subject to flooding more frequently than once in 25 years.

l. *Distance to water bodies.* The following distances, measured along the path of water flow, shall be provided between the point of discharge from the VTA and the receiving water body.

(1) Designated use streams referenced in 567—subrule 61.3(5). A minimum distance of 500 feet or ½ foot distance per animal unit capacity of the feedlot area which drains to the VTA, whichever is greater, shall be provided.

(2) All other uncrossable intermittent streams. A minimum distance of 200 feet shall be provided.

[ARC 7965C, IAB 5/15/24, effective 6/19/24]

#### **567—65.208(455B,459A) Construction certification.**

**65.208(1)** The owner of an open feedlot operation who is issued a construction permit for a settled open feedlot effluent basin or AT system as provided in rule 567—65.203(455B,459A) shall submit to the department a construction certification from a PE certifying all of the following:

a. The settled open feedlot effluent basin or AT system was constructed in accordance with the design plans submitted to the department as part of an application for a construction permit pursuant to rule 567—65.204(455B,459A). If the actual construction deviates from the approved design plans, the construction certification shall identify all changes and certify that the changes were consistent with all applicable standards of these rules.

b. The settled open feedlot effluent basin or AT system was inspected by the PE after completion of construction and before commencement of operation.

**65.208(2)** A written record of an investigation for drainage tile lines, including the findings of the investigation and actions taken to comply with subrules 65.206(1) and 65.207(3), shall be submitted as part of the construction certification.

[ARC 7965C, IAB 5/15/24, effective 6/19/24]

#### **567—65.209(455B,459A) NMP requirements.**

**65.209(1)** The owner of an open feedlot operation that has an animal unit capacity of 1,000 animal units or more or that is required to be issued an NPDES permit shall develop and implement an NMP meeting the requirements of this rule. The owner of an open feedlot operation who seeks to obtain or is required to be issued an NPDES permit shall develop and implement an NMP meeting the requirements of this rule no later than the date on which the NPDES permit becomes effective. For the purpose of this rule, requirements pertaining to open feedlot effluent also apply to settled open feedlot effluent and settleable solids.

**65.209(2)** Not more than one open feedlot operation shall be covered by a single NMP. For an open feedlot operation that is required to have an NPDES permit and the AFO includes an open feedlot operation and a confinement feeding operation, the NMP must include both the open feedlot operation and the confinement feeding operation if the confinement feeding operation does not have an MMP. If the confinement feeding operation portion of the AFO does have an MMP as required in rules 567—65.110(455B,459,459B) and 567—65.111(455B,459,459B), the confinement feeding operation portion shall not be included in the NMP; however, in that event, the MMP must be amended to include the information specified in paragraph 65.209(8)“e.”

**65.209(3)** A person shall not remove manure, process wastewater or open feedlot effluent from an open feedlot operation structure that is part of an open feedlot operation for which an NMP is required under this rule, unless the department approves an NMP as required in this rule.

**65.209(4)** The department shall not approve an application for a permit to construct a settled open feedlot effluent basin or AT system unless the owner of the open feedlot operation applying for approval submits an NMP together with the application for the construction permit as provided in rule 567—65.203(455B,459A). The owner shall also submit proof that the owner has published a notice for public comment as provided in subrule 65.209(7).

**65.209(5)** If a construction permit is required as provided in rule 567—65.203(455B,459A), the department shall approve or disapprove the NMP as part of the construction permit application. If a construction permit is not required, the department shall approve or disapprove the NMP within 60 days from the date that the department receives the NMP.

**65.209(6)** Prior to approving or disapproving an NMP as required in this rule, the department may receive comments exclusively to determine whether the NMP is submitted according to procedures required by the department and that the NMP complies with the provisions of this rule.

**65.209(7)** Public notice.

*a.* The owner of the open feedlot operation shall publish a notice for public comment in a newspaper having a general circulation in the county where the open feedlot operation is or is proposed to be located and in the county where manure, process wastewater, or open feedlot effluent that originates from the open feedlot operation may be applied under the terms and conditions of the NMP.

*b.* The notice for public comment shall include all of the following:

(1) The name of the owner of the open feedlot operation submitting the NMP.

(2) The name of the township where the open feedlot operation is or is proposed to be located and the name of the township where manure, process wastewater, or open feedlot effluent originating from the open feedlot operation may be applied.

(3) The animal unit capacity of the open feedlot operation.

(4) The time when and the place where the NMP may be examined as provided in Iowa Code section 22.2.

(5) Procedures for providing public comment to the department. The notice shall also include procedures for requesting a public hearing conducted by the department. The department is not required to conduct a public hearing if it does not receive a request for the public hearing within ten days after the first publication of the notice for public comment as provided in this subrule. If such a request is received, the public hearing must be conducted within 30 days after the first date that the notice for public comment was published.

(6) A statement that a person may acquire information relevant to making comments under this subrule by accessing the department's Internet website. The notice for public comment shall include the address of the department's Internet website as required by the department.

**65.209(8)** Except as provided in paragraph 65.209(8)“f,” an NMP shall include all of the following:

*a.* An estimate of the nitrogen and phosphorus concentration of manure, process wastewater and open feedlot effluent and an estimate of the manure, process wastewater, and open feedlot volume or weight produced by the open feedlot operation, in accordance with subrule 65.111(3).

*b.* Application rate calculations consistent with the requirements of subrule 65.111(12). The 100 pounds of available nitrogen per acre limitation specified in paragraph 65.111(13)“c” (applicable to open feedlot operations and combined open feedlot operations and confinement operations with an NPDES permit because of requirements in subrule 65.111(4)) pertaining to liquid manure applied to land currently planted to soybeans or to land where a soybean crop is planned applies only to liquid manure, process wastewater or settled open feedlot effluent.

*c.* The location of manure application. If the application is on land other than land owned or rented for crop production by the owner of the open feedlot operation, the plan shall include a copy of each written agreement executed by the owner of the open feedlot operation and the landowner or the person renting the land for crop production where the manure, process wastewater or open feedlot effluent may be applied. The written agreement shall indicate the number of acres on which the manure, process wastewater or effluent may be applied and the length of the agreement.

d. A phosphorus index of each field in the nutrient management plan, as defined in paragraph 65.111(12)“a,” including the factors used in the calculation. A copy of the NRCS phosphorus index detailed report shall satisfy the requirement to include the factors used in the calculation.

e. Information that shows all of the following:

(1) There is adequate storage for manure, process wastewater, stockpiled manure and open feedlot effluent, including procedures to ensure proper operation and maintenance of the storage structures.

(2) The proper management of animal mortalities to prevent discharge of pollutants to surface water and to ensure that animals are not disposed of in an open feedlot operation structure or a treatment system that is not specifically designed to treat animal mortalities.

(3) Surface drainage prior to contact with an open feedlot structure is diverted, as appropriate, from the open feedlot operation.

(4) Animals kept in the open feedlot operation do not have direct contact with any waters of the United States.

(5) Chemicals or other contaminants handled on site are not disposed of in manure, process wastewater, an open feedlot operation structure or a treatment system that is not specifically designed to treat such chemicals or contaminants.

(6) Equipment used for the land application of manure, process wastewater or open feedlot effluent must be periodically inspected for leaks.

(7) Appropriate site-specific conservation practices to be implemented, including as appropriate buffers or equivalent practices, to control runoff of pollutants to waters of the United States.

(8) Protocols for appropriate testing of manure, process wastewater, open feedlot effluent and soil.

(9) Protocols to land-apply manure, process wastewater or open feedlot effluent in accordance with site-specific nutrient management practices that ensure appropriate agricultural utilization of the nutrients in the manure, litter, process wastewater or open feedlot effluent.

(10) Identification of specific records that will be maintained to document the implementation and management of the requirements in this subrule.

f. Sales of scraped solids or settleable solids licensed by IDALS. Open feedlot operations that will sell scraped solids or settleable solids as a commercial fertilizer or soil conditioner regulated by IDALS under Iowa Code chapter 200 or bulk dry animal nutrient product under Iowa Code chapter 200A shall submit a copy of their site-specific IDALS license or documentation that manure will be sold pursuant to Iowa Code chapter 200 or 200A as regulated by IDALS and may, in lieu of complying with this subrule for that portion of open feedlot effluent, submit to the department a copy of the operation’s site-specific IDALS license or documentation for any scraped solids or settleable solids that will be sold pursuant to Iowa Code chapter 200 or 200A, along with the department-approved NMP form for sales of scraped solids or settleable solids.

g. An open feedlot operation must submit a complete NMP using a new phosphorus index, including soil sampling as required in subrule 65.111(11), for each field in the NMP a minimum of once every five years, submitting the plan with the NPDES permit renewal application if the open feedlot operation has an NPDES permit.

**65.209(9)** If an open feedlot operation uses an alternative technology system as provided in rule 567—65.207(455B,459A), the NMP is not required to provide for settled open feedlot effluent that enters the AT system.

**65.209(10)** Current NMP; recordkeeping; record inspections.

a. *Current NMP.* The owner of an open feedlot operation who is required to submit an NMP shall maintain a current NMP at the site of the open feedlot operation and shall make the current NMP available to the department upon request. If nutrient management practices change, a person required to submit an NMP shall make appropriate changes consistent with this rule. If values other than the standard table values are used for NMP calculations, the source of the values used shall be identified.

b. *Recordkeeping.* Records shall be maintained by the owner of an open feedlot operation who is required to submit an NMP. This recorded information shall be maintained for five years following the year of application or for the length of the crop rotation, whichever is greater. Records shall be maintained at the site of the open feedlot operation and shall be made available to the department

upon request. Records to demonstrate compliance with the NMP shall include the requirements of rule 567—65.111(455B,459,459B) and the following:

- (1) Weather conditions at time of application and for 24 hours prior to and following the application.
- (2) Date(s) when application equipment was inspected.
- (3) All applicable records identified in paragraph 65.209(8) “e.”

*c. Record inspection.* The department may inspect an open feedlot operation at any time during normal working hours and may inspect the NMP and any records required to be maintained.

[ARC 7965C, IAB 5/15/24, effective 6/19/24]

**567—65.210 to 65.299** Reserved.

#### DIVISION IV ANIMAL TRUCK WASH FACILITIES

**567—65.300(455B,459A) Minimum animal truck wash effluent control requirements.** An animal truck wash facility shall provide for the management of manure, process wastewater, settleable solids, scraped solids, and animal truck wash effluent by using the control method as provided in subrules 65.300(1) through 65.300(4). A release shall be reported to the department as provided in subrule 65.2(1).

**65.300(1)** No direct discharge of animal truck wash effluent shall be allowed from an animal truck wash facility into a publicly owned lake, a known sinkhole, or an agricultural drainage well.

**65.300(2)** Land application.

*a. General requirements.* Animal truck wash effluent shall be land-applied in a manner which will not cause pollution of surface water or groundwater. Land application of animal truck wash effluent shall not exceed one inch per hour, and land application shall cease immediately if runoff occurs. Land application of animal truck wash effluent shall be conducted on days when weather and soil conditions are suitable. Weather and soil conditions are normally considered suitable for animal truck wash effluent application if (1) land application areas are not frozen or snow-covered, (2) temperatures during application are greater than 32 degrees Fahrenheit, and (3) precipitation has not exceeded the water holding capacity of the soil to accept the effluent application without the possibility of runoff. Application in accordance with the provisions of state law and the rules in this chapter shall be deemed as compliance with this requirement.

*b. Separation distances.* A person shall not apply animal truck wash effluent on land located within 750 feet from a residence not owned by the titleholder of the land, unless one of the following applies:

- (1) The animal truck wash effluent is land-applied by injection or incorporation on the same date as the animal truck wash effluent was land-applied.
- (2) The titleholder of the land benefiting from the separation distance requirement executes a written waiver with the titleholder of the land where the animal truck wash effluent is land-applied.
- (3) The animal truck wash effluent is from a small animal truck wash facility or an animal truck wash facility that is part of a SAFO.

**65.300(3)** The owner of an animal truck wash facility who discontinues the use of the facility shall remove and land-apply in accordance with state law all manure, process wastewater and animal truck wash effluent from the animal truck wash effluent structures as soon as practical but not later than six months following the date the animal truck wash facility is discontinued.

**65.300(4)** Stockpiling of scraped solids and settleable solids. Stockpiles of solids scraped from animal truck wash facilities and stockpiles of settleable solids shall comply with the following requirements:

- a.* Stockpiles must be land-applied in accordance with subrule 65.300(2) as soon as possible but not later than six months after they are established.
- b.* Stockpiles shall not be located within 400 feet from a designated area or, in the case of a high-quality water, within 800 feet.
- c.* Stockpiles shall not be located in grassed waterways or areas where water ponds or has concentrated flow.

d. Stockpiles shall not be located within 200 feet of a terrace tile inlet or surface tile inlet or known sinkhole unless the stockpile is located so that any runoff from the stockpile will not reach the inlet or sinkhole.

e. Stockpiles shall not be located on land having a slope of more than 3 percent unless methods, structures or practices are implemented to contain the stockpiled solids, including but not limited to hay bales, silt fences, temporary earthen berms, or other effective measures, and to prevent or diminish precipitation-induced runoff from the stockpiled solids.

[ARC 7965C, IAB 5/15/24, effective 6/19/24]

**567—65.301(455B,459,459A) Construction permits.**

**65.301(1)** *Animal truck wash facilities required to obtain a construction permit.* An animal truck wash facility must obtain a construction permit as follows:

a. Prior to construction or expansion of an animal truck wash effluent structure.

b. When the department has previously issued the animal truck wash facility a construction permit and the volume of the animal truck wash effluent would be more than the volume approved by the department in the previous construction permit.

c. When the animal truck wash facility is part of a confinement feeding operation and all of the following apply:

(1) The department has issued a construction permit or an NPDES permit for the confinement feeding operation or a letter approving a construction design statement for the confinement feeding operation in lieu of a construction permit.

(2) The animal truck wash effluent will be added to an existing manure storage structure resulting in a total stored volume greater than that approved in the construction permit or the construction design statement approval letter.

d. When the animal truck wash facility is part of an open feedlot operation and all of the following apply:

(1) The department has issued a construction permit or an NPDES permit for an open feedlot operation.

(2) The animal truck wash effluent will be added to an existing settled open feedlot effluent basin resulting in a total stored volume greater than that approved in the construction permit or NPDES permit.

e. When an animal truck wash facility is constructed or expanded as part of a SAFO that includes a manure storage structure and the animal truck wash effluent will be added to the manure storage structure.

**65.301(2)** *Construction permit not required.* A construction permit is not required in the following situations:

a. When a small animal truck wash facility is constructed or expanded and remains a small animal truck wash facility.

b. When a small animal truck wash facility is part of a SAFO and the animal truck wash effluent is added to the manure storage structure.

**65.301(3)** *Construction permit applications that cannot be approved.* The department shall not approve an application for a construction permit unless the applicant submits all of the following:

a. An NMP as provided in rule 567—65.306(455B,459A).

b. An engineering report, construction plans, and specifications prepared by a PE or an NRCS-qualified staff person certifying that the design of the animal truck wash effluent structure complies with the construction design standards required in Division III of this chapter.

**65.301(4)** *Plan review criteria; time for approval or disapproval.*

a. *Plan review criteria.* Review of plans and specifications shall be conducted by the department to determine the potential of the animal truck wash effluent structure to achieve the level of control being required of the animal truck wash facility. Applicable criteria contained in federal law, state law, these rules, NRCS design standards and specifications unless inconsistent with federal or state law or these rules will be used in this review. If the proposed facility plans are not adequately covered by these criteria, applicable criteria contained in current technical literature shall be used.

b. *Time for approval or disapproval.* The department shall approve or disapprove an application for a construction permit within 60 days after receiving the permit application. However, the applicant may

deliver a notice requesting a continuance. Upon receipt of a notice, the time required for the department to act upon the application shall be suspended for the period provided in the notice but for not more than 30 days after the department's receipt of the notice. The applicant may submit more than one notice. If review of the application is delayed because the application is incomplete, and the applicant fails to supply requested information within a reasonable time prior to the deadline for action on the application, the permit may be denied and a new application will be required if the applicant wishes to proceed. The department may also provide for a continuance when it considers the application. The department shall provide notice to the applicant of the continuance. The time required for the department to act upon the application shall be suspended for the period provided in the notice but for not more than 30 days. However, the department shall not provide for more than one continuance.

**65.301(5) *Expiration of construction permits.*** The construction permit shall expire if construction, as defined in rule 567—65.6(455B,459,459A,459B), is not begun within one year and completed within three years of the date of issuance. The director may grant an extension of time to begin or complete construction if it is necessary or justified, upon showing of such necessity or justification to the director.

**65.301(6) *Revocation of construction permits.*** The department may suspend or revoke a construction permit, modify the terms or conditions of a construction permit, or refuse to renew a construction permit expiring according to subrule 65.301(5) if it determines that the operation of the animal truck wash facility constitutes a clear, present and impending danger to public health or the environment.

**65.301(7) *Permit prior to construction.*** An applicant for a construction permit shall notify the department prior to the start of construction for any animal truck wash facility. The applicant shall not begin construction of an animal truck wash facility until the person has been granted a permit for the construction by the department.

**65.301(8) *Materials used in animal truck wash.*** A facility that performs acid washing, aluminum brightening, or other such processes that significantly increase the metals concentration of the effluent is not considered an animal truck wash facility for purposes of this provision. Use of disinfectant materials to control and prevent animal diseases is allowed.

[ARC 7965C, IAB 5/15/24, effective 6/19/24]

**567—65.302(455B,459,459A) Separation distances.**

**65.302(1) *Separation distances for the construction or expansion of an animal truck wash effluent structure.***

a. An animal truck wash effluent structure shall not be constructed or expanded within 1,250 feet from a residence not owned by the titleholder of the animal truck wash facility, a commercial enterprise, a bona fide religious institution, an educational institution, or a public use area.

b. An animal truck wash effluent structure shall not be constructed or expanded within 100 feet from a public thoroughfare.

c. Any separation distance required for a confinement feeding operation structure and a location or object specified in Table 6 for "Water Wells" and "Other Distances" located at [iowadnr.gov/afo/rules](http://iowadnr.gov/afo/rules) shall also apply to the animal truck wash effluent structure and that same location or object.

d. An animal truck wash effluent structure shall not be constructed or expanded on land that is part of a one hundred year floodplain.

**65.302(2) *Exemptions to separation distances for the construction or expansion of an animal truck wash effluent structure.***

a. Paragraph 65.302(1)"a" does not apply if a residence, educational institution, bona fide religious institution, or commercial enterprise was constructed or expanded, or if the boundaries of a public use area were expanded, after the date that the animal truck wash facility was established. The date the animal truck wash facility was established is the date on which the animal truck wash facility commenced operating. A change in ownership or expansion of an animal truck wash facility shall not change the date of operation.

b. Paragraphs 65.302(1)"a" and "b" do not apply if the titleholder of the land benefiting from the separation distance requirement, including a person authorized by the titleholder, executes a written waiver with the owner of the animal truck wash effluent structure. The structure shall be constructed or expanded under such terms and conditions that the parties negotiate. The state or a political subdivision constructing or maintaining the public thoroughfare benefiting from the separation distance requirement may execute

a written waiver with the titleholder of the land where the structure is located. The structure shall be constructed or expanded under such terms and conditions that the parties negotiate. The waiver shall be specific to the construction or expansion project for which it is submitted. The waiver may include specific language to include future projects or expansions.

c. Paragraphs 65.302(1) “a” and “b” shall not apply to small animal truck wash facilities.

d. Exemptions to separation distance requirements from water sources, major water sources, known sinkholes, agricultural drainage wells and designated wetlands and secondary containment. As specified in Iowa Code section 459.310(3), the separation distance required from surface intakes, wellheads or cisterns of agricultural drainage wells, known sinkholes, water sources, major water sources and designated wetlands, specified in Iowa Code section 459.310 and summarized in Tables 6 to 6d located at [iowadnr.gov/afo/rules](http://iowadnr.gov/afo/rules), shall not apply to a farm pond or privately owned lake as defined in Iowa Code section 462A.2 or to an animal truck wash effluent structure constructed with a secondary containment barrier according to subrule 65.108(11). To qualify for this separation distance exemption, the design of the secondary containment barrier shall be filed in accordance with subrule 65.104(5) prior to beginning construction of the animal truck wash facility.

e. Paragraphs 65.302(1) “c” and “d” shall not apply to the replacement of an unformed animal truck wash effluent structure constructed prior to April 28, 2003, with a formed animal truck wash effluent structure. The capacity of a replacement animal truck wash effluent structure shall not exceed the amount required to store animal truck wash effluent for any 18-month period.

**65.302(3) *Unformed animal truck wash effluent structures.*** Unformed animal truck wash effluent structures shall be separated from water wells as follows:

a. *Public wells.* 1,000 feet from shallow wells and 400 feet from deep wells;

b. *Private wells.* 400 feet from both shallow wells and deep wells.

**65.302(4) *Formed animal truck wash effluent structures.*** Formed animal truck wash effluent structures shall be separated from water wells as follows: for both public wells and private wells, 200 feet from shallow wells and 100 feet from deep wells.

[ARC 7965C, IAB 5/15/24, effective 6/19/24]

#### **567—65.303(455B,459A) Construction permit application.**

**65.303(1)** An animal truck wash facility required to obtain a construction permit in accordance with the provisions of subrule 65.301(1) shall apply for the construction permit at least 90 days before the date that construction, installation, or modification is scheduled to start.

**65.303(2)** Application for a construction permit for an animal truck wash facility shall be made on a form provided by the department. The application shall include all of the information necessary to enable the department to determine the potential of the proposed animal truck wash effluent structure to achieve the level of control required of the animal truck wash facility. A construction permit application shall include the following:

a. The name of the animal truck wash facility and the name of the owner of the animal truck wash facility, including the owner’s mailing address and telephone number.

b. The name of the contact person for the animal truck wash facility, including the person’s mailing address and telephone number.

c. The location of the animal truck wash facility.

d. A statement providing that the application is for any of the following:

(1) The construction or expansion of an animal truck wash effluent structure for an existing animal truck wash facility that is not expanding;

(2) The construction or expansion of an animal truck wash effluent structure for an existing animal truck wash facility that is expanding;

(3) The construction of an animal truck wash effluent structure for a proposed new animal truck wash facility.

e. An engineering report, construction plans, and specifications prepared by a PE or by an NRCS-qualified staff person. The engineering report must demonstrate that the storage capacity of the animal truck wash effluent structure is equal to or greater than the amount of effluent to be stored for any

six-month period, in addition to two feet of freeboard for an unformed animal truck wash effluent structure or one foot of freeboard for a formed animal truck wash effluent structure.

- f. A report on the soil and hydrogeologic information for the site, as described in subrule 65.304(2).
- g. Information including but not limited to maps, drawings and aerial photos that clearly show the location of all the following:
  - (1) The animal truck wash facility and all existing and proposed animal truck wash effluent structures.
  - (2) Any animal truck wash facility under common ownership or common management and located within 1,250 feet of the animal truck wash facility.
  - (3) Any public water supply system as defined in Iowa Code section 455B.171 or drinking water well that is located less than the distance from the animal truck wash facility required by subrules 65.302(3) and 65.302(4). Information shall also be provided as to whether the proposed animal truck wash effluent structure will meet all applicable separation distances.

[ARC 7965C, IAB 5/15/24, effective 6/19/24]

**567—65.304(455B,459A) Unformed animal truck wash effluent structure—investigation; design; construction requirements.** An unformed animal truck wash effluent structure required to be constructed pursuant to a construction permit issued pursuant to Iowa Code section 459A.205 shall meet the design and construction requirements set forth in this rule.

**65.304(1) *Drainage tile investigation and removal.*** Prior to constructing an unformed truck wash effluent basin, the site for the basin shall be investigated for drainage tile lines as provided in this subrule. All applicable records of known drainage tiles shall be examined for the existence of drainage tile lines.

a. Prior to excavation for an unformed manure storage structure, an inspection trench of at least ten inches wide shall be dug around the structure to a depth of at least 6 feet below the original grade and within 25 feet of the proposed outside of the toe of the berm.

b. Drainage tile lines discovered during the tile inspection of an unformed manure storage structure shall be removed and rerouted in the inspection trench or in an area outside of the inspection trench. All tiles within the inspection trench perimeter shall be removed or completely plugged with concrete, grout or similar materials. Drainage tile lines installed at the time of construction to lower the groundwater may remain in place as long as they are outside of the proposed toe of berm.

**65.304(2) *Soils and hydrogeologic report.*** An unformed animal truck wash effluent structure required to be constructed pursuant to a construction permit issued pursuant to rule 567—65.301(455B,459,459A) shall meet design standards as required by a soils and hydrogeologic report. The report shall be submitted with the construction permit application as provided in rule 567—65.303(455B,459A). The report shall include all of the following:

a. A description of the steps taken to determine the soils and hydrogeologic conditions at the proposed construction site, a description of the geologic units encountered, and a description of the effects of the soil and groundwater elevation and direction of flow on the construction and operation of the unformed animal truck wash effluent structure.

b. The subsurface soil classification of the site. A subsurface soil classification shall be based on ASTM international designation D 2487-06 or D 2488-06.

c. The results of a soils investigation conducted at a minimum of three locations within the area of the unformed animal truck wash effluent structure reflecting the continuous soil profile existing within the area of the unformed animal truck wash effluent structure. The soils investigation results shall be used in determining subsurface soil characteristics and groundwater elevation and direction of flow at the proposed site. The soils investigation shall be conducted and utilized as follows:

- (1) By a qualified person ordinarily engaged in the practice of performing soils investigations.
- (2) At locations that reflect the continuous soil profile conditions existing within the area of the proposed unformed animal truck wash effluent structure, including conditions found near the corners and the deepest point of the proposed unformed animal truck wash effluent structure. The soils investigation shall be conducted to a minimum depth of ten feet below the proposed bottom elevation of the unformed animal truck wash effluent structure.
- (3) By methods that identify the continuous soil profile and do not result in mixing of soil layers. Soil corings using hollow-stem augers and other suitable methods may be used.

(4) Soil corings may be used to determine current groundwater levels by completing the corings as temporary monitoring wells as provided in subparagraph 65.304(3)“a”(1) and measuring the water levels in these wells no earlier than seven days after installation as provided in subparagraph 65.304(3)“a”(1).

(5) Upon abandonment of soil core holes, all soil core holes, including those developed as temporary water level monitoring wells, shall be plugged with concrete, Portland cement concrete grout, bentonite, or similar materials.

(6) If excavation methods are used in conducting the soils investigation, upon closure these excavations must be filled with suitable materials and adequately compacted to ensure they will not compromise the integrity of the unformed animal truck wash effluent structure liner.

**65.304(3) Hydrology.**

*a.* Determination of groundwater table. For purposes of this rule, the groundwater table is the seasonal high-water table determined by a PE, a groundwater professional certified pursuant to 567—Chapter 134, or qualified staff from the department or NRCS. If a construction permit is required, the department must approve the groundwater table determination.

(1) Current groundwater levels shall be measured as provided in this subparagraph for an unformed animal truck wash effluent structure. Three temporary monitoring wells shall be installed. The top of the well screen shall be within five feet of the ground surface. Each well shall be extended to at least two feet below the proposed top of the liner of an unformed animal truck wash effluent structure or to at least two feet below the proposed bottom of the footings of a formed animal truck wash effluent structure. In addition, the wells must be installed as follows:

1. Unformed animal truck wash effluent structure. For an unformed animal truck wash effluent structure, the monitoring wells may be installed in the soil core holes developed as part of conducting the soils investigation required in paragraph 65.304(2)“c.”

2. Formed animal truck wash effluent structure. For a formed animal truck wash effluent structure, at least three temporary monitoring wells shall be installed as close as possible to three corners of the structure, with one of the wells close to the corner of deepest excavation. If the formed animal truck wash effluent structure is circular, the three monitoring wells shall be equally spaced and one well shall be placed at the point of deepest excavation.

(2) The seasonal high-water table shall be determined by considering all relevant data, including the groundwater levels measured in the temporary monitoring wells not earlier than seven days following installation, NRCS soil survey information, soil characteristics such as color and mottling, other existing water table data, and other pertinent information. If a drainage system for artificially lowering the groundwater table will be installed in accordance with the requirements of paragraph 65.304(3)“c,” the level to which the groundwater table will be lowered will be considered to represent the seasonal high-water table.

*b.* The unformed animal truck wash effluent structure shall be constructed with a minimum separation of two feet between the top of the liner of the unformed animal truck wash effluent structure and the seasonal high-water table.

*c.* If a drainage tile line around the perimeter of the basin is installed a minimum of two feet below the top of the unformed animal truck wash effluent structure liner to artificially lower the seasonal high-water table, the top of the unformed animal truck wash effluent structure’s liner may be a maximum of four feet below the seasonal high-water table which existed prior to installation of the perimeter tile system. The seasonal high-water table may be artificially lowered by gravity flow tile lines or other similar system. However, the following shall apply:

(1) Except as provided in subparagraph 65.304(3)“c”(2), an animal truck wash facility shall not use a nongravity mechanical system that uses pumping equipment.

(2) If the animal truck wash facility was constructed before July 1, 2005, the operation may continue to use its existing nongravity mechanical system that uses pumping equipment or it may construct a new nongravity mechanical system that uses pumping equipment. However, an animal truck wash facility that expands the area of its animal truck wash facility on or after April 1, 2011, shall not use a nongravity mechanical system that uses pumping equipment.

(3) Drainage tile lines may be installed to artificially lower the seasonal high-water table at an unformed animal truck wash effluent structure, if all of the following conditions are satisfied:

1. A device to allow monitoring of the water in the drainage tile lines and a device to allow shutoff of the flow in the drainage tile lines are installed, if the drainage tile lines do not have a surface outlet accessible on the property where the unformed animal truck wash effluent structure is located.

2. Drainage tile lines are installed horizontally no greater than 25 feet away from the outside toe of the berm of the unformed animal truck wash effluent structure. Drainage tile lines shall be placed in a vertical trench and encased in granular material which extends upward to the level of the seasonal high-water table which existed prior to installation of the perimeter tile system.

**65.304(4) *Liner design and construction.*** The liner of an unformed animal truck wash effluent structure shall comply with all of the following:

a. The liner shall comply with any of the following permeability standards:

(1) The liner shall be constructed to have a percolation rate that shall not exceed one-sixteenth inch per day at the design depth of the unformed animal truck wash effluent structure as determined by percolation tests conducted by the PE. If a clay soil liner is used, the liner shall be constructed with a minimum thickness of 12 inches or the minimum thickness necessary to comply with the percolation rate in this subparagraph, whichever is greater.

(2) The liner shall be constructed to have a percolation rate that shall not exceed one-sixteenth inch per day at the design depth of the unformed animal truck wash effluent structure. The design of the liner will specify a moisture content, compaction requirement, and liner thickness that will comply with the maximum allowable percolation requirement and will be based on moisture content and percentage of maximum density as determined by a standard 5-point proctor test performed in accordance with ASTM D698 (Method A), effective date November 11, 1991. The liner thickness will be based on laboratory tests of the compacted material, with a minimum liner thickness of 12 inches. Appropriate field or laboratory testing during construction shall be provided to verify the design requirements are met.

b. If a synthetic liner is used, the liner shall be installed to comply with the percolation rate required in subparagraph 65.304(4)“a”(1).

**65.304(5) *Berm erosion inspection and repair.*** The owner of an animal truck wash facility using an unformed animal truck wash effluent structure shall inspect the berms of the unformed animal truck wash effluent structure at least semiannually for evidence of erosion. If the inspection reveals erosion that may impact the unformed animal truck wash effluent structure’s structural stability or the integrity of the unformed animal truck wash effluent structure’s liner, the owner shall repair the berms.

**65.304(6) *Basins containing confinement manure and animal truck wash effluent.*** Basins containing confinement manure and animal truck wash effluent shall meet the confinement construction standards and separation distance requirements provided in Division II of this chapter. The basin design shall ensure adequate storage including two feet of freeboard for an unformed animal truck wash effluent structure or one foot of freeboard for a formed animal truck wash effluent structure. The basin shall contain the annual manure generated from all confinement animals.

**65.304(7) *Formed animal truck wash effluent structures.*** An animal truck wash facility electing to use a formed animal truck wash effluent structure may submit, in lieu of an engineering report, a construction design statement that meets the requirements in subrule 65.104(3).

[ARC 7965C, IAB 5/15/24, effective 6/19/24]

### **567—65.305(455B,459A) Construction certification.**

**65.305(1)** The owner of an animal truck wash facility who is issued a construction permit for an animal truck wash effluent structure as provided in rule 567—65.301(455B,459,459A) shall submit to the department a construction certification on a form provided by the department from a PE certifying all of the following:

a. The animal truck wash effluent structure was constructed in accordance with the design plans submitted to the department as part of an application for a construction permit pursuant to rule 567—65.303(455B,459A). If the actual construction deviates from the approved design plans, the construction certification shall identify all changes and certify that the changes were consistent with all applicable standards of these rules.

b. The animal truck wash effluent structure was inspected by the PE after completion of construction and before commencement of operation.

**65.305(2)** A written record of an investigation for drainage tile lines, including the findings of the investigation and actions taken to comply with subrule 65.304(1), shall be submitted as part of the construction certification.

[ARC 7965C, IAB 5/15/24, effective 6/19/24]

**567—65.306(455B,459A) NMP requirements.**

**65.306(1)** The owner of an animal truck wash facility, other than a small animal truck wash facility, that has an animal truck wash effluent structure shall develop and implement an NMP meeting the requirements of this rule. However, an animal truck wash facility that is part of a confinement feeding operation, in lieu of submitting an NMP, may submit an original MMP and an updated MMP to the department.

**65.306(2)** A person shall not remove animal truck wash effluent from an animal truck wash facility for which an NMP is required under this rule, unless the department approves an NMP as required in this rule.

**65.306(3)** The department shall not approve an application for a permit to construct an animal truck wash effluent structure unless the owner of the animal truck wash facility applying for approval submits an NMP together with the application for the construction permit as provided in rule 567—65.301(455B,459,459A).

**65.306(4)** If a construction permit is required as provided in rule 567—65.301(455B,459,459A), the department shall approve or disapprove the NMP as part of the construction permit application. If a construction permit is not required, the department shall approve or disapprove the NMP within 60 days from the date that the department receives the NMP.

**65.306(5)** An NMP shall include all of the following:

a. Restrictions on the application of animal truck wash effluent based on all of the following:

(1) A phosphorus index of each field in the NMP, as required in subrule 65.111(12), including the factors used in the calculation. A copy of the NRCS phosphorus index detailed report shall satisfy the requirement to include the factors used in the calculation. In addition, total phosphorus (as  $P_2O_5$ ) available to be applied from the animal truck wash facility shall be included.

(2) Calculations necessary to determine the land area required for the application of animal truck wash effluent from an animal truck wash facility based on nitrogen or phosphorus use levels (as determined by the phosphorus index) in order to obtain optimum crop yields according to a crop schedule specified in the NMP and according to requirements specified in subrule 67.111(4).

b. Information relating to the application of the animal truck wash effluent, including application methods, the timing of the application, and the location of the land where the application occurs.

c. If the application is on land other than land owned or rented for crop production by the owner of the animal truck wash facility, the plan shall include a copy of each written agreement executed by the owner and the landowner or the person renting the land for crop production where the animal truck wash effluent may be applied. The written agreement shall indicate the number of acres on which the animal truck wash effluent may be applied and the length of the agreement.

d. An estimate of the animal truck wash effluent volume or weight produced by the animal truck wash facility.

e. Information that shows all of the following:

(1) There is adequate storage for animal truck wash effluent, including procedures to ensure proper operation and maintenance of the storage structures.

(2) Surface drainage is diverted from the animal truck wash facility.

(3) Chemicals or other contaminants handled on site are not disposed of in an animal truck wash facility that is not specifically designed to store such chemicals or contaminants.

(4) Equipment used for the land application of animal truck wash effluent must be periodically inspected for leaks.

(5) Appropriate site-specific conservation practices to be implemented, including as appropriate buffers or equivalent practices, to control runoff of pollutants to waters of the United States.

- (6) Protocols for appropriate testing of animal truck wash effluent and soil.
- (7) Protocols to land-apply animal truck wash effluent in accordance with site-specific nutrient management practices that ensure appropriate agricultural utilization of the nutrients in the animal truck wash effluent.
- (8) Identification of specific records that will be maintained to document the implementation and management of the requirements in this subrule.

**65.306(6)** Current NMP; recordkeeping; record inspections.

*a. Current NMP.* The owner of an animal truck wash facility who is required to submit an NMP shall maintain a current NMP at the site of the animal truck wash facility and shall make the current NMP available to the department upon request. If nutrient management practices change, a person required to submit an NMP shall make appropriate changes consistent with this rule. If values other than the standard table values are used for NMP calculations, the source of the values used shall be identified.

*b. Recordkeeping.* Records shall be maintained by the owner of an animal truck wash facility who is required to submit an NMP. This recorded information shall be maintained for five years following the year of application or for the length of the crop rotation, whichever is greater. Records shall be maintained at the site of the animal truck wash facility, either as a hard copy or electronically, and shall be made available to the department upon request. Records to demonstrate compliance with the NMP shall include requirements of rule 567—65.111(455B,459,459B) and the following:

- (1) Weather conditions at time of application and for 24 hours prior to and following the application.
- (2) For animal truck wash facilities, the soil test analysis must include phosphorus.
- (3) Dates when application equipment was inspected.
- (4) All applicable records identified in paragraph 65.306(5) “e.”

*c. Record inspection.* The department may inspect an animal truck wash facility at any time during normal working hours and may inspect the NMP and any records required to be maintained.

[ARC 7965C, IAB 5/15/24, effective 6/19/24]

These rules are intended to implement Iowa Code sections 455B.103, 455B.134, and 455B.171 and chapters 459, 459A, and 459B.

<sup>1</sup> Effective date of Chapter 65 [DEQ, ch 20] delayed by the Administrative Rules Review Committee until October 25, 1976, pursuant to Iowa Code section 17A.4 amended by S.F. 1288, §8.

<sup>2</sup> Effective date of 65.17(13) “e” delayed 70 days by the Administrative Rules Review Committee at its meeting held August 11, 2004.

CHAPTER 66  
PESTICIDE APPLICATION TO WATERS  
Rescinded **ARC 9203C**, IAB 5/14/25, effective 6/18/25

CHAPTER 67  
STANDARDS FOR THE LAND APPLICATION OF SEWAGE SLUDGE

Chapter rescission date pursuant to Iowa Code section 17A.7: 6/18/30

**567—67.1(455B) Purpose and scope.**

**67.1(1)** This chapter establishes standards for the land application of sewage sludge generated during the treatment of domestic sewage in a treatment works. This chapter applies to any generator, applicator, or both, and to sewage sludge applied to the land.

*a.* In areas that are not specifically addressed in this chapter or in 567—Chapter 68, but which are addressed in federal regulations for sewage sludge applied to land at 40 CFR Part 503, the federal regulations shall apply under this rule and are hereby adopted by reference under this chapter.

*b.* On a case-by-case basis, the department may impose requirements for the land application of sewage sludge in addition to or more stringent than the requirements in this chapter when necessary to protect public health and the environment from any adverse effect of a pollutant in the sewage sludge.

**67.1(2)** Sewage sludge generators shall ensure that the applicable requirements in this chapter are met when sewage sludge is land applied. If a sewage sludge generator determines that a person being supplied sewage sludge for land application is not complying with applicable requirements of the land application program, the generator shall work with the applicator to obtain compliance with the requirements. If subsequent compliance cannot be achieved, the generator shall not supply additional sewage sludge to the applicator.

**67.1(3)** Exclusions. In accordance with 40 CFR §503.6, this chapter does not establish requirements for the land application of sludge generated at an industrial facility, hazardous sewage sludge, sewage sludge with a polychlorinated biphenyl (PCB) concentration of 50 mg/kg or higher, incinerator ash, grit and screenings, or drinking water treatment sludge.

[ARC 9206C, IAB 5/14/25, effective 6/18/25]

**567—67.2(455B) Sampling and analysis.**

**67.2(1)** Any sewage sludge generator who intends to land apply sewage sludge shall:

*a.* Sample and analyze the waste to determine whether it meets the criteria for sewage sludge for Class I, II, or III; and

*b.* Analyze the waste to determine if any sources exist which may contribute significant quantities of potentially hazardous chemicals or other toxic substances. If any are found, the generator shall inform the department of their presence and shall analyze the waste for chemicals or substances in accordance with department guidelines.

**67.2(2)** Unless rules for specific programs under EPA or department authority provide otherwise, or unless other methods are approved by the department for a specific situation, samples taken and analyses made to document contamination under this chapter shall be conducted in accordance with the methods described in 567—67.9(455B).

[ARC 9206C, IAB 5/14/25, effective 6/18/25]

**567—67.3(455B) Land application plan.** All sewage sludge generators wishing to land apply sewage sludge shall establish and maintain in writing a long-range plan for land application of sewage sludge. A copy of this plan shall be available at the facility for department inspection.

**67.3(1)** The long-range plan shall be:

*a.* Developed for a minimum period of five years;

*b.* Updated annually; and

*c.* Designed to ensure that land application can be conducted in accordance with the requirements of this chapter.

**67.3(2)** At a minimum, the long-term plan shall contain the following information in detail for the next calendar year and in general terms for the following four years:

*a.* An outline of the sewage sludge sampling schedule and procedures that will be followed;

*b.* A determination of the amount of land required for proper land application of the sewage sludge;

- c. Identification of the land areas and appropriate land application methods that will be used;
- d. For each land application area, the names of the landowners and the applicators, an identification of any legal arrangements related to the use of an area, and an outline of any restrictions or special conditions that exist regarding the use of an area for the land application of sewage sludge;
- e. An overall land application schedule, including the areas being used, the time of year that land application will occur on each area, and the estimated application rate for each area; and
- f. A determination of all of the following:
  - (1) The types and capacities of the required application equipment, including an outline of how the equipment will be made available and who will be responsible for conducting land application operations;
  - (2) The types and capacities of necessary sludge storage and handling structures;
  - (3) Whether any additional sludge storage or handling facilities are needed; and
  - (4) A timeline to construct or obtain any required additional sludge storage, handling, or application facilities or equipment.

[ARC 9206C, IAB 5/14/25, effective 6/18/25]

#### **567—67.4(455B) Special definitions.**

**67.4(1)** *Definitions in the Iowa Code.* “Sewage sludge” is defined in Iowa Code section 455B.171(34). For the purposes of this chapter, the term includes materials derived from sewage sludge.

**67.4(2)** *Definitions in the CFR.* The following terms applicable to this chapter are defined in the referenced locations:

- a. 40 CFR §503.9: “dry weight basis,” “food crops,” and “person who prepares sewage sludge.”
- b. 40 CFR §503.11: “agronomic rate,” “annual whole sludge application rate,” “bulk sewage sludge,” and “cumulative pollutant loading rate.”
- c. 40 CFR §503.31: “land with a high potential for public exposure” and “land with a low potential for public exposure.”

**67.4(3)** The following definitions apply to this chapter:

“Applicator” or “sewage sludge applicator” means any person who applies sewage sludge to the land.

“Class I sewage sludge” means sewage sludge that meets the criteria under 67.6(1).

“Class II sewage sludge” means sewage sludge that meets the criteria under 67.7(1).

“Class III sewage sludge” means any sewage sludge that cannot meet either Class I sewage sludge criteria or Class II sewage sludge criteria.

“Generator” or “sewage sludge generator” means any person who generates sewage sludge, who derives a material from sewage sludge, or both.

[ARC 9206C, IAB 5/14/25, effective 6/18/25]

**567—67.5(455B) Permit requirements.** Prior to any land application of sewage sludge, a permit must be obtained by the sewage sludge generator in accordance with the following requirements:

**67.5(1)** The permit for the land application of sewage sludge produced by a wastewater treatment facility that has been issued a construction permit from the department will be issued concurrently and as part of an operation permit or NPDES permit. The issuance process and permit terms will be the same as those specified for NPDES permits in 567—Chapter 60.

**67.5(2)** The department will review, on a case-by-case basis, requests for a permit to land apply sewage sludge or any material derived from sewage sludge if the sewage sludge is produced outside of the state of Iowa or produced by a wastewater treatment plant that has not been issued a construction permit from the department.

[ARC 9206C, IAB 5/14/25, effective 6/18/25]

#### **567—67.6(455B) Land application requirements for Class I sewage sludge.**

**67.6(1)** *Class I criteria.* Class I sewage sludge is sewage sludge that meets the pollutant concentrations in 67.6(1)“a,” the Class A pathogen reduction requirements in 67.6(1)“b,” and the vector attraction reduction (VAR) requirements in 67.6(1)“c.”

a. *Class I pollutant concentrations.* The concentration of each pollutant in the sewage sludge shall not exceed the concentration for the pollutant in Table 1.

**TABLE 1—POLLUTANT CONCENTRATIONS**

| <b>Pollutant</b> | <b>Monthly average concentration in mg per kg, dry weight basis</b> |
|------------------|---------------------------------------------------------------------|
| Arsenic          | 41                                                                  |
| Cadmium          | 39                                                                  |
| Copper           | 1500                                                                |
| Lead             | 300                                                                 |
| Mercury          | 17                                                                  |
| Nickel           | 420                                                                 |
| Selenium         | 100                                                                 |
| Zinc             | 2800                                                                |

b. *Class I pathogen requirements (Class A).* The sewage sludge shall comply with 67.6(1)“b”(1) and “b”(2).

(1) The sewage sludge shall comply with one of the following monitoring processes. Compliance with pathogen density shall not be based on an average value. Each individual sample result shall meet the numerical pathogen standards.

1. The fecal coliform density in the sewage sludge shall be less than 1,000 Most Probable Number (MPN) per gram of total solids (dry weight basis), or
2. The *Salmonella* sp. bacteria density in the sewage sludge shall be less than three MPN per four grams of total solids (dry weight basis).

(2) The sewage sludge shall comply with one of the following analytical and treatment processes:

1. The sewage sludge temperature shall be maintained at a specific value for a period of time using one of the procedures detailed below.

- When the percent solids of the sewage sludge is 7 percent or higher, the sewage sludge temperature shall be 50 degrees Celsius (°C) or higher; the time period shall be 20 minutes or longer; and the temperature and time period shall be determined using Equation 1, except when small particles of sewage sludge are heated by either warmed gases or an immiscible liquid.

- When the percent solids of the sewage sludge is 7 percent or higher and small particles of sewage sludge are heated by either warmed gases or an immiscible liquid, the sewage sludge temperature shall be 50°C or higher; the time period shall be 15 seconds or longer; and the temperature and time period shall be determined using Equation 1.

- When the percent solids of the sewage sludge is less than 7 percent and the time period is at least 15 seconds, but less than 30 minutes, the temperature and time period shall be determined using Equation 1.

$$\text{Equation 1: } D = 131,700,000/10^{0.1400t}$$

Where D = time in days; t = temperature in °C

- When the percent solids of the sewage sludge is less than 7 percent, the sewage sludge temperature is 50°C or higher, and the time period is 30 minutes or longer, the temperature and time period shall be determined using Equation 2.

$$\text{Equation 2: } D = 50,070,000/10^{0.1400t}$$

Where D = time in days; t = temperature in °C

2. The sewage sludge shall meet all of the following requirements:

- The sludge pH shall be raised to above 12 and shall remain above 12 for 72 hours;
- The sludge temperature shall be above 52°C for 12 hours or longer during the period that the sludge pH is above 12; and

- At the end of the 72-hour period during which the sludge pH is above 12, the sludge shall be air dried to achieve a percent solids in the sludge greater than 50 percent.

3. Sewage sludge treated in other known processes shall be analyzed prior to pathogen treatment to determine whether it contains enteric viruses and viable helminth ova. After pathogen treatment, the density of enteric viruses in the sewage sludge shall be less than one plaque-forming unit per four grams of total solids (dry weight basis), and the density of viable helminth ova shall be less than one per four grams

of total solids (dry weight basis). Once the process has been demonstrated to achieve the required pathogen reduction, the process must be operated under the same conditions that were used during the demonstration.

4. Sewage sludge treated by unknown processes or by processes operating at conditions less stringent than the operating conditions at which the sewage sludge could qualify as Class I under other alternatives shall be analyzed prior to pathogen treatment to determine whether the sewage sludge contains enteric viruses and viable helminth ova. The density of enteric viruses in the sewage sludge shall be less than one plaque-forming unit per four grams of total solids (dry weight basis), and the density of viable helminth ova shall be less than one per four grams of total solids (dry weight basis).

5. Sewage sludge shall be treated in one of the Processes to Further Reduce Pathogens (PFRP) described in 67.10(2).

6. Sewage sludge shall be treated in a process that is equivalent to a PFRP, as determined by the department.

c. *Class I VAR requirements.* The sewage sludge shall meet one of the following VAR requirements.

(1) The mass of volatile solids in the sewage sludge shall be reduced by a minimum of 38 percent.

(2) A portion of the previously anaerobically digested sewage sludge shall be digested anaerobically in the laboratory in a bench-scale unit for 40 additional days at a temperature between 30°C and 37°C. If, at the end of the 40 days, the volatile solids in the sludge at the beginning of that period are reduced by less than 17 percent, VAR is achieved.

(3) A portion of the previously aerobically digested sewage sludge that has 2 percent solids or less shall be digested aerobically in the laboratory in a bench-scale unit for 30 additional days at 20°C. If, at the end of the 30 days, the volatile solids in the sludge at the beginning of that period is reduced by less than 15 percent, VAR is achieved.

(4) The specific oxygen uptake rate (SOUR) for sewage sludge treated in an aerobic process shall be equal to or less than 1.5 milligrams (mg) of oxygen per hour per gram of total solids (dry weight basis) at a temperature of 20°C.

(5) Sewage sludge shall be treated in an aerobic process for 14 days or longer. During that time, the sewage sludge temperature shall be higher than 40°C and the average sewage sludge temperature shall be higher than 45°C.

(6) The sewage sludge pH shall be raised to 12 or higher, measured at 25°C, by alkali addition and, without the addition of more alkali, shall remain at 12 or higher for two hours and then at 11.5 or higher for an additional 22 hours.

(7) The percent solids of sewage sludge that does not contain unstabilized solids generated in a primary wastewater treatment process shall be equal to or greater than 75 percent based on the moisture content and total solids prior to mixing with other materials.

(8) The percent solids of sewage sludge that contains unstabilized solids generated in a primary wastewater treatment process shall be equal to or greater than 90 percent based on the moisture content and total solids prior to mixing with other materials.

(9) Sewage sludge shall be injected below the land surface, and no significant amount of the sludge shall be present on the land surface within one hour after injection.

(10) Sewage sludge applied to the land surface or placed on a surface disposal site shall be incorporated into the soil within six hours after application to or placement on the land.

**67.6(2)** *Class I management practices.* Class I sewage sludge may be land applied in conformance with the following rules:

a. Class I sewage sludge may be applied to a lawn or a home garden.

b. Class I sewage sludge shall be applied to the land at an annual whole sludge application rate that is equal to or less than the agronomic nitrogen uptake rate, unless otherwise specified by the department.

c. An information sheet shall be provided to a person who receives Class I sewage sludge that is sold or given away in a container for land application. The information sheet shall contain:

(1) The name and address of the sewage sludge generator;

(2) A statement that land application of the sewage sludge is prohibited except in accordance with the instructions on the information sheet; and

(3) The annual application rate for the sewage sludge.

**67.6(3)** *Class I monitoring frequency.*

*a.* The pollutants listed in Table 1, the pathogen density requirements, and the VAR requirements shall be monitored at the frequency stated in Table 2.

**TABLE 2—MONITORING FREQUENCY**

| <b>Amount of sewage sludge per 365-day period, dry weight basis</b>                      | <b>Monitoring Frequency</b>            |
|------------------------------------------------------------------------------------------|----------------------------------------|
| Greater than 0 but less than 290 metric tons (mt)<br>(or 320 English tons)               | once per year                          |
| Equal to or greater than 290 but less than 1,500 mt<br>(320 to 1,653 English tons)       | once per quarter<br>(4 times per year) |
| Equal to or greater than 1,500 but less than 15,000 mt<br>(1,653 to 16,535 English tons) | once per 60 days<br>(6 times per year) |
| Equal to or greater than 15,000 mt<br>(or 16,535 English tons)                           | once per month<br>(12 times per year)  |

*b.* After the sewage sludge has been monitored for two years, the department may reduce the monitoring frequency, but in no case shall the monitoring frequency be less than once per year when sewage sludge is land applied.

**67.6(4)** *Class I recordkeeping.*

*a.* Both the generator and bulk sludge applicator of Class I sewage sludge shall develop the following information and retain it for five years:

- (1) The concentration of each pollutant listed in Table 1 in the sewage sludge.
- (2) The following certification statement: “I certify, under penalty of law, that the Class I sewage sludge requirements have been met. I am aware that there are significant penalties for false certification including the possibility of fine and imprisonment.”
- (3) Descriptions of how the PFRP are met, how one of the VAR requirements is met, and how the management practices are met for each site.

*b.* Treatment works with a design flow rate of 1 million gallons per day (mgd) or greater and treatment works that serve 10,000 people or more shall submit the above information to EPA, using EPA’s NPDES eReporting Tool (NeT), by February 19 of each year for the previous calendar year.

[ARC 9206C, IAB 5/14/25, effective 6/18/25]

**567—67.7(455B) Land application requirements for Class II sewage sludge.**

**67.7(1)** *Class II criteria.* Class II sewage sludge is sewage sludge that meets the pollutant concentrations in 67.7(1)“a,” the pathogen reduction requirements in 67.7(1)“b,” and the VAR requirements in 67.7(1)“c.”

*a.* *Class II pollutant concentrations.* The concentration of any pollutant in Class II sewage sludge shall not exceed the ceiling concentration for the pollutant in Table 3.

**TABLE 3—CEILING CONCENTRATIONS**

| <b>Pollutant</b> | <b>Ceiling concentration in mg per kg, dry weight basis</b> |
|------------------|-------------------------------------------------------------|
| Arsenic          | 75                                                          |
| Cadmium          | 85                                                          |
| Copper           | 4300                                                        |
| Lead             | 840                                                         |
| Mercury          | 57                                                          |
| Molybdenum       | 75                                                          |
| Nickel           | 420                                                         |
| Selenium         | 100                                                         |
| Zinc             | 7500                                                        |

*b. Class II pathogen reduction requirements.* Class II sewage sludge shall meet one of the following three alternatives:

(1) Seven samples of the sewage sludge shall be collected at the time of disposal, and the geometric mean of the fecal coliform density shall be less than 2,000,000 MPN per gram of total solids (dry weight basis);

(2) Sewage sludge shall be treated in a PSRP described in 67.10(1); or

(3) Sewage sludge shall be treated in a process that is equivalent to a PSRP, as determined by the department.

*c. Class II VAR requirements.* The Class II VAR requirements are the same as those for Class I sewage sludge in 67.6(1)“c.”

**67.7(2) Class II management practices.** Class II sewage sludge may be land applied in conformance with the following:

*a.* Class II sewage sludge shall not be land applied:

(1) To a lawn or a home garden; or

(2) If it is likely to adversely affect a threatened or endangered species listed under section 4 of the Endangered Species Act, 16 U.S.C. 1533, effective December 27, 2022, or the species’ designated critical habitat.

*b.* Land application sites accepting Class II sewage sludge not meeting pollutant concentrations listed in Table 1 in 67.6(1) are subject to the cumulative pollutant loading rates listed in Table 4.

**TABLE 4—CUMULATIVE POLLUTANT LOADING RATES**

| Pollutant | Cumulative Pollutant Loading Rate |                 |
|-----------|-----------------------------------|-----------------|
|           | kg per hectare                    | pounds per acre |
| Arsenic   | 41                                | 36              |
| Cadmium   | 39                                | 34              |
| Copper    | 1500                              | 1335            |
| Lead      | 300                               | 267             |
| Mercury   | 17                                | 15              |
| Nickel    | 420                               | 373             |
| Selenium  | 100                               | 89              |
| Zinc      | 2800                              | 2490            |

*c.* Class II sewage sludge shall be land applied:

(1) At an annual whole sludge application rate that is equal to or less than the agronomic nitrogen uptake rate, unless otherwise specified by the department; and

(2) Only to soils classified as acceptable throughout the top five feet of soil profile. Sewage sludge shall not be applied to soils classified as sand, loamy sand, or silt. The acceptability of a soil shall be determined using the USDA soil classifications.

*d.* Land application sites shall have soil pH maintained above 6.0, unless

(1) Crops prefer soils with lower pH conditions;

(2) The sludge meets the pollution concentrations contained in Table 1; or

(3) The site does not exceed calcium carbonate equivalent levels according to sound farm management practices.

If the soil pH is below 6.0, agricultural lime can be used to increase the pH to an acceptable level.

*e.* If sewage sludge is applied to land on which the soil loss exceeds the soil loss limits established by the county soil conservation district, the sludge shall be injected on the contour or shall be applied to the surface and mechanically incorporated into soil within 48 hours of application. Sewage sludge shall not be applied to ground having greater than 9 percent slope unless approved by the department.

*f.* Sewage sludge application on frozen or snow-covered ground should be avoided unless special precautions are taken, such as proven farm management practices to avoid runoff. If application on frozen

or snow-covered ground is necessary, it shall be limited to land areas of less than 5 percent slope unless otherwise approved by the department.

g. In accordance with Table I in 567—paragraph 60.2(2) “c,” sewage sludge shall not be applied to land that is 35 feet or less from an open waterway. If sewage sludge is applied within 200 feet upgradient of a stream, lake, sinkhole, or tile line surface intake, it shall be injected or applied to the surface and mechanically incorporated into the soil within 48 hours of application unless otherwise approved by the department.

h. If sewage sludge is applied to land subject to flooding more frequently than once in ten years, the sludge shall be injected or shall be applied to the surface and mechanically incorporated into the soil within 48 hours. Information on which land is subject to flooding more frequently than once in ten years is available from the department.

i. Sewage sludge shall not be applied within 200 feet of an occupied residence or any well. Distances may be reduced to a minimum of 35 feet with the written agreement of both the well or residence owner and, in the case of residences, the occupant and an approved farm management plan that addresses soil erodibility, harvest residuals, buffer strips, and other sound farm management practices. The farm management plan shall be approved by the local soil conservation district in accordance with rules implementing Iowa Code sections 161A.42 through 161A.51.

j. After the land application of sewage sludge, all of the following restrictions shall apply:

(1) Food crops with harvested parts that touch the sewage sludge/soil mixture and that are totally above the land surface shall not be harvested for 14 months;

(2) Food crops, feed crops, and fiber crops shall not be harvested for 30 days;

(3) Animals shall not be allowed to graze on the land for 30 days;

(4) Turf grown on land where sewage sludge is applied shall not be harvested for one year after application when the harvested turf is placed on either land with a high potential for public exposure or a lawn, unless otherwise specified by the department;

(5) Public access to land with a high potential for public exposure shall be restricted for one year; and

(6) Public access to land with a low potential for public exposure shall be restricted for 30 days.

k. When required by the director, groundwater monitoring wells and surface monitoring points shall be installed and a monitoring program implemented. Samples must be analyzed by a laboratory that is equipped and competent to perform the required tests. The results shall be forwarded to the department on a stipulated schedule.

l. The sewage sludge generator shall provide information necessary to comply with the requirements of this chapter to the sewage sludge applicator and landowner.

m. The sewage sludge applicator shall provide written notice to the department prior to the initial application of sewage sludge. The notice shall include:

(1) The location, by legal description, of the land application site, and

(2) The name, address, telephone number, and NPDES permit number (if appropriate) of the landowner, sewage sludge generator, and applicator.

**67.7(3) Class II monitoring frequency.**

a. The pollutants listed in Table 3, the pathogen density requirements, and the VAR requirements shall be monitored at the frequency stated in Table 2.

b. After the Class II sewage sludge has been monitored for two years, the department may reduce the monitoring frequency, but in no case shall the monitoring frequency be less than once per year when sewage sludge is land applied.

**67.7(4) Class II recordkeeping.**

a. Both the generator and applicator of Class II sewage sludge shall develop all of the following information and retain it for five years:

(1) The concentration of each pollutant listed in Table 3 in the sewage sludge.

(2) The following certification statement: “I certify, under penalty of law, that the Class II sewage sludge requirements have been met. I am aware that there are significant penalties for false certification including the possibility of fine and imprisonment.”

(3) A description of how the PSRP and VAR requirements are met.

- (4) A description of how the management practices for Class II sewage sludge are met for each site.
  - (5) The location and surface area of each site.
  - (6) The date and time of sewage sludge application at each site.
  - (7) If subjected to cumulative loading limits, the amount and cumulative amount of each pollutant listed in Table 4 of 67.7(2) “b” in the sewage sludge applied to each site.
  - (8) The amount of sewage sludge (i.e., metric tons) applied to each site.
- b. Treatment works with a design flow rate of 1 mgd or greater and treatment works that serve 10,000 people or more shall submit the above information to EPA, using EPA’s NPDES eReporting Tool (NeT), by February 19 of each year for the previous calendar year. In addition, a supplemental sewage sludge report that includes the land application information listed in 67.7(4) “a”(6) through “a”(9) shall be submitted to the department by the same due date.

[ARC 9206C, IAB 5/14/25, effective 6/18/25]

#### **567—67.8(455B) Class III sewage sludge.**

**67.8(1)** Class III sewage sludge is any sewage sludge that cannot meet either Class I or Class II sewage sludge criteria.

**67.8(2)** Class III sewage sludge shall not be utilized for beneficial use for land application as specified in the chapter.

**67.8(3)** Class III sewage sludge shall be disposed according to 40 CFR Part 503, Subpart C, “Surface Disposal,” or according to 40 CFR Part 503, Subpart E, “Incineration.”

[ARC 9206C, IAB 5/14/25, effective 6/18/25]

#### **567—67.9(455B) Sampling and analytical methods.**

**67.9(1)** *General.* Representative samples of sewage sludge that are applied to the land shall be collected and analyzed. The methods and calculation procedures listed below shall be used to analyze samples and to calculate the percent of volatile solids reduction.

**67.9(2)** *Enteric viruses.* 40 CFR §503.8(b)(1) is adopted by reference.

**67.9(3)** *Fecal coliform.*

a. 40 CFR §503.8(b)(2) is adopted by reference.

b. EPA Method 1680: Fecal Coliforms in Sewage Sludge (Biosolids) by Multiple-Tube Fermentation using Lauryl Tryptose Broth (LBT) and EC Medium, EPA-821-R-14-009, September 2014.

c. EPA Method 1681: Fecal Coliforms in Sewage Sludge (Biosolids) by Multiple-Tube Fermentation using A-1 medium, EPA-821-R-06-013, July 2006.

**67.9(4)** *Helminth ova.* 40 CFR §503.8(b)(3) is adopted by reference.

**67.9(5)** *Inorganic pollutants.*

a. *Metals.* 40 CFR §503.8(b)(4) is adopted by reference.

b. *Nonmetals.* For nonmetals not identified elsewhere in this chapter, methods listed in 567—paragraph 83.5(1) “c.”

**67.9(6)** *Salmonella sp. bacteria.*

a. 40 CFR §503.8(b)(5) is adopted by reference.

b. EPA Method 1682: *Salmonella* in Sewage Sludge (Biosolids) by Modified Semisolid Rappaport-Vassiliadis (MSRV) Medium, EPA-821-R-06-14, July 2006.

**67.9(7)** *Specific oxygen uptake rate.* 40 CFR §503.8(b)(6) is adopted by reference.

**67.9(8)** *Total, fixed, and volatile solids.* 40 CFR §503.8(b)(7) is adopted by reference.

**67.9(9)** *Percent volatile solids reduction calculation.* “Environmental Regulations and Technology - Control of Pathogens and Vectors in Sewage Sludge,” EPA-625/R-92/013, July 2003.

[ARC 9206C, IAB 5/14/25, effective 6/18/25]

#### **567—67.10(455B) Pathogen treatment processes.**

**67.10(1)** 40 CFR Part 503, Appendix B, section A, Processes to Significantly Reduce Pathogens (PSRP), is adopted by reference.

**67.10(2)** 40 CFR Part 503, Appendix B, section B, Processes to Further Reduce Pathogens (PFRP), is adopted by reference.

[ARC 9206C, IAB 5/14/25, effective 6/18/25]

These rules are intended to implement Iowa Code section 455B.174.

CHAPTER 68  
COMMERCIAL SEPTIC TANK CLEANERS

Chapter rescission date pursuant to Iowa Code section 17A.7: 6/18/30

**567—68.1(455B) Purpose, applicability, and definitions.**

**68.1(1)** The purpose of this chapter is to implement Iowa Code sections 455B.172(5), 455B.172(6), and 455B.172A by providing standards for the commercial cleaning and disposal of waste from private sewage disposal systems (PSDSs) and toilet units and wastewater from on-farm food processing operations and by providing licensing requirements and procedures.

**68.1(2)** Definitions. For purposes of this chapter, the following definitions apply:

“*Cleaning*” means removal of waste from PSDSs and other actions incidental to that removal.

“*Commercial septic tank cleaner*” means a person or firm engaged in the business of cleaning and disposing of waste from PSDSs, including a person or firm that owns and rents or leases portable toilets.

“*Food commodity*” is defined in Iowa Code section 455B.171(8).

“*Holding tank for waste*” is defined in 567—subrule 69.1(2).

“*On-farm processing operation*” is defined in Iowa Code section 455B.171(18). “On-farm processing operation” does not include food commodities processed by a person exclusively for use by the person and members of the person’s household or the person’s nonpaying guests and employees.

“*Tank*” means any container that is placed on a vehicle to transport waste removed from a private waste facility.

“*Toilet unit*” is defined in Iowa Code section 455B.171(37).

“*Vehicle*” means a device used to transport a tank, including a trailer.

“*Waste*” means human or animal excreta, water, scum, sludge, septage, and grease solids from PSDSs or toilet units.

[ARC 9207C, IAB 5/14/25, effective 6/18/25]

**567—68.2(455B) Commercial septic tank and toilet unit cleaner licensing requirements and procedures.**

**68.2(1)** *General.* Commercial septic tank and toilet unit cleaners must annually apply for and obtain a license from the department before engaging in the commercial cleaning of and disposal of septage from any PSDS or the commercial cleaning and disposal of wastes from any toilet unit in the state of Iowa. The license period will run from July 1 to June 30 of the following year. Owners of a septic tank may clean their own tank without being licensed if all other requirements of this chapter are met.

**68.2(2)** *Application for license.* A commercial septic tank or toilet unit cleaner must apply for a license by completing a department form and submitting it to the department with an annual septage disposal management plan (SDMP) and license fee. In the case of a commercial septic tank cleaner that is a corporation, partnership, association, or any other business entity, the entity itself must apply as provided in this rule. The entity shall designate a person with requisite authority to act as its representative when applying for a license. Individuals employed by a commercial septic tank or toilet unit cleaner business are not required to be licensed, but each cleaning unit (vehicle or tank) must display the business license number (except for the year).

**68.2(3)** *Septage disposal management plan (SDMP).* An applicant must submit an SDMP with a license application using a department form. Applicants must also submit the SDMP to the county board of health in each county where septage is to be land applied.

a. An SDMP shall include:

- (1) A list of vehicles to be registered for use by the licensee.
- (2) The volume of septage expected to be collected from PSDSs or toilet units.
- (3) For disposal to another system, including a publicly owned treatment works (POTW), a different permitted wastewater disposal system (DS), a permitted septage lagoon or septage drying bed, or a permitted sanitary landfill:
  1. The volume of septage or waste to be taken to each system; and

2. A letter of acceptance from the owner of each system where septage or waste is proposed to be disposed.

(4) For septage disposal by land application:

1. The location and area of all sites where septage is to be land applied;
2. The anticipated volume of septage applied to each site;
3. The type of crop to be planted on each site and the date when planting will occur; and
4. The type of land application to be used at each site.

b. Allowance may be made in an SDMP for septage application on the property of the owner of the tank being pumped as long as the disposal standards of this chapter are met.

c. A license will be issued only after department approval of the SDMP. If the SDMP is not approved by the department, it must be modified and resubmitted.

**68.2(4) *SDMP alteration.*** An amended SDMP must be submitted to the department and the county before septage is land applied to any new property not listed in the existing SDMP, or septage is taken to a system not listed in the SDMP.

**68.2(5) *License fees.***

a. *Renewal fees.* The renewal application fee is \$150 per year for the first registered vehicle and \$50 for each additional vehicle. If an applicant intends to land apply any septage during the year, there will be an additional application fee of \$7 per 1,000 gallons of septage to be land applied per year. Land application fees shall be based on the previous year's records.

b. *New license fees.* New license applicants will be charged the following fees:

- (1) Applicants who propose to land apply shall pay a prorated \$300 annual fee until the next June 30.
- (2) Applicants will be charged fees of \$150 for the first registered vehicle and \$50 for each additional vehicle.

**68.2(6) *License renewal.*** In order to remain valid, a license must be renewed by June 30 of each year. Renewal applications must meet the requirements of this rule and be received by the department at least 30 days prior to the expiration date.

**68.2(7) *Ownership change.*** Within 30 days of a change in ownership of any commercial septic tank or toilet unit cleaner, the new owner shall furnish the department with the following information:

- a. Business name and license number;
- b. Name, address, email address, and telephone number of the new owner;
- c. Date of the ownership change; and
- d. Any change in the SDMP.

The license will transfer with the ownership with no additional fee.

**68.2(8) *Address change.*** Within 30 days of any change in the address or location of a commercial septic tank or toilet unit cleaning business, information regarding such change must be reported to the department.

[ARC 9207C, IAB 5/14/25, effective 6/18/25]

### **567—68.3(455B) License suspension, revocation and denial.**

**68.3(1) *Basis for suspension, revocation, and denial.*** The department may suspend, revoke, or deny a commercial septic tank or toilet unit cleaner license for any of the following reasons:

- a. A material misstatement of facts in a license application.
- b. Failure to provide the license fee.
- c. Failure to provide and adhere to an approved SDMP.
- d. Failure to satisfy the requirements of this chapter.
- e. Failure to pay any fines assessed under 68.3(2).

**68.3(2) *Civil penalties.*** The department may assess civil penalties pursuant to Iowa Code section 455B.172.

**68.3(3) *Appeal.*** A commercial septic tank or toilet unit cleaner may appeal the suspension, revocation, or denial of a license under the provisions of 567—Chapter 7.

**68.3(4) *Reinstatement.*** In the case of a denial, revocation, or suspension pursuant to 68.3(1) “b” or “e,” the department may immediately reinstate or issue a license after receipt of the requisite fee or fine and confirmation that the commercial septic tank or toilet unit cleaner is fulfilling the requirements of

567—68.4(455B) and 567—68.6(455B). In case of a denial, revocation or suspension pursuant to 68.3(1) “a,” “c,” or “d,” the department may reinstate or issue a license no sooner than 60 days after the action if the department is satisfied that the commercial septic tank or toilet unit cleaner has corrected the deficiency and will comply with department rules in the future.

[ARC 9207C, IAB 5/14/25, effective 6/18/25]

**567—68.4(455B) Licensee and county obligations.**

**68.4(1) Licensee obligations.** A licensee shall:

- a. Supervise the removal and disposal of septage from PSDSs or waste from toilet units;
- b. Meet the standards established in this chapter for the cleaning of and disposal of septage from PSDSs or waste from toilet units; and
- c. Record the location of all cleaned PSDSs or toilet units, the method of septage or waste disposal, and the volume of septage or waste disposed of for each trip. Such records shall be maintained for five years and shall be made readily available upon request by an administrative authority.

**68.4(2) County obligations.** The county boards of health shall enforce the standards and licensing requirements in this chapter and other referenced rules.

[ARC 9207C, IAB 5/14/25, effective 6/18/25]

**567—68.5(455B) Application sites and equipment inspections.** All land application sites specified on an SDMP shall be inspected annually by a department-approved agent to ensure that the sites meet the requirements for septage disposal and are properly managed. All vehicles, tanks, and related storage and handling facilities for septage shall be inspected annually to ensure compliance with these rules. The department may contract with other entities, such as the county boards of health, to carry out inspections. However, the department shall retain concurrent authority to determine inspection requirements.

[ARC 9207C, IAB 5/14/25, effective 6/18/25]

**567—68.6(455B) Standards for commercial cleaning of PSDSs and toilet units.**

**68.6(1) Vehicles, tanks, and equipment.** For all vehicles, tanks, and equipment used in the commercial cleaning of PSDSs and toilet units, the licensee shall:

- a. Prevent the dripping, falling, spilling, leaking, or discharging of septage or waste onto roads, rights-of-way, or other public properties;
- b. Provide the necessary equipment to properly clean PSDSs or toilet units and to sufficiently agitate and disperse solids, sludge, and scum into the liquid for cleaning;
- c. Install pumps and associated piping with watertight connections to prevent leakage;
- d. Ensure that equipment can easily be cleaned and is maintained in an essentially rust-free and sanitary condition;
- e. If septage is to be land applied, provide a mechanism for properly mixing lime with the septage or a means to incorporate or inject the septage; and
- f. Prominently display the license number and name of the commercial septic tank or toilet unit cleaner on the side of all vehicles or tanks in letters and numbers at least three inches high.

**68.6(2) Miscellaneous.**

- a. Any tanks or equipment used for hauling septage or waste shall not be:
  - (1) Used to haul hazardous or toxic wastes as defined in 567—Chapter 131;
  - (2) Used to haul wastes detrimental to land application or wastewater treatment plants;
  - (3) Used in a manner that would contaminate a potable water supply; or
  - (4) Used in a manner that would endanger the food chain or public health.
- b. A direct connection shall not be made between a potable water source and a tank or equipment on a vehicle.

[ARC 9207C, IAB 5/14/25, effective 6/18/25]

**567—68.7(455B) Standards for septage and waste disposal.** Septage from PSDSs and on-farm processing operations and waste from toilet units and holding tanks shall be disposed of in accordance with this rule.

**68.7(1)** Waste from toilet units and holding tanks shall be disposed of by discharge, with owner approval, to a POTW or other department-permitted wastewater disposal system. Land application of wastes from toilet units or holding tanks is prohibited.

**68.7(2)** Septage from septic tanks or other types of PSDSs that normally discharge effluent for further treatment shall be disposed of by one or more of the following methods:

*a.* Septage may be discharged, with system owner approval, to any of the following systems:

- (1) To a POTW or other department-permitted wastewater disposal system.
- (2) To permitted septage lagoons or septage drying beds.
- (3) To a permitted sanitary landfill in accordance with 567—Chapters 102 and 103 and the following requirements:

1. Septage shall be stabilized by adding and thoroughly mixing sufficient lime to produce a mixture with a pH of 12.

2. A minimum of 30 minutes of contact time shall be provided after mixing the lime with the septage prior to discharging to the landfill.

*b.* Septage from PSDSs and on-farm processing operations may be land applied when such applications are conducted in accordance with the following requirements:

(1) Land application rate. The maximum application rate is 30,000 gallons of septage per acre of cropland per 365-day period. The nitrogen application rate shall be no more than is utilized by the crop. A crop capable of using the nitrogen applied must be grown and harvested from the site after application of the maximum annual allocation or, at a minimum, every third year.

(2) Land application site restrictions.

1. Sites shall have soil pH maintained above 6.0 unless crops prefer soils with lower pH conditions. If the soil pH is below 6.0, agricultural lime may be used to increase the pH to an acceptable level. Soil pH shall be measured and reported in the annual SDMP.

2. If application on frozen or snow-covered ground is necessary, it shall be limited to land areas of less than 5 percent slope and application rates of less than 2,500 gallons per acre per day.

3. If septage is land applied to land in a floodplain with a ten-year magnitude, it shall be injected or applied to the surface and mechanically incorporated into the soil within 48 hours. Information on which land is in a floodplain with a ten-year magnitude is available from the department.

4. Septage shall be land applied in accordance with the separation distances in Table I in 567—paragraph 60.2(2)“c.” If septage is land applied within 200 feet upgradient of a stream, lake, sinkhole, or tile line surface intake, it shall be injected or applied to the surface and mechanically incorporated into the soil within 48 hours of application.

5. Septage shall not be applied to any of the following:

- To a lawn or a home garden;
- To ground that has a slope greater than 9 percent; or
- To land where there is a bedrock layer or seasonal high water table within three feet of the soil surface, as noted in the county USDA soil surveys.

(3) Land application crop harvesting restrictions. After a septage application:

1. Food crops with harvested parts that touch the septage/soil mixture and are totally above ground shall not be harvested for 14 months.

2. Food crops with harvested parts below the land surface shall not be harvested for 38 months.

3. Animal feed, fiber, and those food crops with harvested parts that do not touch the soil surface shall not be harvested for 30 days.

4. Animals shall not be allowed to graze on the land for 30 days.

(4) Land application vector attraction reduction (VAR). One of the following VAR requirements shall be met when septage is land applied:

1. Septage may be injected below the surface of the land. No significant amount of septage shall be present on the land surface within one hour of septage injection.

2. Septage may be incorporated into the soil within six hours after application to or placement on the land.

3. Septage may be stabilized by adding and thoroughly mixing sufficient alkaline material (such as hydrated or quick lime) to produce a mixture with a pH of 12. A minimum of 30 minutes of contact time shall be provided after mixing the alkaline material with the septage prior to land application. Each container of treated septage shall be monitored for compliance by testing two representative samples taken a minimum of 30 minutes apart to verify that the pH remains at 12 or greater for the minimum 30-minute time period.

4. Other stabilization methods may be acceptable if shown to be equivalent to one or more of the methods described in this subparagraph.

(5) Land application records. Persons who land apply septage shall document the following information and retain the records at their residence or business for five years:

1. The location, by either street address or latitude and longitude, of each septage application site;
2. The number of acres and precise application area in each septage application site;
3. The gallons of septage applied to each site for each application;
4. The rate, in gallons per acre, of septage application at each site;
5. The total gallons of septage applied at each site to date for the year;
6. The date and time of septage application at each site; and
7. A description of how the VAR requirements are met (injection, incorporation, or stabilization).

The following certification statement shall be provided with the records when the records are submitted to or requested by the department:

“I certify, under penalty of law, that the pathogen requirements and the vector attraction reduction requirements have been met. I am aware that there are significant penalties for false certification including the possibility of fine and imprisonment.”

[ARC 9207C, IAB 5/14/25, effective 6/18/25]

**567—68.8(455B) Standards for disposal of wastewater from on-farm food processing operations.**

On-farm food processing wastewater shall be disposed of pursuant to Iowa Code section 455B.172A. On-farm food processing operations that meet the requirements for land application in Iowa Code section 455B.172A and 567—68.7(455B) shall not be required to obtain an operation permit as prescribed in 567—60.3(455B).

[ARC 9207C, IAB 5/14/25, effective 6/18/25]

These rules are intended to implement Iowa Code sections 455B.172 and 455B.172A.

CHAPTER 69  
PRIVATE SEWAGE DISPOSAL SYSTEMS

[Prior to 7/1/83, Health Dept. Ch 12]

[Prior to 11/19/86, Water, Air and Waste Management[900] Ch 69]

Chapter rescission date pursuant to Iowa Code section 17A.7: 7/12/31

**567—69.1(455B) General.**

**69.1(1) *Applicability.*** These rules are applicable only to private sewage disposal systems (PSDSs).

**69.1(2) *Definitions.*** In addition to the definitions, references, and abbreviations in 567—Chapter 60, the following definitions shall apply to this chapter:

“*Administrative authority*” means the department or the local county board of health as authorized by Iowa Code section 455B.172 and chapter 137.

“*Approved*” means accepted or acceptable under an applicable specification stated or cited in these rules or accepted by the administrative authority as suitable for the proposed use.

“*Area drain*” means a drain installed to collect surface or storm water from an open area of a building or property.

“*At-grade system*” means a pressurized soil absorption system constructed at or near a primary treatment unit or a secondary treatment system.

“*Building drain*” means that part of the lowest horizontal piping of a drainage system that receives the discharge from soil, waste, and other drainage pipes inside the walls of any building and conveys the same to the building sewer.

“*Building sewer*” means that part of the horizontal piping from the building wall to its connection with the main sewer or the primary treatment portion of a PSDS conveying the drainage of a building site.

“*Chamber system*” means a buried structure, typically with a domed or arched top, providing at least a six-inch height of sidewall soil exposure creating a covered open space above a buried soil infiltrative surface.

“*Confining layer*,” also known as “limiting condition,” means solid or fractured bedrock, seasonally high groundwater level, any layer of soil with a stabilized percolation rate exceeding 60 minutes for the water to fall one inch, or any other factor (natural or manmade) that does not provide the 36-inch depth separation required for soil absorption.

“*Conventional*,” when used in reference to sewage treatment, means a soil absorption system involving a series of two- to three-foot-wide trenches filled with gravel, containing a four-inch diameter rigid pipe or other alternative trench technologies to convey the sewage effluent. Gravel aggregate, chamber, and EPS aggregate systems are considered conventional soil absorption systems.

“*Distribution box*” means a device designed to accomplish the equal distribution of wastewater.

“*Dosing siphon*” means a manufactured device that provides a measured amount of effluent determined by the manufacturer’s specifications and design.

“*Drop box*” means a structure used to divert wastewater flow into a soil absorption trench. When the trench is filled to a set level, the drop box then allows any additional wastewater not absorbed by that trench to flow to the next drop box or soil absorption trench.

“*Dwelling*” means any house or place used or intended to be used by humans as a permanent or temporary residence.

“*Expanded polystyrene aggregate systems*” or “*EPS aggregate systems*” means cylinders comprised of expanded polystyrene (EPS) synthetic aggregate contained in high-strength polyethylene netting. The cylinders are a minimum 12 inches in diameter and are produced both with and without a distribution pipe.

“*Fill soil*” means clean soil, free of debris or large organic material, which has been mechanically moved onto a site and has been in place for less than one year, and is characterized by a lack of distinct horizons or color patterns as found in naturally developed, undisturbed soils.

“*Filtered pump vault*” means a device installed in a septic or pump tank that houses a pump and screens effluent with 1/8-inch or smaller diameter openings before it enters the pump.

*“Foundation drain”* means the portion of a building drainage system that is provided to drain groundwater, not including any wastewater, from the outside of the foundation or over or under the basement floor and that is not connected to the building drain.

*“Gravel”* means stone screened from river sand or quarried and washed free of clay and clay coatings. Concrete aggregate designated as Class II by the Iowa DOT is acceptable.

*“Gravel aggregate system”* means a soil absorption system utilizing gravel for distribution.

*“Grease interceptor”* means a watertight device designed to intercept and retain or remove grease and fatty substances. The device may be located inside (grease separator) or outside (grease tank or grease trap) a facility.

*“Holding tank for waste”* means a structure used for the retention or storage of domestic sewage pending removal for further treatment.

*“Intermittent subsurface sand filter”* or *“ISSF”* means a bed of granular materials underlain by gravel and collecting tile and provided with a natural topsoil cover over the crown of the distribution system. Primary treated effluent is applied intermittently to the surface of the bed through a distribution system, and the bed is underdrained to collect and discharge the secondary treated effluent. Uniform distribution is best obtained by dosing so as to utilize the entire surface of the bed.

*“Mound system”* means a pressurized aboveground soil absorption system used to disperse effluent from septic tanks in cases where a seasonally high water table, high bedrock conditions, slowly permeable soils, or limited land areas prevent conventional soil absorption systems.

*“Other pressure distribution device”* means any device used to evenly distribute effluent other than a manufactured siphon device intended to be used for effluent distribution.

*“Percolation test”* means a falling water level procedure used to determine the ability of soils to absorb effluent or pretreated effluent. See Appendix B of this chapter.

*“Pressure distribution system”* means a network of distribution pipes in which effluent is forced through orifices under pressure. Pressure distribution may be accomplished by use of a pump, siphon device, or other manufactured pressure distribution devices.

*“Pretreated effluent”* means effluent treated through aeration or other methods that, upon laboratory analysis, meets or exceeds a monthly average for CBOD<sub>5</sub> of 25 mg/L and TSS of 30 mg/L.

*“Primary treatment unit”* means a unit or system used to separate the floating and settleable solids from the wastewater before the partially treated effluent is discharged for secondary treatment.

*“Private sewage disposal system”* or *“PSDS”* is defined in Iowa Code section 455B.171. For the purposes of this chapter, the term includes the treatment systems presented in this chapter.

*“Professional soil analysis”* means an alternative to the percolation test that depends upon a knowledgeable person evaluating the soil characteristics, such as color, texture, and structure, in order to determine an equivalent percolation or loading rate.

*“Proprietary treatment system”* or *“PTS”* means any device or product that is certified by a third-party certifier accredited by the American National Standards Institute (ANSI) to meet the National Sanitation Foundation (NSF)/ANSI Standard 40-2023, October 1, 2023, available on the NSF website at: [www.nsf.org](http://www.nsf.org), or equivalent testing as determined by the department. Examples may include but are not limited to peat moss biofilters, coconut fiber filters, synthetic foam filters, polystyrene bead media filters, textile filters, modular fixed film soil systems, or aerobic treatment units.

*“PVC”* means polyvinyl chloride.

*“Qualified sampler,”* for the purposes of collecting compliance effluent samples required under NPDES General Permit No. 4, means one of the following persons: a city or county environmental health staff person; an Iowa-certified wastewater treatment operator; or an individual who has received department-approved training to conduct effluent sampling.

*“Roof drain”* means a drain installed to receive water collecting on the surface of a roof and discharging into an area or storm drain system.

*“SCH”* means schedule, as in Schedule 40 pipe. It describes the wall thickness of a pipe.

*“SDR”* means standard dimension ratio, which is the ratio of pipe diameter to wall thickness. It is a method of rating a pipe’s durability against pressure.

*“Secondary treatment system”* means a system that provides biological treatment of effluent from septic tanks or other primary treatment units. Examples include but are not limited to soil absorption systems, ISSFs, PTSs, or other systems providing equivalent treatment.

*“Septic tank”* means a watertight structure into which wastewater is discharged for solids separation and digestion (referred to as part of the closed portion of the treatment system).

*“Soil absorption bed system”* means a soil absorption system that is a shallow excavation lined with aggregate or other suitable materials, including a leaching chamber or EPS materials.

*“Soil absorption system”* means a conventional, at-grade, mound, or soil absorption bed system that uses a system of perforated conduits connected to a distribution system, forming a series of subsurface, water-carrying channels into which the septic tank effluent or pretreated effluent is discharged for direct absorption into the soil (referred to as part of the open portion of the treatment system).

*“Soil professional”* means a person with training and experience in soil morphology, including but not limited to experience in testing the absorption qualities of soil by the physical examination of the soil’s color, mottling, texture, structure, topography, and hillslope position.

*“Stream”* means any watercourse listed as a “designated use segment” in 567—61.3(455B).

**69.1(3) General PSDS regulations.**

*a. Connections to approved sewer systems.*

(1) No PSDS shall be installed, repaired, or rehabilitated where a publicly owned treatment works (POTW) is available or where a local ordinance requires connection to a POTW. A POTW may be considered unavailable when the POTW, or any building or any exterior drainage facility connected thereto, is located more than 200 feet from any proposed building or exterior drainage facility on any lot or premises that abuts and is served by a POTW. Final determination of availability shall be made by the administrative authority.

(2) When a POTW becomes available within 200 feet, any building then served by a PSDS shall be connected to said POTW within a time frame and under conditions set by the administrative authority.

(3) When a POTW is not available, every building wherein persons generate domestic sewage shall be provided with an approved PSDS. A holding tank for waste may be used only if all other PSDS options are impractical.

(4) If a building is to be connected to an existing PSDS, that existing system shall meet the requirements of these rules.

*b. Construction or alteration.* All constructed or altered PSDSs shall comply with this chapter. Alteration includes any changes that affect the treatment or disposal of the waste. Repair of existing components of a PSDS that do not change the treatment or disposal of the waste are not considered alterations. However, the discharge restrictions in 69.1(8) apply.

*c. Abandonment.* PSDSs shall be abandoned in the following manner:

(1) Concrete tanks shall be pumped, the tank lid crushed into the tank, and the tank filled with sand or soil.

(2) Plastic, fiberglass, or metal tanks shall be pumped and removed and the cavity filled with sand or soil.

**69.1(4) Construction permit required.** No PSDS shall be installed or altered as described in 69.1(3) “b” unless a construction permit issued by the administrative authority is obtained prior to construction. PSDS installation shall be in accordance with these rules.

**69.1(5) Permit by rule.** This chapter is intended to act as a permit by rule for PSDSs. Activities in compliance with this chapter are permitted by the director for purposes of compliance with Iowa Code sections 455B.183 and 455B.186.

**69.1(6) Site analysis.**

*a. Site evaluation.* The administrative authority shall conduct a site evaluation prior to the issuance of a construction permit. Consideration shall be given but not be limited to the impact of the following:

(1) Topography, including but not limited to drainage ways, terraces, floodplains, and percent of land slope;

(2) The location of property lines, easements, buried utilities, existing and proposed tile lines, and existing, proposed, and abandoned water wells;

- (3) The amount of available area for installation of the system;
- (4) Evidence of unstable ground; and
- (5) Alteration (cutting, filling, compacting) of existing soil profiles.

*b. Soil characteristics and permeability.* The soil characteristics and permeability of a specific site shall be determined by performing a percolation test or a soil analysis. The administrative authority shall determine who is a trained and qualified soil professional and who may conduct percolation tests. All percolation tests shall be conducted in accordance with Appendix B of this chapter.

*c. Final inspections.* The administrative authority shall conduct an at-location inspection of all newly constructed PSDSs before the system is backfilled. A final as-built drawing shall be made as part of the final inspection and kept on file with the construction permit.

*d. Onsite wastewater tracking system.* All pertinent information, including but not limited to the site address, owner, type, date of installation, percolation test or soil analysis, and as-built drawing of the PSDS shall be entered into the department's onsite wastewater tracking system, available on the department's website at [www.iowadnr.gov](http://www.iowadnr.gov), after a final inspection is conducted.

**69.1(7) Separation distances (SDs).** All PSDSs shall be located in accordance with the minimum SDs in Table I in 567—paragraph 60.2(2)“c.”

**69.1(8) Discharge restrictions.** It is prohibited to discharge any wastewater from PSDSs (except as permitted in this chapter) to any ditch, stream, pond, lake, natural or artificial waterway, county drain tile, surface water drain tile, or land drain tile, to the groundwater, or to the surface of the ground. Under no conditions shall effluent from PSDSs be discharged to any abandoned well, agricultural drainage well, or sinkhole. Existing discharges to any of the above-listed locations or structures shall be eliminated by the construction of a system in compliance with this chapter.

*a. Requirements when effluent is discharged into surface water.* All discharges from PSDSs that are discharged into any designated waters of the state or subsurface drainage tile shall conform with the requirements of NPDES General Permit No. 4 (GP 4) issued by the department, as referenced in 567—Chapter 60. Prior to the use of any system discharging to designated waters of the state or a subsurface drainage tile, a Notice of Intent to be covered by GP 4 shall be submitted to the department. Systems covered by GP 4 must meet all applicable permit requirements, including effluent sampling and monitoring. No PSDS shall discharge to a state-owned natural or artificial lake, an outstanding Iowa water, or an outstanding national water as defined in 567—subrule 61.2(2).

*b. Requirements when effluent is discharged above the ground surface.* All discharges from PSDSs that are discharged to the surface of the ground and require a maintenance contract shall be installed, operated, and maintained by a manufacturer-certified technician in accordance with the manufacturer's instructions and the requirements of the administrative authority.

*c. Requirements when effluent is discharged into the soil.* No septage or wastewater shall be discharged into the soil except in compliance with this chapter.

**69.1(9) Maximum flow rates.**

*a.* Residential wastewater design flow rates are based on 150 gallons per bedroom per day. Wastewater design flow rates for nonresidential domestic waste applications serving the equivalent of fewer than 16 individuals on a continuing basis are detailed in Appendix A of this chapter.

*b.* Wastewater design flow rates for a nonresidential use that are not listed in Appendix A may be determined by a professional engineer licensed in the state of Iowa prior to issuance of a construction permit by an administrative authority. The administrative authority may require a system to be designed using the nonresidential flows listed in Appendix A.

**69.1(10) Flow equalization.** Flow equalization may be used at the discretion of a professional engineer licensed in the state of Iowa. The determination to use flow equalization shall be made prior to issuance of a construction permit by an administrative authority. If used, flow equalization shall meet all of the following criteria:

*a.* The design flow of the secondary treatment unit receiving the equalized flow cannot exceed 1,500 gallons per day.

*b.* Equalized flow to the secondary treatment unit shall be mechanically time dosed.

[ARC 9467C, IAB 8/6/25, effective 9/10/25; see Delay note at end of chapter]

**567—69.2(455B) General design standards.****69.2(1) Building sewers.**

*a. Location and construction.* Building sewers shall be constructed in accordance with the SDs in Table I in 567—paragraph 60.2(2) “c.” The distances shall be considered minimum distances and shall be increased where possible to provide better protection.

*b. Type.* Building sewers used to conduct wastewater from a building to the primary treatment unit of a PSDS shall be constructed of:

(1) SCH 40 PVC pipe (SDR 26 or stronger) with solvent-weld or bell-and-gasket-type joints approved for use for below grade applications or for the wastewater industry; or

(2) Cast iron with integral bell-and-gasket-type joints.

*c. Size.* Building sewers shall not be less than four inches in diameter.

*d. Grade.* Building sewers shall be laid to the following minimum grades:

4-inch sewer. . . . . 12 inches per 100 feet

6-inch sewer. . . . . 8 inches per 100 feet

**69.2(2) Cleanouts.**

*a. Spacing.* A cleanout shall be provided where the building sewer leaves the structure and at least every 100 feet.

*b. Change of direction or grade.* An accessible cleanout shall be provided at each change of direction or grade if the change exceeds 45 degrees prior to primary treatment.

**69.2(3) Grease interceptors.**

*a. Applicability.* Grease interceptors shall be provided for kitchen flows at restaurants, nursing homes, schools, hospitals, and any other facilities from which grease can be expected to be discharged.

*b. Installation.* Grease interceptors shall be installed on separate building sewers serving kitchen flows into which the grease will be discharged. A discharge from a grease interceptor must flow to either a properly designed septic tank or to a building sewer and then to the primary treatment unit.

**69.2(4) Impervious vault toilets.**

*a. Location.* Impervious vault toilets shall be located in accordance with the SDs in Table I in 567—paragraph 60.2(2) “c” for the closed portion of a treatment system.

*b. Construction.* The vault shall be constructed of reinforced, impervious concrete at least four inches thick. The superstructure, including floor slab, seat, seat cover, riser, and building, shall comply with good design and construction practices to provide permanent, safe, and sanitary facilities. The vault shall be provided with a cleanout opening fitted with a fly-tight cover.

*c. Wastewater disposal.* Wastewater from impervious vault toilets shall be disposed of at a POTW or other department-permitted wastewater disposal system.

**69.2(5) Portable toilets.**

*a. Design.* All portable toilets shall be designed to receive and retain the wastes deposited in them and shall be located and maintained in a manner that will prevent the creation of any nuisance condition.

*b. Wastewater disposal system.* Wastewater from portable toilets shall be disposed of at a POTW or other department-permitted wastewater disposal system.

**69.2(6) Holding tanks for waste.**

*a. General.* Holding tanks may only be used when site characteristics or restrictions do not allow for the installation of a system that consists of both primary and secondary treatment or when the use will be seasonal or sporadic.

*b. Capacity.* The minimum liquid-holding capacity shall be 1,250 gallons.

*c. Pumping frequency.* Holding tanks shall be pumped as necessary to prevent overflows, leaks, or releases of waste.

*d. Recordkeeping.* Holding tank owners shall keep all pumping records for three years. Records shall be made available to the administrative authority upon request.

*e. Construction.* Holding tanks shall be constructed and installed using the materials and processes allowed for septic tanks in 69.3(6) and 69.3(8). All holding tanks shall be equipped with a high-water alarm.

*f. Wastewater disposal.* Wastewater from holding tanks shall be disposed of at a POTW or other department-permitted wastewater disposal system.

**69.2(7) Location.** No PSDS shall be located upon property under ownership different from the ownership of that property or lot upon which the wastewater originates unless easements to that effect are legally recorded and approved by the proper administrative authority.

[ARC 9467C, IAB 8/6/25, effective 9/10/25; see Delay note at end of chapter]

**567—69.3(455B) Primary treatment unit.**

**69.3(1) General.** Every PSDS shall have, as a primary treatment unit, a septic tank as described in this rule.

*a.* All wastewater from a facility shall discharge into a septic tank, and all septic tank effluent shall discharge into a secondary treatment system in compliance with this chapter.

*b.* Septic tanks shall not be used for the disposal of chemical wastes or grease in quantities that might be detrimental to the bacterial action in the tank, or for the disposal of drainage from roof drains, foundation drains, or area drains.

**69.3(2) Capacity.**

*a.* The minimum liquid-holding capacity for septic tanks is specified in Table I (capacity may be obtained by using one or more tanks):

**Table I - Septic Tank Holding Capacity**

| Home Size                           | Septic Tank Minimum Liquid Holding Capacity in gallons |
|-------------------------------------|--------------------------------------------------------|
| Up to and including 3-bedroom homes | 1,250 gal.                                             |
| 4-bedroom homes                     | 1,500 gal.                                             |
| 5-bedroom homes                     | 1,750 gal.                                             |
| 6-bedroom homes                     | 2,000 gal.                                             |
| Each additional bedroom             | + 250 gal.                                             |

*b.* Approval of septic tank capacity and design must be obtained from the administrative authority, if an installation serves a facility other than a dwelling and serves the equivalent of fewer than 16 individuals on a continuing basis. Minimum septic tank liquid-holding capacity shall either be 1,250 gallons or two times the daily sewage flow as estimated from Appendix A, whichever is greater.

*c.* The minimum liquid-holding depth in any tank compartment shall be 40 inches. The maximum liquid-holding depth for calculating capacity of a tank shall not exceed 6½ feet.

*d.* The interior length of a septic tank should not be less than five feet and shall be at least 1½ times the width (larger length-to-width ratios are preferred). No tank or compartment shall have an inside width of less than two feet. The minimum inside diameter of a vertical cylindrical septic tank shall be five feet.

**69.3(3) Compartmentalization.** Every septic tank shall be divided into two compartments as follows. Compartmentalization may be obtained by using more than one tank.

*a.* The influent compartment capacity shall not be less than ½ or more than ⅔ of the total tank capacity.

*b.* The effluent compartment capacity shall not be less than ⅓ or more than ½ of the total tank capacity.

*c.* The invert of the inlet pipe shall be a minimum of two inches and a maximum of four inches higher than the invert of the outlet pipe.

**69.3(4) Baffles.**

*a.* Four-inch diameter SCH 40 PVC pipe tees shall be used as inlet and outlet baffles.

*b.* Inlet tees shall extend at least six inches above and eight inches below the liquid level of the tank. The inlet tee shall extend below the liquid level for no more than 30 percent of the liquid depth.

*c.* The outlet tee shall extend above the liquid level a distance of at least six inches and below the liquid level a distance of at least 15 inches, but no more than 40 percent of the liquid depth.

d. A minimum one-inch clearance between the top of the inlet and outlet tees and the bottom of the tank lid shall be provided. A horizontal separation of at least 36 inches shall be provided between the inlet baffle and the outlet baffle in each compartment.

e. Outlet baffles shall be fitted with, or replaced by, an approved effluent screen. All effluent screens shall be certified by a third-party certifier accredited by ANSI to meet NSF/ANSI Standard 46-2022, September 5, 2022, available on the NSF website at: [www.nsf.org](http://www.nsf.org); or other equivalent testing as determined by the department. Effluent screens require periodic inspection and cleaning to ensure their continued proper operation.

f. A horizontal slot four inches by six inches, or two suitably spaced four- to five-inch diameter holes in the tank partition, may be used instead of a tee or baffle. The top of the slot or holes shall be located below the water level within the middle third of the liquid depth. A ventilation hole or slot, located at least eight inches above the liquid level, shall be provided in the partition.

**69.3(5) Access.**

a. Access necessary for adequate inspection, operation, and maintenance must be provided to all parts of septic tanks.

b. Access openings shall be provided for each chamber, including the inlet, outlet, and pump chamber (if applicable). Openings shall be at least 18 inches in the smallest dimension and of adequate size to allow for pumping, maintenance, and visual inspection.

c. Watertight risers with a minimum diameter of 18 inches shall be installed to bring the access openings to the ground surface. To deter tampering, risers shall be secured using either stainless steel fasteners of sufficient complexity, locking devices, concrete lids of sufficient weight, or another device approved by the administrative authority.

**69.3(6) Installation.**

a. Concrete, fiberglass, or plastic tanks shall be bedded and installed according to the manufacturer's specifications. Provisions should be made to prevent flotation of the tanks when they are empty.

b. Any septic tank placed in fill soil shall be placed upon a level base that is stabilized through compaction or other manufacturer allowed practices.

**69.3(7) Connecting pipes.**

a. Pipes connecting septic tanks installed in series and prior to the distribution box or distribution network or device shall be a minimum of four-inch diameter SCH 40 PVC (SDR 26 or stronger).

b. All inlet and outlet connections shall be made by self-sealing gaskets either cast into the concrete or formed into the plastic or fiberglass approved for below grade applications or for use in the wastewater industry.

c. All joints in connecting pipe shall be approved connections that match the rating of the pipe, such as solvent-welded or compression-type gaskets approved for below grade applications or use.

d. Pipes shall be used to extend across excavations or unstable ground to at least two feet beyond the point where the original ground has not been disturbed during septic tank installation. If the excavation spanned is more than two feet wide, it must be filled with sand or compacted fill to provide a firm bed for the pipe. The first 12 inches of backfill over the pipe shall be applied in thin layers, using material free from stones, boulders, large frozen chunks of earth, or any similar material that could damage or break the pipe.

**69.3(8) Construction.**

a. Septic tanks shall be constructed of either watertight poured concrete, fiberglass, or plastic resistant to corrosion or decay and shall be designed so that the tanks, whether full or empty, will not collapse or rupture when subjected to anticipated earth and hydrostatic pressures. Metal tanks are prohibited.

b. Tanks shall be watertight. Before approving a tank, the administrative authority may ask for proof that a tank is watertight.

c. Tank divider walls and divider wall supports shall be constructed of either heavy, durable plastic, fiberglass, concrete, or other similar corrosion-resistant materials approved by the administrative authority.

d. Inlet and outlet ports of pipes shall be constructed of SCH 40 PVC sanitary tees or other similar approved corrosion-resistant material.

e. Concrete used in precast septic tank construction shall have a maximum water-to-cement ratio of 0.45. Cement content shall be at least 650 pounds per cubic yard. Minimum compressive strength (f') shall be 4,000 psi (28 megapascals) at 28 days of age. The use of Type II cement, as specified in ASTM C150/C150M-24, July 25, 2024, or the addition of either silica fume or Class F fly ash is recommended.

f. Minimum wall thickness for septic tanks shall conform to the current International Association of Plumbing and Mechanical Officials (IAPMO) standards, available on its website at: [www.iapmo.org/publications/read-uniform-codes-online](http://www.iapmo.org/publications/read-uniform-codes-online), or to the following specifications:

|                                               |                  |
|-----------------------------------------------|------------------|
| Poured concrete                               | 6 inches thick   |
| Poured concrete, reinforced                   | 4 inches thick   |
| Special concrete mix, vibrated and reinforced | 2.5 inches thick |
| Fiberglass or plastic                         | IAPMO standard   |

g. Septic tank bottoms shall conform to the specifications in 69.3(8) "f" for septic tank walls, except that special mix concrete shall be at least three inches thick.

h. Concrete or masonry septic tank tops shall be a minimum of four inches in thickness and reinforced with 3/8-inch reinforcing rods in a six-inch grid or equivalent. Fiberglass or plastic tank tops shall meet the IAPMO standard.

i. The concrete cover for reinforcing bars, mats, or fabric shall not be less than one inch.  
[ARC 9467C, IAB 8/6/25, effective 9/10/25; see Delay note at end of chapter]

#### **567—69.4(455B) Effluent distribution.**

**69.4(1) Pump systems.** Dosing through mechanical pumping is the recommended method of effluent distribution and is preferred to improve distribution, improve treatment, and extend system life. In the event that effluent from a septic tank outlet cannot be discharged by gravity while maintaining the proper lateral depths, the effluent may be discharged into a watertight pump pit or tank with an inside diameter of not less than 24 inches, equipped with a tight-fitting cover at grade level. Pumps shall be of a submersible type of corrosion-resistant material.

a. *Inlet.* Pump inlets shall be elevated at least four inches above the bottom of the pump pit or tank to prevent the pump from drawing excessive settled solids.

b. *Electrical.* Electrical installations shall comply with all applicable state and local codes and ordinances. Electrical connections shall be located in an exterior weatherproof box. On-site electrical connections shall not be located in the pump pit or tank, unless a manufactured connection or an electrical connection rated for use inside a pump pit or tank is provided.

c. *Pump setting.* Pumps shall be installed in the pump pit or tank in a manner that ensures ease of service and protection from frost and settled sludge. Pumps shall be set to provide a dosing frequency of approximately four times a day based on the maximum design flow.

d. *Pipe.* Distribution pipe used in pressure-dosed systems shall be rated for pressure use and be a minimum SCH 40 PVC pipe (SDR 26 or stronger).

e. *Pressure line size.* The diameter of the pressure line from the pump to the point of discharge shall not be smaller than the outlet of the pump it serves.

f. *Drainage.* Pressure lines shall either be installed to provide total drainage between dosing to prevent freezing or shall be buried below frost level up to the distribution point.

g. *High water alarm.* Pump pits or tanks shall be equipped with a sensor set to detect if the water level rises above the design high water level if the pump fails. This sensor shall activate an auditory or visual alarm to alert the building occupants.

h. *Discharge point.* The effluent may either be discharged under pressure into a distribution box or distributed by small-diameter pipes throughout the entire absorption system.

i. *Filtered pump vaults.* Filtered pump vaults, when used, require periodic inspection and cleaning to ensure their continued proper operation.

**69.4(2) Gravity distribution.** Septic tank effluent may be serially loaded to soil absorption trenches by drop boxes or overflow piping (rigid sewer pipe). Otherwise, effluent shall be distributed evenly to

all trenches by use of either a distribution box or a commercial distribution regulator approved by the administrative authority.

*a. General design and use.* Gravity distribution boxes shall:

(1) Be installed with separate watertight headers leading from the distribution box to each lateral.

(2) Be constructed of corrosion-resistant rigid plastic materials. Header pipes shall be rigid SCH 40 PVC pipe (SDR 26 or stronger) meeting ASTM 2729-21, November 30, 2021, or equivalent.

*b. Equal length.* Soil absorptions trenches served by a gravity distribution box shall be of equal length. Soil absorptions trenches served by drop boxes may vary in length.

*c. Baffles.* There shall be a pipe tee at the inlet to break the water flow.

*d. Outlets.*

(1) A distribution box shall have outlets at the same level, at least four inches above the bottom of the box, to provide a minimum of four inches of water retention in the box.

(2) All distribution box outlets shall be made level. A four-inch cap with an offset hole approximately 2½ inches in diameter shall be installed on each outlet pipe. The caps shall be rotated until all outlets discharge at the same elevation. Equivalent leveling devices may be approved by the administrative authority.

(3) All unused outlet holes in the box shall be securely closed.

**69.4(3) Other distribution devices.** For all other effluent distribution devices, the manufacturer's specifications shall be adhered to for installation, cleaning, and maintenance.

[ARC 9467C, IAB 8/6/25, effective 9/10/25; see Delay note at end of chapter]

**567—69.5(455B) Secondary treatment—soil absorption systems.** When a PSDS uses secondary treatment prior to the discharge, land application, or other disposal of effluent, it shall comply with all applicable provisions of this rule or 567—69.6(455B).

**69.5(1) Provisions.** The following provisions apply to all soil absorption systems. Soil absorption systems are the best available treatment technology and shall always be used where possible.

*a. Prohibited drainage.*

(1) Nothing shall enter a soil absorption system that does not first pass through a septic tank.

(2) Roof, foundation, area, and storm drains shall not discharge into or upon a soil absorption system.

*b. Prohibited construction.* There shall be no construction of any kind, including driveways, covering the septic tank, distribution box, or absorption field of a soil absorption system. Vehicle access should be infrequent, primarily limited to vegetation maintenance.

*c. Soil evaluation.* Either a percolation test or a professional soil analysis, including a confining layer determination, is required before any soil absorption system is installed.

(1) Percolation test. If a percolation test is performed, it shall comply with the procedure in Appendix B of this chapter.

(2) Professional soil analysis. If a professional soil analysis is performed, soil characteristics including but not limited to soil content, color, texture, and structure shall be used to determine the confining layer and the soil loading rate.

(3) Acceptable percolation rate. An area is deemed suitable if:

1. For conventional systems, soil absorption bed systems, and at-grade systems, the average percolation rate is less than 60 minutes per inch and greater than one minute per inch.

2. For mound systems, an average percolation rate of less than 120 minutes per inch is achieved.

(4) Confining layer determination. At least one additional test hole six feet in depth, or to water or rock, whichever occurs first, shall be provided in the center of the proposed absorption area to determine the location of any confining layer. This six-foot test hole shall be drilled prior to determining the percolation test hole depths and may be augered the same size as the percolation test holes or may be made with a soil probe.

*d. Groundwater.* If the seasonal high groundwater level is present within three feet of the trench bottom final grade and cannot be successfully lowered by subsurface tile drainage, the area shall be classified as unsuitable for a soil absorption system. The administrative authority shall be consulted to determine an acceptable alternative method of wastewater treatment.

*e. Location.*

(1) Soil absorption systems shall be located in accordance with the SDs in Table I in 567—paragraph 60.2(2)“c.”

(2) All soil absorption systems shall be located to maximize the vertical SD from the bottom of the absorption trench to the confining layer, but under no circumstances shall this vertical separation be less than three feet.

(3) In situations where specific location or site characteristics would appear to prohibit installation of a conventional soil absorption system, design modifications to overcome such limitations may be approved by the administrative authority. Such design modifications could include but are not limited to the installation of subsurface drainage; the use of shallow or at-grade systems or mound systems; or the use of pretreated effluent.

*f. Driveway crossings.* Connecting lines under driveways shall be constructed of SCH 40 PVC pipe (SDR 26 or stronger) or equivalent and shall be protected from freezing.

*g. Loading rates and trench size.*

(1) Percolation and soil loading tables. All soil absorption systems installed under this subrule shall comply with the following tables. Table IIa provides a correlation between percolation rates and soil loading rates. Table IIb provides soil loading rates based upon soil texture and structure. Table IIa and Table IIb shall be used to determine the appropriate soil loading rate. Table IIc specifies linear feet of lateral trenches required based upon the soil loading rate, wastewater flow rate, and trench width.

**Table IIa**  
**Maximum Soil Application Rates Based Upon Percolation**  
**Rates - Monthly Averages in gal/ft<sup>2</sup>/day**

| <b>Percolation Rate<br/>(minutes per inch)</b> | <b>Septic Tank Effluent<sup>1,2</sup><br/>CBOD<sub>5</sub> 25 mg/L - 215 mg/L;<br/>TSS 30 mg/L - 150 mg/L</b> | <b>Pretreated Effluent<br/>CBOD<sub>5</sub> ≤ 25 mg/L;<br/>TSS ≤ 30 mg/L</b> |
|------------------------------------------------|---------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------|
| 0 to 5                                         | 1.2                                                                                                           | 1.6                                                                          |
| Fine sands                                     | 0.5                                                                                                           | 0.9                                                                          |
| 6 to 10                                        | 0.8 – 0.6                                                                                                     | 1.2                                                                          |
| 11 to 29                                       | 0.6 – 0.5                                                                                                     | 0.9                                                                          |
| 30 to 45                                       | 0.5 – 0.4                                                                                                     | 0.7                                                                          |
| 46 to 60                                       | 0.4 – 0.2                                                                                                     | 0.5                                                                          |

<sup>1</sup>gpd - gallons per day. Design flow rates are based on 150 gallons per bedroom per day.

<sup>2</sup>Requires pressure distribution (pump).

(2) Unsuitable absorption. Conventional soil absorption trenches and at-grade systems shall not be installed in soils that have a percolation rate less than 1 minute per inch or greater than 60 minutes per inch.

*h. Construction details for all soil absorption trenches.*

(1) Depth. A trench bottom depth of 18 to 24 inches is recommended. Soil absorption trenches shall not exceed 36 inches in depth. Not less than six inches of porous soil shall be provided over the laterals. The minimum separation between the trench bottom and any confining layer shall be 36 inches.

(2) Length. No soil absorption trench shall be greater than 100 feet long unless the administrative authority approves the use of a drop box.

(3) Trench SD. At least six feet of undisturbed soil shall be left between each trench edge on level sites. Two feet of SD should be added for each five percent increase in slope from level.

(4) Grade. The trench bottom should be constructed level from end to end. On sloping ground, the trench shall follow a uniform land contour to maintain a minimum soil cover of six inches and a level trench bottom.

(5) Compaction. There shall be minimum use of, or traffic of heavy equipment on, the area proposed for soil absorption. In addition, heavy equipment shall not be used on the trench bottoms in the absorption area.

(6) Soils. Soil absorption systems shall not be installed in fill soil. Disturbed soils that have stabilized for at least one year shall require a recent percolation test or professional soil analysis.

(7) Soil smearing.

1. Soils with significant clay content should not be worked when wet.

2. If soil moisture causes trench bottom or sidewall smearing, the installation should be discontinued until conditions improve.

**69.5(2) Gravel aggregate systems.** The following provisions apply to gravel aggregate systems.

*a. Gravel.*

(1) A minimum of six inches of clean, washed river gravel, free of clay and clay coatings, shall be laid below the distribution pipe, and enough gravel shall be used to cover the pipe.

(2) This gravel shall be of such a size that 100 percent of the gravel will pass a 2½-inch screen and 100 percent will be retained on a ¾-inch screen.

(3) Limestone or crushed rock is not recommended for soil absorption systems; however, if used, it shall meet the following criteria:

1. The percent wear, as determined in accordance with the American Association of State Highway and Transportation Officials (AAHSTO) T 96, Grading C, 2022, available on the AAHSTO website at [store.transportation.org](https://store.transportation.org), shall not exceed 40 percent.

2. When gravel is subjected to the freezing and thawing test, Iowa DOT Materials Laboratory Test Method 211, Method A, April 15, 2025, available at [erl.iowadot.gov](http://erl.iowadot.gov), the percentage loss shall not exceed 10 percent.

3. The percent absorption, determined in accordance with Iowa DOT Materials Laboratory Test Method 202, April 15, 2025, available at [erl.iowadot.gov](http://erl.iowadot.gov), shall not exceed three percent.

*b. Trench width.* Soil absorption trenches for gravel systems shall have a minimum width of 24 inches and a maximum width of 36 inches at the bottom of the trench.

*c. Grade.* The distribution pipes shall be laid with a minimum grade of two inches per 100 feet of run and a maximum grade of six inches per 100 feet of run, with a preference given to the lesser slope.

*d. Pipe.*

(1) Distribution pipe used in gravity-based distribution type systems shall be PVC rigid plastic meeting ASTM 2729.

(2) The inside diameter shall be not less than four inches, with perforations at least ½ inch and no more than ¾ inch in diameter, spaced no more than 40 inches apart.

(3) Two rows of perforations shall be provided; located 120 degrees apart along the bottom half of the tubing and each 60 degrees up from the bottom centerline.

(4) The end of the pipe in each trench shall be sealed with a watertight cap unless, on a level site, a footer is installed connecting the trenches together.

(5) Coiled perforated plastic pipe shall not be used.

*e. Gravel cover.* Synthetic drainage fabric or other material approved by the manufacturer or administrative authority shall be laid so as to separate the gravel from the soil backfill.

**69.5(3) Chamber systems.** The following provisions apply to chamber systems.

*a. Use.* Chamber systems may be used as an alternative to gravel aggregate systems.

*b. Installation.* The manufacturer's specifications and installation procedures shall be adhered to.

*c. Trench length.* The total length of soil absorption trench for chambers 22 inches wide shall be the same as specified in Table IIc for a two-foot-wide conventional soil absorption trench. Chambers 33 inches wide or greater shall be sized as specified in Table IIc for a three-foot-wide conventional soil absorption trench.

*d. Sidewall.* The chambers shall have at least six inches of sidewall effluent soil exposure height.

**69.5(4) EPS aggregate systems.** The following provisions apply to EPS aggregate systems.

*a. Use.* EPS aggregate systems may be used as an alternative to gravel aggregate systems.

*b. Installation.* The manufacturer's specifications and installation procedures shall be adhered to.

*c. Trench length.* The total length of soil absorption trench using a 12-inch EPS aggregate bundle configuration less than 33 inches wide shall be the same as specified in Table IIc for a two-foot-wide

conventional soil absorption trench. Twelve-inch EPS aggregate bundle configurations 33 inches wide or greater shall be sized as specified in Table IIc for a three-foot-wide conventional soil absorption trench.

*d. EPS bundles.* EPS bundles may be configured in a trench, bed, at-grade, or mound application to obtain the desired width, height, and length. EPS bundles containing a distribution pipe shall be connected end-to-end with an internal coupling device.

**69.5(5) Mound systems.** The following provisions apply to mound systems.

*a. General design and use.*

(1) Mound systems shall:

1. Only be permitted when a thorough site evaluation has been conducted and landscaping, dwelling placement, effect on surface drainage, and general topography have been considered;

2. Be constructed only upon undisturbed naturally occurring soils or where a soil analysis has determined the site is suitable; and

3. Be located in accordance with the SDs in Table I in 567—paragraph 60.2(2) “c” as measured from the outer edge of the sand in the mound.

(2) Mound systems shall not be utilized on:

1. Sites subject to flooding with a ten-year or greater frequency;

2. Soils where the high groundwater level, impermeable bedrock, or soil strata having a percolation rate exceeding 120 minutes per inch occurs within 12 inches of natural grade; or

3. Where creviced bedrock occurs within 20 inches of natural grade.

(3) No buildings, driveways, or other surface or subsurface obstructions shall be permitted within 50 feet on the downgradient side of the mound when the mound is constructed on a slope greater than five percent.

(4) No future construction shall be permitted in the effluent disposal area as long as the mound is in use.

*b. Specifications and design standards.* The specifications provided in these rules for mounds are minimal and may not be sufficient for all locations. Other design information beyond the scope of these rules may be necessary to properly design a mound system. Refer to Appendix C of this chapter for mound system construction design standards.

**69.5(6) At-grade systems.** The following provisions apply to at-grade systems.

*a. General design and use.*

(1) At-grade systems shall:

1. Only be permitted when a thorough site evaluation has been conducted and landscaping, dwelling placement, effect on surface drainage, and general topography have been considered;

2. Be constructed only upon undisturbed naturally occurring soils or where a soil analysis has determined the site is suitable; and

3. Be located in accordance with the SDs in Table I in 567—paragraph 60.2(2) “c” as measured from the outer edge of the distribution bed in the system.

(2) At-grade systems shall not be utilized on:

1. Sites subject to flooding with a ten-year or greater frequency, or

2. Soils where a confining layer occurs or soil strata having a percolation rate exceeding 60 minutes per inch occur within 36 inches of natural grade.

(3) No buildings, driveways, or other surface or subsurface obstructions shall be permitted within 25 feet on the downgradient side of an at-grade system when the system is constructed on a slope greater than five percent.

(4) No future construction shall be permitted in this effluent disposal area as long as the at-grade system is in use.

*b. Specifications and design standards.* The specifications provided in these rules for at-grade systems are minimal and may not be sufficient for all locations. Other design information beyond the scope of these rules may be necessary to properly design an at-grade system. Refer to Appendix D of this chapter for at-grade system construction design standards.

**69.5(7) Soil absorption bed systems.** The following provisions apply to soil absorption bed systems.

*a. General design and use.* Soil absorption bed systems shall:

(1) Only be permitted when a thorough site evaluation has been conducted, and landscaping, dwelling placement, effect on surface drainage, and general topography have been considered;

(2) Be constructed only upon undisturbed naturally occurring soils or where a soil analysis has determined the site is suitable; and

(3) Be located in accordance with the SDs specified in Table I in 567—paragraph 60.2(2) “c.”

b. *Specifications and design standards.* Refer to Appendix E of this chapter for soil absorption bed system construction design standards.

[ARC 9467C, IAB 8/6/25, effective 9/10/25; see Delay note at end of chapter]

**567—69.6(455B) Secondary treatment—other.**

**69.6(1)** *Intermittent subsurface sand filters (ISSFs).* The following provisions apply to ISSFs.

a. *General design and use.*

(1) ISSFs may be used when the administrative authority determines the site is unacceptable for a soil absorption system.

(2) ISSFs shall be located in accordance with the SDs in Table I in 567—paragraph 60.2(2) “c.”

(3) All ISSFs shall have a sample port or means of collecting a representative effluent sample.

(4) There shall be no construction, such as buildings or concrete driveways, covering any part of an ISSF.

(5) ISSFs may be constructed where the water table is below the bottom of the collector pipe. If the water table is verified to be higher than the bottom of the collector pipe, an ISSF may only be installed if either a liner is installed or subsurface drainage tile is used to lower the water table, in accordance with the following.

1. If needed, a plastic liner shall use a minimum of 30-mil plastic or product of equivalent thickness as determined by the administrative authority.

2. Where the water table is lowered by use of subsurface drainage tile, the minimum depth of the drainage tile shall be greater than or equal to the lowest portion of the sand filter bed.

b. *Specifications and design standards.* The specifications in these rules for ISSFs are minimal and may not be sufficient for all applications. Other design information beyond the scope of these rules may be necessary to properly design an ISSF. Refer to Appendix F of this chapter for ISSF construction design standards.

**69.6(2)** *Proprietary treatment systems (PTSs).* The following provisions apply to all PTSs.

a. *General.*

(1) A PTS may be used when the administrative authority determines the site is unacceptable for a soil absorption system or an ISSF.

(2) PTS manufacturers shall submit to the department, by February 1 of each year, their current installation and maintenance manual, including the applicable third-party certification.

(3) For a PTS that utilizes replaceable media, a media disposal plan shall be included in the installation and maintenance manual. Used media from a PTS is considered “septage,” and septage shall be disposed of in accordance with 567—Chapter 68.

(4) PTSs shall be located in accordance with the SDs in Table I in 567—paragraph 60.2(2) “c.”

b. *Design, installation, and operation.* A PTS shall be installed and operated in accordance with the manufacturer’s requirements. Additionally:

(1) A PTS other than an aerobic treatment unit shall be preceded by a septic tank with a minimum capacity in accordance with 69.3(2), or shall have an incorporated component that is, or performs the same function as, a septic tank. A pretank or chamber that is part of the design, that is intended to serve the same function as a septic tank, and that was approved by third-party certification shall satisfy this requirement.

(2) An aerobic treatment unit PTS that does not have an incorporated component that is, or performs the same function as, a septic tank as part of the approved design shall be preceded by a pretreatment tank with a minimum capacity of 500 gallons.

(3) A PTS that utilizes a soil absorption system to disperse the treated effluent shall comply with 567—69.5(455B).

(4) All PTSs shall have a sample port or means of collecting a representative effluent sample.

c. *Monitoring and maintenance.*

(1) Prior to installation, a contract for PTS monitoring and maintenance shall be established between the system owner and a manufacturer-certified technician. A maintenance contract is required for the life of the system. A copy of the maintenance contract shall be made available to the administrative authority. A PTS shall be inspected, monitored, and maintained in accordance with the manufacturer's specifications and third-party certification, or at least once annually, whichever is more frequent.

(2) All PTS monitoring and maintenance shall be performed by a manufacturer-certified technician. PTS manufacturers shall ensure that an adequate number of certified technicians are available to service their PTSs at the specified intervals.

(3) Certified technicians shall report monitoring and maintenance results to the system owner and to the administrative authority. Certified technicians shall also report any discontinuance of PTS maintenance to the administrative authority.

[ARC 9467C, IAB 8/6/25, effective 9/10/25; see Delay note at end of chapter; Editorial change: IAC Supplement 7/8/26]

#### **567—69.7(455B) Time of transfer (TOT) inspections.**

**69.7(1) *Inspection criteria.*** Pursuant to Iowa Code section 455B.172(11), if a building where a person resides, congregates, or is employed is served by a PSDS, the PSDS shall be inspected prior to any transfer of ownership of the building.

*a. Properly functioning system.* If a PSDS is properly treating wastewater and not creating an unsanitary condition in the environment at the time of inspection, the system is not required to meet the department's current construction standards. However, the discharge restrictions in 69.1(8) shall always apply.

*b. Future demolition.* Pursuant to Iowa Code section 455B.172(11) "a"(7), a TOT inspection and upgrade of a PSDS serving a building is not required when the buyer of a building served by a PSDS intends to demolish or raze the building, as long as the building is not occupied and is removed by the date agreed upon in the waiver for building demolition form, available from the department. For purposes of this paragraph, a building includes inhabitable residences, other inhabitable structures, or commercial buildings.

*c. Future inspection.* In the event that weather or other temporary physical conditions prevent an inspection from being conducted, the buyer shall execute a binding agreement for weather delayed inspection with the administrative authority, using a department form.

*d. Future installation or renovation.* In the following instances, a buyer may execute a binding agreement for future installation or renovation with the administrative authority, using a department form.

(1) If an inspection fails; or

(2) If all parties agree an existing PSDS will not pass inspection and a buyer wishes to forego an inspection.

*e. Forms.* The forms for a waiver for building demolition, binding agreement for weather delayed inspection, and binding agreement for future installation are available on the department's website at [www.iowadnr.gov](http://www.iowadnr.gov).

*f. Failure or improper function.* If a PSDS is failing to ensure effective wastewater treatment or is otherwise improperly functioning, the PSDS shall be renovated to meet the department's current construction standards. A PSDS is failing to ensure effective wastewater treatment or is otherwise improperly functioning when one or more of the following conditions exist:

(1) The system's septic tank is constructed of metal; is not watertight; was not designed for use as a PSDS tank; or is damaged and cannot be repaired to the manufacturer's standards using a manufacturer-approved method;

(2) The system's primary treatment tank is less than 500 gallons;

(3) All fixtures on the property served by the PSDS that produce or transport domestic waste do not enter the PSDS;

(4) More than 50 percent of the system's soil absorption area does not accept water;

(5) There is evidence that the system is failing to effectively treat wastewater or is otherwise improperly functioning in a manner not detailed above; or

(6) The system is a dry well structure or seepage pit.

*g. Exemptions.* For purposes of this subrule, transfer does not include the situations listed in Iowa Code section 455B.172(11) "a"(1) through 455B.172(11) "a"(12).

**69.7(2) *Certified TOT inspectors.*** Inspections shall be conducted by an inspector certified by the department, in accordance with Iowa Code section 455B.172 and this rule. In order to be a certified TOT inspector, an individual shall have met the experience requirements, have successfully completed the inspection course and examination, and have been issued a TOT certification by the department.

*a. Experience requirements.* In order to be certified by taking the inspection course and examination only, an individual must have at least two years' experience in the operation, installation, inspection, design or maintenance of PSDSs. Individuals lacking this experience must complete additional coursework before attending the inspection course with examination. The additional courses shall include but not be limited to "Basics of Onsite" offered by the Onsite Wastewater Training Center of Iowa or equivalent courses as determined by the department.

*b. Examination application form and evaluation.*

(1) All applications to take the certified TOT inspector examination shall be filed using a department form, available on the department's website at [www.iowadnr.gov](http://www.iowadnr.gov).

(2) Examination applications shall be reviewed by the department and an application review decision will be sent to the applicant. The applicant shall have the right to dispute the application evaluation.

(3) An examination application approval shall be valid for examination purposes for one year from the date the application is approved by the department.

*c. Certification.* Applicants who successfully meet the requirements of this subrule will receive a TOT certification from the department. The department shall maintain a current listing of certified TOT inspectors on its website at [www.iowadnr.gov](http://www.iowadnr.gov).

(1) All certificates shall expire on June 30 of even-numbered years and must be renewed every two years.

(2) Renewal applications shall be submitted on a department form, available on the department's website at [www.iowadnr.gov](http://www.iowadnr.gov), and shall be submitted 60 days before the expiration date of the current certificate. Renewal certificates will only be granted to inspectors that meet the continuing education unit (CEU) requirements of 69.7(2)"d," that have paid the appropriate certification fee in 69.7(2)"e," and that conduct inspections in accordance with 69.7(3).

(3) Inspectors who have complied with the continuing education requirements may continue to request a renewal up to 45 days following expiration of their certificate. However, inspectors may not perform inspections until a renewal certificate has been issued by the department.

(4) Inspectors whose certification has expired must retake the inspector class and test to become recertified.

*d. Continuing education units (CEUs).* The following CEU requirements apply to TOT certification:

(1) A certified inspector must earn 1.2 CEUs or 12 contact hours during each two-year period. Newly certified inspectors (previously uncertified) who become certified after April 1 of a two-year period will not be required to earn CEUs until the next two-year period.

(2) CEUs must be earned during each two-year period from April 1 of the even-numbered year until March 31 of the next even-numbered year. CEUs earned between April 1 and the end of the 45-day grace period cannot be counted towards a certification that expires on June 30 of that year.

(3) All activities for which CEU credit will be granted must be approved by an accredited college, university, technical institute, or the department and shall be related to PSDSs. Any entity providing training eligible for CEU credit shall, upon request, provide the training at no cost to one department staff member for audit purposes and shall provide all course materials to the department upon request.

(4) It is the personal responsibility of a certified inspector to maintain a record of and notify the department of the CEUs earned during the two-year period. The CEUs earned during the period shall be shown on the renewal application.

*e. Certification fees.* The following nonrefundable fees apply:

(1) The examination application fee is \$50.

(2) The new inspector certification fee is \$300. This fee must be paid prior to the issuance of a certification. This fee shall be prorated to \$75 for each one-half year of a two-year period from a certification issuance date to June 30 of the next even-numbered year. Certifications obtained within the

first half year period of the certification period shall be subject to the full certification fee of \$300. The department will inform the applicant of the prorated fee amount prior to certification.

(3) The certification renewal fee is \$300. This fee must accompany a renewal application in order for a certificate to be renewed.

*f. Certified inspector obligations.* Certified inspectors shall conduct TOT inspections in accordance with this subrule.

**69.7(3)** *Inspection procedures.* TOT inspections shall be conducted as follows:

*a. Inspection report.*

(1) A TOT inspection shall be conducted using a department form, available on the department's website at [www.iowadnr.gov](http://www.iowadnr.gov).

(2) Upon completion of an inspection, all information, inspection data, and all attachments shall be provided as follows: to the department for review; to the county environmental health department for review and enforcement of any follow-up mandatory improvements to the system; and to the person ordering the inspection within ten business days from the inspection date.

(3) Submittal of a complete inspection form and all attachments in the online TOT database, available on the department's website at [www.iowadnr.gov](http://www.iowadnr.gov), shall be deemed compliant with this requirement.

*b. Record search.*

(1) Prior to an inspection, a certified inspector shall contact the administrative authority to obtain any permits, as-built drawings, or other available information concerning the system being inspected. Information may also be obtained from service providers or the homeowner.

(2) The inspector shall:

1. Verify an existing as-built drawing, or

2. If no as-built drawing is available, develop an as-built drawing as part of the inspection.

*c. Septic tanks, vault toilets, and holding tanks.* At the time of inspection, any existing tank(s) shall be opened and have the contents properly disposed of, and the condition of the tank and its components shall be documented and included in the final inspection report. Alternatively, the owner may provide evidence of proper tank pumping by a licensed commercial septic tank cleaner within three years prior to the inspection, so long as such evidence includes documentation of the size and condition of the tank and its components at the time of pumping.

*d. Pumps and pump chambers.* Pump chambers or vaults shall be opened for inspection. The pump and all alarms and controls shall be tested to ensure proper operation.

*e. Secondary treatment.* Proof that a secondary treatment system (if any) is in place shall be provided. This proof includes but is not limited to performing and documenting the following actions during the inspection:

(1) Opening and inspecting all distribution box(es) or drop box(es);

(2) Locating and uncovering the header pipe of a soil absorption system, if the pipe location and status is unknown;

(3) Locating the vents and discharge pipe of a sand filter and probing the treatment area. A gravity sand filter with a distribution box shall have the box opened and inspected;

(4) Locating, opening the lids, and inspecting the components of any PTS according to the manufacturer's recommendations, and documenting the product model and serial numbers of the PTS;

(5) Probing any soil-based treatment systems to determine their condition; and

(6) A hydraulic loading test.

*f. Discharging systems.* During an inspection, a representative sample of effluent shall be collected for CBOD<sub>5</sub> and TSS from all PSDSs, with the exception of soil absorption systems, and the test results shall be included in the inspection report. The effluent quality shall meet the requirements of NPDES General Permit No. 4 for CBOD<sub>5</sub> and TSS. A certified inspector shall report the discharge location(s) for all discharging PSDSs.

*g. Other systems and system components.* Any PSDS or component not mentioned above shall be inspected for compliance with these rules and for proper function. Examples of components include but are not limited to effluent screens, tertiary treatment systems, disinfection devices, alarms, control boxes, and timers.

**69.7(4)** *Certified TOT inspector disciplinary action.*

*a. Reasons for disciplinary action.* Disciplinary action may be taken against a certified TOT inspector on any of the grounds specified in Iowa Code section 455B.219 or the following more specific grounds:

(1) Failure to use reasonable care or judgment or to apply knowledge or ability in performing the duties of a certified inspector.

(2) Failure to submit required inspection records or other reports required under applicable permits or department rules, including failure to submit complete records or reports.

(3) Knowingly making any false statement, representation, or certification on any application, record, report, or document required to be maintained or submitted under any applicable permit or department rule.

*b. Disciplinary sanctions.* Disciplinary sanctions may include the following:

(1) Permanent revocation without chance of recertification or for a specified period of time.

(2) Revocation or suspension of the practice of a particular aspect of a PSDS inspection.

(3) Probation under specified conditions relevant to the specific grounds for disciplinary action.

(4) Additional education, training, or reexamination may be required as a condition of reinstatement.

(5) Civil penalties not to exceed \$1,000 may be assessed for causes identified in 69.7(4)“a” through the issuance of an administrative order.

*c. Procedure.*

(1) Department staff shall initiate a disciplinary action by conducting a lawful investigation to establish a legal and factual basis for action. The department shall provide written notice to a certified inspector when considering disciplinary actions. The notice shall provide the certified inspector 20 days to state their position and present relevant facts.

(2) If an agreement as to appropriate disciplinary action, if any, can be reached between the department and the certified inspector, a written stipulation and settlement shall be entered into. The stipulation and settlement shall recite the basic facts and violations alleged, any facts established by the certified inspector, and the reasons for the particular sanction imposed.

(3) If an agreement as to appropriate disciplinary action cannot be reached, the department may initiate formal disciplinary procedures in a letter, sent by certified mail, that imposes disciplinary sanctions deemed appropriate by the department.

(4) A certified inspector may appeal any disciplinary sanction imposed by the department by filing a notice of appeal with the director within 30 days of receipt of a disciplinary sanction letter. If an appeal is filed, the department shall initiate contested case proceedings in accordance with 567—Chapter 7 and Iowa Code chapter 17A.

(5) Upon certificate revocation, application for certification may be allowed two years from the revocation date unless otherwise specified in accordance with 69.7(4)“b.” Any such applicant must meet all eligibility requirements in 69.7(2), successfully complete an examination, and be certified in the same manner as a new applicant.

**69.7(5)** *Procedures for noncompliance with child support order.* Upon receipt of a certification of noncompliance with a child support obligation as provided in Iowa Code section 252J.7, the department will initiate procedures to deny an application for inspector certification or renewal, or to suspend a certification in accordance with Iowa Code section 252J.8(4). The department shall issue to the person by certified mail a notice of its intent to deny or suspend inspector certification based on receipt of a certificate of noncompliance. The suspension or denial shall be effective 30 days after receipt of the notice unless the person provides the department with a withdrawal of the certificate of noncompliance from the child support recovery unit as provided in Iowa Code section 252J.8(4)“c.” Pursuant to Iowa Code section 252J.8(4), the person does not have a right to a hearing before the department to contest the denial or suspension action under this subrule but may seek a hearing in district court in accordance with Iowa Code section 252J.9.

[ARC 9467C, IAB 8/6/25, effective 9/10/25; see Delay note at end of chapter]

**567—69.8(455B) Waivers.** Waivers to these rules may be granted by the department or the administrative authority provided sufficient information is submitted, prior to construction, to substantiate the need for and

propriety of such action. Applications for waivers and justification shall be in writing and filed with the department in accordance with 561—Chapter 10.

[ARC 9467C, IAB 8/6/25, effective 9/10/25; see Delay note at end of chapter]

These rules are intended to implement Iowa Code chapter 455B, subchapter III, part 1, and Iowa Code chapter 252J.

**Appendix A - Estimates of Nonresidential Domestic Sewage Design Flow Rates**

| Source of use for sewage unit                 | Units                              | Gallons per day per unit |
|-----------------------------------------------|------------------------------------|--------------------------|
| <b>Dwelling Units</b>                         |                                    |                          |
| Hotels or luxury motels<br>or                 | Per guest                          | 60                       |
|                                               | Add per employee                   | 13                       |
|                                               | Per ft <sup>2</sup>                | 0.3                      |
| Discount motels<br>or                         | Per guest                          | 40                       |
|                                               | Add per employee                   | 13                       |
|                                               | Per ft <sup>2</sup>                | 0.46                     |
| Rooming house                                 | Per resident                       | 50                       |
|                                               | Add per nonresident meal           | 4.0                      |
| <b>Commercial/Industrial</b>                  |                                    |                          |
| Retail stores<br>or<br>or                     | Per ft <sup>2</sup> of sales area  | 0.13                     |
|                                               | Per customer                       | 3.8                      |
|                                               | Plus each employee                 | 15                       |
|                                               | Per toilet room                    | 590                      |
| Offices<br>or                                 | Per employee                       | 18                       |
|                                               | Per ft <sup>2</sup>                | 0.25                     |
| Medical offices                               | Per ft <sup>2</sup>                | 1.6                      |
| Industrial buildings                          | Per employee                       | 20                       |
| Construction camp                             | Per employee                       | 20                       |
| Visitor center                                | Per visitor                        | 13                       |
| Laundromat<br>or<br>or                        | Per machine                        | 690                      |
|                                               | Per load                           | 50                       |
|                                               | Per ft <sup>2</sup>                | 2.6                      |
| Barber shops                                  | Per chair                          | 68                       |
| Beauty shops                                  | Per station                        | 285                      |
| Car washes                                    | Per inside ft <sup>2</sup>         | 10                       |
| Shopping Center<br>or<br>or                   | Per employee                       | 11.5                     |
|                                               | Per ft <sup>2</sup>                | 0.15                     |
|                                               | Per parking space                  | 2.5                      |
| Flea Market<br>or                             | Per vendor space, without food     | 15                       |
|                                               | Per vendor space, with food        | 50                       |
| <b>Eating and Drinking Establishments</b>     |                                    |                          |
| Restaurant, not including bar or lounge<br>or | Per meal, without alcoholic drinks | 3.5                      |

**Appendix B - Percolation Test Procedure**

*a.* Prior to performing a percolation test, the confining layer shall be determined in accordance with 69.5(1) “b”(4).

*b.* At least three percolation test holes distributed evenly over the proposed lateral field are required.

*c.* Percolation test holes shall be 4 to 12 inches in diameter and to the same depth as the proposed absorption trenches (not to exceed 36 inches in depth).

*d.* Sides and bottoms of the test holes shall be scratched or roughened to provide a natural surface. All loose material shall be removed from each hole.

*e.* The bottoms of the test holes shall be covered with approximately two inches of rock to protect the bottom from scouring action when the water is added.

*f.* The hole shall be filled with at least 12 inches of clean water, and this depth shall be maintained for at least four hours; preferably overnight if clay soils are present. It is important that the soil be allowed to soak for long enough to swell if accurate results are to be obtained. Failure to perform the presoak when required will invalidate the percolation test results.

*g.* In sandy soils with little or no clay, soaking is not necessary. If, after the hole has been filled twice with 12 inches of water, the water seeps completely away in less than ten minutes, the test can proceed immediately.

*h.* Except for sandy soils, percolation rate measurements should be made at least 4 hours, but no more than 24 hours, after the soaking period began. Any soil that sloughed into the hole during the soaking period shall be removed, and the water level shall be adjusted to six inches above the gravel (or eight inches above the bottom of the hole). At no time during the test is the water level allowed to rise more than six inches above the gravel.

*i.* Immediately after adjustment, the water level shall be measured from a fixed reference point to the nearest  $\frac{1}{8}$  inch at 30-minute intervals. The test is continued until two successive water level drops do not vary by more than  $\frac{1}{8}$  inch. At least three measurements shall be made.

*j.* After each measurement, the water level shall be readjusted to the six-inch level. Use the last water level drop to calculate the percolation rate.

*k.* In sandy soils, or soils in which the first six inches of water added after the soaking period seep away in less than 30 minutes, water level measurements shall be made at ten minute intervals for a one hour period. Use the last water level drop to calculate the percolation rate.

*l.* The percolation rate shall be calculated for each test hole by dividing the time interval between measurements by the magnitude of the last water level drop. This calculation results in a percolation rate in terms of minutes per inch.

(1) To determine the percolation rate for the area, average the rates obtained from each hole.

(2) If tests in the area vary by more than 20 minutes per inch, variations in soil type are indicated. Under these circumstances, percolation rates should not be averaged.

(3) Example: If the last measured drop in water level after 30 minutes is  $\frac{5}{8}$  inch, the percolation rate = (30 minutes)/( $\frac{5}{8}$  inch) = 48 minutes/inch.

## Appendix C - Mound System Construction Design Standards

### Mound fill material.

*a.* A mound shall be constructed using clean, medium-textured sand (a.k.a. concrete sand). The sand size shall be such that:

- (1) At least 25 percent by weight shall have a diameter between 2.0 and 0.25 millimeter (mm);
- (2) Less than 35 percent by weight, a diameter between 0.25 and 0.05 mm; and
- (3) Less than 5 percent by weight, a diameter between 0.05 and 0.002 mm.

*b.* Rock fragments larger than 1/16 inch (2.0 mm) shall not exceed 15 percent by weight of the material used for mound fill.

### Mound construction details.

*a.* There shall be a minimum of three feet of fill material and undisturbed naturally occurring soils between the bottom of the washed gravel and the highest elevation of the confining layer in accordance with 69.5(6) “a”(3)“2.”

*b.* Gravel shall meet the requirements specified in 69.5(2) “a.”

*c.* From one to two feet of medium-textured sand (depending upon the underlying soil depth, see “a” above) must be placed between the bottom of the gravel and the top of the plowed surface of the naturally occurring soil.

*d.* Mound system absorption beds shall be installed with the long dimension parallel to the land contour. Systems on steep slopes with slowly permeable soils should be narrow to reduce the possibility of toe seepage.

*e.* Minimum spacing between distribution pipes shall be four feet, and a minimum of three feet shall be maintained between any trench and the sidewall of the mound.

*f.* No soil under or up to 50 feet downgradient of the mound may be removed or disturbed except as specified herein.

*g.* Construction equipment that would cause undesirable compaction of the soil shall be kept off the base area. Construction or plowing shall not be initiated when the soil moisture content is high. If a sample of soil from approximately nine inches below the surface can be easily rolled into a ⅛- to ¼-inch diameter wire 1½ inches long or more, the soil moisture content is too high for construction purposes.

*h.* Aboveground vegetation shall be closely cut and removed from the ground surface throughout the area to be utilized for the placement of the fill material.

*i.* The area shall be plowed to a depth of eight inches, parallel to the land contour, with the plow throwing the soil up slope to provide a proper interface between the fill and the natural soil. Tree stumps should be cut flush with the surface of the ground, and roots should not be pulled.

*j.* The base absorption area of the mound shall be calculated using the flow rate and the results of the percolation rate test or soil analysis as indicated in Table IIa or IIb of 69.5(1) “g”(1).

*k.* The area of the sand fill material shall be sufficient to extend at least three feet beyond the edge of the gravel area before the sides are shaped to at least a 3:1 slope.

### Distribution system.

*a.* The distribution pipe for a mound system shall:

- (1) Either be SCH 40 or 80 PVC pipe (SDR 26 or stronger), with a one-inch nominal diameter, or an equivalent design that ensures proper distribution.
- (2) Have either a single row of ¼-inch perforations in a straight line 30 inches on center along the length of the pipe or an equivalent design that ensures uniform distribution. No perforations shall be permitted within three inches of the outer ends of any distribution pipe. All joints and connections shall be solvent-cemented.

(3) Be placed in the clean, washed gravel with holes downward. The gravel shall be a minimum of six inches in depth below the pipe and two inches in depth above the pipe.

*b.* The outer ends of all pressure distribution lines shall be turned up, with either a long 90-degree elbow or two 45-degree elbows, to allow for cleaning. The outer ends shall have a screw-on cap and cover that shall be accessible from the ground surface without excavation.

*c.* The central pressure manifold should consist of 1½- or 2-inch solid plastic pipe and should use either a tee for connecting the distribution lines or an equivalent design that ensures uniform distribution.

*d.* Construction should be initiated immediately after preparation of the soil interface by placing all of the sand fill material needed for the mound (to the top of the trench) to a minimum depth of 21 inches above the plowed surface. This depth will permit excavation of the trenches to accommodate the six inches of washed gravel or crushed stone necessary for the distribution piping.

*e.* The absorption trench or trenches shall be hand-excavated into the sand. Trench bottoms shall be level.

*f.* Six inches of gravel shall be placed in the trench and leveled. After the distribution pipe is placed, the pipe shall be covered with a minimum of two inches of gravel.

*g.* The entire sand and gravel area shall be covered with synthetic drainage fabric or other material approved by the administrative authority.

*h.* After installation of the distribution system, the system shall be pressure-tested before it is covered with gravel.

*i.* The entire mound shall be:

(1) Covered with topsoil native to the site or of similar characteristics to support vegetation found in the area;

(2) Crowned by providing a minimum of six inches of topsoil on the side slopes, with a minimum of 12 inches of topsoil over the center of the mound; and

(3) Seeded, sodded, or otherwise provided with a grass cover to ensure stability of the installation.

*j.* The area surrounding the mound shall be graded to provide for diversion of surface runoff water.

**Dosing.**

*a.* Pump dosing shall be required for mound systems.

*b.* The dosing volume shall be three to ten times the distribution piping network volume, but not more than 25 percent of the design flow shall be applied to the soil in one dose.

*c.* The dosing pump shall be capable of maintaining a squirt height of three feet above the pipe at the outer ends of the distribution lines. All lines shall have an equal squirt height above the pipe to maintain equal distribution.

## Appendix D - At-Grade System Construction Design Standards

### At-grade system construction details.

*a.* There shall be a minimum of three feet of undisturbed naturally occurring soils between the bottom of the gravel, chamber, or EPS aggregate in the at-grade system and the highest elevation of any confining layers.

*b.* An at-grade system may be installed up to 12 inches deep.

*c.* Gravel shall meet the requirements of 69.5(2)“a.” EPS aggregate or chambers are acceptable alternatives to gravel if the manufacturer’s specifications and installation procedures are followed and pressure pipe is used to adequately dose the entire bed.

*d.* At-grade system beds shall be installed with the long dimension parallel to the land contour. Systems on steep slopes with slowly permeable soils should be narrow to reduce the possibility of toe seepage.

*e.* Minimum spacing between distribution pipes shall be four feet, and a minimum of three feet shall be maintained between any trench and the sidewall of the at-grade.

*f.* No soils under or within 15 feet of any at-grade system may be disturbed. On sloping sites, no soils shall be disturbed within 10 feet uphill of the system and within 15 feet downhill of the system, plus an additional five feet for every 5 percent slope downhill.

*g.* Construction equipment that would cause undesirable compaction of the soil shall be kept off the base area. Construction or plowing shall not be initiated when the soil moisture content is high. If a sample of soil from approximately nine inches below the surface can be easily rolled into a 1/8-inch diameter wire 1 1/2 inches long, the soil moisture content is too high for construction purposes.

*h.* Aboveground vegetation shall be closely cut and removed from the ground surface throughout the area to be utilized for the placement of the fill material.

*i.* The area shall be plowed to a minimum depth of six to eight inches, parallel to the land contour, with the plow throwing the soil up slope to provide a proper interface between the fill and the natural soil. Chisel teeth on a backhoe bucket shall be at least as long as the depth of plowing. Tree stumps should be cut flush with the surface of the ground, and roots should not be pulled. All work shall be done from the uphill side of the at-grade system.

*j.* The absorption bed area of the at-grade system shall be calculated using the flow rate and the results of the percolation rate test or soil analysis, as indicated in Table IIa or IIb of 69.5(1)“g”(1).

*k.* One foot of loamy cover material shall be installed over the bed. Cover shall extend at least five feet from the ends of the bed and be sloped to divert surface water. Side slopes shall not be steeper than 4:1. The upper six inches of the loamy soil cover must be topsoil borrow. Topsoil borrow must be of a quality that provides a good vegetative cover on the at-grade system.

### Distribution system.

*a.* The distribution pipe(s) shall be:

(1) Either SCH 40 or 80 PVC pipe (SDR 26 or stronger), with a one-inch nominal diameter, or an equivalent design that ensures proper distribution.

(2) Provided with either a single row of 1/4-inch perforations in a straight line 30 inches on center along the length of the pipe or an equivalent design that ensures uniform distribution. No perforations shall be permitted within three inches of the outer ends of any distribution pipe. All joints and connections shall be solvent-cemented.

(3) Be placed in the clean, washed gravel (or crushed limestone as described in 69.5(3)“a”(3)), with holes downward. The gravel shall be a minimum of six inches in depth below the pipe and two inches in depth above the pipe.

(4) Installed in the center of the gravel bed on slopes less than one percent and on the upslope edge at the gravel bed absorption width on slopes one percent or greater.

*b.* The outer ends of all pressure distribution lines shall be turned up, with either a long 90-degree elbow or two 45-degree elbows, to allow for cleaning. The outer ends shall have a screw-on cap and cover that shall be accessible from the ground surface without excavation.

*c.* The central pressure manifold should consist of 1½- or 2-inch solid plastic pipe and should use either a tee for connecting the distribution lines or an equivalent design that ensures uniform distribution.

*d.* The top of the gravel, chambers, or EPS aggregate shall be covered with synthetic drainage fabric or other material approved by the manufacturer or administrative authority.

*e.* After installation of the distribution system, the system shall be pressure-tested before it is covered with gravel.

*f.* The entire at-grade system shall be:

(1) Covered with topsoil native to the site or of similar characteristics to support vegetation found in the area;

(2) Crowned by providing a minimum of 6 inches of topsoil on the side slopes, with a minimum of 12 inches of topsoil over the center of the at-grade system; and

(3) Seeded, sodded, or otherwise provided with a grass cover to ensure stability of the installation.

*g.* The area surrounding the at-grade system shall be graded to provide for diversion of surface runoff water.

**Dosing.**

*a.* Pump dosing shall be required for at-grade systems.

*b.* The dosing volume shall be three to ten times the distribution piping network volume, but not more than 25 percent of the design flow shall be applied to the soil in one dose.

*c.* The dosing pump shall be capable of maintaining a squirt height of three feet above the pipe at the outer ends of the distribution lines. All lines shall have an equal squirt height above the pipe to maintain equal distribution.

## **Appendix E - Soil Absorption Bed System Construction Design Standards**

### **Soil absorption bed system construction details.**

*a.* A soil absorption bed system may only be used when site restrictions limit the use of a conventional system.

*b.* Soil absorption bed system placement shall be limited to areas having natural slopes of less than six percent. Absorption areas for seepage beds and trenches shall not be placed in soils with a percolation rate exceeding 30 minutes per inch or a loading rate of less than 0.40 gpd/ft<sup>2</sup>.

*c.* Soil absorption bed systems shall not be wider than 12 feet if gravity distribution is used and 25 feet if pressure distribution is used.

*d.* Natural, undisturbed soil must exist between multiple soil absorption beds. Multiple soil absorption beds shall be spaced at one-half the bed width.

### **Distribution.**

*a.* If gravity distribution is used in a soil absorption bed system, the bed absorption area shall be calculated by dividing the design flow by the soil loading rate in 69.5(1) "g"(1) Tables IIa and IIb, multiplied by 1.5.

*b.* Distribution piping for gravity distribution in a soil absorption bed system shall be uniformly spaced no more than five feet apart and not more than 30 inches from the side walls of the seepage bed.

*c.* If pressure distribution is used in seepage beds, the seepage bed absorption area shall be determined by dividing the design flow by the soil loading rate in 69.5(1) "g"(1) Tables IIa and IIb.

*d.* Pressure distribution shall be used in soil absorption bed systems when the distribution media is in contact with any soil textures classified as sand or loamy sand or when the system is placed in soils with a percolation rate of 0.1 to 5 minutes per inch.

*e.* Pressure distribution piping in soil absorption bed systems must be spaced no further than 36 inches apart and no further than 24 inches from the outside edge of the bed.

**Appendix F - Intermittent Subsurface Sand Filter (ISSF) Construction Design Standards****ISSF filter sizing.***a. Residential systems.*

- (1) Gravity flow. Residential ISSFs shall be sized at a rate of 240 ft<sup>2</sup> of surface area per bedroom.
- (2) Siphon- or non-pressure dosed. Residential ISSFs dosed by a dosing siphon or other non-pressure dosed system shall be sized at a rate of 180 ft<sup>2</sup> of surface area per bedroom.
- (3) Pressure-dosed. Residential ISSFs dosed by a pump shall be sized at a rate of 150 ft<sup>2</sup> of surface area per bedroom.

*b. Non-residential.* Effluent application rates for commercial ISSFs treating domestic waste shall not exceed the following:

- (1) 1.0 gal/ft<sup>2</sup>/day.
- (2) The total surface area for any non-residential ISSF shall not be less than 200 ft<sup>2</sup>.

*c. Dosing.* The dosing system shall be designed to cover the entire filter bed during the dosing cycle. A dosing frequency of greater than twice per day is recommended.

**Collection pipelines.**

*a.* Each ISSF shall contain a horizontal set of collector lines.

*b.* The collector lines shall be either equivalent to SDR 35 PVC pipe (or stronger), 10-inch diameter gravelless drainage technology, EPS aggregate, chamber, or other suitable materials approved by the administrative authority.

*c.* One collector line shall be provided for each six feet of width or fraction thereof. A minimum of two collector lines shall be provided.

*d.* Collector lines shall be laid to a grade of one inch in ten feet (or 0.5 percent to 1.0 percent).

*e.* Each collector line shall be vented or connected to a common vent. Vents shall either extend at least 12 inches above the ground surface with the outlet either screened, provided with a 180-degree elbow, or provided with a perforated cap.

*f.* Gravelless drainage technology with a synthetic mesh wrap may be used for the collector lines. If a synthetic mesh wrap is used, no gravel or pea gravel is required to cover the collector lines and the pipe shall be bedded in filter sand.

*g.* EPS aggregate may be used for the collection system as an alternative to gravel and rigid PVC pipe. If used, EPS aggregate shall meet requirements equivalent to 69.5(5), follow the manufacturer's specifications and installation procedures, and cover the bottom of the sand filter. A six-foot separation between collection pipes shall be maintained. Fabric filter meeting the requirements of "h"(2) below shall be used instead of washed pea gravel.

*h.* If four-inch plastic pipe with perforations is used for the collector lines, the lines shall be covered as follows:

(1) Gravel  $\frac{3}{4}$  inch to 2 $\frac{1}{2}$  inches in size shall be placed around and over the lower collector lines until there is a minimum of 4 inches of gravel over the pipes; and

(2) The gravel shall be overlaid with a minimum of three inches of washed pea gravel,  $\frac{1}{8}$ -inch to  $\frac{3}{8}$ -inch in size, interfacing with the filter media. A layer of fabric filter may be used in place of the pea gravel. If used, fabric filters must either be 30 by 50 mesh with a percolation rate of at least five gallons/ft<sup>2</sup>/minute, or a material that allows for adequate air and water movement into the collector lines, per manufacturer specifications and as approved by the administrative authority.

*i.* A minimum of 24 inches of coarse washed sand shall be placed over the pea gravel or above the gravelless drainfield pipe. The sand shall meet the Iowa DOT standards for concrete sand, as follows:

- (1) 100 percent of the sand shall pass a 9.5 mm screen,
- (2) 90 to 100 percent shall pass a 4.75 mm screen,

- (3) 70 to 100 percent shall pass a 2.36 mm screen,
- (4) 10 to 60 percent shall pass a 600 Tm screen, and
- (5) 0 to 1.5 percent shall pass a 75 Tm screen.

j. The discharge pipe that extends from the collection system shall be solid SDR 35 PVC pipe (or stronger) at a minimum.

**Distribution system and cover.**

a. Six inches of gravel  $\frac{3}{4}$  inch to  $2\frac{1}{2}$  inches in size or other material as discussed in this section shall be placed upon the sand in the ISSF.

b. Distribution lines shall be level and horizontally spaced a maximum of three feet apart, center to center. Distribution lines shall be rigid, perforated PVC pipe if used with a gravel base. Pipe should meet requirements equivalent to 69.5(2) "d"(2) and "d"(3), or an equivalent design that ensures proper distribution.

c. For ISSFs using gravity distribution, venting shall be placed on the downstream end of the distribution lines, with each distribution line being vented or connected to a common vent. Vents shall either extend at least 12 inches above the ground surface with the outlet screened, have a 180-degree elbow, or be provided with a perforated cap. A vent shall not be used on distribution lines for systems using pressure distribution.

d. Enough gravel shall be placed to cover the distributors.

e. Synthetic drainage fabric or other material approved by the manufacturer or administrative authority shall be placed upon the top of the upper layer of gravel.

f. A minimum of 12 inches of soil backfill shall be provided over the rock or other material as discussed in this section.

g. A distribution box shall be provided for each filter bed where gravity distribution is used. The distribution boxes shall be placed upon undisturbed earth outside the filter bed. Separate watertight lines shall be provided leading from the distribution boxes to each of the distributor lines in the beds.

h. EPS aggregate or chamber may be used for the distribution system as an alternative to gravel and rigid, perforated PVC pipe. If used, EPS aggregate or chamber shall meet requirements equivalent to 69.5(5), follow the manufacturer's specifications and installation procedures, and cover the top of the sand filter. A three-foot separation between distribution pipes shall be maintained. If chamber is used, the system must be dosed.

i. Pressure dosing is recommended to improve effluent distribution across the surface of the filter. Pressure distribution systems may use either conventional rock and PVC pipe, chambers with small-diameter pipe, or EPS aggregate with small-diameter pipe. Distribution lines shall be level and shall be horizontally spaced a maximum of three feet apart, center to center.

(1) The distribution pipe for a pressure-dosed system shall either be SCH 40 or 80 PVC pipe (SDR 26 or stronger) with a one-inch nominal diameter, have either a single row of  $\frac{1}{4}$ -inch perforations in a straight line 30 inches on center along the length of the pipe, or an equivalent design that ensures proper distribution.

(2) The distribution pipe for a siphon-dosed or other manufactured non-pump pressured device shall be either SCH 40 or 80 PVC pipe (SDR 26 or stronger), with a  $1\frac{1}{2}$ -inch nominal diameter, holes  $\frac{1}{4}$  to  $\frac{5}{16}$  inches in size spaced every three feet, or an equivalent design that ensures proper distribution.

(3) It is recommended that the outer ends of all pressure type distribution lines be turned up with either a long 90-degree elbow or two 45-degree elbows to allow for maintenance. The outer ends should have a screw-on cap and cover and should be accessible from the ground surface.

(4) Holes in the distribution pipe shall be configured to evenly distribute the effluent.

Effective date delayed for an additional 70 days after the adjournment of the 2026 Legislative Session of the General Assembly by the Administrative Rules Review Committee at its meeting held April 13, 2026.

TITLE V  
FLOODPLAIN DEVELOPMENT

## CHAPTER 70

## SCOPE OF TITLE—DEFINITIONS—FORMS—RULES OF PRACTICE

[Prior to 7/1/83, see INRC, Chs 2 and 5]

[Prior to 12/3/86, Water, Air and Waste Management[900]]

Chapter rescission date pursuant to Iowa Code section 17A.7: 6/18/30

**567—70.1(455B,481A) Scope of title.**

**70.1(1)** The department has jurisdiction over all floodplains and floodways in the state for the purpose of establishing and implementing a program to promote the protection of life and property from floods and to promote the orderly development and wise use of the floodplains of the state. Any person who desires to construct or maintain a structure, dam, obstruction, deposit or excavation, or allow the same in any floodplain or floodway has a responsibility to contact the department to determine whether approval is required from the department or a local government authorized to act for the department.

**70.1(2)** Minimum statewide criteria for most types of floodplain development are listed in 567—Chapter 72. Special requirements for dams are listed in 567—Chapter 73.

[ARC 9208C, IAB 5/14/25, effective 6/18/25]

**567—70.2(455B,481A) Definitions.** Definitions used in this title are listed in alphabetical order as follows:

*“Agricultural levees or dikes”* means levees or dikes constructed to provide limited flood protection to land used primarily for agricultural purposes.

*“Animal feeding operation”* means the same as defined in 567—65.1(459,459B).

*“Animal feeding operation structure”* means the same as defined in 567—65.1(459,459B).

*“Backwater”* means the increase in water surface level immediately upstream from any structure, dam, obstruction or deposit, erected, used, or maintained in the floodway or on the floodplains caused by the resulting reduction in conveyance area.

*“Bankfull stage”* is the elevation above which a rise in water surface elevation will cause the river or stream to overflow the lowest natural bank that is not an unusually low place or a break in the natural bank through which water inundates a small area.

*“Base flood elevation”* means the elevation that floodwaters would reach at a particular site during the occurrence of a flood having a 1 percent chance of being equaled or exceeded in any given year (also commonly referred to as the “100-year flood”).

*“Building”* means all residential housing including mobile homes as defined herein, cabins, factories, warehouses, storage sheds, and other walled, roofed structures constructed for occupation by people or animals or for storage of materials.

*“Channel”* means a natural or artificial flow path of a stream with definite bed and banks to collect and conduct the normal flow of water.

*“Channel change”* means either (a) the alteration of the location of a channel of a stream or (b) a substantial modification of the size, slope, or flow characteristics of a channel of a stream. (NOTE: Diversions of water subject to the permit requirements of Iowa Code sections 455B.268 and 455B.269 usually are not channel changes.) Increasing the cross-sectional area of a channel by less than 10 percent is not considered a substantial modification of the size, slope, or flow characteristics of a channel of a stream.

*“Confinement feeding operation”* means the same as defined in 567—65.1(459,459B).

*“Confinement feeding operation building”* or *“confinement building”* means the same as defined in 567—65.1(459,459B).

*“Confinement feeding operation structure”* means the same as defined in 567—65.1(459,459B).

*“Dam”* means the same as defined in rule 567—73.2(455B).

*“Development”* means a structure, dam, obstruction, deposit, excavation or flood control work in a floodway or floodplain.

*“Drainage district ditch”* means a channel located within the boundaries of a drainage district and excavated to establish a design channel-bottom profile for efficient conveyance of drainage from agricultural tile systems and open drains.

*“Elevating”* means raising buildings by fill or other means to or above a minimum level of flood protection.

*“Emergency action plan”* means the plan to adequately protect persons or materials in a floodplain during a flood event. An emergency action plan shall include action triggers such as stream levels or flood warnings, responsible parties, and a detailed plan of action.

*“Flood control works”* means physical works such as dams, levees, floodwalls, and channel improvements or relocations undertaken to provide moderate to high degree of flood protection to existing or proposed structures or land uses.

*“Floodplain”* means the area adjoining a river or stream that has been or may be covered by flood water.

*“Flood proofing”* means a combination of structural provisions, changes, or adjustments in construction to buildings, structures, or properties subject to flooding primarily for the reduction or elimination of flood damages.

*“Floodway”* means the channel of a river or stream and the adjacent land areas that must be reserved in order to discharge the waters of a 1 percent annual recurrence chance flood without cumulatively increasing the water surface elevation more than one foot. Floodway establishment procedures can be found in 567—70.4(455B).

*“Floodway fringe”* means those portions of the floodplains located outside of the floodway.

*“High damage potential”* means the flood damage potential associated with the following:

1. Habitable residential buildings and building complexes, which include seasonal residential buildings; or
2. Industrial, commercial, agricultural, recreational and other similar buildings or building complexes, that, if inundated by flooding, would result in high public damages as determined by the department or that contain high-value equipment or contents that are not easily removed; or
3. Public buildings or building complexes, that, if inundated by flooding, would result in high public damages as determined by the department.

*“Low damage potential”* means all buildings, building complexes or floodplain uses not defined as maximum or high damage potential where such structures are designed in a manner that inundation by flood waters results in minimal damage to the structure and its contents. Such structures include but are not limited to the following: detached residential garages, sheds, park shelters, buildings used for storage of equipment or crops that can be easily removed before a flood event, and buildings used as temporary shelter for livestock.

*“Major water source”* means the same as defined in 567—65.1(459,459B).

*“Manure storage structure”* means the same as defined in 567—65.1(459,459B).

*“Maximum damage potential”* means the flood damage potential associated with hospitals and like institutions; buildings or building complexes containing documents, data, or instruments of great public value; buildings or building complexes containing materials dangerous to the public or fuel storage facilities; emergency response facilities, power installations needed in emergency or buildings or building complexes similar in nature or use to those listed above.

*“Minimum level of flood protection”* means the elevation corresponding to the water surface profile of the regulatory flood associated with a damage potential classification listed in these rules plus any freeboard specified in these rules.

*“Mobile home”* means a structure, transportable in one or more sections, that is built on a permanent chassis and designed to be used with or without a permanent foundation when connected to the required utilities. It does not include recreational vehicles or travel trailers.

*“Nominated stream”* means the stream or water source named in the petition described in 567—Chapter 72 that seeks designation of a stream as a protected stream.

*“Protected stream”* means a stream designated by the department as a “protected stream” in 567—Chapter 72.

“*Public damages*” means costs resulting from damage to roads and streets, sewers, water mains, other public utilities and public buildings; expenditures for emergency flood protection, evacuation and relief, rehabilitation and cleanup; losses due to interruption of utilities and transportation routes, and interruption of commerce and employment.

“*Q500*,” “*Q100*,” “*Q50*,” “*Q25*,” “*Q15*,” “*Q10*,” etc., means a flood having a 0.2, 1, 2, 4, 7, 10, etc., percent chance of being equaled or exceeded in any one year as determined by the department.

“*Repair and maintenance of a drainage district ditch*” means the restoration of the original grade line, cross-sectional area, or other design specifications of a drainage district ditch lawfully established as part of a drainage district formed and operating under the provisions of Iowa Code chapter 468.

“*Road projects*” means the construction and maintenance of any bridges, culverts, road embankments, and temporary stream crossings.

“*Rural areas*” means any area not defined or designated as an urban area.

“*Seasonal homes*” means residential buildings or building complexes that are not used for permanent or year-round human habitation.

“*Stream*” means a water source that either drains an area of at least two square miles or has been designated as a protected stream in 567—Chapter 72.

“*Urban areas*” means those lands enclosed by the incorporated limits of municipalities.

“*Water source*” means the same as defined in 567—65.1(459,459B).

[ARC 9208C, IAB 5/14/25, effective 6/18/25]

### **567—70.3(17A,455B,481A) Review and approval of floodplain development.**

**70.3(1) *Development needing approval.*** Any development in a floodway or floodplain that exceeds the thresholds in 567—71.1(455B), that is not exempt pursuant to 567—71.4(455B), and that is not regulated by a locally adopted ordinance, requires approval by the department.

**70.3(2) *Permit application submittal requirements.*** Applications shall be submitted on either forms or an application system provided by the department with required supporting materials as determined by the department describing the work and impacts of the proposed development. Applications shall include a project description and detailed drawings of proposed development. Certified engineering plans, specifications, hydrologic and hydraulic analysis, and other information as specified by the department that is needed for the department to conduct a technical review are also required for complex projects such as bridges, culverts, levees, channel changes and other public infrastructure where the department determines that such materials are necessary to determine impacts of the project and the design’s ability to meet criteria for approval. The engineering plans and other engineering information shall be certified by a licensed professional engineer or, if applicable, a licensed land surveyor, as required by Iowa Code chapter 542B.

**70.3(3) *Application fee.*** No fee is charged at this time.

[ARC 9208C, IAB 5/14/25, effective 6/18/25]

**567—70.4(455B) Establishment of a floodway.** Criteria for approval in 567—Chapter 72 often references the floodway. When available, floodways calculated and published by FEMA on community adopted flood insurance rate maps may be used by the department. When unavailable, or in discretion of the department based on best available information, the department will delineate the encroachment limits defining the outer limits of the floodway, conforming to the following criteria insofar as possible:

**70.4(1) *Increase in water surface elevation.*** The increase in the water surface elevation of Q100 (100-year discharge) that would result from confining flood flows to the floodway must not exceed one foot.

**70.4(2) *Equal and opposite conveyance.*** Floodway boundaries shall be located such that the floodway areas on each side of a stream convey a share of the flood flows proportionate to the total conveyance available on each respective side of the stream.

**70.4(3) *Protection of existing development.*** To the extent feasible, floodway boundaries shall be located as follows:

- a. To avoid the need to seek removal of a lawful existing structure in order to safely convey Q100;
- b. To minimize any increase in the level of Q100 in an area where such increase would adversely affect an existing lawful structure; and

c. To avoid the need to place an existing lawful structure in a delineated floodway if the placement would result in additional restrictions on improvements or reconstruction or replacement of the structure.

**70.4(4)** *When acquisition of property interest is required.* Where protection of an existing structure necessitates prohibition of development in an area that could otherwise be developed under the criteria in 70.4(1) and 70.4(2), the department or local governmental designee may require that the owners of land benefited by the application of criteria in this subrule acquire property interests as needed to provide an adequate alternative floodway.

[ARC 9208C, IAB 5/14/25, effective 6/18/25]

**567—70.5(17A,455B,481A) Procedures for review of applications.**

**70.5(1)** *Initial screening of applications.* Each application upon receipt shall be promptly evaluated by the department to determine whether adequate information is available to review the project. The department shall advise the applicant of any additional information required to review the project. If the requested information is not submitted within 60 days of the date the request is made, the department may consider the application withdrawn.

**70.5(2)** *Order of processing.* In general, complete applications including sufficient plans and specifications shall be reviewed in the order that complete information is received. However, when there is a large number of pending applications, which preclude the department from promptly processing all applications, the department may expedite review of a particular application out of order if the completed application and supporting documents were submitted at the earliest practicable time and any of the following conditions exist:

- a. Relatively little staff review time (generally less than four hours) is required and delay will cause the applicant hardship;
- b. The applicant can demonstrate that a delay in the permit will result in a substantial cost increase of a large project;
- c. Prompt review of the permit would result in earlier completion of a project that conveys a significant public benefit;
- d. The need for a permit is the result of an unforeseen emergency or catastrophic event; or
- e. A permit is needed to complete a project that will abate or prevent an imminent threat to the public health and welfare.

**70.5(3)** *Project investigation.* The department shall make an investigation of a project for which an application is submitted. The following are standard procedures for an investigation of an application:

a. *Inspection.* Agency personnel may make one or more field inspections of the project site when necessary to obtain information about the project. Submission of the application is deemed to constitute consent by the applicant for the agency staff and its agents to enter upon the land on which the proposed activity or project will be located for the sole purpose of collecting the data necessary to process the application, unless the applicant indicates to the contrary on the application.

b. *Technical review.* The department staff shall conduct a technical review using appropriate analytical techniques such as application of hydrologic and hydraulic models to determine the effects and impacts of a proposed project.

c. *Solicitation of expert comments on environmental effects.* For channel changes or other developments that may cause significant adverse effects on the wise use and protection of water resources, water quality, fish, wildlife and recreational facilities or uses, the department shall request comments from the fish and wildlife division of the department or other knowledgeable sources.

d. *Summary report of project review.* The department staff may, if indicated, prepare a project summary report that summarizes the results of the review with respect to relevant criteria, the analytical methods used in the review and other project information. Typical indications of when project summary reports will be prepared are for those projects for which negative comments have been received from potentially affected landowners, those projects that are not approvable, and those projects that are complex in nature. Project summary reports will not normally be prepared for routine, noncontroversial projects.

e. *Notice to landowners who might be affected.* The department shall require the applicant to provide the names of the owners and occupants of land located immediately upstream, downstream, and across from the project site, and owners of any other land that the agency staff determines may be adversely

affected by the project. For those landowners that the department determines may be adversely impacted by the project, the department shall then notify the landowners that the project is under consideration and provide a reasonable opportunity for submission of comments.

*f. Notice to the applicant that project does not conform to criteria.* If the project review discloses that the project violates one or more criteria and that the project should be disapproved, or approved only subject to special conditions to which the applicant has not agreed, the department shall notify the applicant and, when practical, suggest appropriate project modifications. The department shall offer the applicant an opportunity to submit comments before an initial decision is made.

**70.5(4) Decision by the department.** The decision by the department on an application for a floodplain development permit shall be either approval or disapproval. The decision shall include a determination whether the project satisfied all relevant criteria and may incorporate by reference and attachment the summary report described in 70.5(3) “d.”

*a. Approval.* Issuance of a floodplain development permit shall constitute approval of a project. The permit shall include applicable general conditions listed in 567—Chapter 72 and may include one or more special conditions when reasonably necessary to implement relevant criteria.

*b. Disapproval.* A letter to the applicant denying the application shall constitute disapproval of a project.

*c. Notice of decision.* Copies of the decision shall be mailed to the applicant, any person who commented pursuant to 70.5(3) “e,” and any other person who has requested a copy of the decision. The decision may be sent by ordinary mail, first class, and shall be accompanied by a certification of the date of mailing. A decision becomes the final decision of the department unless a timely notice of appeal is filed in accordance with 567—70.6(17A,455B,481A). The final decision may be filed with the appropriate county recorder to give constructive notice to future landowners of any conditions or requirements imposed by the final decision.

[ARC 9208C, IAB 5/14/25, effective 6/18/25]

#### **567—70.6(17A,455B,481A) Appeal of decision.**

**70.6(1)** Any person aggrieved by a decision issued under 567—70.5(17A,455B,481A) of these rules may file a notice of appeal with the director. The notice of appeal must be filed within 30 days following the certified date of mailing of the decision unless the appellant shows good cause for failure to receive actual notice and file within the allowed time. The form of the notice of appeal and appeal procedures are governed by 567—Chapter 7.

**70.6(2)** The department shall mail a copy of the notice of appeal to each person who was sent a copy of the initial decision. The department shall attach an explanation of the opportunity to seek intervention in the contested case.

[ARC 9208C, IAB 5/14/25, effective 6/18/25]

These rules are intended to implement Iowa Code chapter 455B, subchapter III, part 4, and sections 455B.105(11), 459.102, 459.301 and 481A.15.

CHAPTER 71  
FLOODPLAIN OR FLOODWAY DEVELOPMENT—WHEN APPROVAL IS REQUIRED  
[Prior to 7/1/83, INRC, Ch 5, Div. 1]  
[Prior to 12/3/86, Water, Air and Waste Management[900]]

Chapter rescission date pursuant to Iowa Code section 17A.7: 6/18/30

**567—71.1(455B) State floodplain permits.** In the following instances, approval is required by the department for any development including construction, maintenance, and use of a structure, dam, obstruction, deposit, excavation or flood control work on a regulated floodplain or floodway unless the project is otherwise approved by a delegated community's local floodplain ordinances adopted pursuant to 567—71.2(455B) or is exempt under 567—71.4(455B).

**71.1(1) Rural areas.** In rural areas, projects in or on the floodplain of any stream draining ten or more square miles at the downstream end of the project site.

**71.1(2) Urban areas.** In urban areas, projects in or on the floodplain of any river or stream draining two or more square miles at the downstream end of the project site.

**71.1(3) Protected streams.** On protected streams, channel changes at any location on any river or stream designated as a protected stream pursuant to Division III of 567—Chapter 72.

**71.1(4) Buildings and other structures adjacent to or downstream from impoundments.** For new construction, additions, lowering, or reconstruction of buildings, water and waste water treatment facilities, sanitary landfills, animal feeding operation structures, or other miscellaneous structures and associated fill, without regard to the size of the drainage area, if:

*a.* The project is adjacent to an impoundment and the lowest floor level, including any basement, is lower than the top of the adjacent dam; or

*b.* There is an upstream dam and flooding can be reasonably anticipated from principal or emergency spillway discharges; or

*c.* There is an upstream dam that does not substantially comply with high hazard criteria in these rules and where flooding can be reasonably anticipated from overtopping and failure of the dam.

**71.1(5) Dams.** For construction, repair, or modification of any dam that exceeds the thresholds under 567—73.3(455B).

[ARC 9209C, IAB 5/14/25, effective 6/18/25]

**567—71.2(455B) Delegated state floodplain permitting by local communities.** Upon submission to the department for review and approval, a local unit of government may establish encroachment limits, floodplain regulations, and zoning ordinances, subject to the following:

**71.2(1)** Written approval from the department must be obtained before effective adoption or amendment of a local regulation that would control development in a floodplain or floodway for purposes related to flood protection. A local government may appeal the refusal of the department to approve a proposed regulation by notifying the department and requesting that the proposed local regulation be considered at the next meeting of the commission.

**71.2(2)** Prior to receiving approval, a community shall demonstrate capacity to properly review applications and issue floodplain permits.

**71.2(3)** Approved communities shall provide evidence to the department of this capacity at least every five years. Additionally, the department may, from time to time, take action to ascertain the effectiveness of department-approved, locally adopted floodplain management regulations. Upon a finding that the local government has been negligent in administering the approved regulations, the department may revoke approval of same. Floodplain works found to be in violation of department-approved, locally adopted floodplain management regulations may be handled under the provisions of the department's rules for investigation of unauthorized projects.

**71.2(4)** Where it is unclear whether the works are adequately covered by such local regulations, the department shall make the determination.

[ARC 9209C, IAB 5/14/25, effective 6/18/25]

**567—71.3(455B) Review and approval of variances from local regulations.** A variance from an approved local floodplain regulation shall not be effective until it has been reviewed and approved by the department in accordance with the following procedures.

**71.3(1) *Duty of local government to notify department of each variance request.*** After receipt of each request for variance from a local floodplain regulation approved by the department, the local government shall notify the department of the variance request on a form obtained from the department. The notice must be received by the department at least 15 days before any hearing that the local government schedules on the variance request.

**71.3(2) *Written comment from the department.*** After receipt of notice of a variance request, the department shall mail or deliver a written comment on the variance request. The comment shall be issued within 15 days after receipt of the notice or in time for consideration at any hearing held after expiration of the 15-day period. The comment shall be either a statement of objection or “no objection” as follows:

*a. Objection to variance request.* The department may issue an objection to the variance request if the requested variance would violate applicable statewide criteria. The objection may be based on a statement that the applicant for the variance has provided insufficient information for the department to determine whether the requested variance would violate applicable minimum statewide criteria. An objection based on a statement of insufficiency of information shall identify the information needed to determine whether the request would violate applicable criteria.

*b. No objection to variance requests.* The comment issued by the department may state that the department has no objection to the variance request. The comment shall briefly explain why granting of the requested variance would not violate the purposes of minimum statewide criteria. A statement of “no objection” shall constitute approval to grant the requested variance.

**71.3(3) *Basis for variance.*** A variance from an applicable local permitting requirement should only be granted if the applicant can show that denial of the variance would cause unnecessary hardship and that granting of the variance would not be contrary to the public interest or the underlying purposes of the requirement in question.

**71.3(4) *Review or appeal of local ruling on variance request.*** The appropriate forum and procedures for review or appeal of the decision of a local government on a request for variance from a regulation approved by the department depend on the relationship between the local decision and the comment submitted by the department as follows.

*a. When local government grants variance after objection by department.* If the local government grants a variance request after issuance of an objection by the department, the local government shall give written notice of the local action and the supporting reasons to the department. The variance shall not be effective until approved by the commission. The applicant for the variance shall have the right to a contested case proceeding before the commission or its designee if required to resolve a material issue of fact or law.

*b. When local government denies variance after objection by department.* If the local government denies a variance request on the basis of an objection by the department, the applicant may file a notice of appeal with the department within 20 days following the local action. The applicant for the variance shall have the right to a contested case proceeding before the commission or its designee if required to resolve a material issue of fact or law.

*c. When local government grants or denies a variance request after a “no objection” comment by the department.* When a local government grants or denies a variance request after receiving a “no objection” comment from the department, any appeal normally should be taken in the manner provided for appeal of other local actions. An appeal should be filed with the department only if the purpose of the appeal is to challenge the basis of the “no objection” comment.

*d. Duty of local government to notify department of appeal.* The local government shall promptly notify the department of the filing of any petition for judicial review of local action on a variance request so the department may determine whether participation in the judicial review would be in the interest of the state.

[ARC 9209C, IAB 5/14/25, effective 6/18/25]

**567—71.4(455B) Exempted activities.** Notwithstanding 567—70.3(17A,455B,481A) and 567—71.1(455B), the following activities do not require approval pursuant to this title by the department to construct in a floodplain:

**71.4(1) *Rural bridges/culverts/road embankments and associated work.*** Construction, maintenance, or use of bridges, culverts, temporary stream crossings, or road embankments in a rural area floodplain with a drainage area less than 100 square miles including associated channel changes not on protected streams with up to 500 feet in length and maximum of 25 percent reduction in length, and associated excavations within 500 feet of the project.

**71.4(2) *Federally regulated railroad crossing.*** Construction, maintenance, or use of federally regulated railroad crossings having a drainage area of any size.

**71.4(3) *Buildings.***

*a.* Building additions that, when considered in aggregate with all additions constructed after July 4, 1965, increase the original floor area of a building by less than 25 percent.

*b.* Reconstruction of any portion of a building if the cost of reconstruction, including equivalent professional labor and material costs for proposed or actual volunteer labor and donated materials, and as would be determined by a qualified contractor, does not exceed 50 percent of the market value of the existing building or if reconstruction will not increase the market value by more than 50 percent.

**71.4(4) *Pipeline and underground linear utility crossings.*** The construction, operation and maintenance of buried pipeline, conduit and linear utility crossings if the natural contours of the channel and floodplain are maintained and no bank stabilization is required.

**71.4(5) *Excavations.***

*a.* Excavations where the channel cross section is increased by 10 percent or less, as determined based on current survey, original engineering plans if being performed by a drainage district, if available.

*b.* Excavations for the repair and maintenance of a drainage district ditch with less than 100 square mile drainage area.

*c.* Excavations outside the channel and not impacting streambanks on any floodplain of any river or stream draining more than ten square miles where excess spoil is removed from the floodplain, the project does not reduce capacity of the floodplain, and surface waters are not diverted into a sinkhole or quarry excavated in carbonate rock.

**71.4(6) *Boat docks.*** Construction, maintenance, or use of floating boat docks on lakes, and those recreational nonfloating style boat docks located on the Mississippi and Missouri rivers, located on reservoirs within state parks, and the conservation pools of the Coralville, Rathbun, Red Rock, and Saylorville reservoirs.

**71.4(7) *Small projects.*** For developments in rural areas for any low damage potential project where such works obstruct less than 3 percent of the cross-sectional area of the stream channel at bankfull stage or where such works obstruct less than 15 percent of the cross-sectional area of that side of the stream's floodplain at any stage.

[ARC 9209C, IAB 5/14/25, effective 6/18/25]

These rules are intended to implement Iowa Code chapter 455B, subchapter III, part 4, and sections 459.102, 459.301 and 481A.15.

CHAPTER 72  
CRITERIA FOR APPROVAL  
[Prior to 7/1/83, INRC[580] Ch 5, Div. III to V]  
[Prior to 12/3/86, Water, Air and Waste Management[900]]

Chapter rescission date pursuant to Iowa Code section 17A.7: 6/18/30

DIVISION I  
SPECIAL CRITERIA FOR VARIOUS TYPES OF FLOODPLAIN DEVELOPMENT

**567—72.1(455B) Bridges, culverts, and road embankments.** The following criteria shall apply to the construction, operation, and maintenance of bridges, culverts, and road embankments:

**72.1(1) *Bridges and road embankments affecting low damage potential areas.*** For bridges and road embankments affecting floodway or floodplain areas having a low flood damage potential, the following criteria will apply:

*a. Backwater Q100.* The maximum allowable backwater for Q100 is 1.5 feet.

*b. Freeboard.* The minimum freeboard for low superstructure horizontal bridge members above Q50 is 3 feet unless a licensed engineer provides documents on the certified plans that the bridge is designed to withstand the applicable effects of ice and the horizontal stream loads and uplift forces associated with the Q100.

**72.1(2) *Bridges and road embankments affecting high or maximum damage potential development.*** For bridges and road embankments affecting floodway or floodplain areas occupied by buildings or building complexes having a high or maximum flood damage potential, the following criteria will apply:

*a. Backwater Q100.*

(1) The maximum allowable Q100 backwater for bridges and road embankments is 1 foot.

(2) For a bridge and road embankment located within a stream reach for which the Federal Emergency Management Agency has published a detailed Flood Insurance Study which includes a floodway, the backwater for Q100 shall not exceed the surcharge associated with the delineation for the floodway at that location.

(3) In no case shall the Q100 backwater effects of a bridge or road embankment reduce the existing level of protection provided by certain flood control works, unless equivalent remedial measures are provided.

*b. Freeboard.* The minimum freeboard for low superstructure horizontal bridge members above Q50 is 3 feet unless a licensed engineer provides certification that the bridge is designed to withstand the applicable effects of ice and the horizontal stream loads and uplift forces associated with the Q100.

**72.1(3) *Bridge and channel change.*** For bridges and culverts involving channel changes on the floodway of any stream draining at the location of the channel change between 10 and 100 square miles whereby either (i) more than a 500-foot length of the existing channel is being altered or (ii) the length of existing channel being altered is reduced by more than 25 percent, the maximum allowable backwater shall correspond to the limits permitted in 72.1(1), 72.1(2) or 72.1(4) depending upon the associated damage potential.

**72.1(4) *Culverts.*** The maximum allowable backwater at culvert inlets shall correspond to the limits permitted in 72.1(1) or 72.1(2) depending upon the damage potential associated with the affected area. In the case of replacement culverts, the backwater shall not exceed that created by the culvert or waterway crossing being replaced or that specified in 72.1(1) or 72.1(2) depending upon the associated damage potential, whichever is greater.

**72.1(5) *Road embankments.*** The criteria listed in 567—72.11(455B) for miscellaneous floodplain construction projects shall apply to road embankments located on the floodplain but not crossing any stream or river channel.

**72.1(6) Temporary channel obstructions.** Temporary stream crossings and other temporary obstructions usually constructed, operated, and maintained during the construction phase of another floodplain construction project shall meet the following criteria:

- a. *Low flow.* Said structures will provide for the passage of the prevailing flow in the stream or river.
- b. *Flood flow.* Said structure shall be designed to fail, be removed quickly, or otherwise operate in the event of flooding so as to prevent premature overbank flow, or meet the backwater criteria indicated in 72.1(1) or 72.1(2).

**72.1(7) Emergency.** Repairs or temporary construction required to maintain the operation of a bridge, road grade or culverts in time of emergency need not be submitted for prior department approval. Plans of such emergency or temporary construction shall be submitted to the department for review after the event causing the emergency has passed.

[ARC 9210C, IAB 5/14/25, effective 6/18/25]

**567—72.2(455B) Channel changes.** The following criteria shall apply to channel changes:

**72.2(1) Percent reduction in length.**

a. *Streams draining over 100 square miles.* For streams (other than protected streams) draining more than 100 square miles, no more than a 10 percent reduction in the original length of the existing channel through any contiguous parcel(s) of the applicant's(s') property will be allowed.

b. *Rural streams draining 10 to 100 square miles.* For streams (other than protected streams) draining between 10 and 100 square miles in rural areas, no more than a 25 percent reduction in the original length of the existing channel through any contiguous parcel(s) of the applicant's(s') property will be allowed.

c. *Urban streams draining 2 to 100 square miles.* For streams (other than protected streams) draining between 2 and 100 square miles in urban areas, no more than a 25 percent reduction in the original length of the existing channel through any contiguous parcel(s) of the applicant's(s') property will be allowed.

d. *Protected streams.* For protected streams no channel changes will be allowed, because of actual or potential significant adverse effects on fisheries, water quality, flood control, floodplain management, wildlife habitat, soil erosion, public recreation, the public health, welfare and safety, compatibility with the state water plan, rights of other landowners, and other factors relevant to the control, development, protection, allocation, and utilization of the stream. Protected stream status does not prohibit bank stabilization measures; tree maintenance or removal; maintenance or installation of tile outlets; machinery crossings, including concrete drive-throughs and bridges; boat or canoe ramps; or other structures permitted by the department; nor restrict riparian access to the protected stream for such uses as livestock watering or grazing. Protected stream status does not affect current cropping practices or require the establishment or maintenance of buffer strips, filter strips or fences along protected streams.

**72.2(2) Capacity.** In the project reach, excavated channels shall have a discharge capacity equal to or greater than the existing channel. Excessive channel excavation will not be permitted.

**72.2(3) Alignments.** The alignments and dimensions of the excavated channel shall be such as to provide a smooth transition between the existing and the excavated channel.

**72.2(4) Velocities.** Velocities in the excavated channel shall not cause excessive erosion of the channel or banks, with the acceptable velocities being determined by the department. Energy dissipation structures, channel and bank protection, or other engineering measures may be required to eliminate excessive erosion of the channel or banks.

**72.2(5) Spoil disposition.** Disposition of spoil material from channel excavation of the floodplain shall be reviewed under miscellaneous floodplain construction.

**72.2(6) Increase in flood peak.** No significant increase in peak flood discharge will be permitted by the department. Floodwater retardance structures may be required to minimize any increase in peak flood discharges.

**72.2(7) Fish and wildlife habitat and public rights.** The channel change shall not have a significant adverse effect on fish and wildlife habitat or public rights to use of the stream. Conservation easements and other conditions may be required to mitigate potential damages to the quality of water, fish and wildlife habitat, recreational facilities, and other public rights.

**72.2(8) Soil erosion.** The tillage of land along the reach of a straightened stream shall be prohibited or modified when necessary to hold soil erosion to reasonable limits. Zones of land in which tillage shall

be prohibited along the straightened reach shall be set on a case-by-case basis with consideration given to topography, soil characteristics, current use, and other factors affecting propensity for soil erosion. The tillage prohibition shall be recorded by the department in the office of the appropriate county recorder and shall run with the land against the applicant and all successors in interest to the land subject to the prohibition.

**72.2(9) *Encroachment on a confinement feeding operation structure.*** A major water source, as identified in Appendix B, Tables 1 and 2 of 567—Chapter 65, or a water source other than a major water source shall not be constructed, expanded or diverted if the water source or major water source as constructed, expanded or diverted is closer than the following distances from a confinement feeding operation. Measurement shall be from the closest point of the confinement feeding operation structure to the top of the bank of a stream channel or the ordinary high water mark of a lake, pond, impoundment or reservoir. Farm ponds, privately owned lakes, and confinement feeding operations constructed with a secondary containment barrier pursuant to 567—subrule 65.15(17) are exempt from the separation distance requirements. The provisions of this subrule shall not be construed to allow construction of a confinement feeding operation structure on land that would be inundated by Q100 and is adjacent to a major water source.

*a.* Minimum separation between a water source other than a major water source and a confinement feeding operation structure is 500 feet.

*b.* Minimum separation between a major water source and a confinement feeding operation structure is 1,000 feet.

[ARC 9210C, IAB 5/14/25, effective 6/18/25]

**567—72.3** Reserved.

**567—72.4(455B) Levees, floodwalls, and dikes.** The following criteria shall apply to levees, floodwalls, and dikes:

**72.4(1) *Agricultural levees or dikes.***

*a. Level of protection.* The permanent height of agricultural levees or dikes normally shall be limited so that overtopping will occur due to discharges from Q10 to Q25 with the more comprehensive levee system being permitted the greater degree of protection.

*b. Additional protection.* Where it can clearly be shown that loss of valley storage caused by construction of the levee will not increase peak flood stages and discharges, the level of protection provided by the agricultural levee or dike may be increased beyond the Q10 to Q25 range.

*c. Alignment.* The location and alignment of agricultural levees or dikes shall be compatible with existing encroachment limits so that minimum flood protection levels will not be increased, and said levee or dike shall be located outside of the floodway or demonstrate that the construction shall not result in a rise in upstream water surface elevations.

*d. Maximum effect.* The maximum increase in the flood profile resulting from the construction, operation, and maintenance of an agricultural levee or dike shall be 1 foot. Equal and opposite conveyance as defined in 567—Chapter 70 shall be used in determining the maximum increase in flood profile resulting from such levees or dikes.

*e. Interior drainage.* All agricultural levees or dikes shall be provided with adequate interior drainage facilities.

*f. Offset.* A minimum offset equal to 100 feet or twice the width of a river or stream measured from top of bank to top of bank, whichever distance is less, shall be required for all agricultural levees unless a greater offset is dictated by 72.4(1) “c” or “d.”

**72.4(2) *Flood control levees, floodwalls, or dikes.***

*a. Design level.* The minimum design flood protection level for flood control levees or dikes shall correspond to the flood profile for Q100.

*b. Freeboard.* The levee or dike height shall provide for at least 3 feet of freeboard above the design flood profile.

*c. Alignment.* The alignment of a flood control levee or dike shall be located outside of the floodway or demonstrate that the construction shall not result in a rise in upstream water surface elevations.

*d. Interior drainage.* Flood control levees or dikes shall provide for adequate interior drainage and ponding.

*e. Design and specifications.* The structural design and construction of flood control levees or dikes must be undertaken in accordance with accepted engineering and construction procedures and practices.

[ARC 9210C, IAB 5/14/25, effective 6/18/25]

**567—72.5(455B) Buildings.** The following criteria apply to buildings:

**72.5(1) Minimum protection levels.** The minimum level of flood protection for a building depends on the damage potential of the building and contents. “Maximum” and “high” damage potential classifications are defined in 567—Chapter 70. Criteria for determining minimum levels of protection are as follows:

*a.* Buildings with maximum damage potential shall have the lowest floor (including basement) elevated a minimum of 1 foot above the Q500, or together with attendant utility and sanitary systems, be flood proofed to such a level.

*b.* Buildings with high damage potential shall have the lowest floor (including basement) elevated a minimum of 1 foot above the Q100, or together with attendant utility and sanitary systems, be flood proofed to such a level.

*c.* Buildings adjacent to an impoundment shall be protected to the elevation of the top of the dam unless the dam has adequate spillway capacity to discharge the flood corresponding to the damage potential of the building at an elevation below the top of the dam.

*d.* Buildings downstream from a dam shall be protected to a level established by the department after due consideration of the hazards posed by the dam for buildings downstream.

**72.5(2) Flood protection methods.** The following flood protection methods are required for buildings to which a minimum flood protection level applies.

*a. Structural design and flood proofing.* Basement walls and floors below the applicable minimum flood protection level shall be structurally designed and constructed to be flood proof and able to withstand hydrostatic pressure and buoyant forces associated with a water table elevation equivalent to the minimum flood protection level. However, attached garages and storage space may be constructed below the applicable minimum protection level without flood proofing if all electrical circuit boxes, furnaces, and hot-water heaters are located above the applicable minimum protection level and adequate flood vents are provided to equalize hydrostatic forces.

*b. Sanitary sewer drains.* Sanitary sewer drains below the applicable minimum flood protection level shall be provided with automatic closure valves to prevent backflow.

**72.5(3) Location.** The criteria for location of a building include consideration of the potential for obstructing flood flows and the potential hazards which may arise when the building is surrounded by floodwater. Criteria for location of buildings in floodways and floodplains are as follows:

*a. Obstruction.* Buildings shall not be located in the floodway of a stream so as to result, individually or collectively, in any increase in the elevation of Q100 as confined to the floodway. The floodway boundary applicable to an individual application shall be determined as necessary by the department in accordance with the criteria in 567—70.4(455B). Analysis of the effect that a building in the floodway would have on flood levels shall be based on the assumption that all similarly situated landowners would be allowed an equal degree of development in the floodway.

*b. Public damages.* Buildings shall be located to minimize public damages associated with isolation due to flooding of surrounding ground. In identifying the potential for public damages, the department shall determine whether there is a need for access passable by wheeled vehicles during Q100, based on the department’s evaluation of flood warning and response time in the area.

*c. Existing buildings—replacement and improvements.* In applying the criteria in 72.5(3)“a” and “b” to projects that improve or replace existing lawful buildings, the department should prohibit the improvements or replacement only where extension of the useful life of the structure by improvement or replacement would contribute to perpetuation of an individual or collective obstruction that causes a significant increase in the level of Q100, perpetuation of a significant hazard to health or safety during floods, or perpetuation of the potential for significant flood damages to property and associated public costs.

[ARC 9210C, IAB 5/14/25, effective 6/18/25]

**567—72.6(455B) Water supply and wastewater treatment facilities.** The following criteria shall apply to water supply and wastewater treatment facilities:

**72.6(1) Location.** Water supply and wastewater treatment facilities shall be located outside of the floodway or demonstrate that the construction shall not result in a rise in upstream water surface elevations.

**72.6(2) Flood protection.** Flood protection for water supply and wastewater treatment facilities shall be provided to the level necessary for high damage potential buildings or building complexes unless evidence is submitted indicating the facility is of a lesser damage potential.

[ARC 9210C, IAB 5/14/25, effective 6/18/25]

**567—72.7(455B) Sanitary landfills.** The following criteria shall apply to sanitary landfills:

**72.7(1) Location.** Sanitary landfills shall be located outside of the floodway or demonstrate that the construction shall not result in a rise in upstream water surface elevations.

**72.7(2) Flood protection.** Flood protection for the active working portion of the sanitary landfill shall be provided to the level necessary for high damage potential buildings or building complexes.

[ARC 9210C, IAB 5/14/25, effective 6/18/25]

**567—72.8(455B) Campgrounds.** The following criteria shall apply to campgrounds located in the floodplain:

**72.8(1) Location.** Any permanent structures, obstructions, or deposits shall be located outside of the floodway or demonstrate that the construction shall not result in a rise in upstream water surface elevations.

**72.8(2) Flood protection.** Any permanent structures, obstructions, or deposits shall be provided with the minimum level of flood protection associated with the designated damage potential as indicated in 72.5(1) governing buildings and building complexes.

**72.8(3) Recreational vehicles.**

- a. Recreational vehicles shall be located on the site for less than 180 consecutive days, and
- b. Recreational vehicles must be fully licensed and ready for highway use. A recreational vehicle is ready for highway use if it is on its wheels or jacking system and is attached to the site only by quick-disconnect-type utilities and security devices and has no permanently attached additions.

**72.8(4) Emergency action plan.** Any campground with overnight lodging in the floodplain shall have an evacuation plan that includes the following:

- a. Responsible parties for carrying out the evacuation plan.
- b. Action stages that are based on stream levels, gage data, or weather forecasts, as appropriate.
- c. A detailed list of actions that need to be taken to ensure all vehicles and campers are evacuated, including how notifications are to be delivered.

[ARC 9210C, IAB 5/14/25, effective 6/18/25]

**567—72.9(455B) Stream protective devices.** The following criteria shall apply to stream protective devices:

**72.9(1) Overflow.** Stream protective devices shall be constructed in a manner which will not cause premature overbank flow.

**72.9(2) Velocity.** Increased velocities resulting from the construction, operation, and maintenance of stream protective devices shall be limited so as not to cause excessive scour in the channel as determined by the department.

**72.9(3) Stability.** Stream protective devices shall be anchored securely to the bank or constructed in a stable manner so as not to become dislodged and result in the scattering of debris in adjacent and downstream reaches.

**72.9(4) Water quality and aesthetics.** Stream protective devices shall not adversely affect the water quality, fish and wildlife habitat or aesthetics of the stream.

[ARC 9210C, IAB 5/14/25, effective 6/18/25]

**567—72.10(455B) Pipeline river or stream crossings.** The following criteria shall apply to pipeline river and stream crossings:

**72.10(1) Protection.** Pipeline river or stream crossings shall be sufficiently buried in the stream bed and banks or otherwise sufficiently protected to prevent rupture.

**72.10(2) *Overflow and velocities.*** Pipeline river or stream crossings shall be constructed, operated, and maintained so as not to create premature overbank flow or excessive scour to the channel or banks.

**72.10(3) *Spoil.*** Spoil material resulting from the construction of a pipeline crossing shall be disposed of in a manner which will not obstruct low flow or flood flows.

[ARC 9210C, IAB 5/14/25, effective 6/18/25]

**567—72.11(455B) Miscellaneous construction.** The following criteria shall apply to miscellaneous construction:

**72.11(1) *Structures, obstructions, or deposits.***

*a. Location.* Miscellaneous structures, obstructions, or deposits shall be located outside of the floodway or demonstrate that the construction shall not result in a rise in upstream water surface elevations.

*b. Protection.* Miscellaneous structures, obstructions, or deposits shall be provided with the minimum level of flood protection associated with the designated damage potential as indicated in 72.5(1) governing buildings and building complexes.

**72.11(2) *Excavation.***

*a. Spoil.* Spoil material resulting from an excavation shall be disposed of in a manner consistent with 72.11(1)“a” pertaining to miscellaneous structures, obstructions, or deposits.

*b. Levees.* Levees protecting excavations shall meet the requirements of 72.11(1)“a” pertaining to miscellaneous structures, obstructions, or deposits.

*c. Control of surface runoff into rock quarries.* When the department investigates an application for approval of excavation of a quarry in carbonate rock on a floodplain or floodway, the department shall consider the potential for pollution of an underground watercourse or basin from drainage of surface water into the quarry. If available information including topographic and geological information support a finding that drainage of surface water into the quarry would constitute a violation of the permit requirement in Iowa Code section 455B.268(3) and might cause pollution of an underground watercourse or basin if not controlled, then the department shall require that the applicant either request a permit under Iowa Code section 455B.268(3) and 567—51.5(455B) to authorize drainage of surface water into the quarry, or construct and maintain a means of controlling drainage of surface water which would otherwise drain into the quarry.

**72.11(3) *Structures or materials across a channel.*** The following criteria shall apply to structures or materials such as riprap that span the channel of a stream or river and do not meet the thresholds of 567—73.3(455B):

*a.* The location and design of the structure shall not adversely affect the fisheries or recreational use of the stream.

*b.* The pool created by the structure shall not adversely affect drainage on lands not owned or under easements by the applicant.

*c.* The structure shall be hydraulically designed to submerge before bankfull stage is reached in the stream channel in order that increased or premature overbank flooding does not occur. Where this cannot be reasonably accomplished in order for the structure to fulfill its intended purpose, the applicant shall demonstrate that any increased flooding will affect only lands owned or controlled by the applicant.

*d.* For projects that include significant appurtenant structures or works outside the stream channel, the combined effect of the total project shall not create more than one foot of backwater during floods which exceed the flow capacity of the channel, unless the proper lands, easements, or rights-of-way are obtained.

*e.* The structure shall be capable of withstanding the effects of normal and flood flows across its crest and against the abutments with erosion protection added as required to prevent failure of the structure during flood events.

[ARC 9210C, IAB 5/14/25, effective 6/18/25]

**567—72.12** Reserved.

**567—72.13(455B) Animal feeding operation structures.** The following criteria shall apply to animal feeding operation structures:

**72.13(1) Confinement feeding operation structures located on the floodplain of a major water source.** As required by 567—Chapter 65, confinement feeding operation structures shall not be constructed on land that would be inundated by Q100 and is adjacent to a major water source. Placing fill material on floodplain land to elevate the land above the Q100 level will not be considered as removing the land from the one hundred year floodplain for the purpose of this subrule.

**72.13(2) Other animal feeding operation structures.** The following criteria shall apply to animal feeding operation structures located on the floodplain of any water source and confinement feeding operation structures located on the floodplain of a water source other than a major water source:

*a. Location.* Such structures shall be located outside of the floodway or demonstrate that the construction shall not result in a rise in upstream water surface elevations.

*b. Flood protection.* Flood protection for such structures shall be provided to the level necessary for high damage potential buildings or building complexes, pursuant to 567—72.5(455B).

[ARC 9210C, IAB 5/14/25, effective 6/18/25]

These rules are intended to implement Iowa Code sections 455B.262, 455B.264, 455B.270, 455B.275, 455B.277, 459.102 and 459.301.

**567—72.14 to 72.29** Reserved.

DIVISION II  
GENERAL CRITERIA

**567—72.30(455B) General conditions.** Department orders approving an activity or project shall be subject to the following conditions:

**72.30(1) Maintenance.** The applicant and any successor in interest to the real estate on which the project or activity is located shall be responsible for proper maintenance.

**72.30(2) Responsibility.** No legal or financial responsibility arising from the construction or maintenance of the approved works shall attach to the state of Iowa or the agency due to the issuance of an order or administrative waiver.

**72.30(3) Lands.** The applicant shall be responsible for obtaining such government licenses, permits, and approvals, and lands, easements, and rights-of-way which are required for the construction, operation, and maintenance of the authorized works.

**72.30(4) Change in plans.** No material change from the plans and specifications approved by the department shall be made unless authorized by the department.

**72.30(5) Revocation of order.** A department order may be revoked if construction is not completed within the period of time specified in the department order.

**72.30(6) Performance bond.** A performance bond may be required when necessary to secure the construction, operation, and maintenance of approved projects and activities in a manner that does not create a hazard to the public's health, welfare, and safety. The amount and conditions of such bond shall be specified as special conditions in the department order.

[ARC 9210C, IAB 5/14/25, effective 6/18/25]

**567—72.31(455B) Waiver.** A request for a waiver to this chapter shall be submitted in writing pursuant to 561—Chapter 10. The contents of a petition for waiver shall include information pursuant to 561—10.9(17A,455A).

[ARC 9210C, IAB 5/14/25, effective 6/18/25]

**567—72.32(455B) Protected stream information.** The following describes the waiver procedure and the relation of hydrologically connected streams to protected streams:

**72.32(1) Protected streams variance procedure.** The variance shall be requested as part of the permit application and review process provided for in 567—70.3(17A,455B,481A) to 567—70.5(17A,455B,481A) and decisions on the variance request may be appealed in accordance with 567—70.6(17A,455B,481A). If the applicant is denied a permit to channelize a protected stream, the applicant may appeal to the environmental protection commission. The appeal will normally be heard by

an administrative law judge but the applicant may request that the commission hear the appeal directly. If a proposed decision of an administrative law judge would affirm the denial of the permit, the applicant may appeal the administrative law judge's decision to the commission. If, on appeal, the commission affirms the denial of the permit, the applicant may appeal to the district court.

**72.32(2)** *Hydrologically connected streams.* Streams or waters that are hydrologically connected to protected streams are not protected streams unless specifically listed as protected streams in 72.50(2). The environmental protection commission considers the streams and waters that are hydrologically connected to streams proposed to become protected streams as one of the factors in the decision-making process to add streams to the list of protected streams in a rule-making procedure. 72.51(7) lists the other factors that affect the decision.

**72.32(3)** *Protected stream activities.* Protected stream status does not prohibit bank stabilization measures; tree maintenance or removal; maintenance or installation of tile outlets; machinery crossings, including concrete drive-throughs and bridges; boat or canoe ramps; or other structures permitted by the department; nor restrict riparian access to the protected stream for such uses as livestock watering or grazing. Protected stream status does not affect current cropping practices or require the establishment or maintenance of buffer strips, filter strips, or fences along protected streams except as may be required to mitigate environmental damage associated with a channel change on a protected stream.

[ARC 9210C, IAB 5/14/25, effective 6/18/25]

These rules are intended to implement Iowa Code sections 455B.262, 455B.264, 455B.270, 455B.275, 455B.277, 459.102 and 459.301.

**567—72.33 to 72.49** Reserved.

#### DIVISION III PROTECTED STREAM DESIGNATION PROCEDURE

**567—72.50(455B) Protected streams.**

**72.50(1)** *Protected streams defined.* Protected streams shall include streams designated as protected streams pursuant to the procedures of 567—72.51(455B), which upon designation will be listed in 72.50(2). Streams hydrologically connected to protected streams are not protected streams unless specifically listed as protected streams in 72.50(2).

**72.50(2)** *List of protected streams.* Streams designated as protected streams are the following:

**ADAIR COUNTY**

Middle River, east county line to confluence with unnamed creek (NE 1/4, S36, T76N, R30W, Adair Co.);

**ALLAMAKEE COUNTY**

Bear Creek, mouth (S1, T99N, R6W, Allamakee Co.) to west county line;  
 Clear Creek, mouth (S35, T100N, R5W, Allamakee Co.) to north line of S15, T100N, R5W;  
 Clear Creek, mouth (S29, T99N, R3W, Allamakee Co.) to west line of S25, T99N, R4W;  
 Cota Creek, mouth to west line of S10, T97N, R3W;  
 Dousman Creek, mouth (S33, T96N, R3W, Allamakee Co.) to south county line;  
 French Creek, mouth to east line of S23, T99N, R5W;  
 Hickory Creek, mouth to south line of S28, T96N, R5W;  
 Irish Hollow Creek, mouth to north line of S17, T100N, R4W;  
 Little Paint Creek, mouth to north line of S30, T97N, R3W;  
 Norfolk Creek, mouth to confluence with Teeple Creek (S24, T97N, R6W);  
 Paint Creek (a.k.a. Pine Creek), mouth (S9, T99N, R6W, Allamakee Co.) to west county line;  
 Paint Creek, mouth (S15, T96N, R3W, Allamakee Co.) to road crossing S18, T97N, R4W;  
 Patterson Creek, mouth to east line of S3, T98N, R6W;  
 Silver Creek, mouth (S4, T99N, R5W, Allamakee Co.) to south line of S31, T99N, R5W;  
 Suttle Creek, mouth (S17, T96N, R4W, Allamakee Co.) to south county line;  
 Teeple Creek, mouth (S24, T97N, R6W, Allamakee Co.) to spring source in S11, T97N, R6W;

Trout Run, mouth in S16, T98N, R4W through one mile reach;  
Unnamed tributary to Village Creek (a.k.a. Erickson Spring Branch), mouth to west line of S23, T98N, R4W;  
Unnamed tributary to the Yellow River (a.k.a. Bear Creek), mouth to north line of S12, T96N, R5W;  
Upper Iowa River, from Lane's Bridge at river mile 6 to west county line;  
Village Creek, mouth to west line of S19, T98N, R4W;  
Waterloo Creek, mouth (S35, T100N, R6W) to north county line;  
Wexford Creek, mouth to west line of S25, T98N, R3W;  
Yellow River, mouth to west county line;

**APPANOOSE COUNTY**

Chariton River, Highway 2 (S27, T69N, R17W, Appanoose Co.) to Rathbun Lake Dam (S35, T70N, R18W, Appanoose Co.);

**BENTON COUNTY**

Bear Creek, east county line to confluence with Opossum Creek (S 5/8, T84N, R9W, Benton Co.);  
Bear Creek, mouth (S21, T86N, R10W, Benton Co.) to confluence with unnamed creek (NE1/4, NE 1/4, S2, T86N, R10W, Benton Co.);  
Cedar River, east county line to north county line;  
Iowa River, south county line to west county line;  
Lime Creek, mouth (S4, T86N, R10W, Benton Co.) to north county line;  
Prairie Creek, mouth (S10, T85N, R10W, Benton Co.) to confluence with unnamed creek (S36, T86N, R10W, Benton Co.);  
Salt Creek, mouth (S31, T82N, R12W, Benton Co.) to west county line;  
Wild Cat Creek, mouth (S8, T84N, R9W, Benton Co.) to confluence with unnamed creek (W1/2, S33, T84N, R10W, Benton Co.);  
Wolf Creek, north county line to west county line;

**BLACK HAWK COUNTY**

Black Hawk Creek, mouth (S22, T89N, R13W, Black Hawk Co.) to west county line;  
Cedar River, east county line to north county line;  
Crane Creek, mouth (S26, T90N, R11W, Black Hawk Co.) to confluence with unnamed creek (S3, T90N, R12W, Black Hawk Co.);  
Shell Rock River, mouth (S4, T90N, R14W, Black Hawk Co.) to north county line;  
Wapsipinicon River, east county line to north county line;  
West Fork Cedar River, mouth (S10, T90N, R14W, Black Hawk Co.) to west county line;  
Wolf Creek, mouth (S19, T87N, R11W, Black Hawk Co.) to south county line;

**BOONE COUNTY**

Big Creek, south county line to confluence with unnamed creek (NW 1/4, S34, T82N, R25W, Boone Co.);  
Bluff Creek, mouth (S22, T84N, R27W, Boone Co.) to Don Williams Lake Outlet (S5, T84N, R27W, Boone Co.);  
Des Moines River, south county line to north county line;

**BREMER COUNTY**

Cedar River, south county line to north county line;  
Shell Rock River, south county line to west county line;  
Wapsipinicon River, south county line to north county line;

**BUCHANAN COUNTY**

Cedar River, south county line to west county line;  
Lime Creek, south county line to confluence with unnamed creek (S1, T87N, R10W, Buchanan Co.);  
South Fork Maquoketa River, east county line to confluence with major unnamed creek (S4, T90N, R7W, Buchanan Co.);  
Wapsipinicon River, south county line to west county line;

**BUENA VISTA COUNTY**

Little Sioux River, north county line to north county line (entire length in county);

North Raccoon River, south county line to the north line of the NW 1/4, SE 1/4, S12, T90N, R36W, Buena Vista Co.;

**BUTLER COUNTY**

Shell Rock River, east county line to north county line;

West Fork Cedar River, east county line to west county line;

**CALHOUN COUNTY**

Camp Creek, mouth (S7, T86N, R34W, Calhoun Co.) to confluence with unnamed creek (NE1/4, NE 1/4, S33, T87N, R34W, Calhoun Co.);

Cedar Creek, south county line to confluence with unnamed creek (S 1/2, S34, T86N, R32W, Calhoun Co.);

Lake Creek, mouth (S23, T86N, R34W, Calhoun Co.) to confluence with D.D. 13 (S33, T88N, R32W, Calhoun Co.);

North Raccoon River, south county line to west county line;

**CARROLL COUNTY**

Middle Raccoon River, south county line to confluence with unnamed creek (SE 1/4, S15, T84N, R35W, Carroll Co.);

North Raccoon River, east county line to north county line;

**CEDAR COUNTY**

Cedar River, south county line to west county line;

Rock Creek, mouth (S2, T79N, R3W, Cedar Co.) to confluence with West Rock Creek (S11, T81N, R3W, Cedar Co.);

Sugar Creek, south county line to confluence with unnamed creek (S35, T80N, R2W, Cedar Co.);

Wapsipinicon River, east county line to north county line;

**CERRO GORDO COUNTY**

Beaverdam Creek, south county line to confluence with unnamed creek (S12, T95N, R22W, Cerro Gordo Co.);

Shell Rock River, east county line to north county line;

Spring Creek, mouth (S28, T97N, R20W, Cerro Gordo Co.) to confluence with Blair Creek (S9, T97N, R20W, Cerro Gordo Co.);

Willow Creek, mouth (S3, T96N, R20W, Cerro Gordo Co.) to confluence with Clear Creek (S16, T96N, R21W, Cerro Gordo Co.);

Winnebago River, east county line to west county line (entire length in county);

**CHEROKEE COUNTY**

Little Sioux River, south county line to north county line;

Maple River, south county line to confluence with unnamed creek (N 1/2, S29, T91N, R39W, Cherokee Co.);

Mill Creek, confluence with Willow Creek (S1, T93N, R41W, Cherokee Co.) to north county line;

**CHICKASAW COUNTY**

Cedar River, south county line to west county line;

Crane Creek, east county line to confluence with unnamed creek (NE 1/4, S25, T95N, R11W, Chickasaw Co.);

Little Cedar River, mouth (S20, T94N, R14W, Chickasaw Co.) to west county line;

Wapsipinicon River, south county line to north county line;

**CLAY COUNTY**

Little Sioux River, west county line to north county line (entire length in county);

Lost Island Outlet, mouth (S35, T96N, R36W, Clay Co.) to County Road M 54 (S24, T96N, R36W, Clay Co.);

Muddy Creek, mouth (S15, T96N, R36W, Clay Co.) to County Road B 17 (north line, S23, T97N, R36W, Clay Co.);

Ocheyedan River, mouth (S13, T96N, R37W, Clay Co.) to confluence with Stoney Creek (S7, T96N, R37W, Clay Co.);

Prairie Creek, mouth (S26, T96N, R36W, Clay Co.) to confluence with unnamed creek (SE1/4, S35, T96N, R37W, Clay Co.);

Stoney Creek, mouth (S7, T96N, R37W, Clay Co.) to Highway 18 (S31, T96N, R37W, Clay Co.);

#### CLAYTON COUNTY

Bear Creek, mouth (S34, T92N, R4W, Clayton Co.) to west line of S23 T91N, R5W, Clayton Co.;

Bloody Run, mouth (S15, T95N, R3W) to source at Spook Cave;

Bloody Run Creek (a.k.a. Grimes Hollow), mouth (S36, T91N, R3W) to south county line;

Brownfield Creek, mouth to spring source (S31, T91N, R3W);

Buck Creek, mouth (S29, T93N, R2W, Clayton Co.) to west line of S9, T93N, R3W;

Cox Creek, mouth (S21, T92N, R5W, Clayton Co.) to south line S12, T91N, R6W, Clayton Co.;

Dry Mill Creek, mouth to west line of S9, T93N, R4W;

Elk Creek, mouth (S36, T92N, R4W, Clayton Co.) to south county line;

Ensign Creek, mouth (S28, T92N, R6W, Clayton Co.) to spring source (S29, T92N, R6W, Clayton Co.);

Hewett Creek, mouth to south line of S29, T92N, R6W;

Kleinlein Creek (a.k.a. Spring Creek), mouth to spring source (S10, T91N, R6W);

Maquoketa River, south county line to west county line;

Miners Creek, mouth to west line of S1, T92N, R3W;

Mink Creek, mouth (S30, T93N, R6W) to west county line;

Mossey Glen Creek, mouth (S3, T91N, R5W) to south line of S10, T91N, R5W, Clayton Co.;

North Cedar Creek, mouth (S8, T94N, R3W) to source;

Pecks Creek, mouth to south line of S15, T91N, R3W;

Pine Creek, mouth (S26, T91N, R4W) to confluence with Brownfield Creek (S25, T91N, R4W);

Point Hollow Creek (a.k.a. White Pine Creek), mouth (S31, T91N, R2W) to south county line;

Roberts Creek, mouth (SE 1/4, S25, T93N, R5W, Clayton Co.) to confluence with an unnamed creek (SE 1/4, S15, T95N, R6W, Clayton Co.);

Sny Magill Creek (a.k.a. Magill Creek), mouth to source;

South Cedar Creek (a.k.a. Cedar Creek), mouth (S33, T92N, R3W, Clayton Co.) to north line of S30, T93N, R3W, Clayton Co.;

Steeles Branch, mouth (S26, T91N, R4W) to south line S32, T91N, R4W, Clayton Co. (entire length in county);

Turkey River, confluence with Volga River to west county line;

Unnamed tributary to Sny Magill Creek (a.k.a. West Fork Sny Magill Creek), mouth (S7, T94N, R3W) to west line of S7, T94N, R3W;

Volga River, mouth (S26, T92N, R4W, Clayton Co.) to west county line;

#### CLINTON COUNTY

Elk River, mouth (S20, T83N, R7E, Clinton Co.) to confluence with North Branch Elk River (S10, T83N, R6E, Clinton Co.);

Wapsipinicon River, mouth (S13, T80N, R5E, Clinton Co.) to west county line (entire length in county);

#### CRAWFORD COUNTY

Boyer River, south county line to north county line;

#### DALLAS COUNTY

Des Moines River, east county line to north county line (entire length in county);

Middle Raccoon River, mouth (S9, T78N, R29W, Dallas Co.) to west county line (entire length in county);

North Raccoon River, mouth (S21, T78N, R27W, Dallas Co.) to north county line (S5, T81N, R29W, Dallas Co.) (entire length in county);

Raccoon River, east county line to confluence with North Raccoon River (S21, T78N, R27W, Dallas Co.);

#### DAVIS COUNTY

Des Moines River, east county line to north county line (entire length in county);

## DECATUR COUNTY

Thompson River, Highway 69 (S35, T68N, R26W, Decatur Co.) to west county line;

## DELAWARE COUNTY

Bloody Run Creek (a.k.a. Grimes Hollow), north county line to spring source (S3, T90N, R3W);

Coffins Creek, mouth (S19, T89N, R5W, Delaware Co.) to confluence with Prairie Creek (S29, T89N, R6W, Delaware Co.);

Elk Creek, north county line to confluence with unnamed creek (center, S13, T90N, R4W, Delaware Co.);

Fenchel Creek, mouth (S5, T90N, R6W) to Richmond Springs (center of S4, T90N, R6W);

Fountain Spring Creek (a.k.a. Odell Branch), mouth (SE 1/4, S10, T90N, R4W) to confluence with South Branch Fountain Spring Creek (SE 1/4, S16, T90N, R4W);

Little Turkey River, north county line to south line of S11, T90N, R3W;

Maquoketa River, south county line to north county line;

Sand Creek, mouth (S9, T88N, R5W, Delaware Co.) to confluence with major unnamed creek (SW 1/4, S11, T88N, R6W, Delaware Co.);

Schechtman Branch, mouth to south line of S14, T90N, R4W;

South Branch Fountain Spring Creek, mouth (S16, T90N, R4W) to spring source (S16, T90N, R4W);

South Fork Maquoketa River, mouth (S16, T90N, R6W, Delaware Co.) to west county line;

Spring Branch, mouth (S10, T88N, R5W) to major spring source, north of Highway 20 (S35, T89N, R5W, Delaware Co.);

Steeles Branch, north county line to west line of S5, T90N, R4W, Delaware Co. (entire length in county between S4, T90N, R4W and west line of S5, T90N, R4W);

Twin Springs Creek, mouth (S2, T90N, R4W) to spring source (S12, T90N, R4W);

## DES MOINES COUNTY

Cedar Creek, mouth (S1, T69N, R5W, Des Moines Co.) to Geode Lake Dam;

Cedar Creek, west county line to confluence with unnamed creek (S18, T70N, R4W, Des Moines Co.);

Flint Creek, mouth (S28, T70N, R2W, Des Moines Co.) to confluence with unnamed creek (NW 1/4, S21, T71N, R4W, Des Moines Co.);

Skunk River, mouth (S8, T68N, R2W, Des Moines Co.) to east county line (entire length in county);

## DICKINSON COUNTY

Little Sioux River, south county line to confluence with West Fork Little Sioux River (S7, T99N, R37W, Dickinson Co.);

## DUBUQUE COUNTY

Bloody Run, mouth (S34, T90N, R2E) to west line of S21, T90N, R2E;

Catfish Creek, mouth (S5, T88N, R3E, Dubuque Co.) to source;

Cloie Branch, mouth (S5, T89N, R2E) to west line of S5, T89N, R2E;

Hogans Branch, mouth (S35, T89N, R1W) to west line of S9, T88N, R1W;

Little Maquoketa River, mouth (S26, T90N, R2E, Dubuque Co.) to north line of NE 1/4, S5, T88N, R1W, Dubuque Co.;

Middle Fork Little Maquoketa River, west line of S31, T90N, R1E to north line of S33, T90N, R1W;

Point Hollow Creek (a.k.a. White Pine Creek), north county line to spring source (S8, T90N, R2W);

Tete des Morts Creek (a.k.a. Tete des Morts River), mouth (S34, T88N, R4E, Dubuque Co.) to south county line (S34, T88N, R4E, Dubuque Co.);

## EMMET COUNTY

Brown Creek, mouth (S24, T99N, R34W, Emmet Co.) to Highway 9 (S13, T99N, R34W, Emmet Co.);

Des Moines River, south county line to north county line;

East Fork Des Moines River, east county line to Tuttle Lake Outlet (S13, T100N, R32W, Emmet Co.);

## FAYETTE COUNTY

Bass Creek, mouth (S3, T95N, R9W) to west line of S3, T95N, R9W;

Bear Creek, mouth (S8, T92N, R7W, Fayette Co.) to west line of S6, T92N, R7W;

Bell Creek, mouth (S10, T94N, R7W) to west line of S8, T94N, R7W;

Brush Creek, mouth (S26, T93N, R7W, Fayette Co.) to east line of S17, T92N, R7W, Fayette Co.;

Crane Creek, mouth (S31, T95N, R9W, Fayette Co.) to west county line;  
Grannis Creek, mouth (S30, T93N, R7W), to west line of S36, T93N, R8W, Fayette Co.;  
Little Turkey River, mouth (S18, T95N, R8W, Fayette Co.) to north county line;  
Maquoketa River, east county line to north line of S24, T91N, R7W;  
Mink Creek, east county line to west line of S15, T93N, R7W;  
North Branch Volga River, mouth (S33, T93N, R9W, Fayette Co.) to confluence with unnamed creek (S8, T93N, R9W, Fayette Co.);  
Otter Creek, mouth to confluence with unnamed tributary (a.k.a. Glovers Creek) in S22, T94N, R8W;  
Turkey River, east county line to north county line;  
Unnamed tributary to Otter Creek (a.k.a. Glovers Creek), mouth (S22, T94N, R8W) to west line of S15, T94N, R8W;  
Volga River, east county line to confluence with an unnamed creek (NW 1/4, NE 1/4, SE 1/4, S24, T93N, R10W, Fayette Co.);

**FLOYD COUNTY**

Cedar River, east county line to north county line;  
Little Cedar River, east county line to north county line;  
Rock Creek, mouth (S24, T97N, R17W, Floyd Co.) to north county line (entire length in county);  
Shell Rock River, south county line to west county line;  
Winnebago River, mouth (S14, T95N, R18W, Floyd Co.) to west county line;

**FRANKLIN COUNTY**

Beaver Creek, east county line to road crossing (S28, T90N, R19W, Franklin Co.);  
Beaverdam Creek, mouth (S19, T93N, R19W, Franklin Co.) to north county line;  
Iowa River, south county line to west county line (entire length in county);  
Maynes Creek, confluence with unnamed creek (S12, T91N, R19W, Franklin Co.) to confluence with unnamed creek (S30, T91N, R20W, Franklin Co.);  
Otter Creek, mouth (S28, T92N, R19W, Franklin Co.) to County Road C 23 (north line of S31, T93N, R20W, Franklin Co.);  
West Fork Cedar River, east county line to confluence with Beaverdam & Bailey Creeks (S19, T93N, R19W, Franklin Co.);

**GREENE COUNTY**

Cedar Creek, mouth (S33, T85N, R32W, Greene Co.) to north county line;  
North Raccoon River, south county line to west county line (entire length in county);

**GRUNDY COUNTY**

Black Hawk Creek, east county line to confluence with Minnehaha Creek (S7, T87N, R16W, Grundy Co.);  
Wolf Creek, east county line to confluence with unnamed creek (S32, T86N, R17W, Grundy Co.);

**GUTHRIE COUNTY**

Middle Raccoon River, Lake Panorama (S15, T80N, R31W, Guthrie Co.) to north county line;  
Middle Raccoon River, east county line to Lake Panorama Outlet (S31, T80N, R30W, Guthrie Co.);

**HAMILTON COUNTY**

Boone River, west county line to north county line;  
Des Moines River, west county line to west county line (entire length in county);  
Eagle Creek, mouth (S6, T89N, R25W, Hamilton Co.) to north county line;  
White Fox Creek, mouth (S33, T89N, R25W, Hamilton Co.) to north county line;

**HANCOCK COUNTY**

East Fork Iowa River, south county line to confluence with Galls Creek (S12, T95N, R24W, Hancock Co.);  
West Fork Iowa River, south county line to County Road B 55 (north line of S31, T95N, R24W, Hancock Co.);  
Winnebago River, east county line to north county line (entire length in county);

**HARDIN COUNTY**

Iowa River, south county line to north county line;

School Creek, mouth (S28, T89N, R20W, Hardin Co.) to confluence with unnamed creek (S16, T89N, R20W, Hardin Co.);

South Fork Iowa River, mouth (S4, T86N, R19W, Hardin Co.) to Highway 359 (S11, T88N, R22W, Hardin Co.);

#### HENRY COUNTY

Cedar Creek, mouth (S9, T71N, R7W, Henry Co.) to west county line (entire length in county);

Cedar Creek, upper extent of Geode Lake (S25, T70N, R5W, Henry Co.) to east county line;

Crooked Creek, west county line to north county line;

Skunk River, south county line to west county line (NW 1/4, S30, T73N, R7W, Henry Co.)(entire length in Henry Co.);

#### HOWARD COUNTY

Beaver Creek, mouth (S19, T100N, R12W, Howard Co.) to south line of S29, T100N, R13W;

Bohemian Creek, east county line to west line of S2, T97N, R11W;

Chialk Creek, mouth (S1, T98N, R11W, Howard Co.) to north line S36, T99N, R11W, Howard Co.;

Nichols Creek (a.k.a. Bigalks Creek), east county line to west line of S23, T100N, R11W;

Staff Creek, mouth to west line of S27, T100N, R14W;

Turkey River, east county line to confluence with South Branch Turkey River (S2, T98N, R12W, Howard Co.);

Upper Iowa River, all of the river located in Howard County;

Wapsipinicon River, south county line to west county line;

#### HUMBOLDT COUNTY

Des Moines River, south county line to north line S7, T92N, R30W, Humboldt Co.;

East Fork Des Moines River, mouth (S19, T91N, R28W, Humboldt Co.) to north county line;

#### IDA COUNTY

Little Sioux River, west county line to north county line;

Maple River, west county line to north county line;

#### IOWA COUNTY

Iowa River, east county line to north county line;

#### JACKSON COUNTY

Brush Creek, north line of S23, T85N, R3E to north line of S1, T85N, R3E;

Cedar Creek, mouth (S30, T85N, R3E) to east line of S29, T85N, R3E;

Little Mill Creek, mouth to west line of S29, T86N, R4E;

Maquoketa River, mouth (S7, T85N, R6E, Jackson Co.) to west county line (entire length in county);

Mill Creek, mouth (S18, T86N, R5E, Jackson Co.) to confluence with unnamed creek (S1, T86N, R3E, Jackson Co.);

Mineral Creek, mouth (S32, T85N, R1E, Jackson Co.) to west county line;

Ozark Spring Run, mouth (S32, T86N, R1E) to spring source in center of S32, T86N, R1E;

Pleasant Creek (a.k.a. Springbrook), confluence with unnamed creek (E 1/2, S11, T85N, R4E, Jackson Co.) to west line S15, T85N, R4E, Jackson Co.;

South Fork Big Mill Creek, mouth (S8, T86N, R4E, Jackson Co.) to west line S17, T86N, R4E, Jackson Co.;

Storybook Hollow, mouth (S7, T86N, R4E, Jackson Co.) to south line of S12, T86N, R3E, Jackson Co.;

Tete des Morts Creek (a.k.a. Tete des Morts River), north county line (S3, T87N, R4E, Jackson Co.) to confluence with unnamed creek (NW 1/4, S4, T87N, R3E, Jackson Co.);

Unnamed creek, mouth (S1, T86N, R3E, Jackson Co.) to west line S1, T86N, R3E, Jackson Co.;

Unnamed tributary to Lytle Creek, mouth (S7, T86N, R2E) to west line of S11, T86N, R1E;

#### JEFFERSON COUNTY

Crooked Creek, mouth (S1, T73N, R8W, Jefferson Co.) to east county line;

Skunk River, east county line (east line, S13, T72N, R8W, Jefferson Co.) to north county line (north line, S1, T73N, R8W, Jefferson Co.) (entire length in Jefferson Co.);

#### JOHNSON COUNTY

Cedar River, east county line to north county line;

Clear Creek, Interstate 380 (S34, T80N, R7W, Johnson Co.) to confluence with unnamed creek (S29, T80N, R8W, Johnson Co.);

Iowa River, south county line (south line, S32, T77N, R5W, Johnson Co.) to Coralville Dam (S22, T80N, R6W, Johnson Co.);

North Branch Old Mans Creek, mouth (S31, T79N, R7W, Johnson Co.) to north line S23, T79N, R8W, Johnson Co.;

#### JONES COUNTY

Buffalo Creek, mouth (S10, T84N, R4W, Jones Co.) to west county line;

Maquoketa River, east county line to north county line (entire length in county);

Mineral Creek, east county line to west line S29, T85N, R1W, Jones Co.;

Wapsipinicon River, south county line to west county line;

#### KEOKUK COUNTY

North Skunk River, mouth (S5, T74N, R10W, Keokuk Co.) to west county line;

Skunk River, east county line to confluence with North & South Skunk Rivers (S5, T74N, R10W, Keokuk Co.);

South English River, east county line to confluence with unnamed creek (S6, T77N, R13W, Keokuk Co.);

South Skunk River, mouth (S5, T74N, R10W, Keokuk Co.) to confluence with Olive Branch Creek (S30, T75N, R13W, Keokuk Co.);

#### KOSSUTH COUNTY

Buffalo Creek, mouth (S20, T97N, R28W, Kossuth Co.) to confluence with North Buffalo Creek (S4, T97N, R27W, Kossuth Co.);

East Fork Des Moines River, south county line to west county line;

#### LEE COUNTY

Des Moines River, mouth (S34, T65N, R5W, Lee Co.) to west county line (entire length in county);

Skunk River, mouth (S8, T68N, R2W, Lee Co.) to north county line (entire length in county);

#### LINN COUNTY

Bear Creek, mouth (S21, T84N, R8W, Linn Co.) to west county line;

Buffalo Creek, east county line to Highway 13 (S10, T86N, R6W, Linn Co.);

Cedar River, south county line to west county line;

East Otter Creek, confluence with Otter Creek (S7, T84N, R7W, Linn Co.) to confluence with unnamed creek (S 1/2, S28, T85N, R7W, Linn Co.);

Wapsipinicon River, east county line to north county line;

#### LOUISA COUNTY

Cedar River, mouth (S20, T75N, R4W, Louisa Co.) to north county line;

Iowa River, mouth to north county line (NW 1/4, S6, T76N, R5W, Louisa Co.) (entire length in county);

Long Creek, mouth (S1, T74N, R4W, Louisa Co.) to west county line;

#### LUCAS COUNTY

Chariton River, Rathbun Lake (S34, T71N, R20W, Lucas Co.) to Highway 14 (S31, T72N, R21W, Lucas Co.);

White Breast Creek, north county line to confluence with unnamed creek (W 1/2, NW 1/4, S6, T71N, R23W, Lucas Co.);

Wolf Creek, mouth (S15, T71N, R21W, Lucas Co.) to confluence with unnamed creek (NE 1/4, S36, T71N, R22W, Lucas Co.);

#### LYON COUNTY

Big Sioux River, south county line to north county line;

Little Rock River, mouth (S35, T98N, R46W, Lyon Co.) to confluence with unnamed creek (S10, T98N, R44W, Lyon Co.);

Otter Creek, mouth (S21, T98N, R44W, Lyon Co.) to south county line;

Rock River, south county line to north county line;

#### MADISON COUNTY

Middle River, east county line to west county line;

Thompson River, south county line to confluence with unnamed creek (NW 1/4, S7, T74N, R29W, Madison Co.);

#### MAHASKA COUNTY

Des Moines River, south county line to west county line (entire length in county);

North Skunk River, east county line to north county line;

#### MARION COUNTY

Des Moines River, east county line to west county line (entire length in county);

White Breast Creek, mouth to west county line;

#### MARSHALL COUNTY

Iowa River, east county line to Marshalltown Center St. Dam (S26, T84N, R18W, Marshall Co.);

Iowa River, confluence with Dowd Creek (S2, T85N, R19W, Marshall Co.) to north county line;

Minerva Creek, mouth (S2, T84N, R19W, Marshall Co.) to confluence with major unnamed creek (NW 1/4, S9, T85N, R20W, Marshall Co.);

Wolf Creek, north county line to north county line (S2, T85N, R17W, Marshall Co.) (entire length in county);

#### MITCHELL COUNTY

Beaver Creek, mouth to north line of S19, T99N, R15W;

Burr Oak Creek, mouth (S12, T98N, R16W, Mitchell Co.) to north line of S5, T98N, R16W, Mitchell Co.;

Cedar River, south county line to north county line;

Deer Creek, mouth (S23, T99N, R18W, Mitchell Co.) to west county line;

Little Cedar River, south county line to north county line;

Rock Creek, south county line (S14, T97N, R17W, Mitchell Co.) to north line of S26, T98N, R18W, Mitchell Co. (entire length in county between south line of S14, T97N, R17W and north line of S26, T98N, R18W);

Spring Creek, mouth to north line of S8, T97N, R16W;

Turtle Creek, mouth to east line of S7, T99N, R17W;

Wapsipinicon River, east county line to north line of S20, T100N, R15W;

#### MONONA COUNTY

Maple River, south line (S34, T85N, R43W, Monona Co.) to north county line;

#### MONROE COUNTY

Des Moines River, east county line to north county line (entire length in county);

#### MUSCATINE COUNTY

Cedar River, south county line to north county line;

Pine Creek, mouth (S21, T77N, R1E, Muscatine Co.) to confluence with unnamed creek (S26, T78N, R1W, Muscatine Co.);

Sugar Creek, mouth (S17, T78N, R2W, Muscatine Co.) to north county line;

#### O'BRIEN COUNTY

Little Sioux River, south county line to east county line;

Mill Creek, south county line to confluence with unnamed creek (NE 1/4, S9, T95N, R41W, O'Brien Co.);

#### PLYMOUTH COUNTY

Big Sioux River, south county line to north county line;

#### POLK COUNTY

Big Creek, upper extent of Big Creek Lake (S9, T81N, R25W, Polk Co.) to north county line;

Des Moines River, east county line to west county line (entire length in county);

Raccoon River, mouth (S10, T78N, R24W, Polk Co.) to west county line;

#### RINGGOLD COUNTY

Thompson River, east county line to north county line;

#### SAC COUNTY

Boyer River, south county line to confluence with unnamed creek (S6, T89N, R37W, Sac Co.);

Indian Creek, mouth (S24, T87N, R36W, Sac Co.) to north line (S20, T87N, R36W, Sac Co.);  
North Raccoon River, east county line to north county line;

**SCOTT COUNTY**

Lost Creek, mouth (S15, T80N, R5E, Scott Co.) to confluence with unnamed creek (NW 1/4, S7, T79N, R5E, Scott Co.);

Wapsipinicon River, mouth (S13, T80N, R5E, Scott Co.) to north county line (NE 1/4, S1, T80N, R1E, Scott Co.) (entire length in county);

**SIOUX COUNTY**

Big Sioux River, south county line to north county line;

Rock River, mouth (S1, T95N, R48W, Sioux Co.) to north county line;

**STORY COUNTY**

South Skunk River, confluence with Squaw Creek (S12, T83N, R24W, Story Co.) to north county line;

**TAMA COUNTY**

Iowa River, east county line to west county line;

Raven Creek, mouth (S25, T83N, R16W, Tama Co.) to confluence with unnamed creek (S6, T82N, R16W, Tama Co.);

Salt Creek, east county line to confluence with South Branch Salt Creek (S29, T84N, R13W, Tama Co.);

**UNION COUNTY**

Thompson River, south county line to north county line;

Twelve Mile Creek, mouth (S36, T71N, R28W, Union Co.) to Twelve Mile Lake Dam (S12, T72N, R30W, Union Co.);

**VAN BUREN COUNTY**

Cedar Creek, east county line (SE 1/4, S12, T70N, R8W) to east county line (NE 1/4, S12, T70N, R8W);

Des Moines River, south county line to west county line (entire length in county);

**WAPELLO COUNTY**

Des Moines River, south county line to west county line (entire length in county);

South Avery Creek, mouth (S31, T73N, R14W, Wapello Co.) to west county line;

**WARREN COUNTY**

Des Moines River, east county line to north county line (entire length in county);

Middle River, confluence with Clanton Creek (S28, T76N, R25W, Warren Co.) to west county line;

White Breast Creek, east county line to south county line;

**WASHINGTON COUNTY**

Crooked Creek, south county line to confluence with East and West Fork Crooked Creeks (S24, T74N, R7W, Washington Co.);

English River, mouth (S11, T77N, R6W, Washington Co.) to confluence with South English River (S6, T77N, R9W, Washington Co.);

Iowa River, east county line (east line, S36, T77N, R6W, Washington Co.) to north county line (north line, S2, T77N, R6W, Washington Co.) (entire length in Washington Co.);

Long Creek, east county line to confluence with South Fork Long Creek (S26, T75N, R6W, Washington Co.);

Skunk River, south county line (SE 1/4, S36, T74N, R8W, Washington Co.) to west county line (SW 1/4, S6, T74N, R9W, Washington Co.) (entire length in county);

South English River, mouth (S6, T77N, R9W, Washington Co.) to west county line;

**WEBSTER COUNTY**

Boone River, mouth (S36, T87N, R27W, Webster Co.) to east county line;

Brushy Creek, west line (S16, T88N, R27W, Webster Co.) to confluence with unnamed creek (S8, T88N, R27W, Webster Co.);

Brushy Creek, mouth (S15, T87N, R27W, Webster Co.) to south line S34, T88N, R27W, Webster Co.;

Deer Creek, mouth (S24, T90N, R29W, Webster Co.) to north line S16, T90N, R29W, Webster Co.;

Des Moines River, south county line to north county line (entire length in county);

Lizard Creek, mouth (S19, T89N, R28W, Webster Co.) to confluence with D.D. #3 (S35, T90N, R30W, Webster Co.);

South Branch Lizard Creek, mouth (S23, T89N, R29W, Webster Co.) to west line S32, T89N, R29W, Webster Co.;

#### WINNEBAGO COUNTY

Winnebago River, south county line to north county line;

#### WINNESHIEK COUNTY

Bear Creek (a.k.a. South Bear Creek), east county line to source (a.k.a. Mestad Springs, S29, T100N, R7W);

Bohemian Creek, mouth to west county line;

Canoe Creek, mouth (S25, T99N, R7W, Winneshiek Co.) to west line of S8, T99N, R8W, Winneshiek Co.;

Coon Creek, mouth to road crossing in NW 1/4, S13, T98N, R7W;

Dry Run, mouth to west line of S36, T98N, R9W;

East Pine Creek, mouth (S28, T100N, R9W) to north county line (S10, T100N, R9W);

Martha Creek, mouth to west line of S13, T99N, R10W;

Middle Bear Creek, mouth to north line of S16, T100N, R7W;

Nichols Creek (a.k.a. Bigalk Creek), mouth to west county line;

North Bear Creek, mouth to north county line;

North Canoe Creek, mouth to north line of S2, T99N, R8W;

Paint Creek (a.k.a. Pine Creek), east county line to confluence with unnamed creek (SE 1/4, S11, T99N, R7W, Winneshiek Co.);

Pine Creek, mouth (S10, T99N, R9W) to north county line;

Pine Creek, mouth (S26, T99N, R7W) to north line of S21, T99N, R7W;

Silver Creek, mouth to north line of S26, T100N, R9W;

Smith Creek (a.k.a. Trout River), mouth (S21, T98N, R7W) to south line of S33, T98N, R7W;

Ten Mile Creek, mouth to confluence with Walnut Creek (S18, T98N, R9W);

Trout Creek, mouth (S9, T98N, R7W) to confluence with Smith Creek (S21, T98N, R7W);

Trout Creek, mouth (S23, T98N, R8W) to confluence with unnamed tributary (a.k.a. Trout Run) in S27, T98N, R8W;

Turkey River, south county line to west county line;

Twin Springs creek, mouth (S17, T98N, R8W) through one half mile reach;

Unnamed creek, mouth (SE 1/4, S11, T99N, R7W, Winneshiek Co.) to north line S12, T99N, R7W, Winneshiek Co.;

Unnamed tributary to Trout Creek (a.k.a. Trout Run), mouth (S27, T98N, R8W, Winneshiek Co.) to south line of S27, T98N, R8W;

Unnamed tributary to Upper Iowa River (a.k.a. Casey Springs Creek), mouth (S25, T99N, R9W) to west line of S26, T99N, R9W;

Unnamed tributary to Upper Iowa River (a.k.a. Coldwater Creek), mouth (S32, T100N, R9W) to north county line;

Upper Iowa River, east county line to west county line;

Yellow River, east county line to confluence with North Fork Yellow River (S13, T96N, R7W);

#### WOODBURY COUNTY

Little Sioux River, confluence with Parnell Creek (S25, T86N, R44W, Woodbury Co.) to east county line;

Maple River, south county line to east county line;

#### WORTH COUNTY

Deer Creek, east county line to confluence with unnamed creek (east line, S28, T100N, R19W, Worth Co.);

Elk Creek, mouth (S27, T99N, R20W, Worth Co.) to Highway 105 (S5, T99N, R22W, Worth Co.);

Shell Rock River, south county line to north county line;

Winans Creek, mouth (S36, T98N, R22W, Worth Co.) to N/S road crossing (S 1/2, S25, T98N, R22W, Worth Co.);

Winnebago River, south county line (S32, T98N, R21W, Worth Co.) to south county line (S34, T98N, R22W, Worth Co.) (entire length in county);

**WRIGHT COUNTY**

Boone River, south county line to confluence with Middle Branch Boone River (S2, T93N, R26W, Wright Co.);

Eagle Creek, south county line to confluence with Drainage Ditch No. 9 (S30, T91N, R25W, Wright Co.);

East Fork Iowa River, mouth (S19, T93N, R23W, Wright Co.) to north county line;

Iowa River, east county line (S13, T90N, R23W, Wright Co.) to confluence with East and West Fork Iowa Rivers (S19, T93N, R23W, Wright Co.) (entire length in county);

West Fork Iowa River, mouth (S19, T93N, R23W, Wright Co.) to north county line;

White Fox Creek, south county line to confluence with unnamed creek (E 1/2, SE 1/4, S36, T91N, R25W, Wright Co.).

[ARC 9210C, IAB 5/14/25, effective 6/18/25]

**567—72.51(455B) Protected stream designation procedure.**

**72.51(1) Eligible petitioners.** Any state agency, governmental subdivision, association or interested person may petition the commission, according to the rules of this division, to designate a stream as a protected stream. However, if the stream had been the subject of a similar petition filed within the past two years, the commission shall not accept a petition except upon a majority vote.

**72.51(2) Content of petition.** The petition for protected stream designation shall contain the following: (1) names, addresses, and the telephone numbers of the petitioners; (2) location of the stream nominated for designation; (3) reasons why the stream is nominated, each reason being stated in a separate numbered paragraph; and (4) adequate evidence supporting the reasons for nomination. Eleven copies of the petition shall be filed with the department.

**72.51(3) Department review of petition.** Upon receipt of a petition for designation of a stream as a protected stream, the department shall make an initial determination as to whether the petition complies with 72.51(2) and whether the stream has a sufficient number of environmental amenities listed in 72.51(7) that further investigation is warranted. If the department finds the petition not in compliance with 72.51(7) or that further investigation is not warranted, agency proceedings to designate the nominated stream as protected shall cease and the petitioner shall be notified of the reasons for refusing to accept and act upon the petition. A petitioner aggrieved by the department's decision may appeal the decision within 30 days to an executive committee of at least three commission members.

**72.51(4) Notice of initiation of protected stream designation proceedings.** Upon department acceptance of a petition nominating a stream for protected stream designation, the department shall do the following:

*a. Notice of intended action.* Publish a notice of intended action in the Iowa Administrative Bulletin, the content of which identifies the nominated stream and requests public input into the protected stream designation procedure.

*b. Commission notification.* Notify the commission at the next meeting of the filing of a petition for protected stream designation.

*c. Interested agency notification.* Notify regional planning commissions, county boards of supervisors, city councils, soil conservation districts through which the nominated stream runs, the fish and wildlife bureaus of the department, the soil conservation and water quality division of the department of agriculture and land stewardship, the department of agriculture and land stewardship and the Iowa geological survey.

*d. Countywide notification.* Publish notice of the filing of the petition in a newspaper of general circulation for two consecutive weeks in each county in which the nominated stream is located.

**72.51(5) Department investigation report.** Upon department acceptance of a petition nominating a stream for protected stream designation, the department shall do the following:

*a. Investigation.* Supervise a field staff investigation of the stream nominated for protected stream status for the purpose of assessing the effect that extending department floodplain regulation would have on the factors listed in 72.51(7);

*b. Report.* File a report with the commission at a monthly commission meeting held within one year after the notice of intended action was published; the report shall specifically state findings of fact or each reason alleged in the petition in support of a protected stream designation and convey a staff recommendation, including any minority recommendations and recommendations of other governmental bodies and interested persons on whether or not the stream should be regulated;

*c. Interagency coordination.* Invite the fish and wildlife bureaus of the department, the Iowa geological survey, and any other agency or governmental subdivision expressing an interest in the proceeding to participate in the field investigation and preparation of the report, and request their assessment of whether extension of department jurisdiction over the nominated stream would have either an adverse or beneficial impact on their agency's water resource programs.

**72.51(6) Commission determination.** After receipt of the director's report and the public has had an opportunity to submit written comments and make an oral presentation, the commission shall make a determination in writing whether or not to designate the stream identified in the petition as a protected stream, except that the commission may continue the proceeding as needed to collect or analyze additional data. The commission's determination shall be based on the factors listed in 72.51(7), as applied to the nominated stream and its floodplain, and to other relevant streams and floodplains located in the same watershed as the nominated stream, as well as any underground water system hydrologically connected to the nominated stream.

**72.51(7) Basis for protected stream designation.** Commission determination of whether or not to classify a stream as a protected stream shall be based on the balancing of the costs and benefits of possible floodplain development as it would affect the following factors: (1) maintenance of stream fishery capacity; (2) water quality preservation; (3) wildlife habitat preservation; (4) flood control; (5) floodplain management; (6) existing floodplain developments; (7) soil erosion control; (8) the needs of agriculture and industry; (9) the maintenance and enhancement of public recreational opportunities; (10) the public's health, welfare and safety; (11) compatibility with the state water plan; (12) property and water rights of landowners; (13) other factors relevant to the control, development, protection, allocation, and utilization of the nominated stream and water hydrologically connected to it.

[ARC 9210C, IAB 5/14/25, effective 6/18/25]

**567—72.52(455B) Protected stream declassification procedure.** The procedure for removing a stream from the list of protected streams in 72.50(2) shall be the same as the rules for designation of a stream as a protected stream, except that all notices, investigations and reports shall be addressed to the issue of declassification.

[ARC 9210C, IAB 5/14/25, effective 6/18/25]

These rules are intended to implement Iowa Code sections 455B.262, 455B.264, 455B.270, 455B.275, 455B.277, 459.102 and 459.301.

<sup>1</sup> Effective date of 2/23/94 for segments incorporated by **ARC 4559A** in 72.50(2) and 72.52 delayed 70 days by the Administrative Rules Review Committee at their meeting held February 14, 1994.

CHAPTER 73  
APPROVAL, CONSTRUCTION, USE, MAINTENANCE, REMOVAL,  
INSPECTIONS, AND SAFETY OF DAMS  
[Prior to 7/1/83, INRC Ch 7]  
[Prior to 12/3/86, Water, Air and Waste Management[900]]

Chapter rescission date pursuant to Iowa Code section 17A.7: 6/18/30

DIVISION I  
SCOPE AND DEFINITIONS

**567—73.1(455B) Scope and applicability.** The department regulates the storage of water and the construction and maintenance of dams. Any person who desires to construct, repair, modify, abandon, or remove a dam has a responsibility to determine whether approval is required from the department prior to undertaking any such work.

[ARC 9211C, IAB 5/14/25, effective 6/18/25]

**567—73.2(455B) Definitions.** The following definitions apply to this chapter:

*“Abandonment”* means to render a dam nonimpounding by dewatering and filling the reservoir created by that dam with solid materials and by diverting the natural drainage around the site.

*“Acre-foot”* means a volume of water that would cover one acre of land one foot deep, equal to 43,560 cubic feet of water.

*“Adverse consequences”* means negative impacts that may occur upstream, downstream, or at locations remote from the dam. The primary concerns are loss of human life, economic loss including but not limited to property damage, public damages, disruption of public utilities, and environmental impact.

*“Appurtenant structures”* means structures such as spillways, either in the dam or separate therefrom; the reservoir and its rim; low-level outlet works; and water conduits such as tunnels, pipelines, or penstocks, occurring through either the dam or its abutments.

*“Auxiliary spillway”* means any secondary spillway that is designed to be operated infrequently.

*“Dam owner”* means any person who owns, controls, operates, maintains, or manages a dam.

*“Hazard potential”* means a classification based on the possible incremental adverse consequences that result from the release of water or stored contents due to a failure or misoperation of the dam or appurtenances. The hazard potential classification of a dam does not reflect in any way on the current condition of the dam and its appurtenant structures (e.g., safety, structural integrity, or flood routing capacity).

*“Height of dam”* means the vertical distance from the top of the dam to the natural bed of the stream or water source measured at the downstream toe of the dam or to the lowest elevation of the outside limit of the dam if it is not across a water source.

*“Incremental consequence”* means the difference, under the same conditions (e.g., flood, earthquake, or other event), between the consequences that are likely to occur from the failure or misoperation of the dam and appurtenances as compared to the consequences that are likely to occur without such failure or misoperation.

*“Permanent storage”* means the volume of water expressed in acre-feet that is stored upstream from a dam or in an impoundment up the level of the principal outlet works of the structure.

*“Probable”* means more likely than not to occur; reasonably expected; realistic.

*“Probable maximum flood”* means the flood that may be expected from the most severe combination of critical meteorological and hydrologic conditions that are reasonably possible in the region, and is derived from probable maximum precipitation, the theoretical greatest depth of precipitation for a given duration that is physically possible over a particular drainage area at a certain time of year. The probable maximum precipitation within designated zones in Iowa has been determined by the National Weather Service. The probable maximum flood for any location within Iowa is determined by the department.

“*Temporary storage*” means the volume of water expressed in acre-feet that may be stored upstream from a dam or in an impoundment above the level of the principal outlet works.

[ARC 9211C, IAB 5/14/25, effective 6/18/25]

**567—73.3(455B) Regulated dams.**

**73.3(1) *Thresholds.*** Dams meeting any of the following thresholds shall be regulated by the department:

- a. A dam with a height of at least 25 feet and a storage of 15 acre-feet or more at the top of the dam elevation; or
- b. A dam with a storage of 50 acre-feet or more at the top of the dam elevation and a height of at least 6 feet; or
- c. A dam that is assigned a hazard potential of high hazard.

**73.3(2) *Exceptions.*** Road embankments or driveways with culverts are exempt unless such structure serves, either primarily or secondarily, a purpose commonly associated with dams, such as the temporary storage of water for flood control.

**73.3(3) *New construction.*** Before construction begins, department approval is required for construction of any dam meeting the thresholds of a regulated dam. The proposed dam must meet the criteria outlined in this chapter.

**73.3(4) *Existing dams.***

- a. Department approval is required for:
  - (1) Modification, repair, alteration, breach, abandonment, or removal of any existing dam or appurtenant structure beyond the scope of ordinary maintenance if the height of the dam or storage of the dam exceeds the applicable thresholds in this rule.
  - (2) Any change in operating procedures if the height of the dam or storage of the dam exceeds the applicable thresholds in this rule.
- b. Spillway reconstruction, changes in normal water level, and modification of the dam embankment or spillway are examples of modifications that require approval. The dam must meet the criteria outlined in this chapter. Dams found to be unsafe according to 567—73.33(455B) shall be repaired or removed.

**73.3(5) *Required upgrades.*** Improvements may be required for existing dams in order to reduce the risk of a dam failure.

- a. Existing dams assigned a high hazard potential or significant hazard potential that have been inspected or analyzed and found not to meet the criteria in this chapter will be required to meet the requirements outlined in this chapter for the appropriate hazard potential.
- b. Existing dams assigned a low hazard potential that have been inspected or analyzed and found to have a significant hazard potential or high hazard potential shall be required to be upgraded to meet the requirements outlined in this chapter for the appropriate hazard potential.

[ARC 9211C, IAB 5/14/25, effective 6/18/25]

**567—73.4(455B) Assignment of hazard potential.** All existing and proposed dams reviewed by the department shall be assigned a hazard potential. Anticipated future land and impoundment use shall be considered in the determination of hazard potential. The hazard potential shall be determined using the following criteria:

**73.4(1) *Low hazard.*** A dam shall be classified as “low hazard” if failure of the dam would result in no probable loss of human life, low economic losses, and low public damages.

**73.4(2) *Significant hazard.*** A dam shall be classified as “significant hazard” if failure of the dam would result in no probable loss of human life but may damage residential structures or industrial, commercial, or public buildings; may negatively impact important public utilities or moderately traveled roads or railroads; or may result in significant economic losses or significant public damages.

**73.4(3) *High hazard.*** A dam shall be classified as “high hazard” if located in an area where failure would result in probable loss of human life.

**73.4(4) *Consideration of changes affecting hazard potential.*** In locating the site of a dam and in obtaining easements and rights-of-way, the applicant shall consider the impacts to the hazard potential of a

dam from anticipated changes in land use downstream or adjacent to the impoundment, the operation of the dam, and the potential liability of the dam owner.

**73.4(5) *Changes in hazard potential.*** Any future changes in downstream land use, development, impoundment use, or critical hydraulic structures shall require a reevaluation of the hazard potential of the dam. If the hazard potential of the dam changes, the dam shall be required to meet all applicable criteria for that hazard potential. This may require additional increases in spillway capacity for the dam. The owner and any other persons responsible for the construction and operation of the dam shall assume all risks for future costs to upgrade a dam in the event there is a change in hazard potential.

[ARC 9211C, IAB 5/14/25, effective 6/18/25]

**567—73.5 to 73.9** Reserved.

DIVISION II  
APPROVAL PROCESS

**567—73.10(455B) Review and approval process for dam construction, modification, abandonment, or removal.**

**73.10(1) *Application process.*** Application materials are provided by the department. The application shall be submitted by or on behalf of the person or persons who will be the future dam owner or owners. The application shall be signed by the applicant or a duly authorized agent. Completed applications along with supporting information shall be submitted to the department through an online application system or mailed to Iowa Department of Natural Resources, Attn: Joint Application, 502 East 9th Street, Des Moines, Iowa 50319. For dam repairs, abandonment, or removal, the department may waive the requirements of the application process outlined in this rule if the requirements are unnecessary for the application approval or if the dam has been designated as unsafe and immediate temporary emergency stabilization repairs are required to prevent failure of the dam. Permanent repairs or modifications will require review and approval.

**73.10(2) *Preliminary application packet.*** The preliminary application packet includes the joint application form and requires submittal of preliminary design data prepared by or under supervision of a professional engineer licensed in the state of Iowa or by an engineer working for the United States government. The preliminary design data packet shall contain a report summarizing the preliminary design, hydrologic data and reservoir routing, a hazard potential analysis, preliminary design drawings, the soils and geotechnical engineering analysis, and a list of the engineering references used as the basis for design and construction.

**73.10(3) *Project review.*** The department shall review a preliminary application packet and provide feedback or concurrence on the initial design and assumptions. After concurrence with the preliminary application packet and upon reception of the final submittal as required by 73.10(4), the department will review the final submittal and issue a decision based on whether the project meets criteria for approval outlined in this chapter.

**73.10(4) *Final submittal.*** After the department's review of and concurrence with the preliminary submittal, the engineering plans and other engineering information shall be certified by a professional engineer licensed in the state of Iowa, unless prepared by an engineer working for the United States government, and submitted with the following information:

- a. One complete set of certified construction plans;
- b. One complete set of construction specifications;
- c. An operating plan, if required;
- d. Easements, if required;
- e. For high hazard dams, an emergency action plan; and
- f. An engineering design report documenting all aspects of the design of the dam and how the design of the dam meets the criteria outlined in this chapter. The engineering design report shall include the following: hazard potential analysis; hydrology and hydraulic calculations; embankment design and foundation analysis; and structural calculations, where applicable.

**73.10(5) *Public notice.*** Public notice shall be issued by the department to inform persons who may experience adverse consequences by the permitted project. Adverse consequences may occur through maintenance of the dam and appurtenant structures, spillway discharges, temporary ponding of floodwater behind the dam, or failure of the dam. It is the applicant's responsibility to submit sufficient information with the preliminary application packet and on request to enable the department to accurately identify the owners, occupants, and addresses of affected lands.

**73.10(6) *Project approval or disapproval.***

*a. Approval.* Issuance of a dam construction permit shall constitute approval of a project. The permit may include one or more special conditions when reasonably necessary to implement relevant criteria.

*b. Disapproval.* A letter to the applicant denying the application shall constitute disapproval of a project.

*c. Notice of decision.* Copies of the decision shall be mailed or electronically transmitted to the applicant and any person who commented.

**73.10(7) *Appeal of decision.*** Any person aggrieved by a decision issued under this chapter may file a notice of appeal as governed by 567—Chapter 7.

**73.10(8) *General conditions.*** Department approvals of a project shall be subject to the following conditions:

*a. Change in ownership.* The dam owner and any successor in interest to the real estate on which the project or activity is located shall be responsible for notifying the department of change in ownership.

*b. Maintenance.* The dam owner has a responsibility to maintain the dam and appurtenant structures in a safe condition. Maintenance shall include keeping earthen portions of the dam well vegetated, keeping trees and brush off the dam, preventing and repairing erosion, keeping the spillway free of obstructions, repairing deteriorated structural elements, and performing required maintenance on mechanical appurtenances such as gates.

*c. Responsibility.* No legal or financial responsibility arising from the construction or maintenance of the approved works shall attach to the state of Iowa or the department due to the issuance of an approval or administrative waiver.

*d. Lands.* The applicant shall be responsible for obtaining such government licenses, permits, and approvals, and lands, easements, and rights-of-way which are required for the construction, operation, and maintenance of the authorized work.

*e. Change in plans.* No material change from the plans and specifications approved by the department shall be made unless authorized in writing by the department.

*f. Revocation of permit.* A department permit may be revoked if construction is not completed within the period of time specified in the department permit.

*g. Performance bond.* A performance bond may be required when necessary to secure the construction, operation, and maintenance of approved projects and activities in a manner that does not create a hazard to the public's health, welfare, and safety. The amount and conditions of the bond shall be specified as special conditions in the department permit.

*h. Construction inspection.* For high hazard and significant hazard dams, construction shall be inspected by or under the supervision of a professional licensed engineer in the state of Iowa. The engineer shall prepare and certify as-built plans after completion and a report documenting that the dam was constructed in general conformance with the approved plans (or approved changes) and outlining unusual circumstances encountered during construction. The water storage permit shall not be issued until the department accepts the as-built plans and report.

*i. Postconstruction department inspections.* A department approval that authorizes construction or modification, operation, and maintenance of a dam for which ongoing inspections are required by these rules shall include a condition stating that the department shall have access to the dam site for such inspections at a reasonable time after notification of the dam owner.

*j. Owner inspections.* For high hazard and significant hazard dams, the owner is responsible for annual inspections and submission of written inspection reports to the department as required in subrule 73.30(4).

[ARC 9211C, IAB 5/14/25, effective 6/18/25]

**567—73.11(455B) Water storage permits.**

**73.11(1)** A water storage permit shall be required for all regulated dams in order to legally impound water. No water shall be impounded by a dam or reservoir prior to issuance of a water storage permit.

**73.11(2)** Application for a dam construction permit shall constitute application for a water storage permit if the appropriate fee (as stated in 567—subrule 50.4(2)) is received with the application.

**73.11(3)** A water storage permit shall be issued upon a finding by the department that the dam and reservoir are safe to impound water within the conditions prescribed in the dam construction permit and the project meets the following conditions:

*a.* The proposed storage is for a specified beneficial use such as human or livestock water supply, flood control, water quality, recreation, aesthetic value, erosion control, or low-flow augmentation.

*b.* The impounding structure can be operated in a manner that will not adversely affect any applicable protected flow in the impounded stream. Protected flows are listed in 567—Chapter 52.

*c.* For high hazard and significant hazard dams, the water storage permit will not be issued until as-built plans and a construction report have been submitted documenting that the dam has been constructed in general conformance with the approved plans and conditions of the dam construction permit and until the department has conducted an inspection of the dam.

**73.11(4)** A water storage permit may be modified, canceled, or suspended pursuant to Iowa Code section 455B.271. Conditions of cancellation or suspension of water storage permits shall include draining the lake with any available low-level drain and may include dewatering with other methods or breaching of the dam.

[ARC 9211C, IAB 5/14/25, effective 6/18/25]

**567—73.12 to 73.14** Reserved.

DIVISION III  
CRITERIA FOR APPROVAL

**567—73.15(455B) General criteria.**

**73.15(1)** *Required findings.* The department shall approve the construction, repair, modification, abandonment, or removal of a dam only after finding that the project is designed in accordance with accepted engineering practice and methods, and in a manner consistent with the applicable department criteria in this rule.

**73.15(2)** *Waiver.* A request for a waiver to this chapter shall be submitted in writing pursuant to 561—Chapter 10. The contents of a petition for waiver shall include information pursuant to 561—10.9(17A,455A).

[ARC 9211C, IAB 5/14/25, effective 6/18/25]

**567—73.16(455B) Lands, easements, and rights-of-way.** An application for approval of a dam project shall include information showing the nature and extent of lands, easements, and rights-of-way that the applicant has acquired or proposes to acquire to satisfy the following criteria:

**73.16(1)** Ownership or perpetual easements shall be obtained for the area to be occupied by the dam embankment, spillways, and appurtenant structures, and the permanent or maximum normal pool.

**73.16(2)** Ownership or easements shall be obtained for temporary flooding of areas that would be inundated by the flood pool up to the top of dam elevation and for spillway discharge areas.

**73.16(3)** Easements covering areas affected by temporary flooding or spillway discharges shall include provisions prohibiting the erection and usage of structures for human habitation or commercial purposes without prior approval by the department.

**73.16(4)** As a condition of granting approval of a dam rated less than high hazard, the applicant may be required to acquire control over lands downstream from the dam as necessary to prevent downstream development that would affect the hazard classification of the dam.

[ARC 9211C, IAB 5/14/25, effective 6/18/25]

**567—73.17(455B) Emergency action plans for high hazard dams.**

**73.17(1) *Emergency action plan required.*** All high hazard dams shall be required to have an approved emergency action plan on file with the department. The plan shall include the following:

- a. A statement of purpose;
- b. A project description;
- c. An emergency response process;
- d. An emergency notification plan with flowchart;
- e. Responsibilities of all parties;
- f. A list of emergency preparedness and plan maintenance activities; and
- g. Inundation maps or another acceptable description of the inundated area.

**73.17(2) *Emergency action plan maintenance.*** The owner of the dam shall keep the emergency action plan up to date. Contact information shall be verified in the plan at least once a year, and an exercise shall be performed at least every five years. The owner of the dam shall keep an up-to-date copy of the emergency action plan on file with the department and with the local county emergency manager.

[ARC 9211C, IAB 5/14/25, effective 6/18/25]

**567—73.18(455B) Encroachment on a confinement feeding operation structure.** A dam shall not be constructed or modified so that the ordinary high water of the lake, pond, or reservoir created by the dam is closer than the following distances from a confinement feeding operation structure unless a secondary containment barrier according to 567—subrule 65.15(17) is in place. Measurement shall be from the closest point of the confinement feeding operation structure to the water edge of the lake, pond, or reservoir for a pool level at the elevation of the crest of the auxiliary spillway or at the top of dam elevation if the dam does not have an auxiliary spillway.

**73.18(1)** The minimum separation between a water source other than a major water source and a confinement feeding operation structure is 500 feet.

**73.18(2)** The minimum separation between a major water source and a confinement feeding operation structure is 1,000 feet or such distance that the structure is not located on land that would be inundated by Q100, whichever is greater.

[ARC 9211C, IAB 5/14/25, effective 6/18/25]

**567—73.19(455B) Hydrologic and hydraulic criteria.**

**73.19(1) *Hydrology and hydraulic calculations.*** Hydrology and hydraulic calculations shall be submitted in the design report documenting the methods and analysis followed in modeling software selection, inflow design hydrograph determination, and reservoir routing. The hydrology and hydraulics section of the design report shall include design references, inflow hydrograph, reservoir stage storage, and stage discharge curves and clearly identify peak inflows, peak discharges, and reservoir elevations for the design floods.

**73.19(2) *Design floods.*** The specified freeboard design floods in the table below shall be passed without overtopping of the dam or the dam shall be designed to withstand such overflow. The specified spillway design flood in the table below shall be passed by the principal spillway without need for operation of an auxiliary spillway unless the auxiliary spillway is designed such that erosion is not expected during operation.

| Hazard Potential   | Freeboard Design Flood | Spillway Design Flood |
|--------------------|------------------------|-----------------------|
| Low Hazard         | Q100                   | Q10                   |
| Significant Hazard | Q1000                  | Q50                   |
| High Hazard        | Probable Maximum Flood | Q100                  |

**73.19(3) *Precipitation amounts.*** The National Oceanic and Atmospheric Administration's NOAA Atlas 14, Precipitation-Frequency Atlas of the United States, Volume 8, Version 2.0, dated 2013, shall be used for the Q10–Q1000 frequency storm events. NOAA Hydrometeorological Report No. 51, Probable Maximum Precipitation Estimates, United States, East of the 105th Meridian, dated 1978, shall be used for the probable maximum precipitation.

**73.19(4) *Spatial and temporal rainfall distributions and storm durations.*** The design report shall document the sources and methodologies for inflow hydrograph development. Distributions and durations that produce the highest impoundment water level shall be used for design.

**73.19(5) *Spillway discharge capacity.*** The spillway discharge capacity shall be sufficient to evacuate at least 80 percent of the volume of water temporarily stored during the principal spillway design flood within ten days. If this cannot be accomplished, the auxiliary spillway and freeboard design flood routings shall be made beginning with the impoundment level at the ten-day drawdown elevation.

**73.19(6) *Incremental consequence analysis.*** An inflow design flood based on an incremental consequence analysis may be developed and submitted to the department for review as an alternative to the design floods stated in 73.19(2). The design flood selected using incremental consequence analysis is the flood above which there is a negligible increase in downstream water surface elevation, velocity, and consequences due to failure of the dam when compared to the same flood without failure. If the department concurs with the analysis, the freeboard design storm may be reduced. The minimum design flood for a high hazard dam shall be Q500. The minimum design flood for low hazard and significant hazard dams shall be Q100.

[ARC 9211C, IAB 5/14/25, effective 6/18/25]

**567—73.20(455B) Spillway design requirements.**

**73.20(1)** Spillways shall be designed to operate safely for the life of the structure and at the discharges and pressures that would be experienced under all flow conditions, including the freeboard design flood.

**73.20(2)** Spillways shall be provided with a means of piping and seepage control (e.g., drainage diaphragms), antivortex devices, trash racks, or other inlet debris control measures, and stable outlets capable of handling design exit flow velocities.

**73.20(3)** When a conduit is proposed to be used in a high hazard or significant hazard dam, detailed hydraulic, hydrologic, and structural computations supporting selection of the size and type of pipe to be used shall be provided by the applicant.

**73.20(4)** Detailed drawings and specifications relating to the installation of the pipe shall include, but not be limited to, construction measures that adequately address critical load bedding, backfill, compaction, joints, and seepage precautions related to installation of the pipe.

**73.20(5)** Structural computations and drawings shall be submitted for all proposed concrete structures. Drawing details, as necessary, shall be provided showing reinforcement, cutoffs, underdrains/filters, waterstops, construction joints, control joints, and any other details necessary to construct.

**73.20(6)** If an auxiliary spillway is proposed, it shall be analyzed, designed, and constructed adequately to establish and maintain stability during the passage of design flows without blockage or breaching. Open-channel auxiliary spillways shall have a minimum depth of 2 feet and minimum width of 10 feet and be designed with appropriate curvature and slopes to prevent excessive erosion.

**73.20(7)** A gated low-level outlet shall be provided for high hazard and significant hazard dams. The gated low-level outlet shall be capable of draining at least 50 percent of the permanent storage behind the dam within ten days. The pipe conduit shall be designed so that negative pressures will not occur at any point.

[ARC 9211C, IAB 5/14/25, effective 6/18/25]

**567—73.21(455B) Embankment design requirements.**

**73.21(1)** The applicant shall document the engineering standards and design references used for dam embankment design. Drawing details, as necessary, shall be provided showing embankment slopes, required additional fill for anticipated settlement, top width, foundation preparation, core trench or cutoff wall, fill materials and methodology, internal seepage controls, and embankment erosion protection.

**73.21(2)** A geotechnical report shall be submitted for high hazard and significant hazard dams documenting the evaluation of slope stability requirements, anticipated vertical settlement and horizontal elongation, seepage and underseepage potential, whether cathodic protection is needed for metal pipes, and proper construction practices for the soil types and conditions encountered. A stability evaluation shall include end-of-construction, steady-state seepage and sudden-drawdown conditions.

[ARC 9211C, IAB 5/14/25, effective 6/18/25]

**567—73.22(455B) Operating plan.** A written operating plan shall be prepared for any dam with gates or other movable structures that must operate or be operated during times of flood or to provide a minimum downstream release rate. Development of the operating plan is considered part of the design process. An operating plan shall include, at a minimum, the following items:

**73.22(1) Responsibility.** The operating plan shall outline and identify the necessary personnel who will be present to operate the equipment or, in the case of automatic equipment, to monitor it and ensure it is functioning properly.

**73.22(2) Operating circumstances.** The circumstances under which operation must occur shall be clearly defined, and a means shall be provided to ensure that operating personnel are present when necessary.

**73.22(3) Method of operation.** The means and methods by which operation is to be conducted shall be clearly defined and shall include, at a minimum, the following items: rates and sequences for opening or closure of gates, target water levels, and target flow rates.

**73.22(4) Flood capacity.** The operating plan shall allow for safe passage of all floods up to and including the freeboard design flood. Flood discharges through the dam greater than the design peak flood inflows into the impoundment shall not be permitted.

**73.22(5) Low flow.** The operating plan shall address low flow situations and shall specify a minimum release rate if required by the department and how the minimum release will be provided and maintained.

**73.22(6) Equipment.** Consideration shall be given to and allowance made for the possible failure of or malfunctioning of the equipment.

**73.22(7) Discharge measurement.** A means shall be provided to determine the discharge through the control structures, especially where operation is to maintain a minimum downstream flow. Stage discharge tables, streamflow gages or other means of obtaining discharge readings shall be provided. The settings of control structures shall be easily read.

[ARC 9211C, IAB 5/14/25, effective 6/18/25]

**567—73.23(455B) Removal and abandonment of dams.** Removal is the draining of the impoundment and removal of all or a significant portion of the embankment. A dam may be abandoned by rendering a dam nonimpounding by dewatering and filling the reservoir with solid materials and by diverting the natural drainage around the site.

**73.23(1) Removal requirements.** A dam removal project shall meet all of the following requirements:

a. The dam removal plan shall clearly show removal limits and will demonstrate how the proposed construction will render the dam height and storage below thresholds in rule 567—73.3(455B);

b. An impoundment dewatering plan shall be submitted that documents how the water will be released in a controlled manner and not cause upstream erosion or pose a flooding risk downstream;

c. A dam breach plan shall be submitted that demonstrates how the breach process will not pose an increased risk compared to the existing structure; and

d. A sediment disposition plan shall be submitted that provides for stabilization, release, or removal of stored sediment and shall demonstrate no significant adverse consequences on fish and wildlife habitat downstream from the proposed construction.

**73.23(2) Abandonment requirements.** An abandonment plan shall be submitted documenting the final site stabilization, evidence that the structure will no longer impound water or waterborne materials that would be released in the event of a dam failure, and evidence that the structure will not store water above the thresholds outlined in this chapter.

[ARC 9211C, IAB 5/14/25, effective 6/18/25]

**567—73.24 to 73.29** Reserved.

DIVISION IV  
DAM OWNERSHIP, INSPECTIONS, AND ENFORCEMENT

**567—73.30(455B) Dam owner responsibilities.**

**73.30(1) *Operation and maintenance required.*** The intent to permanently cease or cause to cease all acts of construction, operation, and maintenance of a dam is prohibited. If any person wishes to be relieved of the responsibilities inherent in the ownership or control of a dam structure, those responsibilities shall be undertaken by another person through sale, transfer, or other means or the dam shall be removed.

**73.30(2) *Dam maintenance.*** The dam owner shall be required to maintain the dam and appurtenant structures in a safe condition. Maintenance shall include, but not be limited to, keeping earthen portions of the dam well vegetated, keeping trees and brush off the dam, preventing and repairing erosion, keeping spillways and drains free of obstructions, repairing structural deterioration, and performing required maintenance on mechanical appurtenances such as gates. The dam owner shall perform regular inspections to identify potential maintenance problems.

**73.30(3) *Dam repairs.*** The dam owner shall arrange for performance of engineering investigations when needed to evaluate potential safety problems. The dam owner shall perform any required repairs. When the department determines the need for follow-up inspections, the dam owner may be required to have a qualified person make inspections and prepare written inspection reports at specified intervals.

**73.30(4) *Maintenance inspections by dam owner.*** The dam owner of a high hazard or significant hazard structure shall be responsible for annual inspections and submission of written inspection reports. Annual inspection reports are due to the department on or before December 1. Inspection reports shall include:

- a. Maintenance work done since the previous annual report;
- b. Observed deficiencies on the dam or appurtenant structures;
- c. Remedial measures necessary and the method and schedule the dam owner proposes to correct the deficiencies found; and
- d. Changes in land use downstream of the dam.

[ARC 9211C, IAB 5/14/25, effective 6/18/25]

**567—73.31(455B) Dam safety inspection program.**

**73.31(1) *Scope of dam safety inspection program.*** Dams subject to inspection under these rules are regulated dams as defined in this chapter. The scope of department staff field inspections normally is limited to visually observable features of dams and their appurtenant structures.

**73.31(2) *Purpose of dam safety inspection program.*** The general purposes of inspections are as follows: to evaluate the construction, operation, and maintenance of dams; to identify observable deficiencies in dams or appurtenant structures; and to identify other floodplain structures or uses that may affect the hazard potential of a dam or use of an associated impoundment. Inspection reports shall be used by the department in determining whether a proposed dam project complies with applicable criteria and to determine whether any of the following conditions exist:

- a. A permit violation;
- b. A violation of law which requires that a permit be obtained; or
- c. A condition that constitutes a public nuisance by causing unacceptable risk of injury to the public health, safety or welfare.

**73.31(3) *Inspections of significant hazard and high hazard dam structures.***

a. *Inspection prior to construction.* A field inspection may be made by the department to determine the hazard potential of the dam and verify the location and plan information upon receipt of an application for approval of construction or modification of a dam.

b. *Inspection during construction.* Construction or modification of a dam structure shall be inspected by an engineer licensed in the state of Iowa or by a trained inspector under the supervision of the engineer. After completion of construction or modification of a dam structure, the engineer shall prepare and submit

a construction report, as-built plans, and a statement that in the engineer's professional opinion the work was conducted in general conformance with the approved plans and specifications.

*c. Acceptance inspections.* When construction of a dam or modifications thereto is completed, and as-built plans and a construction report have been submitted, the department shall make a field inspection to determine whether visually observable features of the dam and appurtenant structures are consistent with the approved plans and the conditions of the dam construction permit. The department shall thereafter issue the water storage permit or a letter stating that additional work is required for acceptance of construction. Closure of the low-level outlet gate shall not begin until the department has issued the water storage permit.

*d. Periodic inspections after acceptance.* High hazard structures shall be inspected at least once every two years by the department. Significant hazard structures shall be inspected at least once every five years by the department. Structures poorly maintained or those that require repairs identified by the department shall be inspected more frequently until required maintenance and repairs are completed. The department shall notify the dam owner or agent before each inspection. Each inspection shall assess the condition of the dam and appurtenant structures and the adequacy of operation and maintenance practices. The inspection may include reevaluation of the ability of the dam and appurtenant structures to adequately withstand the hydraulic loadings and pass the appropriate design floods.

**73.31(4) Inspections of low hazard dams.**

*a. Preliminary site evaluation.* The department may evaluate the site of a proposed dam from maps and aerial photographs in lieu of a field inspection.

*b. Inspection during construction.* The applicant shall be responsible for providing supervision of construction by a person experienced in the type of construction involved.

*c. Inspection of dams with operating plans.* Low hazard dams with operating plans shall be inspected by the department at least once every five years. Any problems noted shall be reported to the dam owner in writing.

*d. General inspections of low hazard dams.* Low hazard dams may be periodically inspected by the department to determine their condition. Any serious problems noted shall be reported to the dam owner in writing.

**73.31(5) Special inspections and investigations.** Special inspections and investigations shall be made by department personnel in the following instances:

*a.* Upon notice or evidence of unauthorized construction;

*b.* Upon notice or evidence that a dam has failed or is in a condition where failure appears likely, and public damages would result from such failure; or

*c.* Upon notice or evidence that the hazard classification of a dam may no longer be valid due to changes in downstream conditions.

**73.31(6) Inspections by others.** At the discretion of the department, an inspection report submitted by a qualified individual may be accepted in lieu of an inspection and report by the department.

**73.31(7) Inspection reports.** The department shall prepare a report of each inspection and provide a copy to the dam owner. The report shall state the deficiencies observed during the inspection. If appropriate, the report shall detail the actions required to address the noted deficiencies.

[ARC 9211C, IAB 5/14/25, effective 6/18/25]

**567—73.32(455B) Raising or lowering of impoundment levels.**

**73.32(1) When approval is required.** A separate approval is required to temporarily or permanently raise or lower the normal level of water impounded by a regulated dam unless the raising and lowering has been authorized as part of an approved operating plan. Such approval shall be in the form of a letter authorizing the lowering or raising and may be conditioned upon various requirements.

**73.32(2) Information required for approval.** The applicant shall submit the following information:

*a.* The date when the raising or lowering will be initiated, the level to which the impoundment will be raised or lowered and, if the raising or lowering is temporary, the anticipated date when the normal water level will be restored; and

*b.* Evidence that the discharge rate during lowering will not exceed the capacity of the stream channel below the dam.

**73.32(3) Criteria for approval.** The department's review of the raising or lowering of the impoundment includes determining the effects on flooding or flood control for any proposed works and adjacent lands and property; on the wise use and protection of water resources; on the quality of water; on fish, wildlife, and recreational facilities or uses; and on all other public rights and requirements.

**73.32(4) Conditions.** Conditions of approving the temporary or permanent raising or lowering of water levels may include:

- a. Giving prior notice to the director of the local county conservation board or local enforcement officer for the department;
- b. Publicizing the lowering locally in order to notify downstream users, persons who have boats or docks on the impoundment and other persons whose use of the impoundment might be affected; and
- c. Maintaining a minimum release rate as determined by the department during refilling.

[ARC 9211C, IAB 5/14/25, effective 6/18/25]

**567—73.33(455B) Unsafe dams.**

**73.33(1) Procedures for designation of a dam as unsafe.**

a. *Department report.* If after inspection or other investigation the department determines that a dam is unsafe, a report shall be prepared. Copies of the report shall be provided to the dam owner and any other person whom the report identifies as responsible for the unsafe condition of the dam. The report shall identify the problems that cause the dam to be unsafe and recommend action to remedy the unsafe condition.

b. *Opportunity for comment.* The department shall provide the dam owner or other responsible person with a reasonable opportunity to comment on the department report considering the degree and imminence of hazard identified in the department report.

**73.33(2) Criteria for designating a dam as unsafe.** Designation of a dam as unsafe shall be based on one or more of the following findings:

- a. The dam has serious deficiencies in its design, construction, use, maintenance, or physical condition that would contribute to failure or otherwise increase flood damages;
- b. A high hazard or significant hazard dam has inadequate spillway capacity for the size and hazard potential of the dam.

**73.33(3) Department action concerning an unsafe dam.** After completion of the procedures for designating an unsafe dam, the department shall issue an initial decision that may order remedial work depending on the degree and imminence of hazard caused by the unsafe condition. Remedial work may include draining of the impoundment or removal of any structure determined to constitute a public nuisance. Procedures for appealing an initial decision are the procedures in 567—Chapter 7. If the initial decision requires emergency remedial work to abate an imminent danger of failure that would cause significant public damages, the director of the department may request the assistance of the attorney general to seek an appropriate judicial order compelling performance of emergency remedial work.

[ARC 9211C, IAB 5/14/25, effective 6/18/25]

These rules are intended to implement Iowa Code chapter 455B, subchapter III, part 4.

**567—81.1(455B) Definitions.**

**81.1(1)** In addition to the definitions, references, and abbreviations in 567—Chapter 40, the following definitions shall apply to this chapter:

*“Activated sludge system”* means a biological wastewater treatment process in which a mixture of wastewater and sludge floc, produced in a raw or settled wastewater by the growth of microorganisms, is agitated and aerated in the presence of a sufficient concentration of dissolved oxygen, followed by sedimentation. Examples include but are not limited to conventional activated sludge systems, extended aeration activated sludge systems, oxidation ditches, and sequencing batch reactors.

*“Advanced aerated lagoon system”* means an aerated lagoon system that has been augmented by adding other treatment processes. Examples include but are not limited to covered lagoon systems with enhanced aeration and mixing, the addition of fixed film processes to the lagoon process, or the utilization of algal-based treatment processes.

*“Aerated lagoon system”* means a lagoon system that utilizes aeration to enhance oxygen transfer and mixing in the cell.

*“Aeration”* means the process of initiating contact between air and water. Examples include but are not limited to spraying the water in the air, bubbling air through the water, or forcing the air into the water by pressure.

*“Average daily pumpage”* means the total quantity of water pumped during the most recent one-year period of record divided by 365 days.

*“Chlorination”* means the addition of a chlorine compound or chlorine gas to water to inactivate pathogenic organisms.

*“Classification”* means the type of plant or distribution system: wastewater treatment plants, water treatment plants, or water distribution systems.

*“Continuing education unit”* or *“CEU”* means ten contact hours of participation in an organized education experience approved by an accredited college, university, technical institute, or the department, and must be directly related to the subject matter of the particular certificate to which the credit is being applied.

*“Directly related post-high school education”* means post-high school education in chemistry, microbiology, biology, math, engineering, water, wastewater, or other curriculum pertaining to plant or distribution system operation.

*“Direct responsible charge”* or *“DRC”* means, where shift operation is not required, accountability for and performance of active, daily on-site operation of a plant or distribution system, or of a major segment of a plant or distribution system. Where shift operation is required, DRC means accountability for and performance of active, daily on-site operation of an operating shift, or a major segment of a plant or distribution system. A city manager, superintendent of public works, city clerk, council member, business manager, or other administrative official shall not be deemed to have DRC of a plant or distribution system unless that person’s duties include the active, daily on-site operation of a plant or distribution system. On-site operation may not necessarily mean full-time attendance at a plant or distribution system.

*“Direct surface water filtration”* means a water treatment system that applies surface water and influenced groundwater (as defined in rule 567—40.2(455B)) directly to the filters after chemical treatment consisting of both coagulation and flocculation or chemical treatment consisting of coagulation. This type of system eliminates the sedimentation unit process.

*“Electrodialysis”* means the demineralization of water by the removal of ions through special membranes under the influence of a direct-current electric field.

*“Fixed film biological treatment”* means a treatment process in which wastewater is passed over a media onto which are attached biological organisms capable of oxidizing the organic matter, normally followed by sedimentation. Examples include but are not limited to trickling filters, rotating biological contactors, packed towers and activated filters.

*“Fluoridation”* means the addition of fluoride to produce the optimum fluoride concentration in water.

*“Grade”* means one of seven operator certification levels, designated as A, W, I, IL, II, III, or IV.

*“Ion exchange”* means the process of using ion exchange materials such as resin or zeolites to remove undesirable ions from water and substituting acceptable ions (e.g., ion exchange for nitrate removal or ion exchange for softening).

*“Military service”* means honorably serving on federal active duty, state active duty, or national guard duty as defined in Iowa Code section 29A.1 or in the military services of other states or the organized reserves of the United States as provided in 10 U.S.C. Section 101(c) in effect as of April 1, 2025, and 10 U.S.C. Section 10101 in effect as of April 1, 2025, respectively.

*“Military service applicant”* means an individual requesting credit toward certification for military education, training, or service obtained or completed in military service.

*“Operating shift”* means a specified period of time when an operator is present to conduct testing or evaluation to control operations of a plant or distribution system, to make process control changes, and to be responsible for the repair or maintenance of a plant or distribution system. An operating shift may include on-call shifts.

*“Operator-in-charge”* or *“OIC”* means a person or persons on site in direct responsible charge of a plant or distribution system. A city manager, superintendent of public works, city clerk, council member, business manager, or other administrative official shall not be deemed to be the OIC of a plant or distribution system unless that person’s duties include the active, daily on-site operation of the plant or distribution system. On-site operation may not necessarily mean full-time attendance at the plant or distribution system.

*“Plant”* means those facilities identified as either a water treatment plant or a wastewater treatment plant.

*“Post-high school education”* means credit received for completion of courses given or co-sponsored by an accredited college, university, or technical institute. Courses offered by regulatory agencies may also be recognized as post-high school education. One year of post-high school education is 30 semester hours, 45 quarter hours, or 45 CEUs of credit.

*“Primary treatment”* means a treatment process designed to remove organic and inorganic settleable solids from wastewater by the physical process of sedimentation.

*“Public water supply system certificate”* or *“PWS certificate”* means a certificate issued by the department certifying that an operator has successfully completed the certification requirements of this chapter for a water treatment plant or water distribution system. A PWS certificate specifies the grades and classifications for which the certificate is valid.

*“Reverse osmosis”* means the process in which external pressure is applied to mineralized water against a semipermeable membrane to effectively reduce total dissolved solids and radionuclides content as the water is forced through the membrane.

*“Rural water district”* means a water supply incorporated and organized as such pursuant to Iowa Code chapter 357, 357A or 358.

*“Shift operator”* means the operator on site who has responsibility for making process control changes and adjustments to the operation, repair, and maintenance of a plant or distribution system during any operating shift. Duties include testing or evaluation to control operations of the plant or distribution system.

*“Stabilization”* means the addition of chemical compounds to water to maintain an ionic equilibrium whereby the water is not in a depository or corrosive state.

*“Veteran”* means an individual who meets the definition of “veteran” in Iowa Code section 35.1(2).

*“Waste stabilization lagoon”* means an excavation designed and constructed to receive raw or pretreated wastewater in which stabilization is accomplished by several natural self-purification processes. This definition includes both anaerobic and aerobic lagoons.

“*Water distribution system*” or “*distribution system*” is defined in Iowa Code section 455B.211. For the purposes of this chapter, a water distribution system includes storage facilities and pumping stations and does not include individual service lines to the premises of the consumer that are not under the control of the system.

**81.1(2)** The following terms applicable to this chapter are defined in the referenced locations:

- a. Iowa Code section 455B.101: “commission,” “department,” and “director.”
- b. Iowa Code section 455B.211: “certificate,” “operator,” “wastewater treatment plant,” “water supply system,” and “water treatment plant.”
- c. Rule 567—40.2(455B): “coagulation,” “community water system” or “CWS,” “disinfection,” “nontransient noncommunity water system” or “NTNC,” and “transient noncommunity water system” or “TNC.”
- d. 567—subrule 60.2(1): “PE” or “population equivalent.”

[ARC 9212C, IAB 5/14/25, effective 6/18/25]

**567—81.2(455B) General.**

**81.2(1) *Plant classifications.***

- a. *Plants with multiple treatment processes.* A water treatment plant or wastewater treatment plant (hereafter noted as “plant”) having a combination of treatment processes that are in different classifications shall be assigned the highest numerical plant classification of that combination.
- b. *Increase in classification for complex systems.* The director may increase a plant or water distribution system classification above that indicated in 567—81.3(455B) through 567—81.6(455B) for those systems that, in the director’s judgment, include unusually complex treatment processes, complex distribution systems, or present unusual operation or maintenance conditions.

**81.2(2) *Operator certification.***

- a. *Operator-in-charge (OIC).* An OIC shall hold a certificate of the same classification of any plant or water distribution system under the OIC’s control and of equal or higher grade than the grade designated for that plant or distribution system.
- b. *Shift operator.* Any person who is responsible during an operating shift of a plant or distribution system or for major segment of a plant or distribution system and is under the supervision of the OIC identified in 81.2(2) “a” shall be certified in a grade no less than a Grade II for Grade III and IV plants and distribution systems and Grade I for Grade I and II plants and distribution systems.

**81.2(3) *Public water supply system (PWS) certificates.*** A PWS certificate shall be issued as follows:

- a. An operator successfully completing the water treatment certification shall be issued a PWS certificate valid for water treatment.
- b. An operator successfully completing the water distribution certification shall be issued a PWS certificate valid for water distribution.
- c. An operator successfully completing the requirements for both water treatment and water distribution certification shall be issued a dual PWS certificate valid for both classifications. For purposes of renewal of a dual certificate, all renewal fees and CEU requirements shall be applied as one certification. The number of CEUs required for renewal shall be determined by the highest certification grade on the dual PWS certificate.

**81.2(4) *Owner notification and reporting.***

- a. A plant or distribution system owner shall notify the department of a change in the OIC(s) within 30 days after the change.
- b. When requested by the department, a plant or distribution system owner shall report the method of treatment provided, the average daily pumpage, and the name(s) of the OIC(s).

**81.2(5) *Operator notification.*** Certified operators shall notify the department of a change in address or employment within 30 days after the change.

**81.2(6) *Compliance plan.*** When the director allows the owner of a plant or distribution system required to have a certified operator time to obtain an operator, the owner shall submit a compliance plan to the department indicating what action will be taken to obtain a certified operator. The plan shall be on a form provided by the department and shall be submitted within 30 days of the owner’s receipt of a notice of violation for not having a properly certified operator.

[ARC 9212C, IAB 5/14/25, effective 6/18/25]

**567—81.3(455B) Wastewater treatment plant classifications and operator certification grades.**

**81.3(1) Wastewater classifications.** The wastewater treatment plant classifications and grades are listed in the following table:

**Wastewater Treatment Plant Classifications and Grades**

| Treatment Type                            | Certification Grade                             |                |                |                |                  |
|-------------------------------------------|-------------------------------------------------|----------------|----------------|----------------|------------------|
|                                           | Based on Design Pounds of BOD <sub>5</sub> /day |                |                |                |                  |
|                                           | less than 334                                   | 334-835        | 836-2,505      | 2,506-8,350    | more than 8,350  |
|                                           | Based on Design Population Equivalent           |                |                |                |                  |
|                                           | less than 2,000                                 | 2,000-5,000    | 5,001-15,000   | 15,001-50,000  | more than 50,000 |
| 1. Onsite Treatment System                | W                                               | Not Applicable | Not Applicable | Not Applicable | Not Applicable   |
| 2. Waste Stabilization Lagoon System      | IL                                              | IL             | IL             | IL             | IL               |
| 3. Aerated Lagoon System                  | IL                                              | IL             | I              | I              | I                |
| 4. Advanced Aerated Lagoon System         | II                                              | II             | II             | II             | II               |
| 5. Fixed Film Biological Treatment System | II                                              | II             | III            | III            | IV               |
| 6. Activated Sludge System                | II                                              | III            | III            | IV             | IV               |

**81.3(2) Unknown design BOD<sub>5</sub> loading.** When the design BOD<sub>5</sub> loading is unknown, the plant BOD<sub>5</sub> loading shall be determined by using the average pounds of BOD<sub>5</sub> of the 24-hour composite influent samples taken in the last 12 months. If 24-hour composite influent samples are not available, then grab samples shall be used.

**81.3(3) Grade IL wastewater operator.** A Grade I, II, III, or IV wastewater treatment certificate will satisfy the certification requirements for a Grade IL plant.

**81.3(4) Grade W onsite classification.** Any wastewater treatment plant that discharges to a water of the state and that utilizes onsite wastewater treatment technologies, such as those specified in 567—Chapter 69, shall be classified as an onsite treatment system (Grade W).

[ARC 9212C, IAB 5/14/25, effective 6/18/25]

**567—81.4(455B) Water treatment plant classifications and operator certification grades.**

**81.4(1) Water treatment classifications.** The water treatment plant classifications and grades are listed in the following table:

**Water Treatment Plant Classifications and Grades**

| Treatment Type                                                                                                                                        | Certification Grade*         |          |          |      |
|-------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|----------|----------|------|
|                                                                                                                                                       | Average Daily Pumpage in MGD |          |          |      |
|                                                                                                                                                       | 0-0.1                        | >0.1-0.5 | >0.5-1.5 | >1.5 |
| 1. Iron or manganese removal; aeration; chlorination; fluoridation; stabilization; any other chemical addition; or any combination of these processes | I                            | II       | II       | III  |
| 2. Ion exchange                                                                                                                                       | II                           | II       | III      | III  |
| 3. Direct surface water filtration                                                                                                                    | II                           | II       | III      | III  |
| 4. Utilization of lime, soda ash or other chemical addition for pH adjustment in the precipitation and coagulation of iron or manganese               | II                           | II       | III      | III  |
| 5. Complete surface water clarification or lime softening of surface water or groundwater                                                             | III                          | III      | III      | IV   |
| 6. Reverse osmosis and electrodialysis                                                                                                                | II                           | II       | III      | IV   |
| 7. Activated carbon for THM or synthetic organics removal                                                                                             | III                          | III      | III      | IV   |

\*For Grade A PWS classification, see 81.5(3).

**81.4(2) Average daily pumpage.** When the average daily pumpage is unknown, the plant grade will be determined from the population in the most recent census and an evaluation of commercial, industrial, and other users.

[ARC 9212C, IAB 5/14/25, effective 6/18/25]

**567—81.5(455B) Water distribution system classifications and operator certification grades.**

**81.5(1)** *Water distribution classifications.* The water distribution system classifications and grades are listed in the following table:

**Water Distribution System Classifications and Grades\***

| Distribution System Type                      | Certification Grade**        |            |              |        |
|-----------------------------------------------|------------------------------|------------|--------------|--------|
|                                               | Average Daily Pumpage in MGD |            |              |        |
|                                               | 0-0.1                        | >0.1-1.5   | >1.5-5       | >5     |
| All municipal water systems                   | I                            | II         | III          | IV     |
| CWS not classified as a Grade A water system  | I                            | II         | III          | IV     |
| NTNC not classified as a Grade A water system | I                            | II         | III          | IV     |
| TNC not classified as a Grade A water system  | I                            | II         | III          | IV     |
| Rural water districts                         | Miles of Pipe                |            |              |        |
|                                               | 0-100                        | >100-1,000 | >1,000-2,500 | >2,500 |
|                                               | II                           | II         | III          | IV     |

\*Note: A PWS with a well, storage, and a distribution system shall be classified as a water distribution system if no treatment is provided.

\*\*For Grade A water distribution system classification, see 81.5(3).

**81.5(2)** *Average daily pumpage.* When the average daily pumpage is unknown, the system grade will be determined using the most recent census population and an evaluation of commercial, industrial, or other users.

**81.5(3)** *Grade A water distribution system classification.*

*a. Grade A classification.* A PWS that provides either no treatment other than hypochlorination or treatment that does not require any chemical addition, process adjustment, backwashing, or media regeneration by an operator shall be classified as a Grade A water distribution system, based on the following service populations:

(1) Community water system. A CWS, other than a municipal or rural water system, serving a population of 250 persons or less.

(2) Nontransient noncommunity water system. An NTNC serving a population of 500 persons or less.

(3) Transient noncommunity water system. A TNC serving a population of 500 persons or less.

*b. Grade A certification.* Any grade of water treatment or distribution certification will satisfy the certification requirements for a Grade A water distribution system with or without hypochlorination.

[ARC 9212C, IAB 5/14/25, effective 6/18/25]

**567—81.6(455B) Certified operator education and experience qualifications.**

**81.6(1)** *Education and experience qualifications—general.*

*a.* All certified operator applicants shall meet the education and operating experience qualifications for the certificate grade shown in the table below prior to being allowed to take the certified operator examination.

*b.* Operating experience shall be in the same classification for which the applicant is applying unless partial credit is given in accordance with 81.6(2) and 81.6(3).

*c.* Directly related post-high school education shall be in the same subject matter as the classification for which the applicant is applying. The director will determine which courses qualify as “directly related” in cases that are not clearly defined.

*d.* A military applicant may apply for education or experience credit pursuant to 81.6(4).

*e.* Education and experience qualifications table.

**Certified Operator Education and Experience Qualifications**

| Grade | Education                  | Substitution for Education | Operating Experience                                | Substitution for Operating Experience |
|-------|----------------------------|----------------------------|-----------------------------------------------------|---------------------------------------|
| A     | High school diploma or GED | None                       | Completion of a department-approved training course | None                                  |
| W     | High school diploma or GED | None                       | Completion of a department-approved training course | None                                  |

| Grade | Education                                                                                               | Substitution for Education | Operating Experience                                                     | Substitution for Operating Experience |
|-------|---------------------------------------------------------------------------------------------------------|----------------------------|--------------------------------------------------------------------------|---------------------------------------|
| I     | High school diploma or GED                                                                              | None                       | 1 year                                                                   | See 81.6(3) "b"                       |
| IL    | High school diploma or GED                                                                              | None                       | 1 year                                                                   | See 81.6(3) "b"                       |
| II    | High school diploma or GED                                                                              | None                       | 3 years                                                                  | See 81.6(3) "b"                       |
| III   | High school diploma or GED and 2 years of post-high school education (1 year must be directly related)  | See 81.6(3) "a"            | 4 years of experience in a Grade I or higher                             | See 81.6(3) "b"                       |
| IV    | High school diploma or GED and 4 years of post-high school education (2 years must be directly related) | See 81.6(3) "a"            | 4 years of experience, including 2 years of DRC in a Grade III or higher | See 81.6(3) "b" and "c"               |

**81.6(2)** *Related work experience substitutions for operating experience.* The following substitutions of related work experience for operating experience requirements may be accepted by the director.

*a. Personnel.* The following personnel may be allowed 50 percent credit for work experience toward meeting the operating experience requirements as noted:

(1) Laboratory personnel employed in water or wastewater treatment plants; Grades I and II certification only. Laboratory experience must be in the same classification for which the applicant is applying.

(2) Personnel with experience in on-site operation review and evaluation of plants and distribution systems; Grades I and II certification only. On-site experience must be in the same classification for which the applicant is applying.

(3) Maintenance personnel employed in water or wastewater treatment plants; Grades I and II certification only. Maintenance experience may be applied to either the water or wastewater experience requirements.

*b. Certified operators.* The following types of certified operators may be allowed 50 percent credit for work experience toward meeting the operating experience requirements as noted:

(1) Certified water treatment operators; Grades I and II wastewater treatment certification only, or Grades I and II water distribution certification only.

(2) Certified wastewater treatment operators; Grades I and II water treatment certification only.

(3) Certified water distribution operators; Grades I and II water treatment certification only.

*c. Limitation.* The portion of related work experience that is substituted for operating experience cannot also be used to substitute for education.

**81.6(3)** *Operating experience and education substitutions.* The following experience or education substitutions may be accepted by the director.

*a. Substitution of operating experience for education.*

(1) One year of operating experience may be substituted for one year of post-high school education, up to one-half of the post-high school education requirement, as follows:

1. Experience in a Grade II or higher position may substitute as education for a Grade III certification, or

2. Experience in a Grade III or higher position may substitute as education for Grade IV certification.

(2) Two years of DRC experience in a Grade III or higher position may be substituted for one year of directly related post-high school education for Grade IV certification up to three-fourths of the post-high school education requirement.

(3) That portion of operating experience that is applied toward substitution for education cannot also be used for experience.

*b. Substitutions of education for operating experience.*

(1) Two semester hours, three quarter hours, or three CEUs of directly related post-high school education may be substituted for one-half the operating experience requirement for Grades I and IL.

(2) Thirty semester hours, 45 quarter hours, or 45 CEUs of directly related post-high school education may be substituted for one year of experience up to a maximum of one-half the operating experience requirement for Grades II, III and IV.

(3) That portion of education that is applied toward substitution for operating experience cannot also be used for education.

(4) Class hours involving closely supervised on-the-job type training in a pilot or full-scale facility where there are clearly defined educational objectives may be applied to the on-the-job operating experience requirement. The substitution value of such training shall be applicable for Grade I and Grade II certification only and shall not exceed one-half year of on-the-job experience.

1. One hour of on-the-job training is equivalent to three hours of on-the-job operating experience.

2. One month of on-the-job training consists of 20 eight-hour days.

3. Credit for on-the-job training may be applied only to the examination for the type of plant or system in which the experience was obtained.

4. That portion of on-the-job training courses that is applied toward substitution for the on-the-job experience requirement cannot also be used for education.

c. *Substitution of education for DRC operating experience.* Thirty semester hours, 45 quarter hours, or 45 CEUs of directly related post-high school education may be substituted for one year of DRC operating experience up to one-half the requirement for Grade IV certification.

**81.6(4)** *Military education, training, or service credit.*

a. An applicant who is serving or has served in the military shall identify the education or experience certification qualification for which the credit is requested.

b. As part of an examination application pursuant to 81.8(1), an applicant shall provide documents, military transcripts, a certified affidavit, or forms that verify completion of the relevant military education, training, or service, which may include, as applicable, the applicant's Certificate of Release or Discharge from Active Duty (DD Form 214) or Verification of Military Experience and Training (VMET) (DD Form 2586).

[ARC 9212C, IAB 5/14/25, effective 6/18/25]

#### **567—81.7(455B) Certification and examination fees.**

**81.7(1)** *Examination fee.* Fee for each examination: \$30.

**81.7(2)** *Certification fees.*

a. Certification fee for each one-half year of a two-year period from the date of issuance to June 30 of odd-numbered years: \$20.

b. Late certification penalty fee: \$18.

c. Certification renewal fee: \$60.

d. Late certification renewal penalty fee: \$18.

**81.7(3)** *Fee adjustments.* The department may adjust the fees annually by up to plus or minus 20 percent to cover costs of administering and enforcing these rules and reimbursement for other expenses relating to operator certification. The commission must approve any fee increases above those listed in this rule. All fees collected shall be retained by the department for administration of the operator certification program.

[ARC 9212C, IAB 5/14/25, effective 6/18/25]

#### **567—81.8(455B) Operator certification examinations.**

**81.8(1)** *Examination application.*

a. All persons wishing to take the examination to become a certified operator of a wastewater or water treatment plant or a water distribution system shall complete an examination application on a form provided by the department.

b. All examination applications shall be accompanied by the examination fee.

**81.8(2)** *Application evaluation.* After evaluating an application, the department will notify the applicant of examination eligibility or noneligibility. The director will further review applications when it is indicated that the applicant has falsified information or when questions arise concerning an applicant's qualifications or eligibility for examination or certification.

**81.8(3)** *Application expiration.* An approved examination application shall be valid for one year from the approval date.

**81.8(4) Examination fee refund.** An applicant who does not qualify for examination at the time of application will have the examination fee refunded if the applicant cannot qualify for examination within one year. If an applicant will qualify for a scheduled examination within one year, the fee will not be refunded.

**81.8(5) Reexamination.**

- a. Upon failure of the first examination, an applicant may apply for reexamination.
- b. Upon each reexamination when a valid application is on file, an applicant shall submit the examination fee to the department.

**81.8(6) Application invalidation.** Failure to successfully complete the examination within one year from the application approval date shall invalidate the application.

**81.8(7) Reasonable accommodation.** Upon an applicant's request, the director will consider reasonable accommodation to allow administration of the examination without discrimination on the basis of disability. An applicant shall request an accommodation 30 days prior to the examination date. An applicant shall provide documentation of eligibility for an accommodation with the examination application form.

[ARC 9212C, IAB 5/14/25, effective 6/18/25]

**567—81.9(455B) Operator certification.**

**81.9(1) Examination requirement.** All applicants not certified by reciprocity pursuant to 81.9(3) shall successfully pass an operator certification examination prior to receiving certification.

**81.9(2) Certification.**

a. In order to receive a certificate, an applicant who passes an examination shall submit the certification fee to the department within 60 days of the date the applicant receives notification from the department of passing the examination. Payment may either be digitally submitted in accordance with the instructions on the department's website at [www.iowadnr.gov](http://www.iowadnr.gov), mailed, or hand delivered. All certification fee payments that are mailed or hand delivered shall be submitted with the applicant's notification of passing the examination.

b. Any certification payment digitally submitted, postmarked, or hand delivered to the department more than 30 days but less than 60 days after the date the applicant received notification of passing the examination shall be accompanied by the certification fee and the late certification penalty fee.

c. An applicant who does not submit the certification fee within 60 days' notice of passing the examination will not be certified on the basis of that examination.

**81.9(3) Certification by reciprocity.**

a. *Other states' mandatory certification programs.* Applicants who have been certified under other states' mandatory certification programs, the equivalency of which has been previously reviewed and accepted by the department, shall be certified in an appropriate classification and grade without examination. The applicant must have passed an examination generally equivalent to the Iowa examination and must meet the education and experience qualifications established in this chapter.

b. *Other states' voluntary certification programs.* For applicants who have been certified under voluntary certification programs in other states, certification in an appropriate class will be considered. The applicant must have passed an examination generally equivalent to the Iowa examination and must meet the education and experience qualifications established in this chapter. The director may require the applicant to pass the Iowa examination.

c. *Reciprocity application.*

(1) Applicants seeking reciprocal Iowa certification shall submit a reciprocity application form provided by the department and the certification fee. The applicant shall be certified at the appropriate grade pursuant to 81.6(1).

(2) An applicant who is a veteran shall submit a reciprocity application form provided by the department and the certification fee and shall provide documentation to verify their status as a veteran as defined in Iowa Code section 35.1(2).

d. *Lapse of certification obtained through reciprocity.* An applicant who obtains certification in Iowa through reciprocity and subsequently allows their Iowa certification to lapse will be required to reapply for certification in accordance with 81.9(5) "e."

**81.9(4) *Restricted certification.*** Upon written request by a certified operator, the director may determine that the education qualifications can be waived prior to an examination when a plant or distribution system classification is increased and the operator has been in DRC of the existing plant or distribution system. An operator passing an examination will be restricted to that plant or distribution system until the education qualifications are met.

**81.9(5) *Certification renewal.***

*a. Renewal period.* All certificates shall expire on June 30 of odd-numbered years and shall be renewed every two years in order to maintain certification.

*b. Continuing education requirements for renewal.* The CEU credits detailed in 567—81.10(455B,272C) shall be obtained prior to any certificate renewal.

*c. Renewal application and fee.*

(1) Certification renewal applications shall be made available to certified operators on the department's website at [www.iowadnr.gov](http://www.iowadnr.gov) prior to the certificate expiration date.

(2) All renewal applications shall be digitally submitted, postmarked, or hand delivered to the department prior to certificate expiration and shall be accompanied by the certification renewal fee.

*d. Late renewal.* Any certification renewal application digitally submitted, postmarked, or hand delivered to the department after certificate expiration shall be accompanied by the certification renewal fee and the late certification renewal penalty fee.

*e. Failure to renew.* If a certified operator fails to renew within 60 days following certificate expiration, the right to renew the certificate is automatically terminated. Certification may be allowed at any time following such termination, provided that the applicant meets all education and experience eligibility requirements of 567—81.6(455B), successfully passes an examination, and submits the certification fee in accordance with 81.9(2).

*f. Expired certificate.* An operator may not continue as the OIC of a plant, distribution system, operating shift, or major segment of a plant or distribution system after certificate expiration unless the certificate is renewed.

**81.9(6) *Certificate upgrade.*** An operator holding an unexpired certificate may upgrade the certificate by examination to a higher grade in the same classification in accordance with this rule and 567—81.6(455B) and 567—81.8(455B). The expiration date of the upgraded certificate shall be the same as the unexpired certificate. An operator who upgrades a certificate during a biennium must also renew the upgraded certificate in accordance with 81.9(5) to maintain certification.

[ARC 9212C, IAB 5/14/25, effective 6/18/25]

**567—81.10(455B,272C) Continuing education.**

**81.10(1) *Continuing education unit (CEU) general requirements.***

*a.* Only those operators fulfilling the CEU requirements before the end of each two-year period (March 31) will be allowed to renew their certificate(s). All certificates of operators who did not fulfill the CEU requirements as of April 1 of the second year shall expire on June 30 of each odd-numbered year.

*b.* CEUs must be earned during two-year periods between April 1 and March 31 of odd-numbered years.

*c.* A Grade III or IV certified operator must earn two CEUs or 20 contact hours per certificate during each two-year period.

*d.* All other certified operators must earn one CEU or 10 contact hours per certificate during each two-year period.

*e.* For those certified operators holding both a water treatment and a water distribution certification, no less than 25 percent of the required CEUs may be earned in any one area.

**81.10(2) *CEU approval.*** All activities for which CEU credit will be granted must be approved by an accredited college, university, technical institute, or the department, and must be directly related to the subject matter of the particular certificate to which the credit is being applied. Any entity holding courses in Iowa for which CEU credit is offered for operator certification must provide, at no cost to the department, the opportunity for one staff member to audit the training and receive all training materials.

**81.10(3) *Exceptions.*** The following exceptions apply to the requirements of this rule.

a. The director may, in individual cases involving hardship or extenuating circumstances, allow a certified operator up to three additional months to fulfill the minimum CEU requirements. Hardship or extenuating circumstances include documented health-related confinement or other circumstances beyond the certified operator's control that prevent attendance at the required activities. All extension requests must be made prior to March 31 of each biennium.

b. Newly certified operators (previously uncertified) who become certified after April 1 of the second year of a two-year period will not be required to earn CEUs until the next two-year period.

c. If an operator upgrades a certificate after April 1 of the second year of a two-year period and that upgrade increases the CEU requirement, the operator will not be required to meet the higher CEU requirement until the next two-year period, but must fulfill the lower CEU requirement for that period.

**81.10(4) CEU reporting.** It is the certified operator's personal responsibility to maintain a written record of the CEUs earned during each renewal period and to report the credits to the department by following the instructions on the department's website at [www.iowadnr.gov](http://www.iowadnr.gov).

[ARC 9212C, IAB 5/14/25, effective 6/18/25]

**567—81.11(455B) Operator by affidavit.**

**81.11(1) Affidavit allowance.** The owner of a plant or distribution system required to have a Grade A, I, IL, or II certified operator may sign an affidavit with a certified operator of the required classification and grade.

**81.11(2) Affidavit requirements.**

a. An affidavit will verify that the certified operator is the OIC and has direct responsibility for a plant or distribution system that does not have first rights on the services of that operator.

b. The department shall provide an affidavit form that requires the certified operator's name and signature, the operator's certification number, classification and grade, and the date of last renewal of the operator's certificate. The affidavit form shall be proof that the certified operator has agreed to be directly responsible for the operation and maintenance of the plant or distribution system.

c. The affidavit must be returned to and approved by the local regional field office of the department, based upon the ability of the certified operator to properly operate and maintain additional facilities. Upon affidavit approval, the department may specify additional operational and maintenance requirements based on the complexity and size of the plant or distribution system.

d. In the event of affidavit disapproval, the plant or distribution system owner must terminate the agreement with the certified operator and seek the services of another certified operator.

e. Both the plant or distribution system owner and the certified operator shall notify the director at least 30 days before the termination of an affidavit.

[ARC 9212C, IAB 5/14/25, effective 6/18/25]

**567—81.12(455B,272C) Disciplinary actions.**

**81.12(1) Reasons for disciplinary action.** Disciplinary action may be taken against a certified operator on any of the grounds specified in Iowa Code section 455B.219 and chapter 272C and the following more specific grounds:

a. Failure to use reasonable care or judgment or to apply knowledge or ability in performing the duties of a certified operator.

(1) Examples of wastewater operator duties are specified in the Water Environment Federation Manual of Practice #11, 1996; California State University—Sacramento (CSUS) Operation of Wastewater Treatment Plants, Vol. I, 4th edition, 1998; CSUS Operation of Wastewater Treatment Plants, Vol. II, 4th edition, 1998; CSUS Advanced Waste Treatment, 3rd edition, 1998; and 567—Chapters 60 through 63, 67, and 83.

(2) Examples of water treatment or distribution system operator duties are specified in the American Water Works Association (AWWA) Manuals of Water Supply Practice (Volumes 1, 3-7, 9, 11-12, 14, 17, 19-38, 41-42, 44-48); AWWA Water Supply Operations Series, 2nd edition: Vol. 1, 1995; Vol. 2, 1995; Vol. 3, 1996; Vol. 4, 1995; and Vol. 5, 1995; AWWA Water Distribution Operator Handbook, 2nd edition, 1976; California State University—Sacramento (CSUS) Water Treatment Plant Operation, Vol. I, 4th edition, 1999; CSUS Water Treatment Plant Operation, Vol. II, 3rd edition, 1998; CSUS Small Water

System Operation and Maintenance, 4th edition, 1999; CSUS Water Distribution System Operation and Maintenance, 4th edition, 2000; and 567—Chapters 40 through 43 and 83.

b. Failure to submit records of operation or other reports required under applicable permits or department rules, including failure to submit complete records or reports.

c. Knowingly making any false statement, representation, or certification on any application, record, report or document required to be maintained or submitted under any applicable permit or department rule.

**81.12(2) *Disciplinary sanctions.*** Disciplinary sanctions may include those specified in Iowa Code section 272C.3(2) and the following:

a. *Certificate revocation.* Revocation may be permanent without chance of recertification or for a specified period of time.

b. *Partial revocation or suspension.* Revocation or suspension of the practice of a particular aspect of the operation of a plant or distribution system, including the restriction of operation to a particular plant or distribution system, or a particular classification of plant or distribution system.

c. *Probation.* Probation under specified conditions relevant to the specific grounds for disciplinary action.

d. *Additional requirements.* Additional education, training, or reexamination may be required as a condition of certificate reinstatement.

e. *Penalties.* Civil penalties not to exceed \$1,000 may be assessed for the reasons identified in 81.12(1).

**81.12(3) *Procedure.***

a. *General.* All disciplinary action taken under this rule shall comply with the procedures of rule 561—7.19(17A,455A) and all other applicable rules governing contested cases. At any time, the licensee and the department may enter into a settlement agreement, subject to approval by the director, which provides for a disciplinary sanction.

b. *Appeal and review of proposed decision.* After a contested case hearing conducted in accordance with 561—Chapter 7, the director shall review the presiding officer's proposed decision. The proposed decision shall constitute a final decision of the director and the department.

c. *Emergency disciplinary action.* The director may initiate an emergency suspension or other disciplinary action upon such grounds and following the procedures provided in rule 561—7.18(17A,455A). The terms of the emergency order shall be effective upon service as provided in rule 561—7.18(17A,455A). The department shall promptly give notice of an opportunity to appeal and request a contested case hearing following the procedures specified above.

d. *Reinstatement of revoked certificates.* Upon revocation of a certificate in accordance with the authority provided in Iowa Code section 455B.219 and chapter 272C, application for certification may be allowed after two years from the date of revocation unless otherwise specified in 81.12(2). Any such applicant shall meet all education and experience eligibility requirements, pass an examination, and be certified in the same manner as a new applicant in accordance with the requirements of this chapter.

**81.12(4) *Procedures for noncompliance with child support order.*** Upon receipt of a certification of noncompliance with a child support obligation as provided in Iowa Code section 252J.7, the department will initiate procedures to deny an application for operator certification or renewal or to suspend a certification in accordance with Iowa Code section 252J.8(4). The department shall issue to the person by certified mail a notice of its intent to deny or suspend operator certification based on receipt of a certificate of noncompliance. The suspension or denial shall be effective 30 days after receipt of the notice unless the person provides the department with a withdrawal of the certificate of noncompliance from the child support recovery unit as provided in Iowa Code section 252J.8(4)“c.” Pursuant to Iowa Code section 252J.8(4), the person does not have a right to a hearing before the department to contest the denial or suspension action under this subrule but may seek a hearing in district court in accordance with Iowa Code section 252J.9.

[ARC 9212C, IAB 5/14/25, effective 6/18/25]

These rules are intended to implement Iowa Code sections 455B.211 through 455B.224 and chapter 272C.

CHAPTER 82  
WELL CONTRACTOR CERTIFICATION  
[Prior to 5/12/93, see also 567—Ch 37]

Chapter rescission date pursuant to Iowa Code section 17A.7: 6/18/30

**567—82.1(455B) Definitions.** In addition to the definitions in 567—Chapter 39, 567—Chapter 40, 567—Chapter 49, and Iowa Code sections 455B.171, 455B.190, and 455B.190A, which are hereby adopted by reference, the following definitions shall apply to this chapter:

“*Pump installer*” means a person certified by the department to perform pump services.

“*Pump services*” means the same as defined in Iowa Code section 455B.190A. The term also includes modification of the upper terminus of a well; well plugging; well rehabilitation; or the construction of Class 3 wells.

“*Well driller*” means a person certified by the department to perform well drilling services.

“*Well drilling services*” means the same as “well services” as defined in Iowa Code section 455B.190A. The term includes well rehabilitation.

“*Well plugging contractor*” means a well contractor certified to plug only Class 1 or Class 3 wells but not certified to abandon Class 2 wells or perform any other well services.

[ARC 9213C, IAB 5/14/25, effective 6/18/25]

**567—82.2(455B) General.**

**82.2(1) *Certified well contractor requirement.***

a. All well services shall be performed pursuant to this chapter by a certified well contractor who is on site and in direct charge of the well services, except that a person may perform well services on their own property without being certified.

b. Prior to performing well drilling services, a certified well contractor shall notify:

(1) The department or the county, if a well does not have the required construction permits; or

(2) The department, if the use of the water requires a water use allocation and the owner has not applied for or been issued a water use allocation.

**82.2(2) *Applicability exception.*** These rules shall not apply to a water operator certified pursuant to Iowa Code section 455B.213, when the water operator is performing pump services on any well owned by a PWS as defined in Iowa Code section 455B.171. These rules shall not apply to a wastewater operator certified pursuant to Iowa Code section 455B.213, when the wastewater operator is performing pump services on a groundwater monitoring well, groundwater dewatering well, or other well not used to provide drinking water, owned by a sewer system as defined in Iowa Code section 455B.171. Pump installer certification requirements shall not apply to monitoring wells.

**82.2(3) *Address change.*** Certified well contractors shall report address changes to the department within 30 days after the change.

[ARC 9213C, IAB 5/14/25, effective 6/18/25]

**567—82.3(455B) Classification of well contractors.**

**82.3(1) *Classifications.*** The three classifications of certified well contractors are:

a. Certified well contractor, including:

(1) Well driller, and

(2) Pump installer.

b. Provisionally certified well contractor, including:

(1) Well driller, and

(2) Pump installer.

c. Well plugging contractor.

**82.3(2) *Certified well contractor.*** In order to be a certified well contractor, an applicant shall have met the experience requirements, successfully completed the well contractor examination for well drilling services or pump services, or both, been issued a certificate by the department, and renewed the certification in accordance with this chapter.

**82.3(3) Provisionally certified well contractor.** The requirements and conditions for provisional well contractor certification are described in Iowa Code section 455B.190A. A provisionally certified well contractor will become a certified well contractor after the submission of an application showing all certification requirements have been met and submission of appropriate fees to the department. The certificate for a provisionally certified well contractor will be issued for one year. The department shall issue a certified well contractor certificate after the one-year period and the receipt of appropriate fees.

**82.3(4) Well plugging contractor.** In order to be certified as a well plugging contractor, an applicant shall take a four-hour training course designated by the department, successfully complete a well plugging test, be issued a certificate by the department, and renew the certification in accordance with this chapter.

[ARC 9213C, IAB 5/14/25, effective 6/18/25]

**567—82.4(455B) Experience requirements.** All applicants shall meet the experience requirements shown below. Educational programming approved by the department may be substituted for up to one half of any experience requirement at the rate of one continuing education unit (CEU) for each 100 hours of required experience.

| CLASSIFICATION                             | EXPERIENCE                                                                                                         |
|--------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| Certified Well Contractor (well driller)   | Two years' employment and 2000 hours work experience in Class 1 and Class 2 well construction                      |
| Certified Well Contractor (pump installer) | Two years' employment and 1000 hours work experience in the installation, repair, and maintenance of water systems |
| Provisionally Certified Well Contractor    | One half of the employment and experience required for full certification                                          |
| Well Plugging Contractor                   | None                                                                                                               |

[ARC 9213C, IAB 5/14/25, effective 6/18/25]

**567—82.5(455B) Certification and examination fees.** The following fees are nonrefundable.

**82.5(1) Examination fee.** Fee for each examination: \$50.

**82.5(2) Oral examination fee.** Fee for each oral examination: \$100.

**82.5(3) Certification fees.**

*a. Well drilling contractors.*

(1) Initial certification fee for each one-half year of a two-year period from the date of issuance to June 30 of the next even-numbered year: \$75.

(2) Certification renewal fee: \$300.

*b. Pump installation contractors and well plugging contractors.*

(1) Initial certification fee:

1. For each one-half year of the first year of certification: \$75.

2. For each additional one-half year period to June 30 of the next even-numbered year: \$50.

(2) Certification renewal fee: \$200.

**82.5(4) Provisionally certified well contractor fee.** Provisionally certified well contractor fee: \$150.

**82.5(5) Late certification penalty fee.** Penalty fee for late payment of the initial certification fee or renewal fee: \$100.

**82.5(6) Duplicate certificate fee.** A currently certified well contractor may obtain a duplicate certificate upon payment of a \$20 fee.

**82.5(7) Recertification fee.** Contractors who have not earned sufficient CEUs for certification renewal and who wish to recertify within two years after expiration of their certification must retake and pass the examination(s) and pay a certification fee of \$1,000.

[ARC 9213C, IAB 5/14/25, effective 6/18/25]

**567—82.6(455B) Examinations.**

**82.6(1) Examination types.** There are four well contractor examinations available:

- a. General fundamentals examination - well drilling and pump installation contractors.
- b. Specialty examination - well drillers.
- c. Specialty examination - pump installers.
- d. Specialty examination - well plugging contractors.

**82.6(2) Required examinations.**

a. Well drilling contractors and pump installers must take and pass the general fundamentals examination and at least one of the specialty examinations. Examinations may be taken at the same time and place or at different times. Work shall be limited to the specialty in which proficiency has been demonstrated by written examination.

- b. Well plugging contractors must take and pass the well plugging examination only.

**82.6(3) Examination application.**

a. A person wishing to take the examination(s) to become a certified well contractor shall complete and submit an examination application form provided by the department.

- b. All examination applications shall be accompanied by the examination fee.

c. The department may allow local county environmental health officials to take an examination, even if they do not meet the work experience or training requirements, provided they pay the examination fee. If an official receives a passing score on the examination, they will receive a letter of acknowledgment; however, they will not be certified and will not be allowed to perform any well services.

**82.6(4) Application evaluation.** After evaluating an application, the department will notify an applicant of examination eligibility or noneligibility.

**82.6(5) Application expiration.** An approved examination application shall be valid for one year from the approval date. All required examinations shall be completed within one year of application.

**82.6(6) Examination fee refund.** The department may refund a portion of the examination or reexamination fee for an applicant who does not qualify for examination within one year of application approval. If an applicant will qualify for a scheduled examination within one year, the fee will not be refunded.

**82.6(7) Reexamination.**

a. Upon failure of the first examination, an applicant may apply for reexamination. Upon failure of the second examination, the applicant must wait a period of 180 days between each subsequent reexamination.

b. Upon each reexamination while a valid application is on file, an applicant shall submit the examination fee to the department.

**82.6(8) Application invalidation.** Failure to successfully complete the necessary examinations within one year from the application approval date shall invalidate an application.

**82.6(9) Oral examination.** Upon written request by an applicant, the director will consider administering an oral examination on an individual basis when: the applicant has failed the written examination at least twice; the applicant has shown difficulty in reading or understanding written questions but may be able to respond to oral questioning; the applicant is capable of communicating in writing with regard to departmental requirements and inquiries; and the director has received a written recommendation for an oral examination from a department staff member attesting to the operational and performance capabilities of the applicant.

**82.6(10) Reasonable accommodation.** Upon an applicant's request, the director will consider reasonable accommodation to allow administration of an examination without discrimination on the basis of disability. An applicant shall request accommodation 30 days prior to the examination date. An applicant shall provide documentation of eligibility for the accommodation with the examination application form. Accommodations based on documentation may include site accessibility, oral examination, extended time, separate testing area, or other concerns. If an oral examination is considered a reasonable accommodation, the oral examination fee shall apply.

[ARC 9213C, IAB 5/14/25, effective 6/18/25]

**567—82.7(455B) Contractor certification.**

**82.7(1) Examination requirement.** All applicants for well contractor certification shall pass the relevant examinations prior to receiving certification.

**82.7(2) Certification.**

a. To receive certification, an applicant who passes the examination(s) shall submit the appropriate certification fee to the department within 30 days of receiving notification from the department of passing the examination(s). Payment may be digitally submitted in accordance with the instructions on the department's website at [www.iowadnr.gov](http://www.iowadnr.gov), mailed, or hand delivered. All certification fee payments that are mailed or hand delivered shall be submitted with the applicant's notification of passing the examination(s).

b. Any certification payment digitally submitted, postmarked, or hand delivered to the department more than 30 days but less than 60 days after the date the applicant received notification passing the examination(s) shall be accompanied by the appropriate certification fee and the late certification penalty fee.

c. Applicants who do not submit the appropriate certification fee within 60 days' notice of passing the examinations will not be certified on the basis of that examination(s).

**82.7(3) Denial appeal.** Applicants may appeal a denial of certification within 30 days of receiving notification pursuant to 567—Chapter 7.

**82.7(4) Certificate renewal.**

a. *Renewal period.* All certificates shall expire on June 30 of even-numbered years and shall be renewed every two years in order to maintain certification.

b. *Continuing education requirements for renewal.* The CEU credits detailed in 567—82.8(455B) shall be obtained prior to any certificate renewal.

c. *Renewal applications and fee.*

(1) Certification renewal applications shall be made available to certified well contractors on the department's website at [www.iowadnr.gov](http://www.iowadnr.gov) 60 days prior to the certificate expiration date.

(2) All renewal applications shall be digitally submitted, postmarked, or hand delivered to the department prior to certificate expiration, and shall be accompanied by the appropriate certification renewal fee.

d. *Late renewal.* Any certification renewal application digitally submitted, postmarked, or hand delivered to the department after certificate expiration shall be accompanied by the appropriate certification renewal fee and the late certification renewal penalty fee.

e. *Failure to renew.* If a certified well contractor fails to renew within 60 days following certificate expiration, the right to renew the certificate is automatically terminated. Certification may be allowed at any time following such termination, provided that the applicant passes the appropriate examinations and submits the appropriate certification fee in accordance with this rule.

f. *Expired certificate.* A certified well contractor may not continue to provide well services after certificate expiration without renewal thereof.

[ARC 9213C, IAB 5/14/25, effective 6/18/25]

**567—82.8(455B) Continuing education.**

**82.8(1) CEU requirements.** CEUs must be earned during two-year periods between April 1 and March 31 of even-numbered years.

a. A certified well contractor holding well driller certification or both well driller and pump installer certifications must earn 1.6 CEUs or 16 contact hours during each two-year period.

b. A certified well contractor holding only pump installer certification must earn 1.0 CEU or 10 contact hours during each two-year period.

c. A well plugging contractor may be required to earn 0.2 CEUs or 2 contact hours during each two-year period as determined by the department, provided the well plugging contractor is notified of the requirement at the beginning of the renewal period.

d. Newly certified (previously uncertified) well contractors who are certified after April 1 of even-numbered years will not be required to earn CEUs until the next two-year period.

**82.8(2) Certificate renewal.** Only those certified well contractors fulfilling the CEU requirements before the end of each two-year period (March 31) will be allowed to renew their certificate(s). All certificates of certified well contractors not fulfilling the CEU requirements shall expire on June 30 of every even-numbered year.

**82.8(3) CEU approval.** All activities for which CEU credit will be granted must be approved by an accredited college or university, technical institute, or the department, and shall be related to well services, relevant aspects of Iowa groundwater law, well construction, well maintenance, well abandonment practices, well contractor safety (no more than 0.2 CEU per renewal), water system maintenance, or Iowa hydrogeologic conditions that protect groundwater and water supplies.

**82.8(4) CEU exceptions.** The director may, in individual cases involving hardship or extenuating circumstances, grant a certified well contractor six additional months to fulfill the minimum CEU requirements. Hardship or extenuating circumstances include documented health-related confinement or other circumstances beyond the control of the contractor that prevent attendance at the required activities. All extension requests must be made prior to March 31 of each even-numbered year.

**82.8(5) CEU reporting.** It is the certified well contractor's personal responsibility to maintain a written record of the CEUs earned during each renewal period and report the credits to the department by following the instructions on the department's website at [www.iowadnr.gov](http://www.iowadnr.gov).

**82.8(6) Alternative CEU requirements.** A certified well contractor shall be deemed to have complied with the CEU requirements of this rule during periods that they serve honorably on active duty in the military services, for periods of government employment working as a well contractor and assigned to duty outside of the United States, or for other periods of active practice and absence from the state approved by the director.

[ARC 9213C, IAB 5/14/25, effective 6/18/25]

**567—82.9(455B) Certified well contractor obligations.**

**82.9(1) Record and sample submission.** Within 30 days of completion of any water well, each certified well contractor shall submit the following:

- a. A well record form to the authority who issued the well construction permit (the department or the local county health department), in accordance with 82.9(2); and
- b. Drill cutting samples to the Iowa Geological Survey (IGS) for any water well used as part of a public water supply, a well used for water withdrawal for which a permit is required by 567—50.1(455B), or a department-required well used to monitor groundwater quantity or quality, as required by 82.9(3).
- c. Prior to constructing a water well to be used as part of a nonpublic water supply or other water well used to access groundwater, a certified well contractor shall contact the local health department in the county in which the water well is to be located to determine if submittal of drill cutting samples is required.

**82.9(2) Well record form.** Well drilling records shall be submitted on the well record form, or, for all nonpublic water supply wells, into the department's Iowa Well Information System database. Both the form and the database are available on the department's website at [www.iowadnr.gov](http://www.iowadnr.gov). The well record form shall include the following:

- a. Well location and legal description (quarter section, section number, township, range, and county);
- b. Reference point for all depth measurements;
- c. Depth at which each significant change of formation occurs;
- d. Depth at which pump is set, the non-pumping and pumping water levels in the well measured from the land surface, and the rate and duration the well was pumped;
- e. Identification of the material of which each significant stratum is composed;
- f. Depth at which hole diameters (bit sizes) change;
- g. Normal hole diameter of the well bore;
- h. Total depth of the completed hole;
- i. Depth or location of any lost drilling fluids, drilling materials, or tools;
- j. Casing depth, grouting schedule, including materials used and method of placement, and description of the well casing and liner pipe;
- k. A description of well screens, including diameter, length, material slot sizes, amount of open area, and location in well; and
- l. A description of physical and chemical well development activities.

**82.9(3) Cutting samples.** Drill cutting samples shall be collected at intervals of five feet and at each pronounced change in geological formation. The IGS will provide drill cutting bags.

**82.9(4) *Test pumping.*** Certified well contractors shall provide, as requested, test pumping data for water wells used as part of a public water supply and for water wells used as part of a regulated water use pursuant to 567—subrule 50.6(1).

[ARC 9213C, IAB 5/14/25, effective 6/18/25]

**567—82.10(455B) Disciplinary actions.**

**82.10(1) *Reasons for disciplinary action.*** Disciplinary action may be taken against a certified well contractor or well plugging contractor on any of the grounds specified in Iowa Code section 455B.190A and the following more specific grounds:

- a. Knowingly making any false statement, representation, or certification on any application, record, report, or document required to be maintained or submitted under any applicable permit or rule of the department.
- b. Failure to renew certification.
- c. Failure to obtain required CEUs.
- d. Failure to submit, within the time required, drill cutting samples, records, or other reports required under applicable permits or rules of the department, including failure to submit complete records or reports.
- e. Failure to use reasonable care or judgment or to apply knowledge or ability in performing the duties of a certified well contractor or well plugging contractor.
- f. Violation of well construction, plugging or pump installation standards or other requirements in 567—Chapters 39, 43, 49 and 110.
- g. Failure to advise a person for whom well services are being provided that a hazardous or potentially hazardous condition, as defined in Iowa Code section 455B.381(2), has been encountered.
- h. Knowingly causing or allowing a hazardous or potentially hazardous condition due to well construction to exist.
- i. Drilling or reconstructing a well without a construction permit.

**82.10(2) *Disciplinary sanctions.***

- a. *Certificate revocation.* Revocation of a certificate may be permanent without chance of recertification or for a specified period of time.
- b. *Partial revocation or suspension.* Revocation or suspension of the practice of a particular aspect of the contractor's responsibility.
- c. *Probation.* Probation under specified conditions relevant to the specific grounds for disciplinary action. Additional education or training or reexamination may be required as a condition of probation. Reexamination may include written and oral examinations.
- d. *Fees.* The department shall determine which fees in 567—82.5(455B) apply.
- e. *Penalties.* Civil penalties may be assessed in accordance with Iowa Code section 455B.109.

**82.10(3) *Procedure.***

- a. The director shall initiate disciplinary action. The director may investigate any alleged factual situation that may be grounds for disciplinary action under 82.10(1) and report the results of the investigation to the commission.
- b. The director may issue an administrative order that may assess a penalty or refer a case to the attorney general for prosecution for any disciplinary action.
- c. Written notice by certified mail shall be provided to a certified well or well plugging contractor against whom disciplinary action is being considered. The certified well or well plugging contractor will be given 20 days' advance notice that an informal hearing has been scheduled before the commission. The notice will provide the specific date, time, and place, at which time the commission will hold the informal hearing to determine whether a formal hearing is warranted or whether informal resolution can be reached. The certified well or well plugging contractor may present any relevant facts and indicate their position in the matter.
- d. A certified well or well plugging contractor who receives notice of an informal hearing shall communicate orally or in writing with the director, and efforts shall be made to clarify the respective positions of the certified well or well plugging contractor and the director. Department staff may present a recommendation concerning disciplinary sanctions to the commission at the informal hearing.

*e.* Failure to attend the informal hearing or otherwise to communicate facts and position relevant to the matter by the scheduled date will be considered by the commission when determining whether a formal hearing is warranted.

*f.* If agreement as to appropriate disciplinary sanction, if any, can be reached with the certified well or well plugging contractor and the commission concurs, a written stipulation and settlement between the department and the certified well or well plugging contractor shall be entered. The stipulation and settlement shall recite the basic facts and violations alleged, any facts presented by the certified well or well plugging contractor, and the reasons for the particular sanctions imposed.

*g.* If the commission determines that no disciplinary action is warranted on the facts asserted, the certified well or well plugging contractor shall be notified of the decision in writing.

*h.* If the commission determines that an opportunity for formal hearing is required to impose any disciplinary sanction specified in 82.10(2), the director shall proceed in accordance with 567—Chapter 7.

[ARC 9213C, IAB 5/14/25, effective 6/18/25]

**567—82.11(455B,272C) Certificate revocation.** Upon certificate revocation in accordance with Iowa Code section 455B.190A, application for certification may be allowed after two years from the revocation date. Any such applicant shall pass an examination and be certified in the same manner as other applicants. The department shall determine which fees in 567—82.5(455B) apply.

[ARC 9213C, IAB 5/14/25, effective 6/18/25]

These rules are intended to implement Iowa Code sections 455B.187 and 455B.190A.

CHAPTER 83  
LABORATORY CERTIFICATION  
[Prior to 4/10/96, see 567—Chapter 42]

Chapter rescission date pursuant to Iowa Code section 17A.7: 6/18/30

PART A  
GENERAL

**567—83.1(455B) Authority, purpose, and applicability.**

**83.1(1) Authority.** Pursuant to Iowa Code section 455B.113, a laboratory certification program is required for laboratories performing analyses of samples that are required to be submitted to the department as a result of Iowa Code provisions, rules, operation permits, or administrative orders. Pursuant to Iowa Code section 455B.114, the department may suspend or revoke the certification of a laboratory upon its determination that the laboratory no longer fulfills one or more of the requirements for certification.

**83.1(2) Purpose.** The purpose of these rules is to provide the procedures for laboratories to use to apply for and maintain certification, to establish laboratory certification fees, and to provide the appropriate methods and references for evaluating laboratory competence including the requirements for laboratories to become certified.

**83.1(3) Applicability to environmental program areas.** This chapter applies to the following laboratories:

*a. Water supply (drinking water).* All laboratories conducting drinking water analyses pursuant to 567—Chapters 40, 41, and 43.

*b. Underground storage tanks.* All laboratories conducting underground storage tank (UST) analyses for petroleum constituents pursuant to 567—Chapter 135. Routine on-site monitoring conducted by or for UST owners for leak detection or a nonregulatory purpose is excluded from this requirement.

*c. Wastewater (nonpotable water).* All laboratories conducting analyses of wastewater, groundwater or sewage sludge (municipal biosolids), or manure pursuant to 567—Chapters 63, 65, 67, and 69.

*d. Solid waste and contaminated sites.* All laboratories conducting analyses of solid waste parameters pursuant to 567—Chapters 100 through 129, contaminated site parameters pursuant to 567—Chapters 133 and 137, and regulated substances other than petroleum parameters regulated under 567—Chapter 135.

**83.1(4) Exclusions.** Any parameter that must be analyzed immediately upon sample collection is excluded from the requirements of this chapter. Any samples collected or testing conducted that is not part of the specific monitoring required by the department for regulatory purposes are also excluded from the requirements of this chapter.

[ARC 9214C, IAB 5/14/25, effective 6/18/25]

**567—83.2(455B) Definitions.**

*“Batch”* means environmental samples that are prepared, analyzed, or both together with the same process and personnel, using the same lot(s) of reagents. A preparation batch is composed of 1 to 20 environmental samples of the same quality systems matrix (water supply, wastewater, etc.), meeting the above-mentioned criteria and with a maximum time between the start of processing of the first and last sample in the batch to be 24 hours. An analytical batch is composed of prepared environmental samples (extracts, digestates or concentrates) that are analyzed together as a group. An analytical batch can include prepared samples originating from various quality system matrices and can exceed 20 samples. If there is a conflict between this definition and the requirements of an approved method, the more stringent requirements shall apply.

*“Certified”* means a laboratory demonstrates to the satisfaction of the department its ability to consistently produce valid data within the acceptance limits as specified within the department’s requirements for certification and meets the minimum requirements of this chapter and all applicable regulatory requirements. A laboratory may be certified for an analyte, an analytical series, or an

environmental program area, except in the UST program area, where certification for individual analytes is not allowed.

“*Corrective action report*” or “*CAR*” means documentation that demonstrates a laboratory has satisfied cited deficiencies or deviations.

“*Critical staff*” means an analyst who is the only person at a laboratory performing a particular function or analysis (no backup analyst).

“*Demonstration of capability*” or “*DOC*” means a procedure used to demonstrate the ability of an analyst to generate acceptable accuracy for each method the analyst performs.

“*Discharge monitoring report-quality assurance*” or “*DMRQA*” means an effluent performance test study regulated by the National Pollutant Discharge Elimination System (NPDES) program and administered by the EPA.

“*Environmental program area*” means the water supply (drinking water) program, underground storage tank program, wastewater program (nonpotable water), or solid waste and contaminated site program pursuant to 83.1(3).

“*Essential staff*” means an analyst who is primarily responsible for a particular analysis/program and handles the administrative or technical tasks associated with the analysis or program.

“*Holding time*” means the maximum time a sample may be held before beginning of an associated analysis.

“*Level of quantitation*” or “*LOQ*” means the analyte concentration that produces a signal sufficiently stronger than the blank, such that it can be detected with a specified level of uncertainty during routine operations.

“*Manual for the Certification of Laboratories Analyzing Environmental Samples for the Iowa Department of Natural Resources*” is incorporated by reference in this chapter.

Chapter 1 pertains to certification of laboratories analyzing samples of drinking water and incorporates by reference the Manual for the Certification of Laboratories Analyzing Drinking Water, 5th edition, January 2005, EPA document 815-R-05-004; Supplement 1, June 2008, EPA 815-F-08-006; and Supplement 2, November 2012, EPA 815-F-12-006.

Chapter 2 (2020), pertains to laboratories analyzing samples for the UST program.

Chapter 3 (2017), pertains to laboratories analyzing samples for wastewater and sewage sludge disposal programs.

Chapter 4 (2017), pertains to laboratories analyzing samples for the solid waste and contaminated site programs.

“*Method detection limit*” or “*MDL*” means the minimum concentration of a substance that can be measured and reported with 99 percent confidence that the analyte concentration is greater than zero and is determined from analysis of a sample in a given matrix containing the analyte.

“*National environmental laboratory accreditation program*” or “*NELAP*” means the third-party accreditation program that is managed by the NELAC Institute (TNI), a 501(c)(3) nonprofit organization, and that is based on consensus standards representing the best professional practices for laboratories.

“*Quality assurance plan*” or “*QA plan*” means a document that describes the key elements of laboratory functions that provide quality testing results to the client. The key elements include but are not limited to a description of the laboratory organizational structure and lines of responsibility; sampling requirements, procedures, and locations; sampling handling procedures; calibration procedures and frequencies; procedures for data reduction, validation, and reporting; quality control procedures including type, frequency and acceptance criteria; procedure(s) used to determine data precision and accuracy; corrective action contingencies; and preventative maintenance and schedules.

“*Proficiency test sample*” or “*PT sample*” means a reference sample provided to a laboratory for the purpose of demonstrating that a laboratory can successfully analyze the sample within limits of performance specified by the department. The true value of the concentration of the reference material is unknown to the laboratory at the time of analysis.

“*Provisional certification*” or “*provisional status*” means a laboratory has deficiencies, which must be corrected within the specified time frames in 83.6(3)“d,” but demonstrates to the satisfaction of the

department its ability to consistently produce valid data within the acceptance limits as specified within the department's certification requirements.

*"Reporting limit"* means a value established by the laboratory that is at or above the LOQ consistent with the method and compliance reporting requirements.

*"Revoked certification"* means a laboratory no longer fulfills the requirements of this chapter, and certification is revoked by the director upon determination of the director that the laboratory no longer fulfills the requirements for certification (Iowa Code section 455B.114).

*"Signature authority"* means the person with the managerial, educational, and technical experience authorized to sign analytical reports on behalf of the laboratory.

*"Standard operating procedure"* or *"SOP"* is a set of written instructions that describe, in detail, how to perform a laboratory method or process safely, consistently, and effectively.

*"SHL"* means the State Hygienic Laboratory at the University of Iowa.

*"Suspended certification"* means a temporary suspension of certification for a laboratory, conditional upon meeting the time frames in 83.6(5) "d" for the correction of the deficiency.

*"Temporary certification"* or *"temporary status"* means short-term transitional certification granted to a new laboratory that has no history of generating compliance data.

*"Traceability"* means the unbroken chain of events in the process of a sample being collected, received at the laboratory, prepared for analysis, analyzed, data reviewed and reported, and final disposal of the sample.

[ARC 9214C, IAB 5/14/25, effective 6/18/25]

#### PART B CERTIFICATION PROCESS

### **567—83.3(455B) Application for laboratory certification.**

**83.3(1)** *Application forms.* Application for laboratory certification shall be made on department form 542-0492 (July 2021) and shall be accompanied by the nonrefundable fee specified in 83.3(2). The application for certification renewal shall be made at least 60 days prior to the certification expiration date. The department may require submission of additional information necessary to evaluate the application. All documentation and fees must be submitted to the department prior to the on-site audit. Failure to submit a complete application may result in denial of the renewal or certificate update.

**83.3(2)** *Fees and expenses.*

*a.* A nonrefundable fee for the administration, completion of on-site laboratory surveys and assessments, and enforcement of laboratory certification requirements shall be paid with the certification application.

(1) The on-site audit will not be conducted and certification will not be issued until the fees and expenses are paid and all other certification requirements are met. The fee for certification will not be refunded if an on-site audit is not performed.

(2) Out-of-state laboratories will be responsible for paying the expenses of an on-site audit, in addition to the standard certification fee if required, and the department or its agent will bill the out-of-state laboratory directly for the expenses.

(3) When a laboratory's certification status is changed to provisional or suspended and the period for correcting deficiencies extends beyond the certification period, the laboratory must continue to pay the required fees in order to maintain its certification status.

(4) Additional fees will be assessed for the following, and the department or its agent will bill the laboratory directly.

1. The laboratory is responsible for paying for any additional on-site audits, at a fee of \$300 per audit. An example of this is when an additional on-site audit is required when a laboratory seeks certification for an entirely new set of parameters for which it had previously not been certified.

2. When an on-site audit is required to inspect for deficiencies that the laboratory must correct, the fee is \$500 per audit.

- b.* Where a laboratory is certified for the same analyte in more than one environmental program area, the laboratory must meet all the applicable certification requirements in addition to the payment of the fees.
- c.* In general, the department does not certify calculations. However, it is acceptable to report calculated results to clients and for regulatory reporting purposes.
- d.* Applicable fees shall be based on the type of analytical service provided as follows:

| ANALYTICAL GROUP                                    | REGULATORY PROGRAM & PARAMETERS <sup>1</sup>                                                                                     | FEE               |
|-----------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|-------------------|
| Asbestos                                            | SDWA                                                                                                                             | \$400             |
| Basic Drinking Water                                | SDWA (includes total coliform bacteria, <i>E. coli</i> , heterotrophic plate count, nitrate, nitrite, & fluoride)                | \$800             |
| Basic Wastewater                                    | CWA (includes BOD <sub>5</sub> , CBOD <sub>5</sub> , TSS, & ammonia)                                                             | \$400             |
| Bacteria                                            | CWA (includes total coliform, fecal coliform, and <i>E. coli</i> )                                                               | \$800             |
|                                                     | SDWA (basic drinking water) & CWA combined                                                                                       | \$1,300           |
| Dioxin                                              | SDWA                                                                                                                             | \$800             |
| Effluent Toxicity Testing                           | CWA                                                                                                                              | \$800             |
| Inorganics, including metals                        | CWA metals, inorganic compounds, and physical characteristics (\$400 per analyte up to a maximum of \$1,600)                     | \$400 to 1,600    |
|                                                     | SDWA (includes metals, ammonia, cyanide, fluoride, bromate, bromide, chlorite, total organic carbon & other inorganic chemicals) | \$1,600           |
|                                                     | SW/CS                                                                                                                            | \$1,600           |
|                                                     | CWA & SDWA combined                                                                                                              | \$2,400           |
|                                                     | CWA & SW/CS combined                                                                                                             | \$2,400           |
|                                                     | SDWA & SW/CS combined                                                                                                            | \$2,400           |
|                                                     | CWA, SDWA, and SW/CS combined                                                                                                    | \$2,800           |
| Radionuclides                                       | CWA                                                                                                                              | \$400             |
|                                                     | SDWA (includes gross alpha, gross beta, photon emitters, radium, strontium, tritium, & uranium)                                  | \$400             |
|                                                     | SDWA & CWA combined                                                                                                              | \$650             |
| Synthetic Organic Chemicals (SOC)                   | CWA                                                                                                                              | \$1,600           |
|                                                     | SDWA                                                                                                                             | \$1,600           |
|                                                     | SW/CS                                                                                                                            | \$1,600           |
|                                                     | CWA & SDWA combined                                                                                                              | \$2,400           |
|                                                     | CWA & SW/CS combined                                                                                                             | \$2,400           |
|                                                     | SDWA & SW/CS combined                                                                                                            | \$2,400           |
|                                                     | CWA, SDWA, & SW/CS combined                                                                                                      | \$2,800           |
| Volatile Organic Chemicals (VOC)                    | CWA                                                                                                                              | \$1,600           |
|                                                     | SDWA                                                                                                                             | \$1,600           |
|                                                     | SW/CS                                                                                                                            | \$1,600           |
|                                                     | CWA & SDWA combined                                                                                                              | \$2,400           |
|                                                     | CWA & SW/CS combined                                                                                                             | \$2,400           |
|                                                     | SDWA & SW/CS combined                                                                                                            | \$2,400           |
|                                                     | CWA, SDWA, & SW/CS combined                                                                                                      | \$2,800           |
| Underground Storage Tank Program Methods (UST)      | OA1 & OA2 for UST, CWA, & SW/CS programs                                                                                         | \$1,600           |
|                                                     | OA1, OA2, & Air Gas for UST, CWA, & SW/CS programs                                                                               | \$2,000           |
| Other analytes not included in the above categories | SDWA, CWA, UST, or SW/CS                                                                                                         | \$400 per analyte |

<sup>1</sup>CWA: Analysis of wastewater samples for the federal Clean Water Act.

SDWA: Analysis of drinking water samples for the federal Safe Drinking Water Act.

SW/CS: Analysis of water, soil, or solid samples for the solid waste or contaminated sites programs.

UST: Analysis of water and soil samples for the underground storage tank program.

e. Fees shall be paid by cashier's check, check, money order, credit card, electronic payment, or other means acceptable to the department, made payable to the Iowa department of natural resources laboratory certification program. Credit card or electronic payment may incur an additional fee. Purchase orders are not an acceptable form of payment. The fee shall be paid at least 60 days prior to the expiration date of any certification held by a laboratory. If a laboratory does not submit the application and fee by the expiration date, the laboratory is prohibited from conducting certified analytical tests until the application and fee are received by the department.

**83.3(3) Reciprocity.** Reciprocal certification of out-of-state laboratories by Iowa, and of Iowa laboratories by other states, is allowed. If the reciprocal state has a certification program for the area the lab is applying for in Iowa, the laboratory is required to obtain certification from their reciprocal state prior to receiving certification from Iowa. A laboratory must meet all Iowa certification criteria and pay all applicable fees as listed in this chapter. Any laboratory that is granted reciprocal certification in Iowa using primary certification from another state or provider is required to report any change in certification status from the accrediting state or provider to the department within 15 days of notification. A copy of the assessment report including the laboratory's approved corrective actions must be submitted to the department within 15 days after it is approved by the resident state or third-party accreditation provider. A laboratory that loses primary certification, either in its resident state program or third-party accreditation program, will also immediately lose certification for the same program area and parameters in Iowa, pursuant to 83.6(6) "a"(8).

a. *Out-of-state laboratories.* Where an out-of-state laboratory has received an on-site audit within its own state, the fee for certification shall not be reduced if an on-site audit is not performed by Iowa.

b. *Third-party accreditation.* The department will accept third-party accreditation from a state NELAP accreditation authority. The laboratory must provide the most recent on-site assessment and approved corrective action report.

[ARC 9214C, IAB 5/14/25, effective 6/18/25]

**567—83.4(455B) Procedures for new laboratory certification or changes in certification.** Laboratories that wish to become certified to conduct testing for an analyte or a method after the deadline for initial certification has passed, and any laboratory seeking initial certification, shall follow the procedures specified in rule 567—83.5(455B) for laboratory recertification. For changes in certification, the relevant fee must accompany the application where appropriate. New laboratories with no history of generating compliance data in any program area will be issued a temporary certification for a period of up to six months after the initial on-site audit. The laboratory may be re-audited in person or a document review may be conducted at the discretion of the SHL auditor(s).

[ARC 9214C, IAB 5/14/25, effective 6/18/25]

**567—83.5(455B) Laboratory recertification.** Laboratories shall be recertified every two years after initial certification. Applications for recertification must be on department form 542-0492 (June 2021) and must be submitted at least 60 days prior to the renewal date. Applications shall be accompanied by the nonrefundable fee specified in 83.3(2). To be recertified, laboratories must meet the following requirements.

**83.5(1) Approved methodology.** Laboratories must use methods promulgated or approved by the EPA or by the department. Notwithstanding an approval by the EPA, the department may use discretion in determining which methods may be used in Iowa. A laboratory may not analyze and report data from samples collected for an environmental program area until certified in that area. The laboratory shall submit supporting documentation such as calibration curves, MDL studies, LOQs, or other information upon request. The following are adopted by reference:

a. *Drinking Water* – 40 CFR Part 141 Subpart C (Monitoring and Analytical Requirements) as amended February 5, 2024; 40 CFR §141.74 (Filtration and Disinfection) as amended February 13, 2013; 40 CFR §141.89 (Control of Lead and Copper) as amended January 15, 2021; 40 CFR §141.131 (Disinfection By-Products) as amended February 13, 2013; 40 CFR §141.402 (Groundwater Rule) as amended February 13, 2013; 40 CFR §141.704 (Enhanced Treatment for Cryptosporidium) as amended

June 29, 2009; 40 CFR §141.852 (Revised TCR) as amended February 26, 2014; 40 CFR Part 901 (PFAS) as amended through June 25, 2024; 40 CFR §143.4 (Secondary Regulations) as amended June 29, 2009.

*b. Wastewater (nonpotable water)* – 40 CFR Part 136, June 17, 2024.

*c. Municipal biosolids (sewage sludge)* – 40 CFR Part 136, as amended June 17, 2024, and Test Methods for Evaluating Solid Waste: Physical/Chemical Methods (SW-846 Update VII) as amended July 30, 2021.

*d. Solid waste and contaminated sites* – Test Methods for Evaluating Solid Waste: Physical/Chemical Methods (SW-846 Update VII) as amended July 30, 2021.

*e. Underground storage tanks* – Iowa Methods OA-1 and OA-2, December 10, 2019, and EPA method 8260 – Test Methods for Evaluating Solid Waste: Physical/Chemical Methods (SW-846 Update VII) as amended July 30, 2021.

**83.5(2) Proficiency testing samples.** Certified laboratories must satisfactorily analyze PTs at least once every 12 months for each analyte by each method in each program area for which the laboratory intends to retain certification unless a PT sample is not available for the particular analyte, method, or program area. Results must be submitted electronically by the PT provider to the department at [labcert@dnr.iowa.gov](mailto:labcert@dnr.iowa.gov) along with a statement of the method used once the study is published. The laboratory must maintain records of all PT samples including summary pages, explanations, and footnotes, pursuant to the recordkeeping requirements in 83.5(8) “b.”

*a. Test requirements.*

(1) PT samples shall be analyzed in accordance with the laboratory’s routine standard operating procedures using the same quality control, acceptance criteria, and staff as used for the analysis of routine environmental samples. PT samples may not be analyzed multiple times for the purpose of averaging results to be reported to the PT provider.

(2) The PT sample shall be analyzed by a different analyst(s) or analytical team in following years, if there are multiple analysts in the laboratory.

(3) Once the results of a PT sample are submitted to the PT provider, remaining PT samples may be used as check samples or for demonstration of capability of analysts.

(4) Laboratories that receive unacceptable PT result(s) shall notify the department within 10 days of the unacceptable result(s). This does not include the required corrective action report.

*b. Performance testing providers and acceptance limits.* All PT samples must be obtained from a NELAP accredited provider. Performance test results shall be evaluated using criteria from NELAP field of proficiency tables except where noted otherwise. If there is a difference between the NELAP field of proficiency tables and federal rules, the rules shall prevail. Approved PT vendors and fields of proficiency tables may be found at [nelap-institute.org](http://nelap-institute.org).

**83.5(3) Notification of major changes.** Laboratories must notify the department, in writing, of major changes in critical or essential personnel, equipment, laboratory location, or other major change that might alter or impair analytical capability. The department may issue a notice of violation based on cause.

*a. Major equipment.* Laboratories must notify the department 90 days, whenever possible, prior to installation of major equipment when the technology is not currently being utilized by the laboratory. This includes, but is not limited to, inductively coupled plasma spectrophotometers, mass spectrometers, gas chromatographs, liquid chromatographs, and continuous spectrophotometers. The installation of a new water bath or incubator does not need to be reported. If requested, the laboratory must submit the DOC to the department for review and approval prior to reporting compliance data using the new equipment.

*b. Laboratory relocation.* Laboratories must notify the department 90 days prior to a laboratory relocation. Laboratories must complete a DOC for each major piece of equipment once it has been relocated to the new laboratory. If requested, the laboratory must submit the DOC to the department for review and approval prior to reporting compliance data.

*c. Personnel changes.* Laboratories must notify the department 30 days prior to, whenever possible, but in no circumstance later than ten days after, the departure of critical or essential personnel. If requested, a DOC must be submitted to the department before the laboratory may report environmental data. DOC records for all staff must be maintained on file for review by an auditor. The loss of a critical staff person means the lab will not be able to analyze samples and must subcontract samples for a specific method(s)

or program area(s) until another person is hired to perform the particular function or analysis and has completed an initial DOC. The loss of an essential staff person means that existing staff must undergo additional training before they can assume the role.

*d. Laboratory shutdown.* Laboratories must notify the department within five days if the laboratory has shut down due to a natural or man-made disaster, a cybersecurity incident, or other occurrence that renders the laboratory unable to perform analyses for Iowa clients.

*e. Data quality issues.* If a laboratory becomes aware that there are systematic data quality issues that affect the result(s) for one or more analytes, the laboratory must notify the department within five days. The laboratory must resolve the issues, submit a corrective action report, and submit an amended analytical report to the client(s) and the department within 30 days.

**83.5(4) Annual requirements.** Laboratories are required to perform the following updates on an annual basis. Documentation of these updates must be maintained in paper or electronic form, or a combination thereof, pursuant to the recordkeeping requirements in 83.5(8) “b” and shall be made available during the on-site audit, or if requested by the department.

- a.* Balance maintenance and weight verification;
- b.* Working thermometer verification;
- c.* Review the QA plan and document the date, reviewer, and any changes;
- d.* Review SOPs, and document the review and any changes to the SOPs. Confirm that QC requirements are performed with each analysis and that additional QC requirements are conducted monthly, quarterly, or annually as needed;
- e.* Review sample handling, preservation and storage requirements if they are not addressed in the SOP;
- f.* Conduct a continuing DOC for analysts;
- g.* Run and document calibration curves;
- h.* Perform annual PTs;
- i.* Review manufacturer equipment maintenance schedules, perform scheduled maintenance, and document the maintenance performed;
- j.* Replace and document the source of reference cultures used for microbiological analyses; and
- k.* Check spreadsheets annually to determine that calculated results have not changed due to software updates. Spreadsheet calculations may need to be checked manually.

In addition to the above requirements, it is recommended that the laboratory review the safety plan with all employees and conduct an internal audit annually.

**83.5(5) Site audits.**

*a. SHL certification.* The department has designated the SHL as its appraisal authority for laboratory certification. The SHL is responsible for attaining and maintaining laboratory certification for the SDWA program that is acceptable to the EPA. The SHL shall obtain accreditation from a state NELAP accreditation authority in all department program areas specified in 83.1(3), where available. The SHL shall forward audit reports to the department according to the time frame in 83.3(3). The SHL is not required to pay the fees for laboratory certification.

*b. On-site audits.* Laboratories must consent to a periodic site audit by the department or its designee, at least every two years. However, on-site audits may be conducted more frequently if the laboratory undergoes a major change that may alter or impair analytical capability, fails a PE sample analysis, or if the department questions an aspect of data submitted that is not satisfactorily resolved. Laboratories certified by reciprocity generally are not required to have an on-site audit conducted by the SHL. However, the department and the SHL reserve the right to conduct an on-site audit.

**83.5(6) Period of validity.**

*a.* Certification shall be valid for a period not to exceed two years from the date of issuance. Certification shall remain in effect until certification is either renewed or revoked, provided a laboratory has submitted a timely and complete application, and paid the appropriate fee.

*b.* Laboratories that have not submitted a timely and complete application and have not paid the appropriate fee may not report compliance data if their certification has expired.

**83.5(7) Reporting requirements.** Laboratories may not analyze or report sample results for any analyte, analytical series, or environmental program area until an initial certification status of certified or temporary has been granted by the department. Any data generated before certification status is granted will be considered invalid for compliance purposes. A laboratory with provisional status may analyze and report analyses for compliance purposes. A certified laboratory may contract analyses to another certified laboratory. The responsibility lies with the primary certified laboratory contracting for services to verify that the secondary contracting laboratory is certified by the department and to ensure that reporting requirements and deadlines are met.

*a. All program areas.* Laboratories that generate data for clients must list all of the following elements on paper or electronic reports provided to clients.

- (1) Iowa certified laboratory number;
- (2) Laboratory name, address, and phone number;
- (3) Laboratory sample ID;
- (4) Client sample location ID;
- (5) Regulatory ID number, such as a permit number;
- (6) Date and time of sample collection;
- (7) Date and time of sample receipt and temperature (may be recorded on chain of custody, receiving sheet, or comments);
- (8) Sample collector name;
- (9) Date and time of analysis;
- (10) Analyst name;
- (11) Matrix;
- (12) Analyte;
- (13) Analytical method used;
- (14) The reporting limit;
- (15) Analysis result;
- (16) Units of measure;
- (17) Subcontracting laboratory or laboratories, if used;
- (18) Signature of signatory authorized to sign analytical reports; and
- (19) Chain of custody records.

*b. Additional reporting for all program areas.*

- (1) The use of whiteout to correct errors is strictly prohibited.
- (2) Laboratory records and final reports shall be recorded in ink or electronically signed.
- (3) A laboratory shall not express an analytical result as either:
  1. Lower than the LOQ, such as using the MDL; or
  2. As zero, unless specifically required by rule.
- (4) Laboratories reporting data for the purpose of a monthly operation report (MOR) or discharge monitoring report (DMR) must follow the instructions and use the templates specified by the program area(s).

*c. Water supply program.*

(1) Certified laboratories must report all analytical test results for all public water supply systems (PWS) using the electronic reporting system provided by the department. New laboratories shall be fully compliant with electronic data reporting requirements no later than 45 days after the laboratory begins analysis of compliance samples. If a PWS is required by the department to collect and analyze a sample for an analyte not normally required by 567—Chapters 41 and 43, the laboratory testing for that analyte must also be certified and report the results of that analyte to the department. A PWS may request that a laboratory add additional analytes for analysis after samples are received by the laboratory, but may not remove an analyte originally requested after the laboratory has initiated analysis of those analytes without written department approval. It is the laboratory's responsibility to correctly assign and track the sample identification number, the facility ID, and source/entry point data for all reported samples.

1. The following are examples of sample types for which data results must be reported:

- Routine: a regular sample that includes samples collected for compliance purposes at various sampling frequencies;

- Repeat: a sample that must be collected after a positive result from a routine or previous repeat total coliform sample, per 567—paragraph 41.2(1) “j.” Repeat samples must be analyzed by the same laboratory that analyzed the associated original routine sample;

- Confirmation: a sample that verifies a routine sample, normally used to determine compliance with a health-based standard;

- Special: a nonroutine sample, such as raw, plant, and troubleshooting samples, which cannot be used to comply with monitoring requirements assigned by the department;

- Maximum residence time: a sample collected at the maximum residence time location in the distribution system, usually for disinfection byproduct measurement; and

- Replacement: a sample that replaces a missed sample from a prior monitoring period resulting in a monitoring violation.

2. The following additional types of data must be reported to the department:

- MOR data that is required by the department to demonstrate compliance with public health standards; and

- Raw water sampling results specifically covered by 567—Chapters 40 to 43 for new surface water or groundwater sources, or reconstruction of groundwater sources.

3. The following are examples of data results that are not required to be reported by a laboratory to the department:

- Routine MOR data; or

- Distribution samples for the Total Coliform Rule 567—subrule 41.2(1) for water main repair or installation.

4. The sample type cannot be changed after submittal to the laboratory, without written department approval. The prescreening, splitting, or selective reporting of compliance samples is not allowed.

(2) Certified laboratories must report all analytical results to the PWS for which the analyses were performed.

(3) Analytical results must be reported to and received by the department by the seventh day of the month following the month in which the samples were analyzed.

(4) In addition to the monthly reporting of analytical results, the following results must be reported within 24 hours of the completion of the analysis, including data reduction, to the department by email or other acceptable method acceptable to the department, and to the PWS for which the analyses were conducted:

1. Results of positive routine coliform bacteria samples, and all repeat and follow-up samples; and

2. Results of any contaminant that exceeds public drinking water standards (maximum contaminant level, treatment technique, action level, or health advisory), and any subsequent confirmation samples.

Results available outside of routine business hours must be reported to the department’s Environmental Emergency Reporting Hotline at 515.725.8694.

(5) If requested by the department, certified laboratories shall report their MDLs, LOQs, and any other pertinent information when reporting results for PWSs.

- d. *UST program.* No additional information.

- e. *Wastewater program.* No additional information.

- f. *Solid waste and contaminated site programs.* No additional information.

### **83.5(8) Recordkeeping.**

- a. *Appraisal authority.* The laboratory certification program appraisal authority must retain the records for on-site laboratory audits and certification program reviews. The records must be maintained in an easily accessible manner for a period of six years, including the last two on-site audits. The records include correspondence used to determine compliance with the laboratory certification program requirements, and may include checklists, corrective action reports, final reports, certificates, PT study results, and any other related documents.

- b. *Laboratories.* Laboratories shall retain laboratory records in paper or electronic form or a combination of both. Laboratory records include, but are not limited to, calibration curves; raw data;

calculations and supporting data such as chromatographs; analytical results; lists of chemicals and equipment used; QA plans; SOPs; and PT results. Laboratory records shall be retained according to the following schedule:

- (1) Drinking water: microbiology and turbidity, five years; chemical, ten years; lead and copper rule, twelve years.
- (2) Wastewater: all analytes, three years. Federal DMRQA reports, three years.
- (3) Sewage sludge (municipal biosolids): all analytes, five years.
- (4) Solid waste and contaminated sites: all analytes, five years.
- (5) Underground storage tanks: all analytes, five years.

[ARC 9214C, IAB 5/14/25, effective 6/18/25]

**567—83.6(455B) Criteria and procedure for provisional, suspended, and revoked laboratory certification.**

**83.6(1) *Voluntary withdrawal of certification.*** A laboratory may voluntarily withdraw certification for an analyte, a related analytical series, an environmental program area, or the entire laboratory at any time in lieu of receiving a downgraded certificate with a provisional, suspended, or revoked status.

**83.6(2) *Provisional certification criteria.***

*a.* The department may downgrade certification to provisional status based on cause. The reasons for which a laboratory may be downgraded to provisionally certified status include, but are not limited to, the following list.

- (1) Failure to analyze a performance evaluation (PT) sample annually within acceptance limits;
- (2) Failure to notify the department within the time period specified in 83.5(3) of changes in essential personnel, equipment, laboratory facilities, or other major changes that might impair analytical capability;
- (3) Failure to satisfy the department that the laboratory is maintaining the required standard of quality based on an on-site audit;
- (4) Failure to report compliance data in a timely manner to the department or the client, thereby preventing timely compliance with environmental program regulations.

*b.* The department may assess an administrative penalty for a laboratory's failure to comply with the laboratory certification or reporting requirements.

**83.6(3) *Provisional certification procedure.***

*a. Laboratory notification.* If a laboratory is subject to a downgrade to provisional status on the basis of 83.6(2), the department will notify the laboratory or owner in writing of the downgraded status. Certification may be downgraded to provisional for an analyte, a related analytical series, an environmental program area, or the entire laboratory.

*b. Reporting.* A provisionally certified laboratory may continue to analyze samples for compliance purposes.

*c. Right to appeal.* There is no appeal for this process, as it does not affect a laboratory's ability to analyze compliance samples and report to the department.

*d. Correction of deficiencies.*

(1) Once the department notifies a laboratory in writing that it has been downgraded to provisionally certified status, the laboratory must correct the problem within the following time frames, unless a written extension is obtained from the department. If the problem is not corrected, the laboratory is subject to suspension for that analyte, related analytical series, environmental program area, or the entire laboratory.

1. Unacceptable PT sample result within two months of notification.
2. Procedural deficiency within three months of notification.
3. Administrative deficiency within three months of notification.
4. Equipment deficiency within three months of notification.

(2) The laboratory shall submit a corrective action report(s), including documentation that demonstrates the laboratory has complied with the required corrective actions.

*e. Reinstatement.* Certification will be reinstated when the laboratory can demonstrate that all conditions for laboratory certification have been met to the department's satisfaction and that the deficiencies that caused provisional certification status have been corrected. The SHL may conduct an on-site audit to verify that corrective actions have been implemented.

**83.6(4) *Suspended certification criteria.***

a. The department may downgrade certification to suspended status based on cause. The reasons for which a laboratory may be downgraded to suspended status include, but are not limited to, the following:

- (1) Failure to analyze a PT sample annually within acceptance limits;
- (2) Failure to correct previously identified deficiencies, which resulted in provisional certification status, within the prescribed time frames of 83.6(3) “d”(1);
- (3) Failure to satisfy the department that the laboratory is producing accurate data;
- (4) Failure to use required analytical methodology for analyses submitted to the department; or
- (5) Repeated failure to report compliance data in a timely manner.

b. Administrative penalty. The department may assess an administrative penalty for a laboratory’s failure to comply with the laboratory certification or reporting requirements.

c. Emergency certification suspension. The department may suspend certification without providing notice and opportunity to the laboratory to be heard if the department finds that the public health, safety, or welfare imperatively requires emergency action, and incorporates a finding to that effect in its administrative order, pursuant to 561—Chapter 7.

**83.6(5) *Suspended certification procedure.***

a. *Laboratory notification.* If a laboratory is subject to downgrading to suspended status on the basis of 83.6(4), the department will notify the laboratory or owner in writing of its intent to suspend certification in accordance with 561—Chapter 7. Certification may be suspended for an analyte, a related analytical series, an environmental program area, or the entire laboratory.

b. *Reporting.* Once the suspension is effective, a laboratory must immediately discontinue analysis and reporting of compliance samples, may not analyze or report samples for compliance with departmental standards, and must notify the laboratory’s Iowa regulated clientele and other state certifying agencies of the change of the laboratory certification status within three days. Any results generated during the period of suspension may not be used for compliance purposes by the department.

c. *Right to appeal.*

(1) The laboratory may appeal this decision by filing a written notice of appeal and request an administrative hearing with the department director within 30 days of receipt of the notice of suspension of certification. Contested case procedures under 561—Chapter 7 shall govern administration of the appeal. The appeal must identify the specific portion(s) of the department action being appealed, be supported with a statement of the reason(s) for the challenge, and be signed by a responsible official from the laboratory.

(2) If no timely notice of appeal is filed, suspension is effective 30 days after receipt of the notice of suspension unless an emergency suspension order is in effect.

d. *Correction of deficiencies.*

(1) Once the department notifies a laboratory in writing that it has been downgraded to suspended status, the laboratory must correct the problem within the following timetable, unless a written extension is obtained from the department. If the problem is not corrected, the laboratory is subject to revocation for that analyte, related analytical series, environmental program area, or the entire laboratory.

1. Unacceptable PT sample result within two months of notification.
2. Procedural deficiency within three months of notification.
3. Administrative deficiency within three months of notification.
4. Equipment deficiency within three months of notification.

(2) The laboratory shall review the problems cited and, within the time period designated by the department, submit a corrective action report(s) including documentation that demonstrates the laboratory has complied with the required corrective actions. The department shall consider the adequacy of the response and notify the laboratory of its certification status and may follow up to ensure that corrective actions have been taken.

e. *Reinstatement.*

(1) Fee.

1. The laboratory will not be required to pay an additional fee if recertification affects an analyte or related analytical series, provided that:

- The laboratory is currently certified for other analytes, or

- A fee was paid within the two-year certification period for that related analytical series and the laboratory is certified for other parameters within that related analytical series.

2. A fee is required when suspension affects a related analytical series, effectively deleting that fee group from certification (such as all microbiological parameters in SDWA-MICRO), an environmental program area, or the entire laboratory. A fee is also required if an additional on-site audit is required.

(2) Certification will be reinstated when the laboratory can demonstrate that all conditions for laboratory certification have been met and that the deficiencies that caused the suspension have been corrected. This may include an on-site audit, successful analysis of unknown samples, or any other measure that the department deems appropriate.

**83.6(6)** *Revoked certification criteria.*

a. The department may revoke certification for cause. The reasons for which a laboratory's certification may be revoked include, but are not limited to, the following:

- (1) Failure to correct deficiencies according to the time period specified in 83.6(5) "d"(1);
- (2) Submission of a PT sample to another laboratory for analysis and reporting the data as its own;
- (3) Falsification of data or other deceptive practices;
- (4) Failure to use required analytical methodology for analyses submitted to the department;
- (5) Failure to satisfy the department that the laboratory is maintaining the required standard of quality based on the on-site audit;

(6) Persistent failure to report compliance data to the regulated client or the department in a timely manner, thereby preventing compliance with state regulations and endangering public health;

(7) Subverting compliance with state regulations by actions such as changing the sample type for a noncompliance sample to a compliance sample after its submission to the laboratory, allowing compliance samples to be changed to other noncompliance sample types, or selective reporting of split sample results; or

(8) For laboratories certified through a reciprocal agreement with another state or third-party accreditation program, loss of certification in either the resident state or third-party accreditation program is cause for immediate revocation of certification in Iowa for the same parameters or program areas for which certification was lost.

b. The department may assess an administrative penalty for a laboratory's failure to comply with the laboratory certification or reporting requirements.

c. Emergency revocation. The department may revoke certification without providing notice and opportunity to the laboratory to be heard if the department finds that the public health, safety, or welfare imperatively requires emergency action, and incorporates a finding to that effect in its administrative order, pursuant to 561—Chapter 7.

d. Laboratory-requested revocation (withdrawal of certification). The department may revoke certification upon receipt of a written request by the certified laboratory for removal from the certification program.

**83.6(7)** *Revoked certification procedure.*

a. *Laboratory notification.* Except for the instance when the laboratory voluntarily requests revocation in 83.6(6) "d," if a laboratory is subject to revocation on the basis of 83.6(6), the department will notify the party in writing of its intent to revoke certification in accordance with 561—Chapter 7. Certification may be revoked for an analyte, a related analytical series, an environmental program area, or the entire laboratory.

b. *Reporting.* Once revocation is effective, a laboratory must immediately discontinue analysis and reporting of compliance samples, shall not analyze or report samples for compliance with departmental standards, and must notify the laboratory's Iowa-regulated clientele and other state certifying agencies of the change of the laboratory certification status within three business days of receipt of the final notice. Any results generated after revocation may not be used for compliance purposes by the department.

c. *Right to appeal.* When a laboratory requests revocation pursuant to 83.6(6) "d," the revocation will be issued promptly and will be effective immediately with no appeal process.

(1) The laboratory may appeal this decision by filing a written notice of appeal and request for an administrative hearing with the department director within 30 days of receipt of the notice of revocation

of certification. Contested case procedures under 561—Chapter 7 shall govern further administration of the appeal. The appeal must identify the specific portion(s) of the department action being appealed, be supported with a statement of the reason(s) for the challenge, and be signed by a responsible official.

(2) If no timely notice of appeal is filed within the 30-day time period, revocation is effective 30 days after receipt of the notice of revocation.

*d. Reinstatement.* A laboratory that has had its certification revoked may apply for certification in accordance with rule 567—83.3(455B) once the deficiencies have been corrected.

[ARC 9214C, IAB 5/14/25, effective 6/18/25]

These rules are intended to implement Iowa Code sections 455B.113 through 455B.115.

TITLE VII  
WATER POLLUTION CONTROL STATE REVOLVING FUND  
CHAPTER 90  
CLEAN WATER STATE REVOLVING FUND  
[Prior to 12/3/86, Water, Air and Waste Management[900]]

Chapter rescission date pursuant to Iowa Code section 17A.7: 6/18/30

**567—90.1(455B) Statutory authority, purpose, and general policy.**

**90.1(1) *Statutory authority.*** The department of natural resources and the Iowa finance authority are jointly designated to administer the clean water state revolving fund (CWSRF). Authority to administer this fund is provided by Iowa Code sections 455B.291 through 455B.299 and the federal CWA. Section 603(c) of Title VI of the CWA allows the use of state revolving funds to assist in the construction of POTWs and WPC projects.

**90.1(2) *Purpose.*** This chapter provides the definitions, forms, general project and program administration rules, criteria for loan eligibility, and criteria for rating and ranking WPC projects for the CWSRF point source and NPS pollution control programs. The selection criteria, methods for selecting projects or programs for loans, and the extent to which these policies must be described in the IUP are required by 40 CFR §35.3150.

**90.1(3) *Administration.*** The department, in conjunction with the authority, has been delegated the responsibility of administering the CWSRF program described in this chapter and the DWSRF program described in 567—Chapter 44. The director may coordinate with the authority under the terms of an interagency agreement entered into pursuant to Iowa Code chapter 28E.

**90.1(4) *Program funding.*** The commission shall set funding targets for point source and NPS activities and adjust the fundable project list to ensure that the short- and long-term goals of the IUP are achieved. It is the intent of the commission to reserve a portion of the CWSRF funds to provide for the purpose of making low-interest loans for NPS WPC projects. The amount for each NPS program will be determined in the IUP. Loans of up to 100 percent of the eligible costs of WPC projects will be made available pursuant to these rules, rules established by the authority, and Title VI of the CWA.

**90.1(5) *State capitalization grant.*** The CWA authorizes the EPA to offer capitalization grants to states for use in a revolving fund loan program. A portion of the capitalization grant, as allowed by Title VI of the CWA, will be used to administer the CWSRF program.

**90.1(6) *Federal funding coordination.*** Projects may use CWSRF funds to complete the financing of projects partially funded by other federal programs.

**90.1(7) *Project determination.*** A project must comply with this chapter to be eligible for a CWSRF loan. The department shall use a priority rating system to rate eligible projects for funding. An eligible project may be either a point source project or an NPS project or activity. CWSRF assistance will be available to projects in priority order. Additional rating criteria for NPS activities will be established in the IUP and circumstances for use are described in 90.14(1). Projects or activities qualifying for CWSRF assistance shall be identified in the IUP on the state PPL, developed pursuant to this chapter, and only those projects or activities may be considered fundable. WPC projects that provide the best water quality improvements or protection based on the rating system and are ready to proceed are to be funded.

**90.1(8) *Decisions.*** Department decisions are final unless the recipient files a written petition for review with the director. The petition must be addressed to the director and clearly state the decision in question and the basis for the requested review. The recipient has the right to appeal a decision to the commission pursuant to Iowa Code chapter 17A or to the state court.

**90.1(9) *Public participation.*** The public has an opportunity annually, and quarterly as needed, to comment on both the fundable list and the short- and long-term goals of the IUP.

[ARC 9215C, IAB 5/14/25, effective 6/18/25]

**567—90.2(455B) Definitions, abbreviations, and forms.**

**90.2(1) *Definitions.*** In addition to the definitions and references in 567—Chapter 40, the following definitions are applicable to this chapter:

“*Comprehensive Nutrient Management Plan*” or “*CNMP*” means a conservation system that is unique to an AFO. A CNMP is a grouping of conservation practices and management activities which, when implemented as part of a conservation system, will help to ensure that both production and natural resource protection goals are achieved. A CNMP incorporates practices to use animal manure and organic by-products as beneficial resources. A CNMP addresses natural resource concerns dealing with soil erosion, manure, and organic by-products and their potential impacts on all natural resources including water and air quality, which may derive from an AFO. A CNMP is developed to assist an AFO owner/operator in meeting all applicable local, tribal, state, and federal water quality goals or regulations. For nutrient-impaired stream segments or water bodies, additional management activities or conservation practices may be required by local, tribal, state, or federal water quality goals or regulations.

“*CWA*” or “*Clean Water Act*” means the federal Water Pollution Control Act effective July 1, 2024, 33 U.S.C. §1251 et seq.

“*CWSRF*” means the clean water state revolving fund, also known as the water pollution control works revolving loan fund as defined in Iowa Code section 455B.291.

“*Eligible entity*” means a person eligible under the provisions of the CWA, the SDWA, and the commission rules to receive loans for projects from either of the revolving loan funds.

“*Eligible project*” means, in the context of WPC facilities, the acquisition, construction, reconstruction, extension, equipping, improvement, or rehabilitation of any works and facilities useful for the collection, treatment and disposal of sewage and industrial waste in a sanitary manner including treatment works as defined in Section 212 of the CWA, and including construction and undertaking of NPS WPC projects and related development activities authorized under the CWA. Projects for the primary purpose of speculative growth are considered ineligible.

“*Energy conservation*” means renewable energy construction projects such as wind, solar, etc.

“*Facility plan*” means a report certified by a professional engineer licensed to practice in Iowa and prepared in conformance with Chapter 1 of the IWFDS. This report shall include an evaluation of the facility, identify problems, provide alternatives and a recommended solution, outline financing options and project timeline, and address other applicable issues ensuring the viability of the project and the facility to meet project goals and discharge requirements.

“*Fiscal year*” means the state fiscal year starting July 1 and ending June 30.

“*Intended use plan*” or “*IUP*” means a plan identifying the intended uses of funds available for loans in the WPC state revolving fund for each fiscal year as described in Section 606(c) of the CWA.

“*IWFDS*” means the Iowa Wastewater Facilities Design Standards, effective June 2025, located on the department’s website at [www.iowadnr.gov](http://www.iowadnr.gov).

“*Municipality*” means the city, county, sanitary district, state agency, or other governmental corporation or body empowered to provide sewage collection and treatment services, or any combination of two or more such governmental bodies, or corporations acting jointly, in connection with a project.

“*New AFO*” means an animal feeding operation that meets at least one of the following criteria:

1. It was constructed after January 1, 2006.
2. Animal production at the site was resumed after being discontinued for at least 12 months.
3. Production facilities were altered in order to house a different animal species than was produced previously.

“*Nontraditional project*” means a project whose primary purpose is not to protect or improve water quality. A secondary purpose of the project does include water quality improvement or protection.

“*NPS*” means nonpoint source pollution which does not have a single point of origin and/or is not introduced into a receiving stream from a specific outlet. NPS pollution sources are diffuse and may be a result of runoff, precipitation, atmospheric deposition, drainage, seepage, or hydrological modification.

“*POTW*” means publicly owned treatment works as defined in Section 212 of the CWA.

“*Private sewage disposal system*” or “*PSDS*” is defined in 567—subrule 69.1(2). For the purposes of this chapter, “PSDS” means the same as “onsite wastewater treatment system” or “onsite system.”

“*Project category*” means identified categories of projects that comprise mutually exclusive classes of facilities. Each category and the types of projects included in the category are listed below.

1. Category I. Secondary treatment—wastewater treatment costs necessary to meet the minimum level of treatment defined by the CWA.
2. Category II. Advanced treatment—wastewater treatment costs necessary to attain a level of treatment that is more stringent than standard secondary treatment or to produce a significant reduction in nonconventional or toxic pollutants present in the treated wastewater.
3. Category III–A. Infiltration/inflow (I/I) correction—costs for correction of sewer system I/I problems. Infiltration includes controlling the penetration of water into a sanitary or combined sewer system from the ground through defective pipes or manholes. Inflow includes controlling the penetration of water into the system from drains, storm sewers, and other improper entries. This category also includes costs for preliminary sewer system analysis and detailed sewer system evaluation surveys.
4. Category III–B. Sewer replacement/rehabilitation—costs for the reinforcement or reconstruction of structurally deteriorating sanitary or combined sewers. The corrective actions must be necessary to maintain the structural integrity of the system. Rehabilitation is considered to be extensive repair of existing sewers (collector and interceptor) beyond the scope of normal maintenance programs, when sewers are collapsing or structurally unsound. “Replacement” is the construction of parallel sewer or sewers that perform the function of existing sewers where existing sewers are to be abandoned. Sewer work associated with I/I elimination is considered a Category III–A need. Relief sewers do not fall within this category since they are newly constructed sewers with a function beyond that of existing sewers.
5. Category IV–A. New collector sewers and appurtenances—costs of new pipes used to collect and carry wastewater from a sanitary or industrial wastewater source to an interceptor sewer that will convey the wastewater to a treatment facility. The collection system is considered as those public sewers which have a principal purpose of providing service for individual users in existing residential and commercially developed areas to enable collection of wastewater in a centralized system. Pumping stations, force mains, and other related appurtenant structures are considered part of the collection system if their primary mechanical function relates to the collection system.
6. Category IV–B. New interceptor sewers and appurtenances—costs for constructing new interceptor sewers and pumping stations to convey wastewater from collection sewer systems to a treatment facility or to another interceptor sewer. Relief sewers are included in this category where additional sewer capacity is required to accommodate all wastewater in a separate sewer system to ensure that it is transported to a wastewater treatment plant for adequate treatment, and to prevent public health hazards within the service area. Relief sewers may include parallel sewers. Pumping stations and force mains and other related appurtenant structures are considered in this category if their primary mechanical function relates to the interceptor’s principal purpose. Equalization basins are included in this category.
7. Category V. Combined sewer overflow (CSO) correction—costs to prevent or control the periodic discharges of mixed stormwater and untreated wastewater (CSOs) that occur when the capacity of a sewer system is exceeded during a wet weather event. This category does not include costs for overflow control allocated to flood control, drainage improvement, or the treatment or control of stormwater in separate storm systems.
8. Stormwater management program categories. The following categories include costs to address the described stormwater management program activities:
  - Category VI. Gray infrastructure—costs to plan and implement structural and nonstructural measures to control the runoff of water resulting from precipitation (stormwater) with the purpose of improving and protecting water quality. This category includes controlling stormwater pollution from diffuse sources by reducing pollutants in runoff from commercial and residential areas served by the storm sewer, detecting and removing illicit discharges and improper disposal into storm sewers, monitoring pollutants in runoff from industrial facilities that flow into municipal separate storm sewer systems, and reducing pollutants in construction site runoff discharged to municipal separate storm sewers.
  - Category VI–A. Stormwater conveyance infrastructure—planning, design, and construction costs associated with stormwater conveyances including pipes, inlets, roadside ditches, and other similar mechanisms. These costs will be eligible if they are combined with practices described in Category VI–B or VI–C in order to achieve water quality protection or improvement.

- Category VI–B. Stormwater treatment systems—planning, design, and construction costs associated with stormwater treatment including wet ponds, dry ponds, manufactured devices, and other similar means. These costs will be eligible if these activities are implemented in order to achieve water quality protection or improvement.

- Category VI–C. Green infrastructure—planning, design, and construction costs associated with low-impact development and green infrastructure, such as bioretention, constructed wetlands, permeable pavement, rain gardens, green roofs, cisterns, rain barrels, vegetated swales, or restoration of riparian buffers and flood plains. Projects in this category can be both publicly owned and privately owned.

- Category VI–D. General stormwater management—costs associated with implementing a stormwater management program, such as geographic information systems or tracking systems, equipment such as street sweepers and vacuum trucks, stormwater education program startup costs, and stormwater management plan development.

9. NPS project categories. The following categories include costs to address NPS project categories with certain activities, as described:

- Category VII–A. NPS control: agriculture (cropland)—costs associated with agricultural activities related to croplands, such as plowing, pesticide spraying, irrigation, fertilizing, planting, and harvesting.

- Category VII–B. NPS control: agriculture (animals)—costs associated with agricultural activities related to animal production, such as confined animal facilities, open feedlots, and grazing.

- Category VII–C. NPS control: silviculture—costs associated with forestry activities such as removal of streamside vegetation, road construction and use, timber harvesting, and mechanical preparation for tree planting.

- Category VII–E. NPS control: groundwater protection (unknown source)—costs associated with groundwater protection needs such as wellhead and recharge protection activities.

- Category VII–F. NPS control: marinas—costs associated with boating and marinas, such as poorly flushed waterways, boat maintenance activities, sewage discharge from boats, and the physical alteration of shoreline, wetlands, and aquatic habitat during the construction and operation of marinas.

- Category VII–G. NPS control: resource extraction—costs associated with mining and quarrying activities.

- Category VII–H. NPS control: brownfields—costs associated with abandoned industrial sites that might have residual contamination (brownfields).

- Category VII–I. NPS control: storage tanks—costs associated with tanks designed to hold gasoline, other petroleum products, or chemicals. The tanks may be located above or below ground level.

- Category VII–J. NPS control: landfills—costs associated with sanitary landfills.

- Category VII–K. NPS control: hydromodification—costs to address the degradation of water resources as a result of altering the hydrological characteristics of noncoastal waters, including channelization and channel modification, dam, and streambank and shoreline erosion. Work involving wetland or riparian area protection or restoration is included in this category.

10. Category X. Recycled water distribution—costs associated with conveyance of treated wastewater that is being reused (recycled water), including associated rehabilitation/replacement needs.

11. Category XII. Decentralized sewage treatment—costs associated with the rehabilitation or replacement of PSDSs or clustered (community) systems. This category also includes the treatment portion of other decentralized sewage disposal technologies.

*“Project completion”* means the date the final loan certificate is signed by the recipient.

*“Sponsor project”* is defined in Iowa Code section 455B.199.

*“State project priority list”* or *“PPL”* means the list of projects in priority order that may qualify for CWSRF loan assistance.

**90.2(2) Abbreviations.** In addition to the abbreviations in 567—Chapter 40, the following abbreviations are applicable to this chapter.

| Abbreviation | Meaning                  |
|--------------|--------------------------|
| AFO          | animal feeding operation |
| BMP          | best management practice |

| <b>Abbreviation</b> | <b>Meaning</b>                                        |
|---------------------|-------------------------------------------------------|
| EPA                 | U.S. Environmental Protection Agency                  |
| GNS                 | general nonpoint source                               |
| LWQP                | livestock water quality linked-deposit program        |
| LWWP                | local water protection project linked-deposit program |
| MMP                 | manure management plan                                |
| NRCS                | USDA Natural Resource Conservation Service            |
| NMP                 | nutrient management plan                              |
| OSWAP               | onsite wastewater assistance linked-deposit program   |
| SWCD                | soil and water conservation district                  |
| USDA                | U.S. Department of Agriculture                        |
| WPC                 | water pollution control                               |

**90.2(3) Forms.** All CWSRF forms may be obtained from the department's state revolving fund section and may be downloaded from [www.iowasrf.com](http://www.iowasrf.com). Recipients of assistance shall comply with the applicable department rules.

[ARC 9215C, IAB 5/14/25, effective 6/18/25]

#### **567—90.3(455B) IUP preparation.**

**90.3(1) Development.** The department shall prepare an IUP at least annually and on a quarterly basis as needed. The IUP will be subject to public participation and approved by the commission.

**90.3(2) Notification.** A public hearing process is included in the IUP adoption process to provide opportunity for public participation. A notice is published that explains the purpose of the IUP and how additional information may be obtained. All materials relating to the IUP will be posted at [www.iowasrf.com](http://www.iowasrf.com).

**90.3(3) Comments.** Comments regarding the proposed IUP will be accepted during the notice period, at the public hearing, and in writing. After evaluation of all pertinent comments, the IUP will be revised, if necessary, and recommended for commission approval. Subsequent approval by the commission will establish the IUP to be used for loan assistance.

[ARC 9215C, IAB 5/14/25, effective 6/18/25]

**567—90.4(455B) IUP contents.** The IUP will identify the anticipated uses of loan funds available for that fiscal year and will include the following information:

**90.4(1) State PPL.** The state PPL contains the projects eligible for CWSRF direct loans. The PPL includes projects scheduled for loans from funds available during the fiscal year. Projects will be considered in priority order for placement on the fundable list.

*a.* The department will consider the following in developing the list of fundable projects for the IUP:

- (1) How the project conforms to the short- and long-term goals of the CWSRF;
- (2) The priority rating of the POTW project;
- (3) Whether a POTW project will be ready to proceed on a schedule consistent with time requirements for outlay of funds;

- (4) Whether the proposed project addresses the need upon which the eligible entity's priority is based;
- (5) The funds available, department priorities, and the department's administrative capacity; and
- (6) The applicant's conformance to process guidelines provided by the department.

*b.* The PPL will be reviewed at least annually or quarterly as needed to update schedules and project cost estimates.

**90.4(2) Priority for loan assistance.** A fundable project must be technically and administratively complete. A community is responsible for complying with the technical procedures for facility planning and preparation of plans and specifications, including department approval of those documents.

**90.4(3) Notification of revisions.** The department will notify, in writing, all communities that are removed from or placed on an approved fundable list based on revisions.

**90.4(4) *Special considerations.*** Exemptions to the point source rating criteria may be considered by the department, and funding variances may be granted by the commission for projects that have unique or unusual circumstances but that do not logically fit into the criteria. The commission may grant interest rate reductions or other favorable loan incentives to applicants that sponsor a project that improves the quality of the water in the watershed where a city water or wastewater facility is located.

**90.4(5) *Additional contents.*** The IUP will also include:

- a. The long- and short-term goals of the CWSRF;
- b. Information on the types of activities to be supported by the CWSRF. The IUP will identify requests for planning and design loans and funds to be directed to NPS programs;
- c. Assurances and specific proposals on how the state intends to meet the requirements of the operating agreement between the state of Iowa and the EPA;
- d. Loan interest rates and terms, interest rates and terms for linked deposit programs, and loan origination fees and servicing fees; and
- e. The method to be used by the department if the IUP is amended.

[ARC 9215C, IAB 5/14/25, effective 6/18/25]

**567—90.5(455B) Point source project procedures.**

**90.5(1) *Application forms.*** An applicant shall complete the application for placement on the IUP, provide documentation on the project, and submit the application package to the department. Forms may be downloaded from [www.iowasrf.com](http://www.iowasrf.com).

**90.5(2) *General requirements.*** The following items must be included in a CWSRF application for point source projects:

- a. A facility plan that conforms to the IWFDS and is certified by a professional engineer licensed to practice in Iowa;
- b. A schedule for submission of plans and specifications for the project; and
- c. A project construction schedule.

**90.5(3) *Timing.***

a. POTW project applications received by the department for eligible projects will be scored using the rating criteria in 567—90.7(455B) and will be placed on the PPL. Applications may be submitted on an ongoing basis and will be reviewed in accordance with the schedule in the IUP.

b. Applications received after the IUP is drafted will not be placed on the PPL but will be considered for loan assistance when the next IUP is prepared.

**90.5(4) *Project initiation conference.*** The department may require an applicant or their representative to meet with the department. If required, the eligible applicant's official representative (and usually the applicant's consultant) will meet with the department to discuss:

- a. CWSRF program policies, procedures, and guidelines;
- b. Allowable costs;
- c. Wastewater treatment alternatives and technologies;
- d. Environmental impacts and review considerations;
- e. Public participation;
- f. Scheduling; and
- g. Other information as needed.

**90.5(5) *Review criteria for point source projects.*** The department shall review CWSRF applications from eligible applicants and verify the following items:

- a. The project is on the PPL;
- b. The applicant has prepared an adequate facility plan report;
- c. The project will be in conformance with any applicable areawide water quality management plans;
- d. The applicant has adopted or will adopt an acceptable user charge system;
- e. The applicant has demonstrated its ability to provide the necessary legal, institutional, managerial and financial capability to ensure adequate construction, operation and maintenance. If the department has reasonable grounds to believe that an applicant's wastewater treatment facilities are not viable, the department may require the applicant to submit management and financial plans as prescribed in Iowa Code section 455B.174; and

*f.* The applicant has provided an acceptable project schedule for project initiation and completion.

**90.5(6) Allowable and unallowable costs.** Allowable costs shall be limited to those eligible costs deemed necessary, reasonable, and directly related to the efficient completion of the project. Unallowable costs include, but are not limited to, the following:

- a.* Cost of service lines and in-house plumbing;
- b.* Administrative costs of the recipient;
- c.* Purchase of vehicles and tools;
- d.* Land purchase and easement or rights-of-way costs, except as authorized under the CWA;
- e.* Pretreatment program development costs, unless required by federal regulations; and
- f.* Operation and maintenance costs.

**90.5(7) Audit and inspection.** The recipient shall provide access at all times for the department, the authority, the state auditor, and the EPA Office of the Inspector General to all project records and documents for inspection and audit purposes for a period of three years after the date of last loan payment. The same access to the project site(s) shall be provided for inspection purposes.

[ARC 9215C, IAB 5/14/25, effective 6/18/25]

**567—90.6(455B) Point source project requirements.** All wastewater treatment system projects receiving assistance from the CWSRF which entered into binding loan commitments on or after October 1, 1994, and did not initiate construction of the projects in whole or in part prior to October 1, 1994, shall meet the following requirements:

**90.6(1) Planning.** The planning phase of a project consists of those necessary plans and studies that directly relate to a facility's need to comply with enforceable requirements of the CWA and state statutes. This phase consists of a systematic evaluation of feasible alternatives considering the unique demographic, topographic, hydrologic, and institutional characteristics of the planning area. Facilities planning must support selection of the proposed alternative. The planning phase must include the following:

*a. Facility plan.* The facility plan must contain a description of the proposed project and the complete system of which it is a part. The facility plan must be prepared in accordance with Chapter 1 of the IWFDS and meet the applicable provisions of this subrule.

*b. Environmental review.* Loan recipients shall conduct environmental review of projects using procedures in 40 CFR Part 6, September 19, 2007, as a part of facility planning. An applicant should work with the department as early as possible in the facilities planning process to determine if the project qualifies for a categorical exclusion from 40 CFR Part 6 or whether a finding of no significant impact is required. In conjunction with the facility planning process as described in 40 CFR §35.2030(c), December 19, 2014, a potential applicant may request formal determination under 40 CFR Part 6. All of 40 CFR Part 6, September 19, 2007, pertaining to Procedures for Implementing the Requirements of the Council on Environmental Quality of the National Environmental Policy Act, is hereby adopted by reference and incorporated herein. However, all references to the EPA as performing acts or reviews shall be substituted with references to the department for the purposes of this chapter.

**90.6(2) Point source project design and construction.** The project design and construction phase must include all of the following:

*a. Recipient capability.* The recipient must demonstrate to the department that it has the legal, institutional, managerial, and financial capability to ensure adequate construction, operation and maintenance of treatment works.

*b. Disadvantaged business enterprise (DBE).* The recipient must comply with the requirements of DBE participation found in 40 CFR Part 33, May 19, 2022.

*c. Site.* When it is necessary to acquire real property as part of the project and within the project period, the recipient may be required to submit documentation of the acquisition, including the legal description, the date the property was acquired, and an appraisal report from a qualified appraiser. If required, submittal to the department shall occur prior to contract award.

*d. Project changes.* Prior to the final loan disbursement, the recipient must submit to the department for approval all modifications to the project, including changes to the plans and specifications and changes in the contract (change orders). The recipient is responsible for any costs or actions necessary should the changes be implemented prior to departmental review and subsequently found to be unapprovable.

*e. State inspections.* Department personnel shall have the right to examine all construction aspects of the project, including materials and equipment delivered and stored on site for use on the project.

[ARC 9215C, IAB 5/14/25, effective 6/18/25]

**567—90.7(455B) Point source project priority rating system.** The rating criteria consider the use and classification of the receiving waters, water quality of the receiving waters, groundwater protection, project category, project purpose, and a tiebreaker. Priority ranking for POTW projects shall be based on the total points awarded for all the categories; the greater the total number of points, the higher the ranking. For POTW projects, the ranking will be done when the IUP is prepared. The tiebreaker category will be used when necessary.

**90.7(1) Use classification of receiving waters.** This category addresses the receiving water that is impacted or potentially impacted by the existing situation and that would be improved or protected by the proposed project. Points for sludge stabilization, sewers, and lift station projects are based on the designated use of the waters that receive or could receive the effluent discharge. Points will be awarded and be cumulative for all designated use classifications of the receiving water.

| Use and Classification of Receiving Waters | Points |
|--------------------------------------------|--------|
| Outstanding Iowa waters                    | 45     |
| Class A1                                   | 50     |
| Class A2                                   | 45     |
| Class A3                                   | 50     |
| Class C                                    | 40     |
| Class B (CW1)                              | 50     |
| Class B (CW2)                              | 30     |
| Class B (WW1)                              | 30     |
| Class HH                                   | 30     |
| Class B (WW2)                              | 25     |
| Class B (WW3)                              | 20     |
| Class B (LW)                               | 35     |

**90.7(2) Water quality of receiving waters.** This category addresses the water quality in the receiving stream and whether or not the water has been designated as impaired for one or more uses. Points will be awarded for both A and B in the table below and then totaled for this category.

*a.* Bodies of water that are impaired by pollutants and probable pollutant source categories for the impairments are identified in the CWA Section 303(d) list of waters in the integrated report of impaired waters status. Projects primarily impacting these waters will be awarded points if the water body that receives or could receive the wastewater discharge is included on the Section 303(d) list and the probable pollutant source is a point source.

*b.* Waters are also identified in the CWA Section 305(b) report on their use attainment status. Projects primarily impacting these waters are awarded points depending on the use impairment identified for the water body that receives or could receive the wastewater discharge. If no use impairment is identified, indicating the water was not assessed, the partially supported status points will be awarded.

| Indication of Water Quality                                                                             | Points |
|---------------------------------------------------------------------------------------------------------|--------|
| A. Integrated Report overall category (score only overall category)                                     |        |
| 4a, 4b, or 5a                                                                                           | 15     |
| 5b or 5p                                                                                                | 10     |
| 4c or 4d                                                                                                | 5      |
| B. Use support level of designated uses (score all applicable uses) Class A, Class B, Class C, Class HH |        |

| Indication of Water Quality | Points |
|-----------------------------|--------|
| Fully supported             | 5      |
| Not supported               | 15     |
| Not assessed                | 7      |

**90.7(3)** *Protection of groundwater resources.* This category considers the use of the aquifer affected by the project.

| Groundwater Category                                      | Points |
|-----------------------------------------------------------|--------|
| Wellhead protection area for public water supply          | 40     |
| Unconfined aquifer that serves as a drinking water source | 20     |
| Other groundwater protection                              | 10     |

**90.7(4)** *Project category.* For this category, points are based on the project's type and its relative impact on public health and the environment. Points will be awarded for the primary project category.

| Centralized Wastewater Treatment Project Category                                             | Points |
|-----------------------------------------------------------------------------------------------|--------|
| Category I. Secondary treatment                                                               | 40     |
| Category II. Advanced treatment                                                               | 50     |
| Category III–A. Infiltration/inflow correction                                                | 30     |
| Category III–B. Sewer replacement/rehabilitation                                              | 30     |
| Category IV–A. New collector sewers and appurtenances                                         | 10     |
| Category IV–B. New interceptor sewers and appurtenances                                       | 20     |
| Category V. CSO correction                                                                    | 40     |
| Stormwater Project Category                                                                   |        |
| Category VI–A. Gray infrastructure—only projects where sanitary sewer or treatment require it | 30     |
| Conservation Project Category                                                                 |        |
| Category X. Water conservation (water reuse)                                                  | 10     |
| Other Category                                                                                |        |
| Energy conservation (renewable energy)—solar, wind, etc.                                      | 10     |
| Refinance of existing projects that meet CWSRF eligibility criteria                           | 5      |

**90.7(5)** *Project purpose.* For this category, points are based on the project's purpose and expected outcome. Points will be awarded only for the primary purpose.

| Project Purpose                                                                                                                                                                                              | Points |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------|
| Allows facility to meet new water quality standards                                                                                                                                                          | 50     |
| Protects or restores the physical, chemical, and biological integrity of water resources at a specific site                                                                                                  | 50     |
| Reduces the loading of a parameter that has been identified as an impairment to the receiving water or watershed as identified through the total maximum daily load (TMDL) process                           | 40     |
| Provides regional consolidation in wastewater treatment or system management                                                                                                                                 | 30     |
| Brings facility into compliance with a National Pollution Discharge Elimination System (NPDES) permit or other administrative or judicial enforcement action as may be required by the department or the EPA | 25     |
| Eliminates or remediates a source of groundwater pollution                                                                                                                                                   | 20     |
| Meets existing or reasonable future needs of the community in order to maintain compliance with an NPDES permit                                                                                              | 15     |

|                                                                                                          |    |
|----------------------------------------------------------------------------------------------------------|----|
| Provides operational reliability improvements, apart from projects addressing compliance and enforcement | 10 |
|----------------------------------------------------------------------------------------------------------|----|

**90.7(6) Total points.** Total points are calculated using the following formula: Total Points = Use Classification + Water Quality or Groundwater Protection + Project Category + Project Purpose

**90.7(7) Tiebreaker.** Several projects may receive the same total points on the fundable list. If sufficient loan funds are not available to fund the projects, ties will be broken by determining which project has the highest score in each category in the following order:

|                                          |         |
|------------------------------------------|---------|
| Use Classification of Receiving Streams  | Highest |
| Water Quality of Receiving Streams (a+b) |         |
| Groundwater Protection                   |         |
| Project Category                         |         |
| Project Purpose                          | Lowest  |

[ARC 9215C, IAB 5/14/25, effective 6/18/25]

**567—90.8 and 90.9** Reserved.

**567—90.10(455B) NPS project procedures—onsite wastewater system assistance linked-deposit program (OSWAP).** The purpose of the OSWAP is to assist homeowners to rehabilitate or improve existing PSDSs.

**90.10(1) Eligibility conditions and restrictions.** Assistance under the OSWAP shall be in the form of low-interest loans made by participating lending institutions through a linked deposit arrangement with the CWSRF.

*a. Location restrictions.* Assistance is available for the improvement or rehabilitation of PSDSs serving homes that are not connected to a POTW.

*b. County eligibility.* Assistance shall be provided only for systems located in counties that have an environmental health program that meets the requirements of 567—Chapter 69 for PSDSs. At a minimum, counties shall carry out statutory responsibilities as provided in Iowa Code section 455B.172 and provide for:

(1) Site evaluations to determine the appropriate design and size of PSDSs prior to permitting and installation.

(2) Inspection of PSDSs at the time of renovation or construction.

(3) Assurance of regular system maintenance and monitoring for the life of the loan.

*c. Eligible project costs.* The amount of assistance available shall be limited to the total costs deemed necessary, reasonable, and directly related to the repair, rehabilitation, or replacement of a PSDS.

*d. Applicant eligibility.* Assistance is limited to applicants who meet the applicable provisions of 567—Chapter 69 and all other local provisions for the siting and construction of PSDSs.

*e. Eligible projects.* Assistance can be provided only for the repair, rehabilitation, or replacement of existing PSDSs. Assistance is not available for new housing.

**90.10(2) Applying for assistance.**

*a.* Prior to applying for a loan from a participating lending institution, an eligible individual or entity must demonstrate appropriate permitting from the county in which the PSDS is located.

*b.* Application for assistance shall be made on forms provided by the department or its agent. Forms may be downloaded from [www.iowasrf.com](http://www.iowasrf.com).

*c.* Applications for assistance shall include:

(1) A description of the type and general specifications of the proposed work;

(2) An estimate of the population and number of households to be served; and

(3) A description of the system maintenance and monitoring program.

**90.10(3) County review and approval.**

*a.* The county shall review applications to determine if a project meets the applicable provisions of 567—Chapter 69 and all other relevant local provisions for the siting and construction of PSDSs.

b. For projects that meet relevant criteria, the county shall issue a permit or certificate. The county permit or certificate shall be accompanied by a cost estimate.

c. A county may deny an application for noncompliance with applicable state and local criteria. Written notification of the denial shall be provided to the applicant and shall state the reason(s) for denial.

**90.10(4) *Eligible costs.*** All costs directly related to the design, permitting, construction, and financing of a PSDS are eligible for loans. Eligible costs include the removal of existing structures, earth moving, or any land purchases directly related to proper wastewater treatment.

**90.10(5) *Ineligible costs.*** Costs for additional earthwork, replanting, or any other aesthetic improvements are not eligible. Maintenance or monitoring costs will not be allowed as part of a loan.

**90.10(6) *Recipient recordkeeping.*** The loan recipient shall:

a. Maintain adequate records that document all costs associated with the project;

b. Provide access to these records to the department, the state auditor, the EPA SRF project manager, and the EPA Office of the Inspector General; and

c. Retain all project records and documents for inspection and audit purposes for a period of three years from the date of the final loan payment.

**90.10(7) *Site access.*** The loan recipient shall:

a. Provide the department and the administrative authority access to the construction site to verify that the loan was used for the purpose intended and that the constructed works meet applicable state and local environmental requirements and ordinances for PSDSs; and

b. Provide access to the system for periodic monitoring by the department and administrative authority, at times mutually agreed upon with the system owner, for the duration of the loan.

**90.10(8) *Priority allocation of funds and IUP.*** The department shall, in the annual IUP, describe the amount of funding available for loans under the OSWAP for the coming state fiscal year.

**90.10(9) *Targeted assistance.*** The department may budget a portion of the annual available funds identified in the IUP for financing PSDSs in targeted areas. Such targeted areas may include impaired watersheds, high-density housing areas, agricultural drainage areas, or other environmentally sensitive or degraded areas where the repair and rehabilitation of PSDSs are needed to preserve and protect water quality. The annual IUP shall specify the need for targeted assistance, the areas covered, and the estimate of funds needed to address the water quality problems.

[ARC 9215C, IAB 5/14/25, effective 6/18/25]

#### **567—90.11(455B) NPS project procedures—livestock water quality linked-deposit program (LWQP).**

The purpose of the LWQP is to assist owners of existing AFOs to meet state and federal requirements or to prevent, minimize, or eliminate water pollution.

**90.11(1) *Eligibility conditions and restrictions.*** Assistance shall be in the form of low-interest loans made by participating lending institutions through a linked deposit arrangement with the CWSRF.

a. *Eligible project costs.* All costs directly related to the design, permitting, construction, and financing of the WPC facilities are eligible. The amount of assistance available shall be limited to the total costs deemed necessary, reasonable, and directly related to the facilities required to provide WPC as required by the department or to prevent, minimize, or eliminate water pollution.

b. *Applicant eligibility.* Assistance is limited to livestock producers operating AFOs according to federal law. Concentrated AFOs, as defined in 40 CFR §122.23, are not eligible.

(1) Loans will be made only to livestock producers that are operators of record or have legal control of the property containing the AFO for the duration of the loan.

(2) The department has the discretion to deny applications for producers if:

1. The department has issued an administrative order to the producer pursuant to Iowa Code section 455B.175;

2. The department notifies the producer in writing of intent to recommend referral or the commission refers the action to the attorney general pursuant to Iowa Code section 455B.175; or

3. The attorney general has commenced legal proceedings against the producer pursuant to Iowa Code section 455B.112.

c. *Eligible projects.* The WPC facilities considered eligible for assistance include manure storage structures, solids settling basins, composting facilities and equipment, lagoons (including fencing), portions

of feeding floors or loafing areas used for waste collection, water and sediment control basins, vegetative filters or buffers, surface water diversion structures, agitation or transfer pumps, dry bedded confinement feeding operation buildings or structures pursuant to Iowa Code chapter 459B when all or part of an open feedlot is replaced, and other practices shown to improve or protect water quality. Replacement AFOs may be eligible where an existing AFO is eliminated to prevent a water quality impairment or mitigate a documented impairment. Engineering or technical service fees associated with the aforementioned practices are also eligible. A one-time purchase of attachments integral to the manure management system, such as blades, buckets, choppers, or spreaders, may be eligible at the time that an open feedlot is replaced with a dry bedded confinement building.

*d. Funding formula.*

(1) Loans for water quality projects for facilities being expanded by an increase in the animal unit capacity shall be funded according to the following formula:

Existing animal unit capacity/new animal unit capacity  $\times$  total eligible project cost  $\times$  1.5 = maximum linked deposit amount

Example: 450 AUC / 900 AUC  $\times$  \$500,000  $\times$  1.5 = \$375,000

Example: 300 AUC / 600 AUC  $\times$  \$300,000  $\times$  1.5 = \$225,000

Example: 50 AUC / 900 AUC  $\times$  \$500,000  $\times$  1.5 = \$41,666

(2) If existing areas in open feedlots are kept open where some pens are replaced and the operation is expanded through the addition of a dry bedded confinement feeding operation building, the remaining open lot areas must comply with 567—65.101(459A).

**90.11(2) Applying for assistance.** Application for project approval shall be made on forms provided by the department or its agent. Forms may be downloaded from [www.iowasrf.com](http://www.iowasrf.com).

**90.11(3) Project review and approval.**

*a.* Applications shall be submitted to the local SWCD. The local SWCD will evaluate the application, provide an estimated cost, and certify that the practice is eligible and compatible with state water quality goals.

*b.* All practices must comply with 567—Chapter 65 and shall be constructed to applicable USDA NRCS standards. NRCS staff or another technical service provider shall attest that the practice will be constructed to these specifications and standards.

**90.11(4) Project duration.** The project is to be maintained, kept in place, or operated as proposed for the life of the loan. If an open lot is closed and replaced with an eligible replacement facility, the department or its agent shall place a restrictive covenant that prohibits the operation of an open feedlot at the replacement site for the life of the loan. The site or portion of the site that may not house animals shall be defined by the local SWCD.

**90.11(5) Manure management plan (MMP) required.** The livestock producer shall have an MMP that meets the requirements of 567—65.17(459), a nutrient management plan (NMP) as defined in 567—65.112(459A), or a comprehensive NMP (CNMP), to be eligible for the loan or, as part of the loan, develop an MMP, NMP, or CNMP.

*a.* Costs for development of an MMP, NMP, or CNMP are eligible costs.

*b.* Costs for updating an MMP, NMP, or CNMP are eligible costs if required for the implementation of a water quality project financed through the LWQP.

**90.11(6) Ineligible costs.** Costs for development of a new AFO are ineligible. Other ineligible costs include but are not limited to the following:

*a.* Costs for the design, permitting, construction, or financing of WPC facilities that would allow an AFO to expand and become a concentrated AFO;

*b.* Costs for the purchase of land to be used for application of wastewater or manure;

*c.* Operation and maintenance costs; and

*d.* Refinancing costs for WPC facilities constructed prior to approval by the department or its agent.

**90.11(7) Recipient recordkeeping.** The loan recipient shall:

*a.* Maintain adequate records that document all costs associated with the project;

*b.* Provide access to these records to the department, the state auditor, the EPA SRF project manager, and the EPA Office of the Inspector General; and

c. Retain all project records and documents for inspection and audit purposes for a period of three years from the date of the final loan payment.

**90.11(8) Site access.** The livestock producer shall:

a. Provide the department and its agent access to the construction site to verify that the loan was used for the purpose intended and that the construction work meets the applicable state and federal requirements for AFOs; and

b. Provide the department and its agent periodic access to the AFO, pursuant to the biosecurity requirements in 567—paragraph 65.113(9) “b,” for the duration of the loan to ensure that the constructed facility is being operated and maintained as designed.

[ARC 9215C, IAB 5/14/25, effective 6/18/25]

**567—90.12(455B) NPS project procedures—local water protection project linked-deposit program (LWPP).** The purpose of the LWPP is to assist landowners with local water protection projects that will provide water quality improvement or protection.

**90.12(1) Eligibility conditions and restrictions.** Assistance under the CWSRF shall be in the form of low-interest loans made by participating lending institutions through a linked deposit arrangement with the CWSRF.

a. *Eligible project costs.* The amount of assistance available shall be limited to the total costs deemed necessary, reasonable, and directly related to the practices required to provide water quality improvements.

b. *Applicant eligibility.* Assistance is available to any person who is an owner of record or has legal control over land that needs local water protection projects installed to control runoff of sediments, nutrients, pesticides or other NPS pollutants into waters of the state.

c. *Eligible practices.* The LWPP projects that are considered eligible include, but are not limited to, contour buffer strips, diversion, fence, field border, field windbreak, filter strips, grade stabilization structure, grassed waterway, pasture and hayland planting, planned grazing system, pond, riparian forest and vegetative buffers, sediment basin, terrace, underground outlet with secondary water quality treatment, waste management system, water and sediment control basin, stream bank stabilization and restoration, and other practices that are shown to improve or protect water quality.

**90.12(2) Applying for assistance.** Application for project approval shall be made on forms provided by the department or its agent. Forms may be downloaded from [www.iowasrf.com](http://www.iowasrf.com).

**90.12(3) Project review and approval.**

a. Applications shall be submitted to the local SWCD. The local SWCD shall evaluate the application, provide an estimated cost, and certify that the practice is compatible with state water quality goals.

b. All practices shall be constructed to meet NRCS standards and specifications. The NRCS or another technical service provider shall attest that the practice will be constructed to these specifications and standards.

**90.12(4) Project duration.** The project is to be maintained, kept in place, or operated as proposed for the life span of the practice, but in no case for less than the life of the loan.

**90.12(5) Eligible costs.** All costs directly related to and necessary for the implementation of LWPPs approved in the memorandum of project approval are eligible costs.

**90.12(6) Ineligible costs.** Ineligible costs include costs for overbuilding a practice beyond what is required to maintain or improve water quality and costs for the purchase of land.

**90.12(7) Site access.** The applicant shall provide the department or its agent access to the project site to verify that the loan was used for the purpose intended.

[ARC 9215C, IAB 5/14/25, effective 6/18/25]

**567—90.13(455B) NPS project procedures—stormwater linked-deposit program.** The purpose of this program is to assist private landowners with the construction of stormwater BMPs that will provide water quality improvement or protection.

**90.13(1) Eligibility conditions and restrictions.** Assistance under the CWSRF shall be in the form of low-interest loans made by participating lending institutions through a linked deposit arrangement with the CWSRF.

*a. Eligible project costs.* The amount of assistance available shall be limited to the total costs deemed necessary, reasonable, and directly related to the practices required to provide water quality improvements.

*b. Applicant eligibility.* Assistance is available to any person who is an owner of record or has legal control over land that needs stormwater BMPs installed to control runoff of sediments, nutrients, pesticides, or other NPS pollutants.

*c. Eligible practices.* Eligible practices include but are not limited to grade stabilization structure, grassed waterway, stormwater wetland, native landscaping, soil quality restoration, riparian forest and vegetative buffers, sediment basin, underground outlet with water quality treatment, stream bank stabilization, bioretention cell, greenroof, and other practices that are shown to improve or protect water quality.

**90.13(2)** *Applying for assistance.* Application for project approval shall be made on forms provided by the department or its agent. Forms may be downloaded from [www.iowasrf.com](http://www.iowasrf.com).

**90.13(3)** *Project review and approval.*

*a.* Applications shall be submitted to the local SWCD. The local SWCD will evaluate the application, provide an estimated cost, and certify that the practice is compatible with state water quality goals.

*b.* It is recommended that all practices be constructed to meet Iowa Stormwater Management Manual or NRCS standards and specifications as posted on the department's website at [www.iowadnr.gov](http://www.iowadnr.gov) and the NRCS website at [www.nrcs.usda.gov](http://www.nrcs.usda.gov), respectively, as of September 1, 2024. The NRCS or another technical service provider shall attest that the practice is designed to these specifications and standards, or shall attest that the practice is based on these standards and designed with sound engineering principles.

**90.13(4)** *Project duration.* The project is to be maintained, kept in place or operated as proposed for the life span of the practice, but in no case for less than the life of the loan.

**90.13(5)** *Eligible costs.* All costs directly related to and necessary for the implementation of the stormwater BMP approved in the memorandum of project approval are eligible costs.

**90.13(6)** *Ineligible costs.* Ineligible costs include costs for overbuilding a practice beyond what is required to maintain or improve water quality and costs for the purchase of land.

**90.13(7)** *Site access.* The applicant shall provide the department or its agent access to the project site to verify that the loan was used for the purpose intended.

[ARC 9215C, IAB 5/14/25, effective 6/18/25]

**567—90.14(455B) NPS project procedures—GNS loan program.** The purpose of this program is to assist projects that will provide water quality improvements or water quality protection. This program allows for funding of the water quality protection portion of nontraditional projects.

**90.14(1)** *Project ranking.* Projects and activities under NPS project categories VI-B through D, VII-A through K, and XII will all receive a total score of five when placed on the PPL. Once 90 percent of NPS program funds have been allocated, additional NPS project scoring criteria published in the IUP will be used to rank NPS projects for funding and placement on the PPL. Until that time, the loan assistance is based on a first-come, first-funded concept.

**90.14(2)** *Eligibility conditions and restrictions.* Assistance under the CWSRF GNS program shall be in the form of low-interest loans made directly or by participating lending institutions through a participation arrangement with the CWSRF.

*a. Eligible project costs.* The amount of assistance available shall be limited to the total costs deemed necessary, reasonable, and directly related to the facilities or practices required to provide water quality improvements, restoration, or protection. Participation in nontraditional projects where the primary purpose is not water quality protection or improvement will be limited to the portion of the project that is directly related to water quality improvement, restoration, or protection.

*b. Applicant eligibility.* Assistance is available to projects for which facilities are needed to protect, restore, or improve water quality from NPS pollution. Only applicants that are owners of record of the property or have long-term control of the property where the project is to be implemented are eligible. In applications where the WPC project is a plan or document that will direct water quality protection or improvement efforts, loans will be made to applicants that have the capacity and capability of implementing the plan and repaying the loan.

c. *Eligible projects.* Eligible projects include, but are not limited to, practices to address NPS pollution control needs associated with stormwater treatment and green infrastructure, silviculture, groundwater protection, marinas, resource extraction, brownfield remediation, aboveground and underground storage tanks, sanitary landfills, hydromodification, and watershed planning. Nontraditional NPS projects that may have a water quality protection or improvement component include, but are not limited to, bird sanctuaries and wildlife enhancement projects, vegetative plants, sediment removal and other lake restoration practices, and education programs.

**90.14(3)** *Applying for assistance.* Applications for GNS project approval shall be made on forms provided by the department. Forms may be downloaded from [www.iowasrf.com](http://www.iowasrf.com). Applications shall include an explanation of how the water quality will be protected, improved, or restored by the proposed project. Applications may be submitted on an ongoing basis and will be reviewed in accordance with the schedule in the IUP.

**90.14(4)** *Project review and approval.* The department will evaluate eligibility and project design and provide the applicant a memorandum of approval for the proposed WPC project.

**90.14(5)** *Eligible costs.* All costs directly related to the implementation of the project approved in the memorandum of approval are eligible costs.

**90.14(6)** *Ineligible costs.* Costs for livestock water quality facilities are not eligible under this program and are provided for in 567—90.11(455B). Costs for the purchase of land are not eligible costs unless specifically approved by the commission.

**90.14(7)** *Site access.* The recipient shall provide the department and its agent access to the project site to verify that the loan was used for the purpose intended.

[ARC 9215C, IAB 5/14/25, effective 6/18/25]

These rules are intended to implement Iowa Code sections 455B.199, 455B.291 through 455B.299, 466.8 and 466.9.

TITLE VIII  
*SOLID WASTE MANAGEMENT AND DISPOSAL*

CHAPTER 100  
SCOPE OF TITLE—DEFINITIONS—RULES OF PRACTICE  
[Prior to 12/3/86, Water, Air and Waste Management[900]]

Chapter rescission date pursuant to Iowa Code section 17A.7: 9/23/31

**567—100.1(455B,455D) Scope of title.** The department has jurisdiction over the management, dumping, depositing, and disposal of solid waste by establishing standards and regulating solid waste through a system of general rules and specific permits. The construction and operation of any sanitary disposal project or solid waste management activity requires a specific permit from the department.

This chapter provides general definitions applicable to Title VIII (solid waste management and disposal) of the commission's rules and general conditions of solid waste disposal. All rules, standards, technical guidance, and other similar legal or technical documents referenced in this chapter shall be the version of those documents in effect on August 1, 2025, unless otherwise noted in these rules, and except for references to the Iowa Code and Iowa Administrative Code, which shall always be the most recent version unless otherwise noted in these rules.

[ARC 0481D, IAB 8/19/26, effective 9/23/26]

**567—100.2(455B,455D) Definitions.** For the purposes of this title, the following terms shall have the meaning indicated in this chapter. The definitions found in Iowa Code section 455B.301 and chapter 455D shall apply.

*“Active life”* means the period of operation beginning with the initial receipt of solid waste and ending at the completion of closure activities.

*“Active portion”* means that part of a facility or unit that has received or is receiving wastes and that has not been closed.

*“Airport”* means a public-use airport open to the public without prior permission and without restrictions within the physical capacities of available facilities.

*“Alternative cover material”* means a substitute material or mix of materials that can be utilized in lieu of soil as cover material at a sanitary landfill.

*“Annular space”* means the open space formed between the borehole and the well casing.

*“Appliances”* means household and commercial devices such as refrigerators, freezers, kitchen ranges, air-conditioning units, dehumidifiers, gas water heaters, furnaces, clothes washers, clothes dryers, dishwashers, microwave ovens and commercial coolers with components containing mercury, refrigerants, or PCB-containing capacitors.

*“Aquifer”* means a saturated geologic formation or combination of formations that has appreciably greater ability to transmit water than do adjacent formations. Typically, an aquifer is capable of yielding usable quantities of water to a well.

*“Areas susceptible to mass movement”* means those areas of influence (i.e., areas characterized as having an active or substantial possibility of mass movement) where the movement of earth material at, beneath, or adjacent to the sanitary landfill site, because of natural or human-induced events, results in the down slope transport of soil and rock material by means of gravitational influence. Areas of mass movement include but are not limited to landslides, avalanches, debris slides and flows, soil function, block sliding, and rockfall.

*“Attendant”* means an employee of a sanitary disposal project who is not employed or assigned to operate the equipment used on the site.

*“Ballast”* means an electrical device containing capacitors for the purpose of triggering high-level electrical components. A ballast provides electrical balance within the high-level electrical component circuitry.

*“Beneficial use”* means a specific utilization of a solid by-product that constitutes reuse rather than disposal and does not adversely affect human health or the environment.

*“Beneficial use determination”* means a written formal decision or rule issued by the department that affirms that the utilization of a solid by-product constitutes a beneficial use rather than the disposal of solid waste.

*“Bird hazard”* means an increase in the likelihood of bird/aircraft collisions that may cause damage to the aircraft or injury to its occupants.

*“Bulking agent”* means a material that contributes structure and porosity, usually a dry, rigid material such as shredded wood.

*“Capacitor”* means a device for accumulating and holding a charge of electricity that consists of conducting surfaces separated by a dielectric fluid.

*“Cash plus marketable securities”* means all the cash plus marketable securities held by the local government on the last day of a fiscal year, excluding cash and marketable securities designated to satisfy past obligations such as pensions.

*“Cathode ray tube”* or *“CRT”* means a vacuum tube composed primarily of leaded glass that is the visual or video display component of an electronic device. An intact CRT means a CRT whose vacuum has not been released. A broken CRT means glass removed from its housing or casing whose vacuum has been released.

*“Certified compostable products”* means any product specifically manufactured to break down in a compost system at the end of its useful life. Examples include containers; films; or foodservice ware such as bowls, plates, cups, cutlery, and bioplastic liner bags. Products are composed of materials such as vegetable matter, paper, cardboard, and plastics and are certified as conforming to ASTM International Standard ASTM D6400 or ASTM D6868.

*“CFC”* or *“CFCs”* means chlorofluorocarbons, including any of several compounds used as refrigerants.

*“CFR”* or *“Code of Federal Regulations”* means the federal administrative rules adopted by the United States as amended through August 1, 2025.

*“Clean wood waste”* means wood that is free of coatings and preservatives.

*“Coal combustion residuals”* means any solid waste produced by burning coal, either by itself or in conjunction with natural gas or other carbon-based fuels. “Coal combustion residuals” includes but is not limited to bottom ash, fly ash, slag, and flue gas desulfurization system material generated by coal combustion and associated air pollution control equipment.

*“Commercial solid waste”* means the same as defined in 40 CFR Section 258.2.

*“Commission”* means the environmental protection commission.

*“Compost”* means the product manufactured through the controlled aerobic, biological decomposition of biodegradable materials. The product has undergone mesophilic and thermophilic temperatures, which significantly reduces the viability of pathogens and weed seeds and stabilizes the carbon such that it is beneficial to plant growth.

*“Compostable”* means an organic material that undergoes degradation by biological processes during composting to yield carbon dioxide, water, inorganic compounds, and biomass.

*“Composting”* means the controlled process and management of aerobic, biological decomposition resulting in an innocuous final product. This process significantly reduces the viability of pathogens and weed seeds and stabilizes the carbon such that it is beneficial to plant growth.

*“Composting facility”* means all related receiving, processing, production, curing, and storage areas and necessary roads, buildings, equipment, litter control devices, pollution control devices, fire control devices, landscaping, gates, personnel and maintenance facilities, sewer and water lines, and process water.

*“Comprehensive plan”* means a course of action developed and established cooperatively between cities, counties, and municipal solid waste sanitary disposal projects regarding their chosen integrated solid waste management system, its participants, waste reduction strategies, and disposal methods.

*“Comprehensive plan amendment”* means a notification, filed between comprehensive plan updates, that the planning agency seeks to change the participation or change the designated disposal project(s) as set out in the most recent approved comprehensive plan submittal.

*“Comprehensive plan update”* means a planning document that provides status reports on the integrated solid waste management system and that describes revision to the information and evaluation

of the integrated solid waste management system and the proposed course of action for the next planning cycle.

*“Confined aquifer”* means an aquifer with a confining bed above and below. Water in a confined aquifer is under pressure such that water rises above the top of the aquifer in a well that penetrates the aquifer.

*“Confining bed”* means a geologic formation exhibiting relatively low ability to transmit water compared to adjacent formations. Confining beds are typically not capable of yielding usable quantities of water to a well.

*“Construction and demolition waste”* means waste building materials including wood, metals and rubble that result from construction or demolition of structures.

*“Construction and demolition waste disposal site”* means a sanitary landfill that accepts only construction and demolition wastes.

*“Consumer price index”* means the measure of the average change over time in the prices paid by urban consumers for a market basket of consumer goods and services.

*“Contact water”* means liquid that has run off, or emerged from, raw feedstock and materials that are being processed, or a liquid that has come into contact with equipment dedicated to the handling of raw feedstocks or unstabilized compost, and that contains extracted, dissolved, or suspended materials. “Contact water” includes condensate from gasses resulting from the composting process but does not include water from curing materials, finished compost, or product storage piles.

*“Contaminated animal carcasses”* means waste, including carcasses, body parts, and bedding of animals, that was exposed to infectious agents during research, production of biologicals, or testing of pharmaceuticals.

*“Contaminated sharps”* means any contaminated object that can penetrate the skin, including but not limited to needles, scalpels, broken glass, broken capillary tubes, and exposed ends of dental wires.

*“Contaminated soil”* means soil that contains any harmful constituent in a concentration that may harm human health.

*“Cover material”* means soil placed as daily, intermediate, or final cover at a sanitary landfill.

*“CRT collection”* means any activity by a CRT recycling facility or CRT collection facility involving the collection of discarded CRTs that is not a short-term CRT collection event.

*“CRT collection facility”* means a property where ongoing CRT collection is the only CRT recycling activity performed.

*“CRT recycling”* means any process by which discarded CRTs that would otherwise become waste are collected, processed, and returned to use in the form of raw materials or products. CRT recycling includes but is not limited to receiving broken or intact CRTs, intentionally breaking intact CRTs or further breaking or separating broken CRTs, and sorting or otherwise managing glass removed from CRT monitors.

*“CRT recycling facility”* means a property where CRT recycling takes place. A CRT recycling facility may also collect CRTs.

*“Crumb rubber”* means a material derived by reducing waste tires or other rubber into uniform granules of 3/8 inch or less, with the inherent reinforcing materials such as steel and fiber removed along with other contaminants.

*“Cultures and stocks of infectious agents”* means specimen cultures collected from medical and pathological laboratories, cultures and stocks of infectious agents from research and industrial laboratories, wastes from the production of biological agents, discarded live and attenuated vaccines, and culture dishes and devices used to transfer, inoculate, or mix cultures.

*“Cured compost”* means compost that is both stable and mature according to the definitions found in this title.

*“Curing”* means a continuation of the composting process after the high heat stage during which maturity continues to increase.

*“Cut tire”* means a waste tire from which the tire face, tread, or sidewall has been cut or removed for beneficial use or final disposal. A cut tire shall consist of pieces greater than 18 inches on any one side.

*“Debt service”* means the amount of principal and interest due on a loan in a given time period, typically the current year.

*“Deficit”* means total annual revenues minus total annual expenditures.

*“Demanufacturing”* means the removal of components, including but not limited to PCB-containing capacitors, ballasts, mercury-containing components, fluorescent tubes, and refrigerants, from discarded appliances.

*“Discarded”* means no longer to be used for the original intended purpose and means the letting go or throwing away of materials that have become useless or superfluous though often not intrinsically valueless.

*“Displacement”* means the relative movement of any two sides of a fault measured in any direction.

*“DOT-approved container”* means those containers approved by the U.S. Department of Transportation, the agency responsible for shipping regulations for hazardous materials in the United States.

*“Downgradient”* means direction of decreasing hydraulic head.

*“Downgradient well”* means a well that has been installed downgradient of the site and is capable of detecting the migration of contaminants from the site.

*“Electric generating facility”* means electric utilities and independent power producers that fall within the North American Industry Classification System (NAICS) Code 221112.

*“Existing MSWLF unit”* means the same as defined in 40 CFR Section 258.2.

*“FAA certified airport”* means an airport serving air carriers certified by the Civil Aeronautics Board that has been issued an airport operating certificate from the Administrator of the Federal Aviation Administration pursuant to Section 612 of the Federal Aviation Act, 49 U.S.C. §1432, and 49 CFR Part 139.

*“Facility”* means all contiguous land and structures, other appurtenances, and improvements on the land used for the disposal of solid waste. Any specific facility is formally defined in the permit issued by the department. Buffer lands around a facility are not required to be included in the permitted boundary of a facility.

*“Fault”* means a fracture or a zone of fractures in any material along which strata on one side have been displaced with respect to that on the other side.

*“Fill material”* means material that is used to raise the elevation of, take up space in, or build up the level of the land. For the purposes of beneficial use, fill material is not considered subbase for hard-surface pavement construction or structural fill.

*“Finished compost”* means compost that has been cured and, if necessary, screened or refined.

*“Fiscal year”* means the state fiscal year running from July 1 through the following June 30.

*“Fixed facility”* means a permitted appliance demanufacturer operating at a permanent location.

*“Floodplain”* means the area adjoining a river or stream that has been or may be hereafter covered by flood water.

*“Fluff”* means the residual waste from the shredding operation after metals recovery.

*“Food processing residuals”* means organic materials generated as a by-product of the industrial food processing sector that are nontoxic, are nonhazardous, and contain no sanitary wastewater. The term does not include fats, oil, grease, or Dissolved Air Flotation (DAF) skimmings.

*“Foundry sand”* means a solid by-product from the foundry industry that is derived from molding, core-making, and casting cleaning processes that primarily contain sand, olivine, or clay and that is suitable for disposal as solid waste in a sanitary landfill.

*“Free liquid”* means the liquid produced when a 100-milliliter or 100-gram representative sample is placed on a standard mesh number 60 (fine mesh size) conical paint filter for five minutes (Method 9095B EPA SW-846, 2004).

*“Friable ACM waste”* has the same meaning as in 40 CFR Section 61.141.

*“Garbage”* means all solid and semisolid putrescible animal and vegetable waste resulting from the handling, preparing, cooking, storing, serving, and consuming of food or of material intended for use as food and all offal, excluding useful industrial by-products, and shall include all such substances from all public and private establishments and from all residences.

*“General special waste”* means special wastes that are commonly accepted by landfills and have specific handling requirements for disposal that are explicitly listed in 567—102.508(455B,455D). General

special waste is required to be included in the landfill's special waste acceptance criteria (SWAC) but does not require a special waste authorization (SWA).

*"Geologic cross section"* means a drawing of a subsurface profile showing the various strata encountered.

*"Groundwater flow path"* means the route of water and contaminant travel, if any, within a groundwater system.

*"HCFC"* or *"HCFCs"* means hydrochlorofluorocarbons, including any of several compounds used as refrigerants.

*"High water table"* means the position of the water table that occurs in times of above normal precipitation.

*"Holocene"* means the most recent epoch of the Quaternary Period, extending from the end of the Pleistocene Epoch to the present.

*"Household waste"* has the same meaning as in 40 CFR Section 258.2.

*"Human blood and blood products"* means human serum, plasma, other blood components, bulk blood, or containerized blood in quantities greater than 20 milliliters.

*"Hydraulic head"* means the energy contained at a point in the groundwater system. Hydraulic head is measured as the elevation to which water rises in a piezometer.

*"Incidental solid waste transfer"* means the truck-to-truck transfer of solid waste from a satellite solid waste collection vehicle to a solid waste collection vehicle if that solid waste could be collected only by a satellite solid waste collection vehicle due to vehicle access restrictions.

*"Incineration"* means the processing and burning of solid waste for the purpose of volume and weight reduction in facilities designed for such use.

*"Incorporation"* means to mix into the soil by tilling, disking, or other suitable means.

*"Industrial process waste"* means a nonhazardous solid waste that is generated as a result of manufacturing activities, product processing, or commercial activities and is managed separately from municipal solid waste, commercial solid waste, and construction and demolition waste. It may include water treatment residuals or waste but does not include office waste, cafeteria waste, or other types that are not the direct result of production processes.

*"Industrial sludge"* means any sludge produced by industrial activity.

*"Industrial solid waste"* means solid waste generated by manufacturing or industrial processes that is not a hazardous waste regulated under Subtitle C of the Resource Conservation and Recovery Act (RCRA). Such waste may include but is not limited to waste resulting from the following manufacturing processes: electric power generation, fertilizer and agricultural chemicals, food and related products and by-products, inorganic chemicals, iron and steel manufacturing, leather and leather products, nonferrous metals manufacturing and foundries, organic chemicals, plastics and resins manufacturing, pulp and paper industry, rubber and miscellaneous plastic products, textile manufacturing; transportation equipment, and water treatment. "Industrial solid waste" does not include mining waste or oil and gas waste.

*"Infectious"* means containing pathogens with sufficient virulence and quantity so that exposure to an infectious agent by a susceptible host could result in an infectious disease when the infectious agent is improperly treated, stored, transplanted, or disposed of.

*"Infectious waste"* means waste that is infectious, including but not limited to contaminated sharps, cultures and stocks of infectious agents; blood and blood products; pathological waste; and contaminated animal carcasses from hospitals or research laboratories.

*"Initial comprehensive plan"* means a first or new comprehensive plan filed with the department pursuant to Iowa Code section 455B.306.

*"Integrated solid waste management"* means any solid waste management system that is focused on planned development of programs and facilities that reduce waste volume and toxicity, recycle marketable materials, and provide for safe disposal of any residuals.

*"In-vessel"* means the use of a drum, silo, bin, tunnel, or other container for the purpose of producing compost.

*"Karst terranes"* means areas where karst topography, with its characteristic surface and subterranean features, is developed as the result of dissolution of limestone, dolomite, or other soluble rock.

Characteristic physiographic features present in karst terranes include but are not limited to sinkholes, sinking streams, caves, large springs, and blind valleys.

*“Land application”* means a method through which sludge or solid waste is applied to the surface of the ground. Land application may include subsurface injection.

*“Landfarm”* means the area of land used for landfarming a single application of a particular source and type of PCS.

*“Landfarm applicator”* means an entity permitted by the department to apply PCS to the land to create one or more landfarms.

*“Landfarming”* means a surface-level soil remediation technology for petroleum contaminated soils that reduces concentrations of petroleum constituents through biodegradation to a level safe for human health and the environment. This technology usually involves spreading excavated contaminated soils in a thin layer on the ground surface and stimulating aerobic microbial activity within the soils through aeration. The enhanced microbial activity results in degradation of adsorbed petroleum product constituents through microbial respiration. Some petroleum product constituents volatilize during the landfarming process.

*“Landfarm plot”* means the specific operating area of a landfarm upon which a particular source and type of PCS is applied.

*“Landfarm season”* means the period of the year when the ground is not frozen or snow-covered and runoff from these situations is not expected to transport PCS beyond the landfarm area.

*“Landfill property”* means the entire area of the landfill including the disposal site and any other contiguous property proposed for actual landfill use.

*“Landfill site”* means any location; place; or tract of land used for collection, storage, conversion, utilization, incineration or landfilling of solid waste, to include the landfill area, nonfill work areas, borrow areas plus a 100-foot wide perimeter surrounding the working areas or the property line if it is closer than 100 feet to the working areas.

*“Land pollution”* means the presence in or on the land of any solid waste in such quantity, of such nature, for such duration, and under such condition as would affect injuriously any waters of the state, cause air pollution, or create a nuisance.

*“Lateral expansion”* means a horizontal expansion of the waste boundaries of an existing sanitary landfill.

*“License”* means the same as defined in Iowa Code section 17A.2.

*“Lithified earth material”* means all rock, including all naturally occurring and naturally formed aggregates or masses of minerals or small particles of older rock that formed by crystallization of magma or by induration of loose sediments. This term does not include human-made materials, such as fill, concrete, and asphalt, or unconsolidated earth materials, soil, or regolith lying at or near the earth surface.

*“Lower explosive limit”* means the lowest percent by volume of a mixture of explosive gases in air that will propagate a flame at 25°C and atmospheric pressure.

*“Maturity”* means the degree or level of completeness of composting. Mature compost is free of phytotoxic components.

*“Maximum horizontal acceleration in lithified earth material”* means the maximum expected horizontal acceleration depicted on a seismic hazard map, with a 90 percent or greater probability that the acceleration will not be exceeded in 250 years, or the maximum expected horizontal acceleration based on a site-specific seismic risk assessment.

*“Mercury-containing components”* means devices containing mercury. Examples include but are not limited to thermostats, thermocouples, mercury switches, and fluorescent tubes.

*“Mobile operation”* means a permitted appliance demanufacturer that has equipment capable of operating in an area away from a fixed, permitted location.

*“Monitoring well”* means any well installed solely for the sampling of groundwater quality at a given location and depth and constructed in a manner approved by the department.

*“Municipal solid waste landfill”* or *“MSWLF”* means a discrete area of land or an excavation that receives household waste and that is not a land application site, surface impoundment, injection well, or waste pile as those terms are defined under 40 CFR Section 257.2. An MSWLF may also receive other types of RCRA Subtitle D wastes, such as commercial solid waste, nonhazardous dry sludge, and industrial

solid waste. An MSWLF may be publicly or privately owned. An MSWLF may be a new MSWLF site, an existing MSWLF site, or a lateral expansion.

*"Municipal solid waste landfill (MSWLF) unit"* means a discrete area of land or an excavation that receives household waste and that is not a land application site, surface impoundment, injection well, or waste pile as those terms are defined under 40 CFR Section 257.2. An MSWLF unit may also receive other types of RCRA Subtitle D wastes, such as commercial solid waste, nonhazardous sludge, construction and demolition debris, and industrial solid waste. An MSWLF unit may be publicly or privately owned.

*"Municipal solid waste sanitary disposal project"* means all facilities and appurtenances, including all real and personal property connected with such facilities, which are acquired, purchased, constructed, reconstructed, equipped, improved, extended, maintained, or operated to facilitate the final disposition of household waste without creating a significant hazard to the public health or safety. A municipal solid waste sanitary disposal project may also receive other types of RCRA Subtitle D wastes, such as construction and demolition debris and commercial and industrial solid waste.

*"Net worth"* means total assets minus total liabilities and is equivalent to an owner's equity.

*"Nonfriable ACM waste"* means the same as defined in 40 CFR Section 61.141.

*"Nonstandard PCS"* means soil contaminated with a petroleum product other than gasoline, diesel fuel, kerosene, jet fuel, motor oil, hydraulic fluid, or some combination thereof.

*"Open burning"* means any burning of combustible materials where the products of combustion are emitted into the open air without passing through a chimney or stack.

*"Open dump"* means any exposed accumulation of solid waste at a site other than a sanitary disposal project operating under a permit from the department.

*"Open dumping"* means the illegal depositing of solid wastes on the surface of the ground or into a body or stream of water.

*"Operating area"* means the immediate portion of a sanitary disposal project used for unloading and handling of solid waste to prepare it for processing or final disposal.

*"Operator"* means an individual who is employed and assigned to operate the equipment used on the site.

*"Organic materials"* means any material of animal or plant origin.

*"Parent corporation"* means a corporation that directly owns at least 50 percent of the voting stock of the corporation that is the facility owner or operator; the latter corporation is deemed a subsidiary of the parent corporation.

*"Passenger tire equivalent"* means a conversion measurement that is used to estimate waste tire weights and volume amounts and in which one passenger car tire with a rim diameter of 19 inches or less is equal to 25 pounds. One cubic yard of volume shall contain ten passenger tire equivalents. Tires larger than a passenger car tire shall be evaluated for volume using this conversion measurement.

*"Pathological waste"* means human tissues and body parts that are removed during surgery or autopsy.

*"PCB"* or *"PCBs"* means polychlorinated biphenyl, which is a chemical substance that is limited to the biphenyl molecule that has been chlorinated to varying degrees or any combination of substances that contain polychlorinated biphenyl.

*"Perched saturated zone"* means a localized saturated zone occurring above the regional zone of saturation. The perched saturated zone's presence is caused by a lens of relatively impermeable material within the unsaturated zone that impedes the downward movement of water toward the zone of saturation.

*"Petroleum contaminated soil"* or *"PCS"* means soil contaminated with petroleum products including but not limited to gasoline, diesel fuel, kerosene, jet fuel, motor oil, hydraulic fluid, or some combination thereof.

*"Piezometer"* means a device used to measure hydraulic head at a specific point in the groundwater system. Piezometers are generally small diameter wells sealed along the entire length and open to water only at the bottom through a short section of well screen, which is the point where hydraulic head is measured. A piezometer may be constructed similar to a monitoring well or may be a driven well point.

*"Planning agency"* means the designated contact agency on file with the department.

*“Planning area”* means the combined jurisdiction of the local governments and the designated municipal solid waste sanitary disposal project(s) involved in a comprehensive plan. A planning area may include one or more municipal solid waste sanitary disposal projects.

*“Planning cycle”* means the length of time between the due date for each comprehensive plan update submittal as approved by the department, which shall be every five years on a schedule prescribed by the department.

*“Point of compliance”* or *“POC”* means the point at which the sanitary landfill owner or operator demonstrates compliance with the liner performance standard, if applicable, and with the groundwater protection standard. The point of compliance is a vertical surface located hydraulically downgradient of the waste management area that extends down into the uppermost aquifer underlying the regulated sanitary landfill unit(s) and where groundwater monitoring shall be conducted.

*“Point of demanufacturing”* means the actual location of demanufacturing for fixed facilities and mobile operations.

*“Pollution control waste”* means any solid waste residue extracted by, or resulting from, the operation of pollution control equipment.

*“Poor foundation conditions”* means those areas where features exist that indicate that a natural or man-induced event may result in inadequate foundation support for the structural components of an MSWLF site.

*“Potentiometric surface”* means the imaginary surface that represents the level to which water from an aquifer (confined or unconfined) will rise in wells.

*“Premises”* means a geographically contiguous property owned by a generator or noncontiguous property owned by a generator that is connected by a controlled right-of-way to which the public does not have access. Two or more pieces of property that are geographically contiguous and divided by public or private right-of-way are a single premises.

*“Processed tire”* means a tire that has been processed through grinding, shredding, or other means, thereby producing a material that is readily suitable for marketing into product manufacturing, energy recovery, or other beneficial reuse markets. Waste tires that have been compacted, baled, cut, or shredded without a suitable market shall not be considered processed tires and shall be regulated as solid waste. Waste tires that have been cut into pieces that are not more than 18 inches on any side shall be accepted at a permitted sanitary landfill for final disposal as solid waste.

*“Public agency”* means the same as defined in Iowa Code section 28E.2.

*“Qualified groundwater scientist”* means a scientist or engineer who has received a baccalaureate or postgraduate degree in the natural sciences or engineering and has sufficient training and experience in groundwater hydrology and related fields demonstrated by state registration, professional certifications, or completion of accredited university programs that enable that individual to make sound professional judgments regarding groundwater monitoring, contaminant fate and transport, and corrective action.

*“Raw rendering material”* means any body, part of a body, or product of a body of any dead animal that is unwholesome, condemned, inedible, or otherwise unfit for human consumption.

*“RCRA”* means the Resource Conservation and Recovery Act as amended in 1996 and as implemented through 40 CFR Parts 239 through 282.

*“Refuse”* means putrescible and nonputrescible solid wastes including but not limited to garbage, rubbish, ashes, incinerator ash, incinerator residues, street cleanings, industrial solid wastes, and sewage treatment wastes in dry or semisolid form.

*“Refuse collection service”* means a publicly or privately operated agency, business, or service engaged in the collecting and transporting of solid waste for disposal purposes.

*“Residential lead-based paint waste”* means the same as defined in 40 CFR Section 258.2.

*“Rubbish”* means nonputrescible solid waste consisting of combustible and noncombustible wastes, such as ashes, paper, cardboard, tin cans, glass, bedding, crockery, or litter of any kind.

*“Runoff”* means the same as defined in 40 CFR Section 258.2.

*“Run-on”* means the same as defined in 40 CFR Section 258.2.

*“Salvageable material”* means discarded material that is no longer of value for its original purpose but has value if reclaimed.

*“Salvaging”* means the systematic removal of salvageable material in a formal and orderly manner as a part of the normal operating procedure of a sanitary disposal project.

*“Sanitary disposal”* means a method of treating solid waste so that it does not produce a hazard to the public health or safety or create a nuisance.

*“Sanitary landfill”* means a discrete area of land or an excavation used for solid waste disposal. Types of sanitary landfills include MSWLFs, construction and demolition debris landfills, industrial landfills, and coal combustion residuals landfills.

*“Sanitary landfill operator”* means an individual having active, daily on-site responsibility for day-to-day operation of a department-permitted sanitary landfill. This individual must also have the authority to turn waste away at the gate when the waste is considered unacceptable.

*“Sanitary landfill unit”* means a designated portion of a sanitary landfill’s footprint to distinguish the area from other areas.

*“Satellite solid waste collection vehicle”* means a small, specialized solid waste collection vehicle that has been specifically designed to service locations that have vehicle access restrictions that would otherwise render solid waste collection technically prohibitive.

*“Saturated zone”* means the same as defined in 40 CFR Section 258.2.

*“Scavenging”* means the uncontrolled removal of materials from the unloading or working area of a sanitary disposal project.

*“Seismic impact zone”* means an area with a 10 percent or greater probability that the maximum horizontal acceleration in the lithified earth material, expressed as a percentage of the earth’s gravitational pull, will exceed 0.10g in 250 years.

*“Service area”* means an area served by a specific municipal solid waste sanitary disposal project defined in terms of the jurisdictions of the local governments using the facility. A planning area may include more than one service area.

*“Sewage sludge”* means the same as defined in Iowa Code section 455B.171(34).

*“Shelby tube”* means a thin-walled, seamless steel tube with a sharp cutting edge that is used to obtain undisturbed samples of cohesive or moderately cohesive soils (silts and clays).

*“Shoreland”* means land within 300 feet of the high water mark of any natural or artificial publicly or privately owned lake or any impoundment of water used as a source of public water supply.

*“Short-term CRT collection event”* means any temporary activity involving the collection of discarded CRTs for recycling that is not on the premises of a CRT recycling facility or CRT collection facility.

*“Sludge”* means any solid, semisolid, or liquid waste generated from a commercial or industrial wastewater treatment plant, water supply treatment plant or air pollution control facility.

*“Small capacitor”* means a capacitor that contains less than 1.36 kg (3 lbs) of dielectric fluid. The following assumptions may be used if the actual weight of the dielectric fluid is unknown. A capacitor whose total volume is less than 1,639 cubic centimeters (100 cubic inches) may be considered to contain less than 1.36 kg (3 lbs) of dielectric fluid, and a capacitor whose volume is more than 3,278 cubic centimeters (200 cubic inches) must be considered to contain more than 1.36 kg (3 lbs) of dielectric fluid. A capacitor whose volume is between 1,639 and 3,278 cubic centimeters may be considered to contain less than 1.36 kg (3 lbs) of dielectric fluid if the total weight of the capacitor is less than 4.08 kg (9 lbs).

*“Soil boring”* means a hole drilled or driven into the subsurface for the purpose of determining subsurface characteristics.

*“Soil stabilization”* means the treatment or coating of soil to increase or maintain the stability of a mass of soil, to protect soil areas at risk of erosion, or to improve the engineering properties of the soil.

*“Solid by-product”* means a solid secondary material or residual, produced or created by an industrial, commercial or institutional process or activity. Solid by-products are composed of materials that are suitable for disposal as solid waste in a sanitary landfill.

*“Solid waste”* means the same as defined in Iowa Code section 455B.301. Pursuant to Iowa Code section 455B.301(29) “b,” the commission has determined that solid waste includes those wastes exempted from federal hazardous waste regulation pursuant to 40 CFR 261.4(b), except to the extent that any such exempted substances are liquid wastes or wastewater. This determination shall apply to all chapters within Title VIII.

*“Solid waste collection”* means the gathering of solid waste from public and private places.

*“Solid waste collection vehicle”* means a vehicle that has the primary purpose of collecting solid waste from a variety of locations, including at curbside and from dumpsters, compactors, and roll-off boxes.

*“Solid waste incinerator operator”* means an individual with active, daily on-site responsibility for day-to-day operation of a permitted solid waste incinerator. This individual must also have the authority to turn waste away when it has been determined to be unacceptable.

*“Solid waste storage”* means the holding of solid waste pending intermediate or final disposal.

*“Solid waste transfer station”* means any site, location, tract of land, installation or building that has the primary purpose of receiving solid waste generated off the premises from multiple generators and consolidating the waste prior to transporting it to a final disposal facility. A solid waste transfer station is a sanitary disposal project and may hold or store solid waste before transport for a short period. A solid waste transfer station is not a final disposal facility.

*“Solid waste transportation”* means the conveying of solid waste from one place to another by means of vehicle, rail car, water vessel, conveyor, or other means.

*“Solid waste transport vehicle”* means a vehicle that has the primary purpose of transporting solid waste received by a solid waste transfer station (e.g., walking floor semi-trailer).

*“Source of PCS”* means the contaminated area from which the PCS originated. Examples of a source include but are not limited to a specific gas station or spill location.

*“Special wastes”* means the same as defined in Iowa Code section 455B.304(17).

*“Specific yield”* means the ratio of the volume of water that a given mass of saturated rock or soil will yield by gravity to the volume of that mass. This ratio is stated as a percentage.

*“Split spoon sampler”* means a device used in conjunction with a drilling rig to obtain core samples from unconsolidated strata.

*“Stability”* when used in reference to composting means a stage in the composting process when microbial activity is diminished with the corresponding decrease of available organic carbon and other energy sources. Stable compost consumes little nitrogen and oxygen and generates little carbon dioxide or heat.

*“Stabilized sludge”* means sludge that has been processed to a point where it has the ability to resist further change, produces minimal odor, and has achieved a substantial reduction in the pathogenic organism content. The department recognizes principles of stabilization other than the conventional biological processes. Whether these processes produce a stabilized sludge will be evaluated on an individual basis.

*“Standard PCS”* means soil contaminated with gasoline, diesel fuel, kerosene, jet fuel, motor oil, hydraulic fluid, or some combination thereof.

*“Statistically significant increase”* or *“SSI”* means a statistical difference large enough to account for data variability and not thought to be due to chance alone.

*“Storage coefficient”* means the volume of water an aquifer releases from or takes into storage per unit surface area of aquifer per unit change in head.

*“Structural components”* means liners, leachate collection systems, final covers, run-on/runoff systems, and any other component used in the construction and operation of the MSWLF that is necessary for protection of human health and the environment.

*“Structural fill”* means the discrete, controlled use of a solid by-product as a substitute for a conventional aggregate, raw material, or soil under or immediately adjacent to a building or structure to provide strength, stability, and improved drainage characteristics (e.g., embankments, trench or foundation backfill, and pipe bedding). Structural fill does not include uses that involve general filling or grading operations that bring a naturally low area up to grade.

*“Subbase for hard-surface pavement construction”* means material that is used in subsurface applications for the construction of roads, including their shoulders, and parking lots that have hard surfaces such as concrete or asphalt. For the purposes of beneficial use, subbase for hard-surface pavement construction is not considered fill material.

*“Substantial business relationship”* means the extent of a business relationship necessary under applicable state law to make a guarantee contract issued incident to that relationship valid and enforceable.

A “substantial business relationship” must arise from a pattern of recent or ongoing business transactions, in addition to the guarantee itself, such that a currently existing business relationship between the guarantor and the owner or operator is demonstrated to the satisfaction of the department.

“*Suitable for disposal as solid waste in a sanitary landfill*” means that the material is in compliance with all state and federal rules and regulations pertaining to what may be disposed of in an Iowa sanitary landfill. Such materials are at a minimum nonhazardous and nonradioactive, are solid or semisolid, and do not contain free liquids as defined by Method 9095B (Paint Filter Liquids Test) (2004), included in “Test Methods for Evaluating Solid Waste, Physical/Chemical Methods” (EPA Publication SW-846) that is incorporated by reference.

“*Surge pit*” means a pit inside a solid waste transfer station building that receives solid waste from the tipping floor or directly from solid waste collection vehicles. Surge pits provide more space for temporary storage during peak operating hours and allow for additional compaction of the solid waste before it is loaded into solid waste transport vehicles.

“*Tangible net worth*” means the tangible assets that remain after deducting liabilities; such assets would not include intangibles such as goodwill and rights to patents or royalties.

“*Tar ball*” means a ball or conglomeration of tarlike petroleum constituents.

“*Tire casing*” means a used and worn tire that is suitable for the process of recapping. A tire casing stored for more than one year without being recapped shall be considered a waste tire.

“*Total expenditures*” means all expenditures, excluding capital outlays and debt repayment.

“*Total revenues*” means revenues from all taxes and fees, excluding revenue from funds managed by a local government on behalf of a specific third party, and does not include the proceeds from borrowing or asset sales.

“*Toxic wastes*” means materials containing poisons, biocides, acids, caustics, pathological wastes, and similar harmful wastes that may require special handling and disposal procedures to protect the environment and the persons involved in the storage, transport, and disposal of the wastes.

“*Transmissivity*” means the rate at which water is transmitted through a unit width of an aquifer under a unit hydraulic gradient.

“*Trees*” means trunks, limbs, stumps, or branches from trees or shrubs and untreated, uncoated, chemically unchanged wood wastes. This shall not include wood products that are part of an otherwise defined waste or have been contaminated by coatings, treatments, or metals.

“*Tremie tube*” means a pipe used to carry materials (e.g. gravel pack, grout) to the bottom of a boring and allow placement from the bottom up without segregation of materials or introduction of appreciable air pockets.

“*Truck-to-truck transfer*” means the direct transfer of solid waste from one vehicle to a second vehicle with no intermediary handling.

“*Type of PCS*” means the specific petroleum product or combination thereof that contaminated the soil. Examples include but are not limited to gasoline, diesel fuel, kerosene, jet fuel, motor oil, hydraulic fluid, or some combination thereof.

“*Unconfined aquifer*” means an aquifer that does not have a confining bed above it. The level of water in a well in an unconfined aquifer is below the top of the aquifer formation.

“*Unsaturated zone*” means the subsurface zone above the water table in which the interstitial spaces are only partially filled with water or not filled at all.

“*Unstable area*” means a location that is susceptible to natural or human-induced events or forces capable of impairing the integrity of some or all of the landfill structural components responsible for preventing releases from a landfill. Unstable areas can include poor foundation conditions, areas susceptible to mass movements, and karst terranes.

“*Upgradient*” means direction of increasing hydraulic head.

“*Upgradient well*” means a well that is capable of yielding groundwater samples that are representative of regional conditions and are not affected by the landfill site.

“*Uppermost aquifer*” means the geologic formation nearest the natural ground surface that is an aquifer, as well as lower aquifers that are hydraulically interconnected with this aquifer within the facility’s property boundary.

*“Used tire”* means a tire that previously has been on a vehicle but that retains suitable tread depth and is free of damage or defects so that it may be safely returned to its original purpose.

*“Vector”* means a carrier organism that is capable of transmitting a pathogen from one organism to another. Vectors include but are not limited to birds, rats and other rodents, and insects.

*“Vertical expansion”* means additional waste placement on top of or against the side slopes of a previously filled sanitary landfill unit, whether active, closed, or inactive.

*“Washwater”* means a water-based liquid that has either originated from solid waste unloaded inside the enclosed portion of a solid waste transfer station or that has come into contact with enclosed solid waste transfer station areas that have come into contact with solid waste.

*“Waste management unit boundary”* means the same as defined in 40 CFR Section 258.2.

*“Waste tire stockpile”* means a permitted site that is used for the storage, collection, or deposit of waste tires, including indoor, outdoor, and underground storage.

*“Water table”* means the water surface below the ground at which the unsaturated zone ends and the saturated zone begins.

*“Water well”* means the same as defined in Iowa Code section 455B.171(44).

*“Wearing surface”* means a layer or top surface that is in direct contact with traffic or other moving objects and is subject to wear.

*“Yard waste”* means debris such as grass clippings, leaves, garden waste, brush, and trees. “Yard waste” does not include tree stumps.

*“Zone of saturation”* means the subsurface zone below the water table in which the interstitial spaces are completely filled with water.

[ARC 0481D, IAB 8/19/26, effective 9/23/26]

**567—100.3(455B,455D) Permit required.** No public or private agency shall construct or operate a sanitary disposal project or solid waste management activity without first obtaining a permit from the department. In order to be issued a municipal solid waste sanitary disposal project permit, the permit applicant must also satisfy the comprehensive planning requirements set forth in 567—Chapter 104. The issuance of a permit by the department in no way relieves the applicant of the responsibility of complying with all other local; state; or federal statutes, ordinances, and rules or other requirements applicable to the solid waste management activity.

[ARC 0481D, IAB 8/19/26, effective 9/23/26]

**567—100.4(455B,455D) Types of permits.** There are five types of permits issued by the director; all are described in this rule.

**100.4(1) Sanitary disposal project permit.** A sanitary disposal project permit is issued by the director under the authority of Iowa Code section 455B.305 to facilitate the final disposition of solid waste. Such permits are issued for a term of up to ten years and are renewable for similar terms.

*a.* To be timely filed, an application for renewal must be received at the department’s office prior to the expiration date of the existing permit on a form prescribed by the department.

*b.* The department may conduct an inspection of the sanitary disposal project following receipt of the application for renewal. Following the inspection, the permit holder shall be notified of all measures needed to bring the sanitary disposal project into conformance with Iowa Code chapter 455B and the applicable rules.

*c.* A permit shall be renewed when a properly completed application has been received and all corrective measures required under 100.4(1) “*b*” have been completed.

**100.4(2) Solid waste management permit.** A solid waste management permit is issued by the director under the authority of Iowa Code chapters 455B and 455D for the management of solid waste. Such permits are issued for a term of up to five years and are renewable for similar terms.

*a.* To be timely filed, an application for renewal must be received at the department’s office prior to the expiration date of the existing permit on a form prescribed by the department.

*b.* The department may conduct an inspection of the solid waste management activity following receipt of the application for renewal. Following the inspection, the permit holder shall be notified of all

measures needed to bring the solid waste management activity into conformance with Iowa Code chapter 455B, Iowa Code chapter 455D, and the applicable rules.

c. A permit shall be renewed when a properly completed application has been received and all corrective measures required under 100.4(2)“b” have been completed.

**100.4(3) *Developmental permit.*** The director may issue a developmental permit for construction and operation of a sanitary disposal project or solid waste management activity that is not specifically described in these rules if the permit applicant demonstrates at a public hearing that the proposed project can provide satisfactory management or disposal of solid waste without adverse health-related or environmental effects.

a. No such permit shall be issued until the director, after public hearing, considers and approves the proposed project.

b. Developmental permits shall be issued for a term no less than one year and no more than three years.

c. Developmental permits may be renewed if the director finds, following public hearing, that the project provided satisfactory management or disposal of solid waste without adverse health-related or environmental effects over the term of the prior permit.

**100.4(4) *Temporary permit.*** A temporary permit is issued by the director under the authority of Iowa Code section 455B.307(1) for sanitary disposal projects that do not comply with the requirements of Iowa Code chapter 455B and these rules. Such permits are issued for a term of one year and are renewable. Temporary permits may be renewed if the director finds that the public interest will be best served by granting a renewal and the conditions of the previous temporary permit have been complied with.

a. Temporary permits shall incorporate as a condition a compliance schedule specifying how and when the applicant will meet the requirements of Iowa Code chapter 455B and these rules.

b. The decision of the director whether to issue a temporary permit, being discretionary, shall be a final decision. Once a temporary permit has been issued, it may be suspended or revoked only as provided in Iowa Code section 455B.305 and 7—Chapter 2506 and 561—Chapter 2506.

**100.4(5) *Closure permit.*** A closure permit is issued by the director under the authority of Iowa Code section 455B.305 for sanitary disposal projects that no longer accept solid waste. Such permits are issued for a term of up to 30 years. The term of subsequent renewal of the permit, if the post-closure period is extended, will be determined on a site-specific basis. A sanitary disposal project shall require a closure permit until the department determines that post-closure maintenance, monitoring, and operation of a leachate control system, if applicable, are no longer necessary.

a. Application shall be filed at the time of departmental notification of intended closure.

b. The application for issuance of this permit to a municipal solid waste sanitary disposal project shall be based on a previously approved comprehensive plan and the rules adopted pursuant to the authority of Iowa Code section 455B.306.

c. This permit shall require submission of an annual audit report, pursuant to Iowa Code section 455B.306(9)“e,” detailing the status of the financial instrument and other funds as required to guarantee completion of post-closure and monitoring requirements.

d. Requests for permit modification may be initiated by the department or by the permit holder.

e. At the end of the applicable post-closure period, and upon satisfactory completion of all required post-closure activities as established by Iowa Code chapter 455B, written notification shall be issued by the director stating that a permit is no longer required for the facility.

[ARC 0481D, IAB 8/19/26, effective 9/23/26]

#### **567—100.5(455B,455D) Permit applications.**

**100.5(1) *Application contents.*** Each application for a permit to construct and operate a sanitary disposal project or solid waste management activity shall include the following unless project conditions render the specific item as not applicable. The rationale for exclusion of any item that is determined not to be applicable must be provided in either the body of the application or as a supplement to facilitate department review. Each application shall be on a form prescribed by the department and include specific information as required by 567—Chapter 101 or 102, as applicable.

a. The name, address, email, and telephone number of:

(1) Owner of site where the project will be located.

- (2) Permit applicant.
- (3) Official responsible for operation of the project.
- (4) Professional engineer (P.E.) licensed in the state of Iowa and retained for financial assurance or the design of the facility, if any.
  - b. A legal description and physical address of the site.
  - c. A map or aerial photograph locating the boundaries of the site and identifying:
    - (1) North or other principal compass points.
    - (2) Zoning and land use within one-half mile.
    - (3) Haul routes to and from the site with load limits or other restrictions.
    - (4) Homes and buildings within one-half mile.
    - (5) Section lines or other legal boundaries.
  - d. Type, source, and expected volume or weight of solid waste to be handled per day, week, and year.
  - e. For municipal solid waste sanitary disposal projects, the solid waste comprehensive planning area of the facility and political jurisdictions included within that area.
  - f. A detailed description of the management or disposal process to be used and the sanitary disposal project designated for final disposal, if applicable.
  - g. A listing of equipment available on site for operations, including types as well as size, capacity, and production rates.
  - h. Proof of the applicant's ownership of the site or legal entitlement to use the site for the management of solid waste.
  - i. A closure plan that:
    - (1) Details how and when the facility will be closed in accordance with applicable requirements.
    - (2) Describes the proposed groundwater monitoring plan, leachate control system, and site inspection and maintenance activities, if applicable.
    - (3) States the name, address, email, and telephone number of the person or office to serve as contact with regard to the facility during the post-closure period, if applicable.
  - j. For sanitary disposal projects, an emergency response and remedial action plan (ERRAP) pursuant to 567—100.14(455B).
  - k. Proof of financial assurance pursuant to 567—Chapter 101, Division VIII, for all sanitary disposal projects.
  - l. Such other information as may be required by the director.

**100.5(2) *Incomplete application.*** If an application for a permit is found to be incomplete by the department, the applicant will be notified of that fact and of the specific deficiencies. Thirty days following such notification, the application may be returned by the department as incomplete without prejudice to the applicant's right to reapply. The applicant may be granted, upon request, an additional 30 days to complete the application. If an application for renewal or modification is found to be incomplete by the department, the applicant will be notified of that fact and of the specific deficiencies. Thirty days following such notification, the application for renewal or modification may be denied by the department.

**100.5(3) *Factors in permit issuance decision.*** The department may request that additional information be submitted for review to make a permit issuance decision. The department shall issue a permit if, after a review and inspection of the facility and its compliance history, the department finds that the facility is in substantial compliance with Iowa Code chapters 455B and 455D, these rules, and the conditions of the permit. If the facility is found not to be in substantial compliance with Iowa Code chapters 455B and 455D, these rules, and the conditions of the permit, or if a good-faith effort to maintain compliance is not being made, the project shall be placed on a compliance schedule approved by the department before the permit is issued. The permit may be issued with new conditions pursuant to 567—100.8(455B,455D).

**100.5(4) *Request for permit modification.*** A request for permit modification shall be submitted in writing to the department with supporting documentation and materials. The department may also request that information pursuant to 100.5(1) be resubmitted, in part or in whole, in order to make a permit modification decision. The modified permit may be approved with new conditions pursuant to 567—100.8(455B,455D).

**567—100.6(455B,455D) Construction and operation.** All sanitary disposal projects and solid waste management activities shall be constructed and operated according to the plans and specifications as approved by the department and the conditions of the permit. The approved plans and specifications shall constitute a condition of the permit.

[ARC 0481D, IAB 8/19/26, effective 9/23/26]

**567—100.7(455B,455D) Inspection prior to start-up.** The department shall be notified when the construction of a sanitary disposal project or solid waste management activity has been completed, in order that an inspection may be made to determine if the project has been constructed as designed and approved by the department. No solid waste shall be accepted by a sanitary disposal project or solid waste management activity until it has been inspected and approved by the department.

[ARC 0481D, IAB 8/19/26, effective 9/23/26]

**567—100.8(455B,455D) Permit conditions.** Any permit may be issued subject to conditions specified in writing by the department that are necessary to ensure that the project is constructed and operated in compliance with Iowa Code chapters 455B and 455D and these rules.

[ARC 0481D, IAB 8/19/26, effective 9/23/26]

**567—100.9(455B,455D) General operating requirements for sanitary disposal projects and solid waste management activities.** Every application for a permit issued by the department shall detail the means of compliance with the following operating requirements. All projects shall be operated in conformance with these requirements and any specific requirements imposed by applicable rules or permit conditions.

**100.9(1)** Open burning shall be prohibited, except when permitted by 567—Chapter 23. Any burning to be conducted at the site shall be at a location separate and distinct from the operating area.

**100.9(2)** Unless the project is regulated by 567—101.5(455B), litter shall be confined to the property on which the project is located. At the conclusion of each day of operation, any litter strewn beyond the confines of the operating area shall be collected and stored in covered leakproof containers or properly disposed.

**100.9(3)** Scavenging shall be prohibited. Any salvaging to be conducted must be described in the application, and all salvaged materials must be stored and removed from the project site in conformance with the permit conditions. Each area where salvaged materials are stored shall be segregated and clearly marked.

**100.9(4)** Effective means shall be taken to prevent the attraction or harborage of vectors and to prevent a nuisance or public health hazard.

**100.9(5)** Equipment designated in the plans and specifications or equivalent equipment shall be used to operate the site at all times.

**100.9(6)** The major internal roads shall be of all-weather construction and maintained in good condition. Dust shall be controlled on internal roads.

**100.9(7)** Sites open to the public or otherwise required by a permit issued by the department for that site shall have a permanent sign posted at the site entrance specifying:

- a. Name of the operation.
- b. Site permit number.
- c. Hours and days the site is open.
- d. Telephone number.

[ARC 0481D, IAB 8/19/26, effective 9/23/26]

**567—100.10(455B,455D) General closure requirements for sanitary disposal projects and solid waste management activities.** Every application for a permit issued by the department shall detail the means of compliance with the following closure requirements. All projects shall be closed in conformance with these requirements and any specific requirements imposed by applicable rules or permit conditions.

**100.10(1)** The owner or operator shall submit to the local political jurisdictions, the department, and the department field office with jurisdiction over the facility at least 90 days written notice of intent to permanently close or suspend operations.

**100.10(2)** Notice shall be posted at least 90 days prior to closure at the facility indicating the date of closure and alternative solid waste management facilities. If the facility is open to the public, notice of closure shall be published at least 90 days prior to closure in a newspaper of local circulation. This notice shall include the date of closure and, where applicable, identification of alternative solid waste management facilities.

**100.10(3)** Unless otherwise authorized by the department, implementation of the closure plan shall be completed within 90 days of the closure of the facility. For sanitary landfills, the owner and an Iowa-licensed professional engineer shall certify that the closure plan has been implemented in compliance with this rule, the closure plan, and the permit. Closure shall not be official until the department has inspected the site and given written certification of the completion of proper disposal of all solid waste.

**100.10(4)** Upon completion of closure activities, as-built plans shall be submitted showing changes from the original design plans, if any; test results indicating compliance with final cover, where applicable; waste removal; equipment decontamination; and other forms of closure documentation requested by the department.

[ARC 0481D, IAB 8/19/26, effective 9/23/26]

**567—100.11(455B,455D) Compliance with rule changes.**

**100.11(1)** *Design and construction.* Sanitary disposal projects and solid waste management activities designed and constructed in accordance with rules in effect at the time of construction shall not be required to be redesigned or reconstructed due to subsequent rule changes unless the department finds that such facilities pose a threat to human health or the environment. Such facilities shall be brought into compliance with rules in effect at the time of reconstruction, expansion, or otherwise modifying the project or at the time of permit renewal.

**100.11(2)** *Operation.* If any new rule conflicts with an operating procedure prescribed in the engineering plans or the permit of a sanitary disposal project or solid waste management activity, the operation shall conform with the new rule.

[ARC 0481D, IAB 8/19/26, effective 9/23/26]

**567—100.12(455B,455D) Transfer of title.** If title to a sanitary disposal project or solid waste management activity is transferred and the transferee desires to continue operation of the project, the transferee shall apply in writing to the department within 30 days of the title transfer for a transfer of the permit.

**100.12(1)** The department shall transfer the permit when it determines that the site is in compliance with Iowa Code chapters 455B and 455D, these rules, and the conditions of the permit and that the transferee possesses the equipment and personnel to operate the project in conformance with applicable rules and the conditions of the permit.

**100.12(2)** No permit is valid after 60 days following transfer of title unless the permit has been transferred by the department to the new titleholder pursuant to this rule. If the permit has not been transferred within 60 days, the new titleholder shall submit a complete permit application to operate the sanitary disposal project or solid waste management activity pursuant to 567—100.5(455B,455D).

[ARC 0481D, IAB 8/19/26, effective 9/23/26]

**567—100.13(455B,455D) Effect of revocation.** The director may revoke and reissue, or terminate, in whole or in part, any license or permit for cause. If a license or permit held by any public or private agency for a sanitary disposal project or solid waste management activity is revoked by the director, no new license or permit shall be issued to that agency for that project for a period of one year from the date of revocation. Such revocation shall not prohibit the issuance of a license or permit for the project to another public or private agency.

[ARC 0481D, IAB 8/19/26, effective 9/23/26]

**567—100.14(455B) Emergency response and remedial action plans.**

**100.14(1)** *Purpose.* The purpose of this rule is to implement Iowa Code section 455B.306(7) “d” by providing the criteria for developing a detailed ERRAP for permitted sanitary disposal projects. Each ERRAP shall include established provisions to minimize the possibility of fire; explosion; or any release

to air, land, or water of pollutants that could threaten human health and the environment and to identify possible occurrences that may endanger human health and the environment.

**100.14(2) *Applicability.*** This rule applies to the owners or operators of all sanitary disposal projects that are permitted pursuant to 567—Chapter 101 and any activity deemed necessary by the department to maintain an ERRAP as part of their permit. The ERRAP does not replace or supersede other regulatory requirements related to public health, safety, or welfare.

**100.14(3) *Submittal requirements.***

*a.* The owner or operator of a facility that is subject to this rule shall, at the time of application, incorporate a complete, detailed ERRAP that meets the requirements set forth in this rule.

*b.* An updated ERRAP shall be submitted at the time of each permit renewal or permit reissuance application and with any request for permit modification or significant change in facility operation that requires revision of the currently approved ERRAP.

**100.14(4) *Content.*** The content of ERRAP documents shall be concise and readily usable as a reference manual by facility managers and operators during emergency conditions. The ERRAP document content shall address at least the following primary issues in detail unless project conditions render the specific issue as not applicable. The rationale for exclusion of any issue areas that are determined not to be applicable must be provided in either the body of the plan or as a supplement to facilitate department review. Additional ERRAP requirements unique to the facility shall be addressed, as applicable.

*a.* Facility information.

- (1) Permitted agency.
  - (2) Department permit number.
  - (3) Facility description.
  - (4) Responsible official and contact information.
  - (5) Project location.
  - (6) Site and environs map.
- b.* Regulatory requirements.
- (1) Iowa Code section 455B.306(7) “d” criteria citation.
  - (2) Reference to provisions of the permit.

*c.* Emergency conditions—response activities—remedial action for short-term (48 hours or less) and long-term (over 48 hours) for the following:

(1) Failure of utilities that impede or prohibit operation of the facility, including but not limited to power/electricity and communications.

(2) Weather-related events that impede or prohibit operations of the facility, including but not limited to flooding and storms.

(3) Fire and explosions related to solid waste.

1. Solid waste fires, including landfill working face.
2. Hot loads.
3. Landfill gas.

(4) Solid waste spills and releases, including but not limited to waste materials, leachate, and landfill gas.

(5) Mass movement of land and waste, including but not limited to earthquakes, slope failures, waste shifts, or subsidence.

(6) Emergency notifications and reporting.

1. Federal agencies.
  2. State agencies.
  3. Local agencies.
  4. News media.
  5. Public and private facilities with special populations within five miles.
  6. Emergency response agencies and contact information.
  7. Reporting requirements and forms.
- (7) Emergency waste management procedures.
1. Communications and public relations.

2. Temporary discontinuation of services—short- and long-term.
3. Facilities access and rerouting.
4. Waste acceptance.
5. Wastes in process.
6. Equipment.
- (8) Emergency aid.
  1. Responder contacts.
  2. Medical services.
  3. Contracts and agreements.
- (9) ERRAP training requirements.
  1. Training providers.
  2. Employee orientation.
  3. Annual training updates.
  4. Training completion and recordkeeping.

**100.14(5) ERRAP review.** The ERRAP shall be developed with the review and input of the local fire department and local emergency management coordinator. Documentation shall be maintained that such review and input has been requested.

[ARC 0481D, IAB 8/19/26, effective 9/23/26]

**567—100.15(455B) Laboratory analyses.** Analyses for a contaminant regulated under Title VIII must be performed by a laboratory certified for the analyte(s) and applicable method pursuant to 567—Chapter 83.

[ARC 0481D, IAB 8/19/26, effective 9/23/26]

These rules are intended to implement Iowa Code sections 455B.304 and 455B.305 and chapter 455D.

CHAPTER 101  
SANITARY DISPOSAL PROJECTS

[Prior to 7/1/83, DEQ Ch 26]  
[Prior to 12/3/86, Water, Air and Waste Management [900]]

Chapter rescission date pursuant to Iowa Code section 17A.7: 9/23/31

DIVISION I  
LANDFILL-SPECIFIC REQUIREMENTS

**567—101.1(455B) Purpose, applicability, and compliance.** The purpose of this division is to provide sanitary landfill-specific requirements for sanitary disposal projects regulated in Divisions II, III, and IV of this chapter. All sanitary landfills regulated in Divisions II, III, and IV of this chapter must comply with the provisions of this division and with 567—Chapter 100, except as noted below and in those respective divisions.

**101.1(1)** Municipal solid waste landfills that did not receive waste after October 9, 1994, shall be governed by the closure permit issued or the rules in place at the time for post-closure activities.

**101.1(2)** All rules, standards, technical guidance, and other similar legal or technical documents referenced in this division shall be the version of those documents in effect on August 1, 2025, unless otherwise noted in these rules, and except for references to the Iowa Code and Iowa Administrative Code, which shall always be the most recent version unless otherwise noted in these rules.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.2(455B) Farm exceptions.** This chapter does not apply to farm waste and farm buildings that are disposed of in compliance with the following requirements.

**101.2(1) Definitions.** For the purpose of this rule:

*“Farm buildings”* means barns, machine sheds, storage cribs, animal confinement buildings, and homes located on the premises and used in conjunction with crop production or with livestock or poultry raising and feeding operations.

*“Farm waste”* means machinery, vehicles and equipment used in conjunction with crop production or with livestock or poultry raising and feeding operations, trees, brush and grubbed stumps generated on the same property or ashes from the burning thereof. “Farm waste” does not include agricultural chemicals, fertilizers or manures, or domestic household wastes.

**101.2(2)** A person may dispose of farm waste and farm buildings without first having obtained a sanitary disposal project permit, provided that the disposal is in accordance with 101.2(3), the rules of the department of agriculture and land stewardship, and the following:

- a. The farm waste was owned by a person and was used on the premises where disposal occurs.
- b. Prior to disposal of vehicles, machinery, and equipment, all fluids are drained, including motor oils, motor fuels, lubricating fluids, coolants and solvents, and agricultural chemicals; and all batteries and rubber tires are removed.
- c. Prior to disposal of storage or feeding equipment, the equipment is emptied of all contents not otherwise authorized for burial pursuant to these rules.
- d. Farm buildings have been emptied of contents not otherwise authorized for burial pursuant to these rules and have been buried on the premises where they were located.
- e. All materials drained or removed from farm waste or farm buildings prior to disposal are recycled, reused, or disposed of in accordance with Iowa Code chapters 455B and 459 and the rules implementing that chapter.
- f. The farm waste and farm buildings are buried in soils listed in tables contained in the county soil surveys and soil interpretation records (published by the U.S. Soil Conservation Service) as being moderately well drained, well drained, somewhat excessively drained, or excessively drained soils. Other

soils may be used if artificial drainage is installed to obtain water-level depth more than two feet below the burial depth of the waste.

g. The lowest elevation of the burial pit is six feet or less below the surface.

h. The farm waste and farm buildings are immediately covered with a minimum of 6 inches of soil and finally covered with a total minimum of 24 inches of soil.

**101.2(3)** Farm waste and farm buildings must be disposed of in accordance with the following separation distances:

a. At least 100 feet from any private well and 200 feet from any public well that is being used or would be used without major renovation for domestic purposes.

b. At least 50 feet from any adjacent property line.

c. At least 500 feet from an existing neighboring residence.

d. More than 100 feet from any body of surface water such as a stream, lake, pond, or intermittent stream, except as provided in 101.2(3)“f.”

e. Outside the boundaries of a floodplain, wetland, or shoreline area, except as provided in 101.2(3)“f.”

f. Trees, brush and grubbed stumps generated as a result of clearing, snagging, or maintenance or repair of drainage ditches or outlets may be buried within 100 feet of a surface water and within a floodplain or shoreline area.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.3(455B) Definitions.** For the purposes of this division, the definitions in Iowa Code section 455B.301 and 567—Chapter 100 shall be incorporated by reference.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.4(455B) Permits.** In addition to the permit requirements in 567—Chapter 100 and as otherwise required by law, the following permit requirements shall apply to all sanitary landfills.

**101.4(1) Operating permits.** An MSWLF, construction and demolition debris, or industrial landfill operating permit shall be issued and may be renewed for a period no longer than five years. A coal combustion residuals landfill operating permit shall be issued and may be renewed for a period no longer than ten years. If an MSWLF adopts research, development, and demonstration (RD&D) provisions pursuant to 101.104(2), an MSWLF operating permit with RD&D provisions shall be issued and may be renewed for a period no longer than three years.

**101.4(2) Closure permits.** An MSWLF or industrial landfill closure permit shall be issued for a period of 30 years. A coal combustion residuals landfill closure permit shall be issued for a period of ten years. A sanitary landfill requires a closure permit until the department determines that post-closure operations are no longer necessary. A request for a closure permit renewal or termination shall be filed at least 180 days before the expiration of the current permit. If the department finds that a sanitary landfill has completed all required post-closure activities and no longer presents a significant risk to human health or the environment, then the department shall issue written notification that a closure permit is no longer required for the facility. If the department extends the post-closure period, then the duration of the subsequent closure permit will be determined on a site-specific basis.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.5(455B) Applications and construction requirements.** Unless otherwise authorized by the department, a permit applicant shall submit on a form prescribed by the department, and shall provide evidence demonstrating how the landfill will comply with the requirements in 567—Chapter 100, the following general requirements, and any requirements specified in the applicable division of this chapter.

**101.5(1) Local siting approval.** Documentation that local siting approval pursuant to Iowa Code section 455B.305A, if applicable, has been obtained.

**101.5(2) Separation from groundwater.** The base of a sanitary landfill unit shall be situated so that the base of the waste within the proposed unit is at least five feet above the high water table unless a greater separation is required to ensure that there will be no significant adverse effect on groundwater or surface waters or a lesser separation is unlikely to have a significant adverse effect on groundwater or surface

waters. Artificial means of lowering the high water table are acceptable. The separation of the base of a sanitary landfill unit from the high water table shall be measured and maintained in a manner acceptable to the department.

**101.5(3) Wells.** A sanitary landfill unit shall not be within 1,000 feet of any water well in existence at the time of receipt of the original permit application or application to laterally expand the permitted sanitary landfill unit for the facility. Groundwater monitoring wells are exempt from this requirement. The department may also exempt extraction wells utilized as part of a remediation system from this requirement.

**101.5(4) Floodplains.** New sanitary landfill units or lateral expansions shall not be located in a 100-year floodplain. Existing sanitary landfills located in 100-year floodplains must demonstrate to the department that the unit will not restrict the flow of a 100-year flood, reduce the temporary water storage capacity of the floodplain, or result in washout of solid waste so as to pose a hazard to human health and the environment. The owner or operator must place the demonstration in the operating record and submit a copy of the demonstration to the department. For purposes of this subrule, the definitions for floodplain, 100-year flood, and washout are the same as defined in 40 CFR 258.11.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.6(455B) General operating requirements.** In addition to the general operating requirements in 567—Chapter 100, the following shall apply to all sanitary landfills unless otherwise noted.

**101.6(1) Controlled access.** Sanitary landfills will control public access and prevent unauthorized vehicular traffic and illegal dumping of wastes by using artificial barriers, natural barriers, or both, as appropriate to protect human health and the environment.

**101.6(2) Scales and weights.** A scale certified by the Iowa department of agriculture and land stewardship shall weigh all solid waste collection vehicles and solid waste transport vehicles. The owner or operator shall maintain a record of the weight of waste disposed.

**101.6(3) All-weather access to disposal.** A disposal area shall be accessible during all weather conditions when the landfill is open.

**101.6(4) Salvaged and processed materials.** Salvaged and processed materials (e.g., scrap metal, compost, mulch, aggregate, tire chips) from a sanitary landfill shall be managed and stored in an orderly manner that does not create a nuisance or encourage the attraction or harborage of vectors.

**101.6(5) Vector control.** Sanitary landfills shall prevent or control the on-site populations of vectors using techniques appropriate for the protection of human health and the environment.

**101.6(6) Litter control.** Sanitary landfills shall take steps to minimize the production of litter and the release of windblown litter off site of the facility. All windblown litter off site of the facility shall be collected daily unless prevented by unsafe working conditions. On-site litter shall be collected daily unless prevented by working conditions. A dated record of unsafe conditions that prevented litter collection activities shall be maintained by the facility.

**101.6(7) Dust control.** Sanitary landfills shall take steps to minimize the production of dust so that unsafe or nuisance conditions are prevented.

**101.6(8) Mud control.** Sanitary landfills shall take steps to minimize the tracking of mud by vehicles exiting the facility so that slick or unsafe conditions are prevented.

**101.6(9) Leachate and wastewater treatment.** The leachate management system shall be managed and maintained pursuant to the requirements of Divisions II, III, and IV of this chapter. Leachate collection pipes shall be cleaned and inspected as necessary but not less than once every three years. Leachate and wastewater shall be treated as necessary to meet the pretreatment limits, if any, imposed by a publicly owned wastewater treatment works (POTW) or by the effluent discharge limits established by a National Pollutant Discharge Elimination System (NPDES) permit. Documentation of the pretreatment permit or pretreatment agreement with the POTW or NPDES permit must be submitted to the department. All leachate and wastewater treatment systems shall conform to the department's wastewater design standards.

**101.6(10) Signage.** Facilities open to the public shall have signs or pavement markings indicating on-site traffic patterns.

**101.6(11) Traffic control.** Adequate queuing distance shall be provided for vehicles entering and exiting the property.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.7(455B) Sanitary landfill operator certification.** Sanitary landfill operators shall be trained, tested, and certified by a department-approved certification program.

**101.7(1)** A sanitary landfill operator shall be on duty during all hours of operation of all sanitary landfills, except coal combustion residuals sanitary landfills, consistent with the respective certification.

**101.7(2)** To become a certified operator, an individual shall complete a basic operator training course that has been approved by the department or an alternative, equivalent training approved by the department and shall pass a departmental examination as specified by this subrule. An operator certified by another state may have reciprocity subject to prior approval by the department.

**101.7(3)** A sanitary landfill operator certification is valid until June 30 of the following even-numbered year.

**101.7(4)** The required basic operator training course for a certified sanitary landfill operator shall have at least 20 contact hours and shall address the following areas at a minimum:

- a. Description of types of wastes.
- b. Interpreting and using engineering plans.
- c. Construction surveying techniques.
- d. Waste decomposition processes.
- e. Geology and hydrology.
- f. Landfill design.
- g. Landfill operation.
- h. Environmental monitoring.
- i. Applicable laws and regulations.
- j. Permitting processes.
- k. Leachate control and treatment.

**101.7(5)** Alternate basic operator training must be approved by the department. The applicant shall be responsible for submitting any documentation the department may require to evaluate the equivalency of alternate training.

**101.7(6)** Fees.

- a. The fee for each examination is \$20.
- b. The initial certification fee is \$8 for each one-half year of a two-year period from the date of issuance to June 30 of the next even-numbered year.
- c. The certification renewal is \$24.
- d. The penalty fee is \$12.

**101.7(7)** Examinations.

a. The operator certification examinations shall be based on the basic operator training course curriculum.

b. All individuals wishing to take the examination required to become a certified operator of a sanitary incinerator shall complete an operator certification examination application on a form prescribed by the department. A listing of dates and locations of examinations is available from the department upon request. The application form requires the applicant to indicate the basic operator training course taken. Evidence of training course completion must be submitted with the application for certification. The completed application and the application fee shall be sent to the Iowa Department of Natural Resources, 6200 Park Avenue, Des Moines, Iowa 50321. Application for examination must be received by the department prior to the date of examination.

c. A properly completed application for examination shall be valid for one year from the date the application is approved by the department.

d. Upon failure of the first examination, the applicant may be reexamined at the next scheduled examination. Upon failure of the second examination, the applicant shall be required to wait a period of 180 days between each subsequent examination.

e. Upon each reexamination when a valid application is on file, the applicant shall submit to the department the examination fee at least ten days prior to the date of examination.

*f.* Failure to successfully complete the examination within one year from the date of approval of the application shall invalidate the application.

*g.* Completed examinations will be retained by the department for a period of one year, after which they will be destroyed.

*h.* Oral examinations may be given at the discretion of the department.

**101.7(8) Certification.**

*a.* All operators who passed the operator certification examination by July 1, 1991, are exempt from taking the required operator training course. Beginning July 1, 1991, all operators are required to take the basic operator training course and pass the examination in order to become certified.

*b.* Application for certification must be received by the department within 30 days of the date the applicant receives notification of successful completion of the examination. All applications for certification shall be made on a form prescribed by the department and shall be accompanied by the certification fee.

*c.* Applications for certification by examination that are received more than 30 days but less than 60 days after notification of successful completion of the examination shall be accompanied by the certification fee and the penalty fee. Applicants who do not apply for certification within 60 days of notice of successful completion of the examination will not be certified on the basis of that examination.

*d.* For applicants who have been certified under other state mandatory certification programs, the equivalency of which has been previously reviewed and accepted by the department, certification without examination will be approved.

*e.* For applicants who have been certified under voluntary certification programs in other states, the department shall consider certification by reciprocity if the applicant has successfully completed a basic operator training course and an examination generally equivalent to the Iowa examination. The department may require the applicant to successfully complete the Iowa examination.

*f.* Applicants who seek Iowa certification pursuant to 101.7(8)“*d*” and “*e*” shall submit an application for examination accompanied by a letter requesting certification pursuant to this subrule. Application for certification pursuant to this subrule shall be received by the department in accordance with 101.7(8)“*b*” and “*c*.”

**101.7(9) Duration and renewal of certification.** All certificates shall expire every two years, on even-numbered years, and must be renewed every two years to maintain certification. Application and fee are due prior to expiration of certification.

*a.* Late application for renewal of a certificate may be made, provided that such late application shall be received by the department within 30 days of the expiration of the certificate. Such late application shall be on forms prescribed by the department and accompanied by the penalty fee and the certification renewal fee.

*b.* If a certificate holder fails to apply for renewal within 30 days following expiration of the certificate, the right to renew the certificate automatically terminates. Certification may be allowed at any time following such termination, provided that the applicant successfully completes an examination. The applicant must then apply for certification in accordance with 101.7(8).

*c.* An operator shall not continue to operate a sanitary landfill after expiration of a certificate without renewal thereof.

*d.* Continuing education must be earned during the two-year certification period. All certified operators must earn eight contact hours per certificate during each two-year period. The two-year period will begin upon issuance of certification.

*e.* Only those operators fulfilling the continuing education requirements before the end of each two-year period will be allowed to renew their certificates. The certificates of operators not fulfilling the continuing education requirements shall be void upon expiration unless an extension is granted by the department.

*f.* All activities for which continuing education credit will be granted must be related to the subject matter of the particular certificate to which the credit is being applied.

*g.* The department may, in individual cases involving hardship or extenuating circumstances, grant an extension of time of up to three months within which the applicant may fulfill the minimum

continuing education requirements. Hardship or extenuating circumstances include documented health-related confinement or other circumstances beyond the control of the certified operator that prevent attendance at the required activities. All requests for extensions must be made 60 days prior to expiration of certification.

*h.* The certified operator is responsible for notifying the department of the continuing education credits earned during the period. The continuing education credits earned during the period shall be shown on the application for renewal.

*i.* A certified operator shall be deemed to have complied with the continuing education requirements of this subrule during periods that the operator serves honorably on active duty in the military service, for periods that the operator is a resident of another state or district having a continuing education requirement for operators and meets all the requirements of that state or district for practice there, for periods that the person is a government employee working as an operator and is assigned to duty outside the United States, or for other periods of active practice and absence from the state approved by the department.

**101.7(10)** Discipline of certified operators.

*a.* Disciplinary action may be taken on any of the following grounds:

(1) Failure to use reasonable care or judgment or to apply knowledge or ability in performing the duties of a certified operator. Duties of certified operators include compliance with rules and permit conditions applicable to sanitary landfill operation.

(2) Failure to submit required records of operation or other reports required under applicable permits or rules of the department, including failure to submit complete records or reports.

(3) Knowingly making any false statement, representation, or certification on any application, record, report or document required to be maintained or submitted under any applicable permit or rule of the department.

*b.* Disciplinary sanctions allowable are:

(1) Revocation of a certificate.

(2) Probation under specified conditions relevant to the specific grounds for disciplinary action. Additional education or training or reexamination may be required as a condition of probation.

*c.* The procedure for discipline is as follows:

(1) The department shall initiate disciplinary action. The commission may direct that the department investigate any alleged factual situation that may be grounds for disciplinary action under 101.7(10) "a" and report the results of the investigation to the commission.

(2) A disciplinary action may be prosecuted by the department.

(3) Written notice shall be given to an operator against whom disciplinary action is being considered. The notice shall state the informal and formal procedures available for determining the matter. The operator shall be given 20 days to present any relevant facts and indicate the operator's position in the matter and to indicate whether informal resolution of the matter may be reached.

(4) An operator who receives notice shall communicate verbally, in writing, or in person with the department, and efforts shall be made to clarify the respective positions of the operator and department.

(5) The applicant's failure to communicate facts and positions relevant to the matter by the required date may be considered when determining appropriate disciplinary action.

(6) If agreement as to appropriate disciplinary sanction, if any, can be reached with the operator and the commission concurs, a written stipulation and settlement between the department and the operator shall be entered into. The stipulation and settlement shall recite the basic facts and violations alleged, any facts brought forth by the operator, and the reasons for the particular sanctions imposed.

(7) If an agreement as to appropriate disciplinary action, if any, cannot be reached, the department may initiate formal hearing procedures. Notice and formal hearing shall be in accordance with 7—Chapter 2506 and 561—Chapter 2506 related to contested and certain other cases pertaining to license discipline.

**101.7(11)** Upon revocation of a certificate, application for certification may be allowed after two years from the date of revocation. Any such applicant must successfully complete an examination and be certified in the same manner as a new applicant.

**101.7(12)** Temporary certification. A temporary operator of a sanitary landfill may be designated for a period of six months when an existing certified operator is no longer available to the facility. The facility must make application to the department, explain why a temporary certification is needed, identify the temporary operator, and identify the efforts that will be made to obtain a certified operator. A temporary operator designation shall not be approved for greater than a six-month period, except for extenuating circumstances. In any event, not more than one six-month extension to the temporary operator designation may be granted. Approval of a temporary operator designation may be rescinded for cause as set forth in 101.7(10). All sanitary landfills, with the exception of coal combustion residuals landfills, shall have at least one sanitary landfill operator trained, tested, and certified by a department-approved program.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.8(455B) Groundwater monitoring and reporting.**

**101.8(1)** The planning, monitoring, and reporting for groundwater monitoring at a sanitary landfill shall be performed by a qualified groundwater scientist.

**101.8(2)** Monitoring wells must be constructed and cased by a well contractor certified pursuant to 567—Chapter 82 in a manner that maintains the integrity of the monitoring well borehole. This casing must be screened or perforated and packed with gravel or sand, where necessary, to enable collection of groundwater samples. The annular space (i.e., the space between the borehole and well casing) above the sampling depth must be sealed to prevent contamination of samples and the groundwater. Monitoring wells constructed in accordance with the rules in effect at the time of construction shall not be required to be abandoned and reconstructed as a result of subsequent amendments to these rules unless the department finds that the well is no longer providing representative groundwater samples. Figure 1 contains a general diagram of a properly constructed monitoring well.

a. The owner or operator must notify the department that the design, installation, development, and decommission of any monitoring wells; piezometers; and other measurement, sampling, and analytical devices documentation has been placed in the operating record.

b. The monitoring wells; piezometers; and other measurement, sampling, and analytical devices must be operated and maintained so that they perform to design specifications throughout the life of the monitoring program.

c. Each groundwater monitoring point must have a unique and permanent number, and that number must never change or be used again at the sanitary landfill. The types of groundwater monitoring points shall be identified as follows:

- (1) Monitoring wells by “MW# (insert unique and permanent number)”.
- (2) Piezometers by “PZ# (insert unique and permanent number)”.
- (3) Groundwater underdrain systems by “GU# (insert unique and permanent number)”.

d. Monitoring well construction shall comply with the following requirements:

(1) In all phases of drilling, well installation, and completion, the methods and materials used shall not introduce substances or contaminants that may alter the results of water quality analyses.

(2) Drilling equipment that comes into contact with contaminants in the borehole or aboveground shall be thoroughly cleaned to avoid spreading contamination to other depths or locations. Contaminated materials or leachate from wells must not be discharged onto the ground surface or into waters of the state so as to cause harm in the process of drilling or well development.

(3) The owner or operator must ensure that, at a minimum, the well design and construction log information is maintained in the facility’s permanent record on a form prescribed by the department and that a copy is sent to the department.

e. Monitoring well casings shall comply with the following requirements:

(1) The diameter of the inner well casing (e.g., Figure 1) of a monitoring well shall be at least two inches.

(2) Plastic-cased wells shall be constructed of materials with threaded and non-glued joints that do not allow water infiltration under the local subsurface pressure conditions and when the well is evacuated for sampling.

(3) Well casing shall provide sufficient structural stability so that a borehole or well collapse does not occur. Flush joint casing is required for small diameter wells installed through hollow stem augers.

*f.* Monitoring well screens shall comply with the following requirements:

(1) Slot size shall be based on sieve analysis of the sand and gravel stratum or filter pack. The slot size must keep out at least 90 percent of the filter pack.

(2) Slot configuration and open area must permit effective development of the well.

(3) The screen shall be no longer than ten feet in length, except for water table wells, in which case the screen shall be of sufficient length to accommodate normal seasonal fluctuations of the water table. The screen shall be placed five feet above and below the observed water table unless local conditions are known to produce greater fluctuations. Screen length for piezometers shall be two feet or less. Multiple-screened, single-cased wells are prohibited.

*g.* Monitoring well filter packs shall comply with the following requirements:

(1) The filter pack shall extend at least 18 inches above and 12 inches below the well screen.

(2) The size of the filter pack material shall be based on sieve analysis when sand and gravel are screened. The filter pack material must be 2.5 to 3 times larger than the 50 percent grain size of the zone being monitored.

(3) In stratum that is neither sand nor gravel, the size of the filter pack material shall be selected based on the particle size of the zone being monitored.

*h.* Monitoring well annular space shall comply with the following requirements:

(1) Grouting materials must be installed from the top of the filter pack up in one continuous operation with a tremie tube.

(2) The annular space between the filter pack and the frostline must be backfilled with bentonite grout.

(3) The remaining annular space between the protective casing and the monitoring well casing must be sealed with bentonite grout from the frostline to the ground surface.

*i.* Monitoring well heads shall be protected as follows:

(1) Monitoring wells shall have a protective metal casing installed around the upper portion of the monitoring well casing as follows:

1. The inside diameter of the protective metal casing shall be at least two inches larger than the outer diameter of the monitoring well casing.

2. The protective metal casing shall extend from a minimum of one foot below the frostline to slightly above the well casing top; however, the protective casing shall be shortened if such a depth would cover a portion of the well screen.

3. The protective casing shall be sealed and immobilized with a concrete plug around the outside. The bottom of the concrete plug must extend at least one foot below the frostline; however, the concrete plug shall be shortened if such a depth would cover a portion of the well screen. The top of the concrete plug shall extend at least three inches above the ground surface and slope away from the well. Soil may be placed above the plug and shall be at least six inches below the cap to improve runoff.

4. The inside of the protective casing shall be sealed with bentonite grout from the frostline to the ground surface.

5. A vented cap shall be placed on the monitoring well casing.

6. A vented, locking cap shall be placed on the protective metal casing. The cap must be kept locked when the well is not being sampled.

(2) All monitoring wells shall have a ring of brightly colored protective posts or other protective barriers to help prevent accidental damage.

(3) All monitoring wells shall have a sign or permanent marking clearly identifying the permanent monitoring well number (MW#).

(4) Run-on shall be directed away from all monitoring wells.

*j.* Well development is required prior to the use of the monitoring well for water quality monitoring purposes. Well development must loosen and remove fines from the well screen and gravel pack. Any water utilized to stimulate well development must be of sufficient quality that future samples are not contaminated. Any gases utilized in well development must be inert gases that will not contaminate future samples. Following development, the well shall be pumped until the water does not contain significant amounts of suspended solids.

**101.8(3)** Groundwater monitoring points that are no longer functional must be sealed. Groundwater monitoring points that are to be sealed and are in a future waste disposal area shall be reviewed to determine if the method utilized to seal the monitoring point needs to be more protective than the following requirements. All abandoned groundwater-monitoring points (e.g., boreholes, monitoring wells, and piezometers) shall be sealed by a well contractor certified pursuant to 567—Chapter 82 and in accordance with the following requirements.

*a.* The following information shall be placed in the operating record on a form prescribed by the department and a copy sent to the department:

- (1) The unique, permanent monitoring point number.
- (2) The reasons for abandoning the monitoring point.
- (3) The date and time the monitoring point was sealed.
- (4) The method utilized to remove monitoring point materials.
- (5) The method utilized to seal the monitoring point.

*b.* The monitoring point materials (e.g., protective casing, casing, screen) shall be removed. If drilling is utilized to remove the materials, then the drilling shall be to the maximum depth of the previously drilled monitoring point. All drilling debris shall be cleaned from the interior of the borehole.

*c.* The cleared borehole shall be sealed with impermeable bentonite grout via a tremie tube. The end of the tremie tube shall be submerged in the grout while filling from the bottom of the borehole to the top of the ground surface. Uncontaminated water shall be added from the surface as needed to aid grout expansion.

*d.* After 24 hours, the bentonite grout shall be retopped if it has settled below the ground surface.

**101.8(4)** Groundwater samples shall not be field-filtered prior to laboratory analysis.

Figure 1 – Typical Monitoring Well Cross-Section

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.9(455B) Contingency planning.** In addition to the emergency response and remedial action plan (ERRAP) requirements in 567—Chapter 100, all sanitary landfills shall include a contingency plan in their ERRAP detailing specific procedures to be followed in case of equipment breakdown, maintenance downtime, or fire in equipment or vehicles, including methods to be used to remove or dispose of accumulated waste.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.10(455B) Disruption and excavation of sanitary landfills or closed dumps.** No person shall excavate, disrupt, or remove any deposited material from any active or discontinued sanitary landfill or closed dump without first having notified the department in writing.

**101.10(1)** Notification shall include an operational plan stating the area involved, lines and grades defining limits of excavation, estimated number of cubic yards of material to be excavated, sanitary disposal project where material is to be disposed, and estimated time required for excavation procedures.

**101.10(2)** An excavation shall be confined to an area consistent with the number of pieces of digging equipment and trucks used for haulage.

**101.10(3)** The disposal of all solid waste resulting from excavation shall be in conformity with Iowa Code chapter 455B and applicable solid or hazardous waste regulations.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.11(455B) Transfer of title.** If title of a closed sanitary disposal project is transferred, any future waste exhumation activities, excluding repairs or maintenance activities, are considered to be operation of the landfill due to the similar environmental effects possible from the two activities due to waste exposure.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

These rules are intended to implement Iowa Code section 455B.304 and chapter 455D.

**567—101.12 to 101.100** Reserved.

DIVISION II  
MUNICIPAL SOLID WASTE LANDFILLS

**567—101.101(455B) Purpose.** The purpose of this division is to implement Iowa Code chapter 455B, subchapter IV (solid waste disposal), and to protect human health and the environment through the implementation of minimum national standards pursuant to the Resource Conservation and Recovery Act (“RCRA” or “the Act”) for all municipal solid waste landfill (MSWLF) units and under the Clean Water Act for MSWLFs that are used to dispose of sewage sludge.

This division details the permitting, siting, design, operating, monitoring, corrective action, reporting, recordkeeping, closure, and post-closure requirements for sanitary landfills accepting municipal solid waste.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.102(455B) Applicability and compliance.**

**101.102(1)** This division shall apply to sanitary landfills that are constructed and operated exclusively for the final deposition of municipal solid waste.

**101.102(2)** Pursuant to Iowa Code section 455B.305(1), an MSWLF shall not be constructed or operated without first obtaining a permit from the department pursuant to this division, the requirements set forth in 567—Chapter 100, and Division I of this chapter.

**101.102(3)** The issuance of a permit to an MSWLF pursuant to this division in no way relieves the applicant of the responsibility of complying with all other local, state, or federal statutes; ordinances; and rules or other requirements applicable to the construction and operation of an MSWLF.

**101.102(4)** Sanitary landfills accepting municipal solid waste must comply with the provisions of this division.

**101.102(5)** These rules do not pertain to the management and disposal of special wastes. Division VI of this chapter contains rules pertaining to the management and disposal of special wastes.

**101.102(6)** These rules do not apply to MSWLF units that did not receive waste after October 9, 1994. The closure permit issued or the rules in effect at the time of closure shall govern post-closure activities for such MSWLF units.

**101.102(7)** This division does not apply to MSWLF units that ceased receiving waste before October 1, 2007, and are not contiguous with MSWLF units that continued to accept waste after October 1, 2007. For the purpose of this subrule, contiguous MSWLF units are those that adjoin, abut, or have a common boundary or edge with one another or that utilize the same groundwater monitoring network system. The permit issued and the rules in effect at the time waste acceptance ceased shall govern post-permit activities for such MSWLF units, except as follows:

- a. Financial assurance in accordance with 567—101.114(455B) shall be required.
- b. Surface water sampling in accordance with 101.110(3) shall be required.
- c. MSWLF units shall perform groundwater sampling for the following parameters:
  - (1) Routine semiannual water sampling parameters:
    1. Chloride.
    2. Specific conductance (field measurement).
    3. pH (field measurement).
    4. Ammonia nitrogen.

5. Iron, dissolved.
6. Chemical oxygen demand.
7. Any additional parameters deemed necessary by the department.
- (2) Routine annual water sampling parameters:
  1. Total organic halogen.
  2. Phenols.
  3. Any additional parameters deemed necessary by the department.
- d. If the analytical results for a downgradient groundwater monitoring point do not fall within the control limits of two standard deviations above (or below, for pH) the mean parameters, listed in 101.102(7) “d”(1) and “d”(2), in a corresponding upgradient groundwater monitoring point and it cannot be demonstrated that a source other than an MSWLF unit caused the control limit exceedance, then the owner or operator shall comply with the groundwater assessment monitoring program requirements in 101.110(6) and corrective action requirements in 101.110(7), 101.110(8), and 101.110(9), if necessary.

**101.102(8)** Compliance with amendments to these rules.

a. Owners or operators of existing MSWLF units that have an approved leachate collection system and a composite liner, or a leachate collection system and an alternative liner modeled at an approved point of compliance, shall not be required to redesign or reconstruct the MSWLF units due to amendments to these rules subsequent to such approval unless the department finds that such units are causing pollution or that continued use of such units will result in a vertical expansion on top of or against the side slopes of a previously filled noncompliant MSWLF unit. Prior to waste placement in the vertical expansion area, revised design plans shall be submitted to include construction of a separatory liner and leachate collection system that comply with all the requirements of 101.107(5) to be placed between the area of vertical expansion and the underlying noncompliant MSWLF unit.

b. Except as authorized by 101.102(8) “a,” if any new regulation conflicts with a provision of or an operating procedure prescribed in the engineering plans or the MSWLF permit, the facility shall conform to the new regulation.

**101.102(9)** Equivalency review procedure.

a. In approving a permit application under this division, the department may authorize, in writing, alternatives to the design requirements in this division only if, and only to the extent that, specific rules in this division expressly state that alternatives may be authorized under this division.

b. An owner or operator requesting an alternative design under this division shall submit a request to the department prepared by an Iowa-licensed professional engineer. The request shall:

- (1) Identify the specific rule for which an equivalency alternative is being sought.
- (2) Demonstrate through supporting technical documentation, justification and quality control procedures that the requested alternative to the design requirements in the rules of this division will, for the life of operations at the facility, achieve the performance standards in that rule.

c. No equivalency alternative will be approved unless the application affirmatively demonstrates that the following conditions are met:

- (1) The request is complete and accurate and the requirements of this subrule have been met.
- (2) The proposed alternative will provide protection equivalent to the design requirements in this division for the air, water, or other natural resources of the state of Iowa and will not harm or endanger the public health, safety, or welfare.

**101.102(10)** All rules, standards, technical guidance, and other similar legal or technical documents referenced in this division shall be the version of those documents in effect on August 1, 2025, unless otherwise noted in these rules, and except for references to the Iowa Code and Iowa Administrative Code, which shall always be the most recent version unless otherwise noted in these rules.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.103(455B) Definitions.** The definitions in Iowa Code section 455B.301 and 567—Chapter 100 shall apply to this division.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.104(455B) Permits.**

**101.104(1) *Applicability.*** For purposes of this division, the permit requirements in 567—Chapter 100; Division I of this chapter, and this rule apply.

**101.104(2) *Research, development, and demonstration (RD&D) permits.*** The director or the director's designee may issue an RD&D permit that overrides the applicable portions of this division pursuant to 40 CFR 258.4 without issuing a waiver pursuant to 7—Chapter 2504. A permit amendment from the department for leachate recirculation only does not require an RD&D permit.

**101.104(3) *Notice and public participation in the MSWLF permit issuance and post-permit actions.***

*a.* For the purposes of this subrule, “post-permit actions” includes permit renewals and requests for the following facility modifications:

- (1) Change in an MSWLF facility boundary or an MSWLF unit.
- (2) Application for an RD&D permit pursuant to 101.104(2).
- (3) Installation of a landfill gas collection system.
- (4) Application for a closure permit for an MSWLF unit.
- (5) Transfer of an MSWLF permit to a new owner.
- (6) Waiver from this division under 567—101.115(455B).
- (7) Change in the post-permit land use of the property.

(8) Other significant permit actions that are determined by the department to require public notice and participation. Such actions may include requests to change any of the requirements set forth as special provisions in the permit.

*b.* Prior to the issuance of approval or denial for an MSWLF permit or post-permit action, public notice shall be circulated in a manner designed to inform interested and potentially interested persons of the permit or post-permit action request. Procedures for the circulation of public notice shall include at least the following:

(1) Upon receipt of the permit application or post-permit action request, the department shall determine whether public notice is required in accordance with this subrule. If public notice is required, then the department shall prepare the public notice that shall be circulated by the owner or operator within the service area of the MSWLF by posting the public notice near the entrance to the MSWLF; and by publishing the public notice in periodicals or, if appropriate, in a newspaper(s) of general circulation.

(2) The public notice shall be posted on the department's webpage.

*c.* The department shall provide a period of not less than 30 days following the date of the public notice during which time interested persons may submit their written views with respect to the MSWLF permit application or post-permit action request. All written comments submitted during the 30-day comment period shall be retained by the department and considered by the department in the formulation of the department's final determinations. The period for comment may be extended at the sole discretion of the department.

*d.* The contents of the public notice shall include at least the following:

- (1) The name, address, and telephone number of the department.
- (2) The name and address of each applicant.
- (3) A brief description of each applicant's activities or operations that result in the submittal of the permit application or post-permit action request.

(4) A statement that any person may submit written and signed comments or may request a public hearing, or both, on the proposed permit or post-permit action request. A statement of procedures to request a public hearing pursuant to 101.104(3) “e” shall be included.

(5) Locations where copies of the permit application or post-permit action request may be reviewed and the times at which the copies shall be available for public inspection.

*e.* The applicant or any interested agency, person, or group of persons may request or petition for a public hearing with respect to an MSWLF permit application or post-permit action request. Any such request shall clearly state issues and topics to be addressed at the hearing. Any such request or petition for public hearing must be filed with the department within the 30-day period prescribed in 101.104(3) “c” and shall indicate the interest of the party filing such request and the reasons why a hearing is warranted. The department shall hold an informal and noncontested case hearing if there is a significant public interest (including the filing of requests or petitions for such hearing) in holding such a hearing. Frivolous or

insubstantial requests for hearing may be denied by the department. Instances of doubt should be resolved in favor of holding the hearing. Any hearing requested pursuant to this subrule shall be held in the service area of the MSWLF or other appropriate area at the sole discretion of the department.

*f.* If the department determines that a public hearing is warranted, then the department shall prepare the public notice of the hearing. Public notice of any hearing held shall be circulated at least as widely as was the notice of the permit application or post-permit action request.

*g.* The contents of public notice of any hearing held pursuant to 101.104(3) “e” shall include at least the following:

- (1) The name, address, and telephone number of the department;
- (2) The name and address of each applicant whose application will be considered at the hearing;
- (3) A brief reference to the public notice issued for each permit application and post-permit action request;
- (4) Information regarding the time and location for the hearing;
- (5) The purpose of the hearing;
- (6) A concise statement of the issues raised by the person requesting the hearing;
- (7) Locations where copies of the permit application or post-permit action may be reviewed, including the closest department field office, and the times at which the copies shall be available for public inspection; and
- (8) A brief description of the nature of the hearing, including the rules and procedures to be followed.

*h.* The department shall keep a record of the commenters and of the issues raised during the public participation process and shall prepare written responses to all comments received. At the time a final decision is made, the record and copies of the department’s responses shall be made available to the public.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.105(455B) Permit applications.** Unless otherwise authorized by the department, a permit applicant shall submit on a form prescribed by the department compliance with the requirements in 567—Chapter 100 and Division I of this chapter and the following information:

1. A site exploration and characterization report for the facility that complies with the requirements of 101.106(3).
2. Plans and specifications for the facility, and quality control and assurance (QC&A) plans, that comply with the requirements of 101.107(4).
3. A development and operations (DOPs) plan for the facility.
4. An environmental monitoring plan that complies with the requirements of 567—101.109(455B) and 567—101.110(455B).
5. The project goals and timelines and other documentation as necessary to comply with 101.104(2) and other requirements of the department if an RD&D permit is being requested or renewed.
6. A closure and post-closure plan that complies with the requirements of 567—101.112(455B) and 567—101.113(455B).

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.106(455B) Siting and location requirements.** This rule applies to new MSWLF units and horizontal expansions of existing MSWLF units. Except for 101.106(2), this rule does not apply to permitted MSWLF units that have been approved prior to October 1, 2007. Information required to document compliance with 567—101.106(455B) shall be consolidated and maintained in a site exploration and characterization report pursuant to 101.106(3).

**101.106(1) Location restrictions.** MSWLFs shall comply with the following location restrictions.

*a. Airports.*

(1) No new MSWLF shall be constructed or established within six miles of a smaller public airport unless approved or authorized by the Federal Aviation Administration (FAA).

(2) Owners or operators of new MSWLF units, existing MSWLF units, and lateral expansions that are located within 10,000 feet (3,048 meters) of any airport runway end used by turbojet aircraft or within 5,000 feet (1,524 meters) of any airport runway end used by piston-type aircraft only must demonstrate to the FAA and obtain its approval that the units are designed and operated so that the MSWLF unit does not

pose a bird hazard to aircraft. The owner or operator must place the demonstration of this requirement in the operating record and submit to the department a copy of the demonstration approved by the FAA.

(3) Owners or operators proposing to site new MSWLF units or lateral expansions within a five-mile radius of any airport runway end used by turbojet or piston-type aircraft must notify the affected airport and the FAA. A copy of these notifications shall be submitted to the department.

*b. Wetlands.* New MSWLF units and lateral expansions shall not be located in wetlands unless the owner or operator can make the demonstrations in 40 CFR 258.12 to the department.

*c. Fault areas.* New MSWLF units or lateral expansions shall not be located within 200 feet (60 meters) of a fault that has had displacement in Holocene time unless the owner or operator demonstrates to the department that an alternative setback distance of less than 200 feet (60 meters) will prevent damage to the structural integrity of the MSWLF unit and will be protective of human health and the environment.

*d. Seismic impact zones.* New MSWLF units and lateral expansions shall not be located in seismic impact zones unless the owner or operator demonstrates to the department that all containment structures, including liners, leachate collection systems, and surface water control systems, are designed to resist the maximum horizontal acceleration in lithified earth material for the site. The owner or operator must place the demonstration in the operating record and submit a copy of the demonstration to the department.

*e. Unstable areas.* Owners or operators of new MSWLF units, existing MSWLF units, or lateral expansions located in an unstable area must demonstrate to the department that engineering measures have been incorporated into the MSWLF unit's design to ensure that the integrity of the structural components of the MSWLF unit will not be disrupted. The owner or operator must place the demonstration in the operating record and submit a copy of the demonstration to the department. The owner or operator must consider the following factors, at a minimum, when determining whether an area is unstable:

- (1) On-site or local soil conditions that may result in significant differential settling;
- (2) On-site or local geologic or geomorphologic features; and
- (3) On-site or local human-made features or human-induced events (both surface and subsurface).

*f. Property line setback.* An MSWLF unit shall be at least 50 feet from an adjacent property line.

*g. Housing and sensitive populations.* An MSWLF unit shall not be within 500 feet of an occupied residence, recreational area, child care facility, educational facility, or health care facility in existence at the time of receipt of the original permit application or application to laterally expand the permitted MSWLF unit unless there is a written agreement between the MSWLF owner and such facility. The written agreement shall be filed with the county recorder for abstract of title purposes and a copy submitted to the department.

**101.106(2)** *Soil and hydrogeologic investigations.* An MSWLF shall have a qualified groundwater scientist, as defined in 567—101.3(455B), conduct a soil and hydrogeologic investigation in accordance with this subrule. The purpose of this investigation is to obtain data to determine potential routes of contaminant migration via groundwater. Such information is vital for completion of the site exploration and characterization report and the hydrologic monitoring system plan and design. This subrule sets forth the minimum requirements for soil and hydrogeologic investigations. An MSWLF shall comply with this subrule unless the department issues written approval due to specific site conditions.

*a. Number of borings.* A sufficient number of borings shall be made to accurately identify the stratigraphic and hydrogeologic conditions at the site.

*b. Depth of borings.* Unless otherwise approved by the department in writing, the following requirements shall apply to the depth of borings:

- (1) All borings shall be a minimum of 25 feet deep and at least 10 feet below the water table.
- (2) At a minimum, half of all borings shall extend 20 feet into the uppermost aquifer, 50 feet below the water table, or 10 feet into bedrock.
- (3) At a minimum, one boring shall extend 10 feet into bedrock or 100 feet below the lowest ground surface elevation.
- (4) All borings shall be of sufficient depth to correlate strata between borings.

*c. Boring method and soil samples.*

(1) Continuous samples shall be collected for all borings unless otherwise approved by the department in writing.

- (2) Boring logs shall be as detailed as possible in describing each stratum.
- (3) Samples shall be clearly marked, preserved, and transported in accordance with laboratory procedures.
- (4) The permit applicant shall keep and preserve samples until at least 30 days after the permit is issued.
- (5) Soil samples from each stratum shall be tested for falling-head hydraulic conductivity and grain size distribution.

*d. Conversion of or plugging borings.*

(1) Borings may be converted to piezometers or monitoring wells. However, the conversion of such borings does not guarantee that more piezometers or monitoring wells will not be required in the department-approved hydrologic monitoring system plan and design.

(2) Borings not converted to piezometers or monitoring wells shall be plugged and properly sealed so as not to create pathways for subsurface or surface pollution migration. Borings converted to piezometers or monitoring wells may still need to be partially plugged depending on the depth of the boring. Plugging shall be performed pursuant to 101.110(2).

*e. Soil and hydrogeologic investigation description and analysis.* A soil and hydrogeologic investigation description and analysis shall be completed and maintained and, at a minimum, shall contain the following:

- (1) The boring logs pursuant to 101.106(3) "c"(2).
- (2) A description of the properties of each soil and bedrock stratum as appropriate, including:
  1. Soil texture and classification.
  2. Particle size distribution.
  3. Mineral composition, cementation, and soil structure.
  4. Permeability, including horizontal and vertical permeability, and porosity.
  5. Geologic structure, including strike, dip, folding, faulting, and jointing.
  6. Previous activities and infrastructure at the site that could affect geology and hydrogeology, such as but not limited to mining, quarry operations, borrow pits, waste disposal, storage tanks, pipelines, utilities, and tile lines.
  7. Lenses and other discontinuous units, voids, solution openings, layering, fractures, other heterogeneity, and the scale or frequency of the heterogeneity.
  8. Correlation and continuity of strata between borings.
- (3) Descriptions of the hydrogeologic units within the saturated zone, including:
  1. Thickness.
  2. Hydraulic properties, including as appropriate conductivity, transmissivity, storativity, and effective porosity.
  3. Concentrations of chemical constituents listed in 40 CFR Part 258, Appendix I, present in the groundwater of hydrogeologic units and the source of those constituents, if known.
  4. Role and effect of each hydrogeologic unit as an aquifer, aquitard, or perched saturated zone.
  5. The actual or potential use of the aquifers as water supplies.
- (4) Plan view maps, and a series of cross sections with two oriented perpendicular and two oriented parallel to the predominant directions of groundwater flow through the MSWLF unit, showing:
  1. The extent of soil and bedrock strata.
  2. The position of the water table.
  3. The position of the uppermost aquifer.
  4. Measured values of hydraulic head.
  5. Equipotential lines and inferred groundwater streamlines of the water table, and the uppermost aquifer if different from the water table.
  6. Location of soil and bedrock borings.
  7. Location of piezometers and monitoring points, if any.
- (5) A description and evaluation of horizontal and vertical groundwater flow that specifically addresses the following and their significance to the movement of pollutants carried by groundwater:
  1. Local, intermediate, and regional groundwater systems.

2. Groundwater recharge and discharge areas within and immediately surrounding the facility, including interactions with perennial and intermittent surface waters and how the facility affects recharge rates.

3. Existing and proposed groundwater and surface water withdrawals.

4. The effects of heterogeneity, fractures, or directional differences in permeability on groundwater movement.

5. Directions of groundwater movement, including vertical components of flow, specific discharge rates, and average linear velocities within the hydrologic strata.

6. Seasonal or other temporal fluctuations in hydraulic head.

7. The effect of existing and proposed MSWLF units.

(6) An analysis of potential impacts on groundwater and surface water quality, and water users, in the event of a theoretical release at the most downgradient portion of each MSWLF unit. The analysis shall at a minimum utilize contaminants and indicator parameters with high mobility in groundwater. This analysis shall include:

1. Assumptions and approximations utilized and why they were utilized.

2. If a model is utilized, a thorough description of models used and each model's capabilities and limitations, including the reliability and accuracy of the models in actual field tests.

3. Projected paths and rates of movement of contaminants found in leachate.

(7) Recommendations for the location of the proposed MSWLF unit and conceptual design based on hydrogeologic information.

**101.106(3) *Site exploration and characterization report.*** An MSWLF shall develop and submit to the department for review a site exploration and characterization report. At a minimum, the site exploration and characterization report shall detail compliance with the requirements of this rule and contain the following components:

a. A title page and index.

b. A legal description of the site.

c. Proof of the applicant's ownership of the site and legal entitlement to use the site as an MSWLF. If the applicant does not own the site, then proof of legal entitlement to the site must be submitted. Such legal entitlement must include the following:

(1) Provisions that allow continued disposal operations until closure of the facility.

(2) Provisions for the performance of facility closure operations.

(3) Provisions for post-closure care for at least a 30-year period after facility closure.

d. Proof of the applicant's local siting approval pursuant to Iowa Code section 455B.305A, if applicable.

e. Scaled maps or aerial photographs locating the boundaries of the facility and identifying:

(1) North and other principal compass points.

(2) Section lines and other legal boundaries.

(3) Zoning and land use within one-half mile.

(4) Haul routes to and from the facility, including load limits or other restrictions on those routes.

(5) Topography within one-half mile.

(6) Applicable setback distances and location requirements pursuant to this rule, including:

1. Airports within six miles of existing, new, and planned MSWLF units.

2. Floodplains within or adjacent to the facility.

3. Wetlands within or adjacent to the facility.

4. Fault areas within 200 feet of existing, new, and planned MSWLF units.

5. Seismic impact zones within or adjacent to the facility.

6. Unstable areas within or adjacent to the facility.

7. Water wells within 1,000 feet of upgradient existing, new, and planned MSWLF units.

8. Public water wells within one mile of upgradient existing, new, and planned MSWLF units.

9. Boundaries of the existing, new, and planned MSWLF units and the facility property line.

10. Housing and sensitive populations within 500 feet of existing, new, and planned MSWLF units.

f. The bird-aircraft hazard demonstration pursuant to 101.106(2) "a," if applicable.

- g. The floodplain demonstration pursuant to 101.106(2) “b,” if applicable.
  - h. The wetlands demonstration pursuant to 101.106(2) “c,” if applicable.
  - i. The fault area demonstration pursuant to 101.106(2) “d,” if applicable.
  - j. The seismic impact zone demonstration pursuant to 101.106(2) “e,” if applicable.
  - k. The unstable area demonstration pursuant to 101.106(2) “f,” if applicable.
  - l. Copies of written agreements with surrounding property owners pursuant to 101.106(2) “l,” if applicable.
  - m. The soil and hydrogeologic investigation description and analysis pursuant to 101.106(3) “e.”
- [ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.107(455B) MSWLF unit design and construction standards.** MSWLF units shall be designed and constructed in accordance with this rule.

**101.107(1) Plans and specifications.**

- a. Unless otherwise requested by the department, one copy of plans, specifications, and supporting documents shall be provided to the department for review.
- b. New MSWLF units shall be constructed in compliance with the rules and regulations in effect at the time of construction. Previous department approval of plans and specifications for MSWLF units not yet constructed shall be superseded by the promulgation of new rules and regulations, after which plans and specifications shall be resubmitted to the department for approval prior to construction and operation.

**101.107(2) MSWLF unit subgrade.** The subgrade for a new MSWLF unit shall be constructed as follows:

- a. All trees, stumps, roots, boulders, debris, and other material capable of deteriorating in situ material strength or of creating a preferential pathway for contaminants shall be completely removed or sealed off prior to construction of the MSWLF unit.
- b. The material beneath the MSWLF unit shall have sufficient strength to support the weight of the unit during all phases of construction and operation. The loads and loading rate shall not cause or contribute to failure of the liner and leachate collection system.
- c. The total settlement or swell of the MSWLF unit’s subgrade shall not cause or contribute to failure of the liner and leachate collection system.
- d. If the in situ material of the MSWLF unit’s subgrade cannot meet the requirements of 101.107(4) “b” and “c,” then such material shall be removed and replaced with material capable of compliance.
- e. The subgrade of an MSWLF unit shall be constructed and graded to provide a smooth working surface on which to construct the liner.
- f. The subgrade of an MSWLF unit shall not be constructed in or with frozen soil.

**101.107(3) MSWLF unit liners and leachate collection systems.** The liner and leachate collection system for a new MSWLF unit shall be constructed in accordance with the requirements of this subrule. All active portions must have a composite liner or an alternative liner approved by the department. An MSWLF unit must have a functioning leachate collection system during its active life.

- a. *Liner systems.* An MSWLF unit shall have a liner system that complies with either the composite liner requirements of 101.107(5) “a”(1) or an alternative liner system that complies with the requirements of 101.107(5) “a”(2). Liners utilizing compacted soil must place the compacted soil in lifts no thicker than eight inches after compaction.

(1) Composite liner systems.

- 1. A composite liner consists of two components, an upper flexible membrane liner and a lower compacted soil liner.
- 2. The upper component must consist of a minimum 30 mil flexible membrane liner. Flexible membrane liner components consisting of high-density polyethylene (HDPE) shall be at least 60 mil thick. The flexible membrane liner component must be installed in direct and uniform contact with the lower compacted soil component.
- 3. The lower component must consist of at least a two-foot layer of compacted soil with a hydraulic conductivity of no more than  $1 \times 10^{-7}$  centimeters per second (cm/sec). The compacted soil must be placed in lifts no thicker than eight inches after compaction.

4. The composite liner must be adequately sloped toward the leachate collection pipes to provide drainage of leachate. Unless alternative design requirements to this performance standard are approved as part of the permit under 101.102(11) (relating to equivalency review procedure), the leachate collection system shall have a slope greater than or equal to 2 percent and not exceeding 33 percent.

(2) Alternative liner systems.

1. The design must ensure that the concentration values listed in Table I of 567—101.107(455B) will not be exceeded in the uppermost aquifer at the relevant point of compliance, as specified pursuant to 101.107(5) “a”(2)“2.” Alternative liners utilizing compacted soil must place the compacted soil in lifts no thicker than eight inches.

2. The relevant point of compliance specified by the department must be within 50 feet of the planned liner or waste boundary, unless site conditions dictate otherwise, downgradient of the facility with respect to the hydrologic unit being monitored in accordance with 101.110(2) “a”(2), and located on land owned by the owner of the MSWLF unit. The relevant point of compliance specified by the department shall be at least 50 feet from the property line of the facility.

3. When approving an alternative liner design, the department shall consider at least the following factors:

- The hydrogeologic characteristics of the facility and surrounding land.
- The climatic factors of the area.
- The volume and physical and chemical characteristics of the leachate.
- The sensitivities and limitations of the modeling demonstrating the applicable point of compliance.
- Practicable capability of the owner or operator.

4. The alternative liner must be adequately sloped toward the leachate collection pipes to provide drainage of leachate. Unless alternative design requirements to this performance standard are approved as part of the permit under 101.102(11) (relating to equivalency review procedure), the leachate collection system shall have a slope greater than or equal to 2 percent and not exceeding 33 percent.

Table I

| Chemical                                 | MCL (mg/l) |
|------------------------------------------|------------|
| Arsenic. ....                            | 0.01       |

| Vinyl chloride. ....                     | 0.002      |

*b. Leachate collection system.* MSWLF units shall have a leachate collection system that complies with the following requirements:

(1) The leachate collection system shall be designed and constructed to function for the entire active life of the facility and the post-closure period.

(2) The leachate collection system shall be of a structural strength capable of supporting waste and equipment loads throughout the active life of the facility and the post-closure period.

(3) The leachate collection system shall be designed and constructed to minimize leachate head over the liner at all times. An MSWLF unit shall have a leachate collection system that maintains less than a 30-centimeter (12-inch) depth of leachate over the liner. The leachate collection system shall have a method for accurately measuring the leachate head on the liner at the system's lowest point(s) within the MSWLF unit (e.g., sumps). Furthermore, an additional measuring device shall be installed to measure leachate directly on the liner in the least conductive drainage material outside of the sump and collection trench. Leachate head measurements from cleanout lines or manholes are not acceptable for the second measurement. All such measurement devices shall be in place before waste is placed in the MSWLF unit.

(4) If the leachate collection system is not designed and constructed factoring in leachate recirculation or bioreactor operations, the department may prohibit such activities within the MSWLF unit.

(5) The collection pipes shall be of a length and cross-sectional area that allow for cleaning and inspection through the entire length of all collection pipes at least once every three years. The collection pipes shall not be designed or constructed with sharp bends that prevent cleaning or inspection along any section of the collection pipe or that may cause the collection pipe to be damaged during cleaning or inspection.

(6) Leachate collection system designs shall attempt to minimize the potential for clogging due to mass loading.

(7) Unless alternative design requirements are approved as part of the permit under 101.102(11) (relating to equivalency review procedure), the following design requirements shall apply:

1. A geotextile cushion over the flexible membrane liner if the system utilizes such a liner and granular drainage media. A geotextile cushion is not required if the granular drainage media is well rounded and less than 3/8 inch in diameter. The geotextile's mass shall be determined based on the allowable pressure on the geomembrane.

2. Collection pipe(s) at least four inches in diameter at the base of the liner slope(s), surrounded by the high hydraulic-conductivity material listed in 101.107(5) "b"(7)"3" below. The collection pipe shall have slots or holes large enough to minimize the potential for clogging from fines conveyed by incoming leachate.

3. One of the following high hydraulic-conductivity materials:

- High hydraulic-conductivity material (e.g., gravel) of uniform size and a fines content of no more than 5 percent by weight passing a #200 sieve. The high hydraulic-conductivity material shall be at least 12 inches in depth and have a hydraulic conductivity of at least  $1 \times 10^{-2}$  cm/sec; or

- A geosynthetic drainage media (e.g., geonet). The transmissivity of geonets shall be tested to demonstrate that the design transmissivity will be maintained for the design period of the facility. The testing for the geonet in the liner system shall be conducted using actual boundary material intended for the geonet at the maximum design normal load for the MSWLF unit and at the design load expected from one lift of waste. At the maximum design normal load, testing shall be conducted for a minimum period of 100 hours unless data equivalent of the 100-hour period is provided, in which case the test shall be conducted for a minimum period of one hour. In the case of the design load from one lift of waste, the minimum period shall be one hour. For geonets used in final covers, only one test shall be conducted for a minimum period of one hour using the expected maximum design normal load from the cover soils and the actual boundary materials intended for the geonet. A granular layer at least 12 inches thick with a hydraulic conductivity of at least  $1 \times 10^{-3}$  cm/sec shall be placed above the geosynthetic drainage material that readily transmits leachate and provides separation between the waste and liner.

(8) Manholes within the MSWLF unit shall be designed to minimize the potential for stressing or penetrating the liner due to friction on the manhole exterior from waste settlement.

(9) The leachate drainage and collection system within the MSWLF unit shall not be used for the purpose of storing leachate. If leachate is to be stored, it shall be stored in designated storage structures outside of the MSWLF unit.

(10) All of the facility's leachate storage and management structures outside of the MSWLF unit and operations shall have containment structures or countermeasures adequate to prevent seepage to groundwater or surface water. The containment structures and countermeasures for leachate storage shall be at least as protective of groundwater at the liner of the MSWLF unit on a performance basis.

(11) Unless alternative design requirements are approved as part of the permit under 101.102(11) (relating to equivalency review procedure), the leachate storage structures shall be able to store at least seven days of accumulated leachate at the maximum generation rate used in designing the leachate collection system. Such minimum storage capacity may be constructed in phases over time so long as the seven-day accumulation capacity is maintained. The storage facility shall also have the ability to load tanker trucks in case sanitary sewer service is unavailable for longer than seven days.

(12) The leachate collection system shall be equipped with valves or devices similar in effectiveness so that leachate can be controlled during maintenance.

(13) The leachate collection system shall be accessible for maintenance at all times and under all weather conditions.

(14) The permit holder shall annually submit a Leachate Control System Performance Evaluation (LCSPE) Report as a supplement to the facility Annual Water Quality Report, as defined in 101.110(10). The report shall include an evaluation of the effectiveness of the system in controlling the leachate, leachate head levels and elevations, the volume of leachate collected and transported to the treatment works or discharged under any National Pollutant Discharge Elimination System (NPDES) permits, records of leachate contaminants testing required by the treatment works, proposed additional leachate control measures, and an implementation schedule in the event that the constructed system is not performing effectively.

**101.107(4) *Quality control and assurance program (QC&A).*** MSWLF units shall be constructed under the supervision of a QC&A program to ensure that MSWLF units are constructed in accordance with the requirements of 567—101.107(455B) and the approved plans and specifications. At a minimum, such QC&A program shall consist of the following.

*a.* The owner or operator shall designate a QC&A officer. The QC&A officer shall be an Iowa-licensed professional engineer. The QC&A officer shall not be an employee of the facility, the construction company or construction contractor. The owner or operator shall notify the department of the designated QC&A officer and provide the department with that person's contact information. The QC&A officer may delegate another person or persons who are not employees of the facility to supervise or implement aspects of the QC&A program.

*b.* The QC&A officer shall document compliance with 567—101.107(455B), and the approved plans and specifications, for the following aspects of construction:

(1) The MSWLF unit's subgrade.

(2) The liner system, as follows:

1. For a flexible membrane liner, destructive testing of the flexible membrane liner shall be kept to side slopes when continuous seams are utilized. Patches over destructive testing areas shall be checked with nondestructive methods.

2. For the compacted clay component of the liner system, a minimum of five field moisture density tests per eight-inch lift per acre shall be performed to verify that the correct density, as correlated to permeability by a laboratory analysis, has been achieved. Laboratory hydraulic conductivity testing of Shelby tube samples from the constructed soil liner or test pad, field hydraulic conductivity testing of the constructed soil liner or test pad, or other methods approved by the department shall be utilized as a QC&A test.

(3) The leachate collection, conveyance, and storage systems.

(4) Any other aspect of construction as required by the department.

*c.* A sampling and testing program shall be implemented by the QC&A officer as part of the QC&A program. The sampling and testing program shall:

(1) Verify full compliance with the requirements of 567—101.107(455B) and the approved plans and specifications.

(2) Be approved by the department prior to construction of the MSWLF unit.

(3) Detail how each stage of construction will be verified for full compliance with the requirements of 567—101.107(455B) and the approved plans and specifications.

(4) Be based on statistically significant sampling techniques and establish criteria for the acceptance or rejection of materials and constructed components of the MSWLF unit.

(5) Detail what actions will take place to remedy and verify any material or constructed component that is not in compliance with the requirements of 567—101.107(455B) and the approved plans and specifications.

d. The QC&A officer shall document the QC&A program. Upon completion of the MSWLF unit construction, the QC&A officer shall submit a final report to the department that verifies compliance with the requirements of 567—101.107(455B) and the department-approved plans and specifications. A copy of the final report shall also be maintained by the facility in the operating record. At a minimum, the final report shall include the following.

(1) A title page and index.

(2) The name and permit number of the facility.

(3) Contact information for the QC&A officer and persons delegated by the QC&A officer to supervise or implement an aspect of the QC&A program.

(4) Contact information for all construction contractors.

(5) Copies of daily reports containing the following information:

1. The date.

2. Summary of weather conditions.

3. Summary of locations on the facility where construction was occurring.

4. Summary of equipment, materials, and personnel utilized in construction.

5. Summary of meetings held regarding the construction of the MSWLF unit.

6. Summary of construction progress.

7. Photographs of the construction progress, with descriptions of the time, subject matter, and location of each photograph.

8. Details of sampling and testing program for that day. At a minimum, this report shall include details of where sampling and testing occurred, the methods utilized, personnel involved, and test results.

9. Details of how any material or constructed component that was found not to be in compliance via the sampling and testing program was remedied.

(6) A copy of detailed as-built drawings with supporting documentation and photographic evidence. This copy shall also include a narrative explanation of changes from the original department-approved plans and specifications.

(7) A signed and sealed statement by the QC&A officer that the MSWLF unit was constructed in accordance with the requirements of 567—101.107(455B) and the approved plans and specifications.

**101.107(5)** *Vertical and horizontal expansions of MSWLF units.* All vertical and horizontal expansions of disposal airspace over existing and new MSWLF units shall comply with the following:

a. Horizontal expansions shall, at a minimum, comply with the following requirements:

(1) Horizontal expansions are new MSWLF units and, at a minimum, shall be designed and constructed in accordance with 101.107(4), 101.107(5) and 101.107(6).

(2) The slope stability of the horizontal expansion between the existing unit and new MSWLF unit shall be analyzed. The interface between two MSWLF units shall not cause a slope failure of either of the MSWLF units.

(3) A horizontal expansion may include a vertical elevation increase of an existing MSWLF unit, pursuant to 101.107(7) “b,” if approved by the department.

b. Vertical expansions shall, at a minimum, comply with the following:

(1) A vertical expansion of an MSWLF unit shall not be allowed if the MSWLF unit does not have an approved leachate collection system and a composite liner or a leachate collection system and an alternative liner modeled at an approved point of compliance.

(2) An analysis of the structural impacts of the proposed vertical expansion on the liner and leachate collection system shall be completed. The vertical expansion shall not contribute to the structural failure of the liner and leachate collection system.

(3) An analysis of the impact of the proposed vertical expansion on leachate generation shall be completed. The vertical expansion shall not overload the leachate collection system or contribute to excess head on the liner.

(4) An analysis of the effect of the proposed vertical expansion on run-on, runoff, and discharges into waters of the state shall be completed. The vertical expansion shall not cause a violation of 101.107(8).

(5) The proposed vertical expansion shall be in compliance with the final slopes required at closure pursuant to 101.112(1) "e."

**101.107(6) *Run-on and runoff control systems.***

a. Owners or operators of MSWLF units must design, construct, and maintain the following:

(1) A run-on control system to prevent flow onto the active portion of the landfill during the peak discharge from a 25-year storm;

(2) A runoff control system from the active portion of the landfill to collect and control at least the water volume resulting from a 25-year, 24-hour storm.

b. Runoff from the active portion of the MSWLF unit must be handled in accordance with 101.110(1) "a."

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.108(455B) Operating requirements.** The requirements of this rule shall be consolidated in a DOPs pursuant to 101.108(4).

**101.108(1) *Prohibited operations and activities.*** For the purposes of this subrule, "regulated hazardous waste" means a solid waste that is a hazardous waste as defined in Iowa Code section 455B.411.

a. *Waste screening for prohibited materials.* Owners or operators of MSWLF units must implement a program at the facility for detecting and preventing the disposal of regulated hazardous wastes, polychlorinated biphenyls (PCB) wastes, and other prohibited wastes listed in 101.108(1) "b." This program must include, at a minimum:

(1) Random inspections of incoming loads unless the owner or operator takes other steps to ensure that incoming loads do not contain regulated hazardous wastes, PCB wastes or other prohibited wastes listed in 101.108(1) "b";

(2) Records of any inspections;

(3) Training of facility personnel to recognize regulated hazardous wastes, PCB wastes and other prohibited wastes listed in 101.108(1) "b"; and

(4) Notification of the EPA regional administrator if regulated hazardous wastes or PCB wastes are discovered at the facility.

b. *Materials prohibited from disposal.* The following wastes shall not be accepted for disposal by an MSWLF.

(1) Waste that is a chemical compound specifically listed by U.S. Environmental Protection Agency (EPA) as a regulated hazardous waste or that is a characteristic hazardous waste pursuant to the following characteristics:

1. Ignitable in that the waste has a flash point of less than 140°F.

2. Corrosive in that the waste has a pH less than 2 or greater than 12.5.

3. Reactive in that the waste is normally unstable, reacts violently with water, forms an explosive mixture with water, contains quantities of cyanide or sulfur that could be released into the air in sufficient quantity to be a danger to human health, or can easily be detonated or exploded.

4. Toxicity characteristic leaching procedure (TCLP) (EPA Method 1311) toxic, in that a TCLP listed chemical constituent exceeds the EPA-assigned concentration standard in 40 CFR Part 261 or the department-assigned concentration standard in Table I of 567—101.107(455B). Waste from a residential building that is contaminated by lead-based paint (i.e., the waste fails the TCLP test for lead only) may be disposed of in an MSWLF unit. The purpose of this exclusion is to help prevent the exposure of children to lead-based paint. Therefore, the meaning of "residential building" in regard to this TCLP exclusion shall be interpreted broadly and include any building that children or parents may utilize as a residence (temporarily

or permanently). Such residential buildings include but are not limited to single-family homes, apartment buildings, townhomes, condominiums, public housing, military barracks, nursing homes, hotels, motels, bunkhouses, and campground cabins.

(2) Polychlorinated biphenyl (PCB) wastes with a concentration equal to or greater than 50 parts per million (ppm).

(3) Free liquids, liquid waste and containerized liquids. However, free liquids and containerized liquids may be placed in MSWLF units if:

1. The containerized liquid is household waste other than septic waste. The container must be a small container similar in size to that normally found in household waste;

2. The waste is leachate or gas condensate derived from the MSWLF unit, whether it is a new or existing MSWLF unit or lateral expansion, and is designed with a composite liner and leachate collection system as described in 101.107(5)“a.” The owner or operator must demonstrate compliance with this subparagraph and place the demonstration in the operating record; or

3. The MSWLF unit is a RD&D project in which the department has authorized the addition of liquids and meets the applicable requirements of 101.104(2).

(4) Septage, which is the raw material, liquids, and pumpings from a septic system, unless treated pursuant to 567—Chapter 68.

(5) Appliances as defined pursuant to 567—Chapter 102, Division VII, unless there is documentation that the appliance has been demanufactured pursuant to 567—Chapter 102, Division VII.

(6) Radioactive waste, excluding luminous timepieces and other items using very small amounts of tritium.

(7) Infectious waste unless managed and disposed of pursuant to 567—Chapter 102, Division VI.

(8) Hot loads, meaning solid waste that is smoking, smoldering, emitting flames or hot gases, or otherwise indicating that the solid waste is in the process of combustion or close to igniting. Ash that has not been fully quenched or cooled is considered a hot load. Such wastes may be accepted at the gate but shall be segregated and completely extinguished and cooled in a manner as safe and responsible as practical before disposal.

(9) Asbestos-containing material (ACM) waste with greater than 1 percent asbestos unless managed and disposed of pursuant to 567—Chapter 102, Division VI.

(10) Grit and bar screenings, grease skimmings, and sewage sludge unless managed and disposed of pursuant to 567—Chapter 102, Division VI.

(11) Waste tires unless each tire is processed into pieces no longer than 18 inches on any side.

(12) Yard waste, except in the circumstances given in Iowa Code section 455D.9(1).

(13) Lead-acid batteries.

(14) Waste oil and materials containing free-flowing waste oil. Materials contaminated with waste oil may be disposed of if no free-flowing oil is retained in the material and the material is not a hazardous waste.

(15) Baled solid waste unless the waste is baled on site after the waste has been visually inspected for prohibited materials.

*c. Open burning and fire hazards.* No open burning of any type shall be allowed within the permitted boundary of an MSWLF facility. The fueling of vehicles and equipment, and any other activity that may produce sparks or flame, shall be conducted at least 50 feet away from the working face.

*d. Scavenging and salvaging.* Scavenging shall not be allowed at the MSWLF facility. However, salvaging by MSWLF operators may be allowed by the permitted or other authorized entity.

*e. Animal feeding and grazing.* Feeding animals municipal solid waste shall not be allowed at an MSWLF facility. The grazing of domestic animals on fully vegetated areas of the MSWLF facility not used for disposal, including closed MSWLF units, may be allowed by the department so long as the animals do not cause damage or interfere with operations, inspections, environmental monitoring, and other required activities. Hoofed animals shall not be allowed on closed MSWLF units.

**101.108(2)** *Disposal operations and activities.* MSWLFs shall comply with the following requirements.

*a. Survey controls and monuments.* Survey controls and monuments shall be maintained as follows.

(1) The property boundary, the permitted boundary, and the boundaries of MSWLF units shall be surveyed and marked by a professional land surveyor at least once prior to closure.

(2) Prior to waste placement, all new MSWLF unit boundaries shall be surveyed and staked by an Iowa-licensed professional engineer or land surveyor.

(3) Survey monuments shall be established and maintained by an Iowa-licensed professional land surveyor to provide vertical and horizontal control.

(4) An Iowa-licensed professional engineer or land surveyor shall check vertical elevations and the progression of fill sequencing.

(5) All survey stakes and monuments shall be clearly marked.

(6) An Iowa-licensed professional engineer or land surveyor shall biennially inspect all survey monuments. Any missing or damaged survey monuments shall be replaced by a professional land surveyor.

*b. First lift.* The first lift and initial placement of MSW over a new MSWLF unit liner and leachate collection system shall comply with the following requirements.

(1) Waste shall not be placed in the new MSWLF unit until the QC&A officer has submitted a signed and sealed final report to the department pursuant to 101.107(4)“d” and that report has been approved by the department.

(2) Construction and earth-moving equipment shall not operate directly on the liner and leachate management system. Waste disposal operations shall begin at the edge of the new MSWLF unit by pushing MSW out over the liner and leachate collection system. Compactors and other similarly heavy equipment shall not operate directly on the leachate collection system until a minimum of four feet of waste has been mounded over the top of the leachate collection system.

(3) Construction and demolitions (C&D) debris waste and materials clearly capable of spearing through the leachate collection system and liner shall not be placed in the first four feet of waste over the top of the leachate collection system. The first four feet of waste shall consist of select waste that is unlikely to damage the liner and performance of the leachate collection system.

(4) The owner or operator must place documentation in the operating record and submit a copy to the department that adequate cover material was placed over the top of the leachate collection system in the MSWLF unit or that freeze/thaw effects had no adverse impact on the compacted clay component of the liner.

*c. Fill sequencing.* The rate and phasing of disposal operations shall comply with the following requirements.

(1) The fill sequencing shall be planned and conducted in a manner and at a rate that does not cause a slope failure, lead to extreme differential settlement, or damage the liner and leachate collection system.

(2) The fill sequencing shall be planned and conducted in a manner compliant with the run-on and runoff requirements of 101.107(8) and surface water requirements of 567—101.110(455B).

*d. Working face.* The working face shall comply with the following requirements.

(1) The working face shall be no larger than necessary to accommodate the rate of disposal in a safe and efficient manner.

(2) The working face shall not be so steep as to cause heavy equipment and solid waste collection vehicles to roll over or otherwise lose control.

(3) Litter control devices of sufficient size to help prevent blowing litter shall be utilized at the working face. The operation of the working face shall attempt to minimize blowing litter.

(4) The operation of the working face shall prevent the harborage of vectors and attempt to minimize the attraction of vectors.

(5) Employees at the working face shall be trained to visually recognize universal symbols, markings and indications of prohibited wastes pursuant to 101.108(1)“b.”

*e. Special wastes.* Special wastes shall be managed and disposed of pursuant to 567—Chapter 102, Division VI.

*f. Cover material and alternative cover material.* Alternative cover material of an alternative thickness (e.g., tarps, spray covers) may be authorized if the owner or operator demonstrates to the department that the alternative material and thickness control vectors, fires, odors, blowing litter, and scavenging without presenting a threat to human health and the environment. Cover material or alternative

cover material shall be available for use during all seasons in all types of weather. Cover material and alternative cover material shall be utilized as follows.

(1) Daily cover. Six inches of cover material or an approved depth or application of alternative cover material shall be placed and maintained over waste at the end of each operating day, or at more frequent intervals if necessary, to control vectors, fires, odors, blowing litter, and scavenging.

(2) Intermediate cover. At least one foot of compacted cover material or an approved depth or application of alternative cover material shall be placed and maintained over waste in the active portion that has not or will not receive more waste for at least 30 days. At least two feet of compacted cover material or alternative cover material shall be placed and maintained over waste that has not or will not receive waste for at least 180 days. Such active portions shall be seeded if they will not receive waste for a full growing season.

(3) Scarification of cover. To help prevent leachate seeps by aiding the downward flow of leachate, cover material or alternative cover material that prevents the downward flow of leachate and is at least five feet from the outer edge of the MSWLF unit shall be scarified prior to use of that area as a working face. Cover material or alternative cover material that does not impede the downward flow of leachate, as approved by the department, does not require scarification. Scarification may be as simple as the spearing or breaking up of a small area of the cover. Areas of intermediate cover may require removal of some of the cover material or alternative cover material to aid the downward flow of leachate.

(4) Final cover. Final cover over an MSWLF unit that is to be closed shall be constructed and maintained according to the closure and post-closure requirements of 567—101.112(455B) and 567—101.113(455B).

g. *Leachate seeps.* Leachate seeps shall be contained and plugged upon being identified. Leachate seeps shall not be allowed to reach waters of the state. Soils outside of the MSWLF unit that are contaminated by a leachate seep shall be excavated and then disposed of within the MSWLF unit. Such soils may be used for daily cover material.

h. *Leachate recirculation.* The department must approve an MSWLF unit for leachate recirculation. The primary goal of the leachate recirculation system is to help stabilize the waste in a more rapid, but controlled, manner. The leachate recirculation system shall not contaminate waters of the state, contribute to erosion, damage cover material, harm vegetation, or spray persons at the MSWLF facility. Leachate recirculation shall be limited to MSWLF units constructed with a composite liner.

i. *Differential settlement.* Areas of differential settlement sufficient to interfere with runoff and run-on shall be brought back up to the contours of the surrounding active portion. Differential settlement shall not be allowed to cause ponding of water on the active portion.

**101.108(3)** *Universally approved beneficial use determinations for alternative cover material.* The following alternative cover materials may be beneficially used as daily cover material at MSWLF in the manner and volume specified below. However, MSWLFs shall amend their sanitary landfill permits by notifying the department, and the department field office with jurisdiction over the facility, of their intent to utilize solid by-products pursuant to this rule at least 30 days prior to actual utilization of the by-products as alternative cover material.

a. *Asphalt shingles.* Asphalt shingles that are certified, consistent with federal regulations (Reference: Appendix E, Subpart E, 40 CFR Part 763, Section 1, Polarized Light Microscopy), as not containing more than 1 percent asbestos and are ground to an average size of three inches or less in any dimension may be mixed with soil in a 50/50 volume.

b. *Compost.* One hundred percent cured or finished compost, including compost overs, may be used.

c. *Diatomaceous earth.* Diatomaceous earth may be mixed with soil in a 50/50 volume.

d. *Foundry sand.* Foundry sand may be mixed with soil in a 50/50 volume.

e. *Glass.* Glass that has been ground to an average size of one-half inch or less in any dimension may be mixed with soil in a 10 percent glass and 90 percent soil by volume mixture.

f. *Gypsum and gypsum wallboard.* Gypsum and gypsum wallboard that have been ground to an average size of three inches or less in any dimension may be mixed with soil in a 50/50 volume.

g. *Paper mill sludge.* Uncontaminated, dewatered paper mill sludge may be mixed with soil in a 50/50 volume.

*h. Sandblasting abrasive.* Sandblasting abrasive and residuals may be mixed with soil in a 50/50 volume.

*i. Tire chips.* Tire chips that are an average size of three inches or less in any dimension may be mixed with soil in a 50/50 volume.

**101.108(4)** *Beneficial use determination application requirements for alternative cover material.* Unless the alternative cover material beneficial use is approved pursuant to 101.108(3), the applicant shall submit the following application information to the department to amend the MSWLF permit. The department may request that additional information be submitted in order to make a beneficial use determination. The department may also require specific beneficial use determination conditions and issue a temporary beneficial use determination on a trial basis.

If the department finds the application information to be incomplete, then it shall notify the applicant in writing of that fact and of the specific deficiencies and return the application materials to the applicant within 30 days of such notification. The applicant may reapply without prejudice.

*a.* The name, address, and telephone number of:

- (1) Owner of the site where the project will be located.
- (2) Applicant for the beneficial use determination.
- (3) Official responsible for the operation of the project.
- (4) Professional engineer licensed by the state of Iowa and retained for the project, if any. The

department may, at its sole discretion, require the applicant to retain a professional engineer for the project or specific parts thereof.

(5) Agency to be served by the project, if any.

(6) Responsible official of agency to be served.

*b.* A description of the proposed alternative cover material and whether it is to be used as daily, intermediate, or final cover.

*c.* The chemical and physical characteristics of the alternative cover material.

*d.* The proposed volume ratio of the alternative cover material(s) to soil or other alternative cover material(s).

*e.* A demonstration that there is a known or reasonably probable suitability of the alternative cover material as cover material by provision of previous case studies of the alternative cover material being utilized as cover material or information on the ability of the alternative cover material to do the following:

- (1) Reduce or maintain current odor levels.
- (2) Reduce or deter vectors.
- (3) Reduce or maintain the current risk of fire.
- (4) Control litter and dust.
- (5) Impede the infiltration of liquids and precipitation.
- (6) Control landfill gas migration.
- (7) Provide a safe and effective working surface.
- (8) Provide effective growing media.
- (9) Other documentation that the alternative cover material is suitable for cover material.
- (10) A demonstration that the proposed use of the alternative cover material will not adversely

affect human health or the environment. The demonstration may include but is not limited to a toxicity characteristics leaching procedure (TCLP, EPA Method 1311) analysis of a representative sample of the alternative cover material.

**101.108(5)** *Beneficial use of alternative cover material and state goal progress.* Alternative cover material placed at no more than the thickness required by MSWLF rules shall be exempt from landfill tonnage measurements used for state goal progress and waste diversion calculations.

**101.108(6)** *Development and operations plan (DOPs).* An MSWLF unit shall maintain a DOPs. At a minimum, the DOPs shall detail how the facility will operate and how compliance with the requirements of this rule will be maintained. The DOPs shall contain at least the following components:

*a.* A title page and table of contents.

*b.* Telephone number and email address of the official responsible for the operation of the facility and an emergency contact person if different.

- c. Service area of the facility and political jurisdictions included in that area.
  - d. Days and hours of operation of the facility.
  - e. Details of how the site will comply with the prohibited operations and activity requirements of 101.108(1) and any related permit conditions.
  - f. Details of how the site will comply with the disposal operation and activity requirements of 101.108(2) and any related permit conditions.
  - g. Details of how the site will comply with the facility operations and activity requirements of 101.108(3), any related permit conditions, and any leachate and wastewater treatment requirements.
- [ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.109(455B) Environmental monitoring and corrective action requirements for air quality and landfill gas.** MSWLFs shall comply with the following environmental monitoring and corrective action requirements for air quality and landfill gas.

**101.109(1) Air criteria.** Owners or operators of MSWLFs must ensure that the units do not violate any applicable requirements developed under a state implementation plan (SIP) approved or promulgated by the department pursuant to Section 110 of the Clean Air Act.

**101.109(2) Landfill gas.** MSWLFs shall comply with the following requirements for landfill gas. For purposes of this subrule, “lower explosive limit” means the lowest percent by volume of a mixture of explosive gases in air that will propagate a flame at 25°C and atmospheric pressure.

- a. Owners or operators of MSWLF units must ensure that:
  - (1) The concentration of methane gas generated by the facility does not exceed 25 percent of the lower explosive limit for methane in facility structures (excluding gas pipeline, control or recovery system components), and
  - (2) The concentration of methane gas does not exceed the lower explosive limit for methane at the facility property boundary.
- b. Owners or operators of MSWLF units must implement a routine methane-monitoring program to ensure that the standards of 101.109(2)“a” are met. Such a program shall include routine subsurface methane monitoring (e.g., at select groundwater wells, at gas monitoring wells).
  - (1) The type and frequency of monitoring must be determined based on the following factors:
    - 1. Soil conditions;
    - 2. The hydrogeologic conditions surrounding the facility;
    - 3. The hydraulic conditions surrounding the facility;
    - 4. The location of facility structures (including potential subsurface preferential pathways such as but not limited to pipes, utility conduits, drain tiles, and sewers) and property boundaries; and
    - 5. The locations of structures near the outside of the facility to which or along which subsurface migration of methane gas may occur. Examples of such structures include but are not limited to houses, buildings, basements, crawl spaces, pipes, utility conduits, drain tiles, and sewers.
  - (2) The minimum frequency of monitoring shall be quarterly.
- c. If methane gas levels exceeding the limits specified in 101.109(2)“a” are detected, the owner or operator must:
  - (1) Immediately take all necessary steps to ensure protection of human health and notify the department and department field office with jurisdiction over the MSWLF;
  - (2) Within seven days of detection, place in the operating record and notify the department and department field office with jurisdiction over the MSWLF of the methane gas levels detected and a description of the steps taken to protect human health; and
  - (3) Within 60 days of detection, implement a remediation plan for the methane gas releases, place a copy of the plan in the operating record, and notify the department and department field office with jurisdiction over the MSWLF that the plan has been implemented. The plan shall describe the nature and extent of the problem and the proposed remedy.
- d. The owner or operator shall submit an annual report to the department detailing the gas monitoring sampling locations and results, any action taken, and the results of steps taken to address gas levels exceeding the limits of 101.109(2)“a” during the previous year. This report shall include a site map that delineates all structures, perimeter boundary locations, and other monitoring points where gas readings

were taken. The site map shall also delineate areas of landfill gas migration outside the MSWLF units, if any. The report shall contain a narrative explaining and interpreting all of the data collected during the previous year. The report shall be due each year at a date specified by the department in the facility's permit.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.110(455B) Environmental monitoring and corrective action requirements for groundwater and surface water.** MSWLFs shall comply with the following environmental monitoring and corrective action requirements for groundwater and surface water.

**101.110(1) General requirements for environmental monitoring and corrective action for groundwater and surface water.**

*a.* MSWLF units shall not:

(1) Cause a discharge of pollutants into waters of the United States, including wetlands, that violates any requirements of the Clean Water Act, including but not limited to NPDES requirements, pursuant to Section 402 of the Clean Water Act.

(2) Cause the discharge of a nonpoint source of pollution into waters of the United States, including wetlands, that violates any requirement of an areawide or statewide water quality management plan that has been approved under Section 208 or 319 of the Clean Water Act.

*b.* A new MSWLF unit must be in compliance with the groundwater monitoring requirements specified in 101.110(2), 101.110(4), 101.110(5) and 101.110(6) before waste can be placed in the unit unless the department establishes an alternative schedule for demonstrating compliance with:

(1) Subparagraph 101.110(2)“c”(3), pertaining to notification of placement of certification in operating record;

(2) Subparagraph 101.110(5)“c”(1), pertaining to notification that statistically significant increase (SSI) notice is in operating record;

(3) Subparagraphs 101.110(5)“c”(2) and “c”(3), pertaining to an assessment monitoring program;

(4) Paragraph 101.110(6)“b,” pertaining to sampling and analyzing 40 CFR Part 258, Appendix II, constituents;

(5) Subparagraph 101.110(6)“d”(1), pertaining to placement of notice (40 CFR Part 258, Appendix II, constituents detected) in record and notification of placement of notice in record;

(6) Subparagraph 101.110(6)“d”(2), pertaining to sampling for 40 CFR Part 258;

(7) Paragraph 101.110(6)“g,” pertaining to notification (and placement of notice in record) of SSI above groundwater protection standard;

(8) Numbered paragraph 101.110(6)“g”(1)“4” and paragraph 101.110(7)“a,” pertaining to assessment of corrective measures;

(9) Paragraph 101.110(8)“a,” pertaining to selection of remedy and notification of placement in record;

(10) Paragraph 101.110(9)“f,” pertaining to notification of placement in record (certification of remedy completed).

*c.* Once established at an MSWLF unit, groundwater monitoring shall be conducted throughout the active life and post-closure care period of that MSWLF unit.

**101.110(2) Groundwater monitoring systems.** MSWLFs shall have a groundwater monitoring system that complies with the following requirements:

*a. Objectives.* A groundwater monitoring system must be installed that meets the following objectives:

(1) Yields groundwater samples from the uppermost aquifer that represent the quality of background groundwater that has not been affected by leakage from a unit. A determination of background quality may include sampling of wells that are not hydraulically upgradient of the waste management area where either:

1. Hydrogeologic conditions do not allow the owner or operator to determine which wells are hydraulically upgradient; or

2. Sampling at other wells will provide an indication of background groundwater quality that is as representative as or more representative than that provided by the upgradient wells.

(2) Yields groundwater samples from the uppermost aquifer that represent the quality of groundwater passing the relevant point of compliance specified by the department under 101.107(5)“a”(2)“2.” A downgradient monitoring system must be installed at the relevant point of compliance specified by the department under 101.107(5)“a”(2)“2” that ensures detection of groundwater contamination in the uppermost aquifer. When physical obstacles preclude installation of groundwater monitoring wells at the relevant point of compliance at existing units, the downgradient monitoring system may be installed at the closest practicable distance, hydraulically downgradient from the relevant point of compliance specified by the department under 101.107(5)“a”(2)“2,” that ensures detection of groundwater contamination in the uppermost aquifer.

(3) Provides a high level of certainty that releases of contaminants from the site can be promptly detected. Downgradient monitoring wells shall be placed along the site perimeter, within 50 feet of the planned liner or waste boundary unless site conditions dictate otherwise, downgradient of the facility with respect to the hydrologic unit being monitored. Each groundwater underdrain system shall be included in the groundwater detection monitoring program under 101.110(5). The maximum drainage area routed through each outfall shall not exceed ten acres unless it can be demonstrated that site-specific factors such as drain flow capacity or site development sequencing require an alternative drainage area. If contamination is identified in the groundwater underdrain system pursuant to 101.110(5), the owner or operator shall manage the underdrain discharge as leachate in lieu of assessment monitoring and corrective action.

(4) Be designed and constructed with the theoretical release evaluation pursuant to 101.106(3)“e”(6) taken into consideration.

*b. Long-term, multiphase operations.* For those facilities that are long-term, multiphase operations, the department may establish temporary waste boundaries in order to define locations for monitoring wells. The convergence of groundwater paths to minimize the overall length of the downgradient dimension may be taken into consideration in the placement of downgradient monitoring wells provided that the multiphase unit groundwater monitoring system meets the requirements of 101.8(2), 101.8(3), and 101.110(2)“a” and “c” and will be as protective of human health and the environment as the individual monitoring systems for each MSWLF unit, based on the following factors:

- (1) Number, spacing, and orientation of the MSWLF units;
- (2) Hydrogeologic setting;
- (3) Site history;
- (4) Engineering design of the MSWLF units; and
- (5) Type of waste accepted at the MSWLF units.

*c. Hydrologic monitoring system plan (HMSP).* Unless otherwise approved by the department in writing, the number, spacing, and depth of groundwater monitoring points shall be:

(1) Determined based upon site-specific technical information, including but not limited to the soil and hydrogeologic investigation pursuant to 101.106(3) and the site exploration and characterization report pursuant to 101.106(3), that must include thorough characterization of:

1. Aquifer thickness, groundwater flow rate, and groundwater flow direction including seasonal and temporal fluctuations in groundwater flow;
2. Saturated and unsaturated geologic units and fill materials overlying the uppermost aquifer, materials comprising the uppermost aquifer, and materials comprising the confining unit defining the lower boundary of the uppermost aquifer, including but not limited to thicknesses, stratigraphy, lithology, hydraulic conductivities, porosities and effective porosities; and

3. Projected paths and rates of movement of contaminants found in leachate pursuant to 101.106(3)“e”(6).

(2) Designed and constructed with a maximum of 300 feet between downgradient groundwater monitoring wells unless it is demonstrated by site-specific analysis or modeling that an alternative well spacing is justified. The convergence of groundwater paths to minimize the overall length of the downgradient dimension may be taken into consideration in the placement of downgradient monitoring wells provided that the groundwater monitoring system meets the requirements of 101.8(2), 101.8(3), and 101.110(2)“a” and “c.”

(3) Certified by a qualified groundwater scientist and approved by the department. Within 14 days of this certification and approval by the department, the owner or operator must notify the department that the certification has been placed in the operating record.

*d. Monitoring well maintenance and performance reevaluation plan.* A monitoring well maintenance and performance reevaluation plan shall be included as part of the HMSP. The plan shall ensure that all monitoring points remain reliable. The plan shall provide for the following:

(1) A biennial examination of high and low water levels accompanied by a discussion of the acceptability of well location (vertically and horizontally) and exposure of the screened interval to the atmosphere.

(2) A biennial evaluation of water level conditions in the monitoring wells to ensure that the effects of waste disposal or well operation have not resulted in changes in the hydrologic setting and resultant flow paths.

(3) Measurements of well depths to ensure that wells are physically intact and not filling with sediment. Measurements shall be taken annually in wells that do not contain dedicated sampling pumps and every five years in wells containing dedicated sampling pumps.

(4) A biennial evaluation of well recharge rates and chemistry to determine if well deterioration is occurring.

**101.110(3)** *Surface water monitoring systems.* The department may require an MSWLF facility to implement a surface water monitoring program if there is reason to believe that a surface water of the state has been impacted as a result of facility operations (i.e., leachate seeps, sediment pond discharge) or a groundwater SSI over background has occurred.

*a.* A surface water monitoring program must be developed that consists of a sufficient number of monitoring points, designated at appropriate locations, to yield surface water samples that provide a representative sample of:

(1) The upstream quality of a surface water of the state if the surface water being monitored is a flowing body of water.

(2) The downstream quality of a surface water of the state if the surface water being monitored is a flowing body of water.

*b.* Surface water levels must be measured at a frequency specified in the facility's permit, within 1/10 of a foot at each surface water monitoring point immediately prior to sampling, each time surface water is sampled. The owner or operator must determine the rate and direction of surface water flow, if any, each time surface water is sampled. Surface water level and flow measurements for the same surface water of the state must be measured on the same day to avoid temporal variations that could preclude accurate determination of surface water flow and direction.

*c.* The owner or operator must notify and receive approval from the department for the designation or decommission of any surface water monitoring point and must place that approval in the operating record.

*d.* A surface water monitoring point shall be designated to maintain sampling at that monitoring point throughout the life of the surface water monitoring program.

*e.* Each surface water monitoring point must have a unique and permanent number, and that number must never change or be used again at the MSWLF. Surface water monitoring points shall be identified by "SW# (insert unique and permanent number)".

*f.* The number, spacing, and location of the surface water monitoring points shall be determined based upon site-specific technical information, including:

(1) Water level, including seasonal and temporal fluctuations in water level; and

(2) Flow rate and flow direction, including seasonal and temporal fluctuations in flow.

*g.* The MSWLF may discontinue the surface water monitoring program if monitoring data indicates that facility operations are not impacting surface water.

**101.110(4)** *Groundwater sampling and analysis requirements.*

*a.* The groundwater monitoring program must include consistent sampling and analysis procedures that are designed to ensure monitoring results that provide an accurate representation of groundwater quality at the background and downgradient wells installed in compliance with 101.110(2). Analyses for a contaminant regulated under this division must be performed by a laboratory certified for the analyte(s) and

applicable method pursuant to 567—Chapter 83. The owner or operator must notify the department that the sampling and analysis program documentation has been placed in the operating record, and the program must include procedures and techniques for:

- (1) Sample collection;
- (2) Sample preservation and shipment;
- (3) Analytical procedures;
- (4) Chain of custody control; and
- (5) Quality assurance and quality control.

*b.* The groundwater monitoring programs must include sampling and analytical methods that are appropriate for groundwater sampling and that accurately measure hazardous constituents and other monitoring parameters in groundwater samples. Groundwater samples shall not be field-filtered prior to laboratory analysis.

*c.* The sampling procedures and frequency must be protective of human health and the environment and consistent with 101.110(5).

*d.* Groundwater elevations must be measured at a frequency specified in the facility's permit, within 1/100 of a foot in each well immediately prior to purging, each time groundwater is sampled. The owner or operator must determine the rate and direction of groundwater flow each time groundwater is sampled. Groundwater elevations in wells that monitor the same waste management area must be measured within a period of time short enough to avoid temporal variations in groundwater flow that could preclude accurate determination of groundwater flow rate and direction.

*e.* The owner or operator must establish background groundwater quality in a hydraulically upgradient or background well(s) for each of the monitoring parameters or constituents required in the particular groundwater monitoring program that applies to the MSWLF unit, as determined under 101.110(5) "a" or 101.110(6) "a." Background groundwater quality may be established at wells that are not located hydraulically upgradient from the MSWLF unit if the wells meet the requirements of 101.110(2) "a"(1).

*f.* The number of samples collected to establish groundwater quality data must be consistent with the appropriate statistical procedures determined pursuant to 101.110(4) "g." The sampling procedures shall be those specified under 101.110(5) "b" for detection monitoring, 101.110(6) "b" and 101.110(6) "d" for assessment monitoring, and 101.110(7) "b" for corrective action.

*g.* The owner or operator must specify in the operating record which of the following statistical methods will be used in evaluating groundwater monitoring data for each hazardous constituent. The statistical test chosen shall be conducted separately for each hazardous constituent in each well.

(1) A parametric analysis of variance (ANOVA) followed by multiple comparisons procedures to identify statistically significant evidence of contamination. The method must include estimation and testing of the contrasts between each compliance well's mean and the background mean levels for each constituent.

(2) An analysis of variance (ANOVA) based on ranks followed by multiple comparisons procedures to identify statistically significant evidence of contamination. The method must include estimation and testing of the contrasts between each compliance well's median and the background median levels for each constituent.

(3) A tolerance or prediction interval procedure in which an interval for each constituent is established from the distribution of the background data and the level of each constituent in each compliance well is compared to the upper tolerance or prediction limit.

(4) A control chart approach that gives control limits for each constituent.

(5) Another statistical test method that meets the performance standards of 101.110(4) "h." The owner or operator must place a justification for this alternative in the operating record and notify the department of the use of this alternative test. The justification must demonstrate that the alternative method meets the performance standards of 101.110(4) "h."

*h.* The statistical method required pursuant to 101.110(4) "g" shall comply with the following performance standards.

(1) The statistical method used to evaluate groundwater monitoring data shall be appropriate for the distribution of chemical parameters or hazardous constituents. If the distribution of the chemical parameters or hazardous constituents is shown by the owner or operator to be inappropriate for a normal theory test, then the data shall be transformed or a distribution-free theory test shall be used. If the distributions for the constituents differ, more than one statistical method may be needed.

(2) If an individual well comparison procedure is used to compare an individual compliance well constituent concentration with background constituent concentrations or a groundwater protection standard, the test shall be done at a Type I error level not less than 0.01 for each testing period. If a multiple comparisons procedure is used, the Type I experiment-wise error rate for each testing period shall be not less than 0.05; however, the Type I error level of not less than 0.01 for individual well comparisons must be maintained.

(3) If a control chart approach is used to evaluate groundwater monitoring data, the specific type of control chart and its associated parameter values shall be protective of human health and the environment. The parameters shall be determined after the number of samples in the background database, the data distribution, and the range of the concentration values for each constituent of concern have been considered.

(4) If a tolerance interval or a prediction interval is used to evaluate groundwater monitoring data, the levels of confidence and, for tolerance intervals, the percentage of the population that the interval must contain, shall be protective of human health and the environment. These parameters shall be determined after the number of samples in the background database, the data distribution, and the range of the concentration values for each constituent of concern have been considered.

(5) The statistical method shall account for data below the limit of detection (LD) by recording such data at one-half the limit of detection (i.e., LD/2) or as prescribed by the statistical method. Any practical quantitation limit that is used in the statistical method shall be the lowest concentration level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operating conditions that are available to the facility.

(6) If necessary, the statistical method shall include procedures to control or correct for seasonal and spatial variability as well as temporal correlation in the data.

*i.* The owner or operator must determine whether or not there is an SSI over background values for each parameter or constituent required in the particular groundwater monitoring program that applies to the MSWLF unit, as determined under 101.110(5) "a" or 101.110(6) "a."

(1) In determining whether an SSI has occurred, the owner or operator must compare the groundwater quality of each parameter or constituent at each monitoring well designated pursuant to 101.110(2) to the background value of that constituent, according to the statistical procedures and performance standards specified under 101.110(4) "g" and "h."

(2) Within 45 days after completing sampling and analysis, the owner or operator must determine whether there has been an SSI over background at each monitoring well.

**101.110(5) Detection monitoring program.**

*a.* Detection monitoring is required at MSWLF units at all groundwater monitoring wells defined under 101.110(2). At a minimum, a detection monitoring program must include the monitoring for the constituents listed in 40 CFR Part 258, Appendix I, and any additional parameters required by the department on a site-specific basis. An alternative list of constituents may be used if it can be demonstrated that the constituents removed are not reasonably expected to be in or derived from the waste contained in the unit and if the alternative list of constituents is expected to provide a reliable indication of leachate leakage or gas impact from the MSWLF unit.

The department may establish an alternative list of inorganic indicator parameters for an MSWLF unit within 40 CFR Part 258, Appendix I, in lieu of some or all of the heavy metals (constituents 1 through 15 in 40 CFR Part 258, Appendix I) if the alternative parameters provide a reliable indication of inorganic releases from the MSWLF unit to the groundwater. In determining alternative parameters, the department shall consider the following factors.

(1) The types, quantities, and concentrations of constituents in wastes managed at the MSWLF unit;

(2) The mobility, stability, and persistence of waste constituents or their reaction products in the unsaturated zone beneath the MSWLF unit;

(3) The detectability of indicator parameters, waste constituents, and reaction products in the groundwater; and

(4) The concentration or values and coefficients of variation of monitoring parameters or constituents in the groundwater background.

b. The monitoring frequency for all constituents listed in 40 CFR Part 258, Appendix I, or in the alternative list approved in accordance with 101.110(5)“a”(1) shall be at least semiannual (i.e., every six months) during the active life of the facility (including closure) and the post-closure period. Where insufficient background data exist, a minimum of five independent samples from each well, collected at intervals to account for seasonal and temporal variation, must be analyzed for the constituents in 40 CFR Part 258, Appendix I, or in the alternative list approved in accordance with 101.110(5)“a”(1) during the first year. At least one sample from each well must be collected and analyzed during subsequent semiannual sampling events. The department may specify an appropriate alternative frequency for repeated sampling and analysis for constituents in 40 CFR Part 258, Appendix I, or in the alternative list approved in accordance with 101.110(5)“a”(1) during the active life (including closure) and the post-closure care period. The alternative frequency during the active life (including closure) shall be not less than annually. The alternative frequency shall be based on consideration of the following factors.

- (1) Lithology of the aquifer and unsaturated zone;
- (2) Hydraulic conductivity of the aquifer and unsaturated zone;
- (3) Groundwater flow rates;
- (4) Minimum distance between upgradient edge of the MSWLF unit and downgradient monitoring well screen (minimum distance of travel); and
- (5) Resource value of the aquifer.

c. If the owner or operator determines, pursuant to 101.110(4)“i,” that there is an SSI over background for one or more of the constituents listed in 40 CFR Part 258, Appendix I, or in the alternative list approved in accordance with 101.110(5)“a”(1) at any monitoring well specified under 101.110(2), then the owner or operator:

(1) Must, within 14 days of this finding, place a notice in the operating record indicating which constituents have shown statistically significant changes from background levels and notify the department that this notice was placed in the operating record.

(2) Must establish within 90 days an assessment monitoring program meeting the requirements of 101.110(6), except as provided in 101.110(5)“c”(3).

(3) May demonstrate that a source other than an MSWLF unit caused the contamination or that the SSI resulted from error in sampling, analysis, statistical evaluation, or natural variation in groundwater quality. A report documenting this demonstration must be certified by a qualified groundwater scientist, approved by the department, and placed in the operating record. If resampling is a part of the demonstration, resampling procedures shall be specified prior to initial sampling. If a successful demonstration to the department is made and documented, the owner or operator may continue detection monitoring as specified in 101.110(5). If, after 90 days, a successful demonstration is not made, the owner or operator must initiate an assessment monitoring program as required in 101.110(6).

**101.110(6) Assessment monitoring program.**

a. Assessment monitoring is required whenever an SSI over background has been confirmed pursuant to 101.110(5)“c” to be the result of a release from the facility.

b. Within 90 days of triggering an assessment monitoring program, and annually thereafter, the owner or operator must sample and analyze the groundwater for all constituents identified in 40 CFR Part 258, Appendix II. A minimum of one sample from each downgradient well shall be collected and analyzed during each sampling event. For any constituent detected in the downgradient wells as a result of the complete 40 CFR Part 258, Appendix II, analysis, a minimum of four independent samples from each well must be collected and analyzed to establish background for the constituents. The department may specify an appropriate subset of wells to be sampled and analyzed for 40 CFR Part 258, Appendix II, constituents during assessment monitoring. The department may delete any of the 40 CFR Part 258,

Appendix II, monitoring parameters for an MSWLF unit if it can be shown that the removed constituents are not reasonably expected to be in or derived from the waste contained in the unit.

c. The department may specify an appropriate alternate frequency for repeated sampling and analysis for the full set of 40 CFR Part 258, Appendix II, constituents required by 101.110(6) "b" during the active life (including closure) and post-closure care period of the unit. The following factors shall be considered:

- (1) Lithology of the aquifer and unsaturated zone;
- (2) Hydraulic conductivity of the aquifer and unsaturated zone;
- (3) Groundwater flow rates;
- (4) Minimum distance between upgradient edge of the MSWLF unit and downgradient monitoring well screen (minimum distance of travel);
- (5) Resource value of the aquifer; and
- (6) Nature (fate and transport) of any constituents detected in response to this paragraph.

d. After obtaining the results from the initial or subsequent sampling events required in 101.110(6) "b," the owner or operator must:

- (1) Within 14 days, place a notice in the operating record identifying the 40 CFR Part 258, Appendix II, constituents that have been detected and notify the department that this notice has been placed in the operating record;

- (2) Within 90 days, and on at least a semiannual basis thereafter, resample all wells specified by 101.110(2) and conduct analyses for all constituents in 40 CFR Part 258, Appendix I, or in the alternative list approved in accordance with 101.110(5) "a"(1), and for those constituents in 40 CFR Part 258, Appendix II, that are detected in response to the requirements of 101.110(6) "b." Concentrations shall be recorded in the facility operating record. At least one sample from each well must be collected and analyzed during these sampling events. The department may specify an alternative monitoring frequency during the active life and the post-closure period for the constituents referred to in this subparagraph. The alternative frequency for constituents in 40 CFR Part 258, Appendix I, or in the alternative list approved in accordance with 101.110(5) "a"(1) during the active life shall be no less than annual. The alternative frequency shall be based on consideration of the factors specified in 101.110(6) "c";

- (3) Establish background concentrations for any constituents detected pursuant to 101.110(6) "b" or 101.110(6) "d"(2); and

- (4) Establish groundwater protection standards for all constituents detected pursuant to 101.110(6) "b" or "d." The groundwater protection standards shall be established in accordance with 101.110(6) "h" or "i."

e. If the concentrations of all 40 CFR Part 258, Appendix II, constituents are shown to be at or below background values, using the statistical procedures in 101.110(4) "g" for two consecutive sampling events, the owner or operator must notify the department of this finding and may return to detection monitoring.

f. If the concentrations of any 40 CFR Part 258, Appendix II, constituents are above background values, but all concentrations are below the groundwater protection standard established under 101.110(6) "h" or "i," using the statistical procedures in 101.110(4) "g," the owner or operator must continue assessment monitoring in accordance with this subrule.

g. If one or more 40 CFR Part 258, Appendix II, constituents are detected at statistically significant levels above the groundwater protection standard established under 101.110(6) "h" or "i" in any sampling event, the owner or operator must, within 14 days of this finding, place a notice in the operating record identifying the 40 CFR Part 258, Appendix II, constituents that have exceeded the groundwater protection standard and notify the department and all other appropriate local government officials that the notice has been placed in the operating record. The owner or operator also:

- (1) Must, within 90 days of this finding, comply with the requirements in 101.110(6) "g"(2) or the following requirements.

1. Characterize the nature and extent of the release by installing additional monitoring wells as necessary until the horizontal and vertical dimensions of the plume have been defined to background concentrations;

2. Install at least one additional monitoring well at the facility boundary in the direction of contaminant migration and sample this well in accordance with 101.110(6) "g"(2);

3. Notify all persons who own the land or reside on the land that directly overlies any part of the plume of contamination if contaminants have migrated off site when indicated by sampling of wells in accordance with 101.110(6)“g”(1); and

4. Initiate an assessment of corrective measures as required by 101.110(7).

(2) May demonstrate that a source other than an MSWLF unit caused the contamination or that the SSI resulted from error in sampling, analysis, statistical evaluation, or natural variation in groundwater quality. A report documenting this demonstration must be certified by a qualified groundwater scientist, approved by the department, and placed in the operating record. If a successful demonstration is made, the owner or operator must continue monitoring in accordance with the assessment monitoring program pursuant to 101.110(6) and may return to detection monitoring if the 40 CFR Part 258, Appendix II, constituents are at or below background as specified in 101.110(6)“e.” Until a successful demonstration is made, the owner or operator must comply with 101.110(6)“g,” including initiating an assessment of corrective measures.

*h.* The owner or operator must establish a groundwater protection standard for each 40 CFR Part 258, Appendix II, constituent detected in the groundwater. The groundwater protection standard shall be:

(1) For constituents for which a maximum contaminant level (MCL) has been promulgated under Section 1412 of the Safe Drinking Water Act (codified) under 40 CFR Part 141, the MCL for that constituent;

(2) For constituents for which MCLs have not been promulgated, the background concentration for the constituent established from wells in accordance with 101.110(2); or

(3) For constituents for which the background concentration is higher than the MCL identified under 101.110(6)“h”(1) or health-based concentrations identified under 101.110(6)“i,” the background concentration.

*i.* The department may establish an alternative groundwater protection standard for constituents for which MCLs have not been established. These groundwater protection standards shall be appropriate health-based concentrations that comply with the statewide standards for groundwater established pursuant to 567—Chapter 137.

*j.* In establishing alternative groundwater protection standards under 101.110(6)“i,” the department may consider the following:

(1) The policies set forth by the Groundwater Protection Act;

(2) Multiple contaminants in the groundwater with the assumption that the effects are additive regarding detrimental effects to human health and the environment;

(3) Exposure threats to sensitive environmental receptors; and

(4) Other site-specific exposure or potential exposure to groundwater.

**101.110(7) *Assessment of corrective measures.***

*a.* Within 90 days of finding that any of the constituents listed in 40 CFR Part 258, Appendix II, have been detected at a statistically significant level exceeding the groundwater protection standards defined under 101.110(6)“h” or “i,” the owner or operator must initiate an assessment of corrective measures. Such an assessment must be completed and submitted to the department for review and approval within 180 days of the initial finding unless otherwise authorized or required by the department.

*b.* The owner or operator must continue to monitor in accordance with the assessment monitoring program as specified in 101.110(6).

*c.* The assessment shall include an analysis of the effectiveness of potential corrective measures in meeting all of the requirements and objectives of the remedy as described under 101.110(8), addressing at least the following:

(1) The performance, reliability, ease of implementation, and potential impacts of appropriate potential remedies, including safety impacts, cross-media impacts, and control of exposure to any residual contamination;

(2) The time required to begin and complete the remedy;

(3) The costs of remedy implementation; and

(4) The institutional requirements such as state or local permit requirements or other environmental or public health requirements that may substantially affect implementation of the remedy(ies).

d. Within 60 days of approval from the department of the assessment of corrective measures, the owner or operator must discuss the results of the corrective measures assessment, prior to the selection of a remedy, in a public meeting with interested and affected parties. The department may establish an alternative schedule for completing the public meeting requirement. Notice of public meeting shall be sent to all owners and occupiers of property adjacent to the permitted boundary of the facility, the department, and the department field office with jurisdiction over the facility. A copy of the minutes of this public meeting and the list of community concerns must be placed in the operating record and submitted to the department.

**101.110(8) Selection of remedy.**

a. Based on the results of the corrective measures assessment conducted under 101.110(7), the owner or operator must select a remedy within 60 days of holding the public meeting that, at a minimum, meets the standards listed in 101.110(8)“b.” The department may establish an alternative schedule for selecting a remedy after holding the public meeting. The owner or operator must submit a report to the department within 14 days of selecting a remedy describing the selected remedy, stating that the report has been placed in the operating record, and explaining how the selected remedy meets the standards in 101.110(8)“b.”

b. Remedies must:

- (1) Be protective of human health and the environment;
- (2) Attain the groundwater protection standards specified pursuant to 101.110(6)“h” or “i”;
- (3) Control the source(s) of releases so as to reduce or eliminate, to the maximum extent practicable, further releases of 40 CFR Part 258, Appendix II, constituents into the environment that may pose a threat to human health or the environment; and

- (4) Comply with standards for management of wastes as specified in 101.110(9)“d.”

c. In selecting a remedy that meets the standards of 101.110(8)“b,” the owner or operator shall consider the following evaluation factors.

- (1) The long-term and short-term effectiveness and protectiveness of the potential remedy(ies), along with the degree of certainty that the remedy will prove successful based on consideration of the following:

1. Magnitude of reduction of existing risks;
2. Magnitude of residual risks in terms of likelihood of further releases due to waste remaining following implementation of a remedy;

3. The type and degree of long-term management required, including monitoring, operation, and maintenance;

4. Short-term risks that might be posed to the community, workers, or the environment during implementation of such a remedy, including potential threats to human health and the environment associated with excavation, transportation, redisposal, or containment;

5. Time period until full protection is achieved;

6. Potential for exposure of humans and environmental receptors to remaining wastes, considering the potential threat to human health and the environment associated with excavation, transportation, redisposal, or containment;

7. Long-term reliability of the engineering and institutional controls; and

8. Potential need for replacement of the remedy.

- (2) The effectiveness of the remedy in controlling the source to reduce further releases based on consideration of the following factors:

1. The extent to which containment practices will reduce further releases; and

2. The extent to which treatment technologies may be used.

- (3) The ease or difficulty of implementing a potential remedy(ies) based on consideration of the following factors:

1. Degree of difficulty associated with constructing the technology;

2. Expected operational reliability of the technology;

3. Necessity of coordination with and obtaining necessary approvals and permits from other agencies;

4. Availability of necessary equipment and specialists; and

5. Available capacity and location of needed treatment, storage, and disposal services.

(4) Practicable capability of the owner or operator, including a consideration of technical and economic capabilities.

(5) The degree to which community concerns, including but not limited to the concerns identified at the public meeting required pursuant to 101.110(7) "d," are addressed by a potential remedy(ies).

d. The owner or operator shall specify as part of the selected remedy a schedule(s) for initiating and completing remedial activities. Such a schedule must require the initiation of remedial activities within a reasonable period of time taking into consideration the factors set forth in 101.110(8) "d"(1) through "d"(8). The owner or operator must consider the following factors in determining the schedule of remedial activities:

- (1) Extent and nature of contamination;
- (2) Practical capabilities of remedial technologies in achieving compliance with groundwater protection standards established under 101.110(6) "h" or "i" and other objectives of the remedy;
- (3) Availability of treatment or disposal capacity for wastes managed during implementation of the remedy;
- (4) Desirability of utilizing alternative or experimental technologies that are not widely available but that may offer significant advantages over already available technologies in terms of effectiveness, reliability, safety, or ability to achieve remedial objectives;
- (5) Potential risks to human health and the environment from exposure to contamination prior to completion of the remedy;
- (6) Resource value of the aquifer, including:
  1. Current and future uses;
  2. Proximity and withdrawal rate of users;
  3. Groundwater quantity and quality;
  4. The potential damage to wildlife, crops, vegetation, and physical structures caused by exposure to waste constituents;
5. The hydrogeologic characteristics of the facility and surrounding land;
6. Groundwater removal and treatment costs; and
7. The cost and availability of alternative water supplies;
- (7) Practicable capability of the owner or operator; and
- (8) Other relevant factors.

**101.110(9) *Implementation of the corrective action plan.***

a. Based on the schedule established under 101.110(8) "d" for initiation and completion of remedial activities, the owner or operator must:

- (1) Establish and implement a corrective action groundwater monitoring program that:
  1. At a minimum, meets the requirements of an assessment monitoring program under 101.110(6);
  2. Indicates the effectiveness of the corrective action remedy; and
  3. Demonstrates compliance with groundwater protection standards pursuant to 101.110(9) "e";
- (2) Implement the corrective action remedy selected under 101.110(8); and
- (3) Take any interim measures necessary to ensure the protection of human health and the environment. Interim measures should, to the greatest extent practicable, be consistent with the objectives of and contribute to the performance of any remedy that may be required pursuant to 101.110(8). The following factors must be considered by an owner or operator in determining whether interim measures are necessary.
  1. Time period required to develop and implement a final remedy;
  2. Actual or potential exposure of nearby populations or environmental receptors to hazardous constituents;
  3. Actual or potential contamination of drinking water supplies or sensitive ecosystems;
  4. Further degradation of the groundwater that may occur if remedial action is not initiated expeditiously;
  5. Weather conditions that may cause hazardous constituents to migrate or be released;
  6. Risk of fire or explosion or potential for exposure to hazardous constituents as a result of an accident or the failure of a container or handling system; and

7. Other factors that may pose threats to human health and the environment.
- b. An owner or operator may determine, based on information developed after implementation of the remedy has begun or other information, that compliance with the requirements of 101.110(8) "b" is not being achieved through the remedy selected. In such cases, the owner or operator must notify the department and implement other methods or techniques that could practicably achieve compliance with the requirements unless the owner or operator makes the determination under 101.110(9) "c." The notification shall explain how the proposed alternative methods or techniques will meet the standards in 101.110(8) "b," or the notification shall indicate that the determination was made pursuant to 101.110(9) "c." The notification shall also specify a schedule(s) for implementing and completing the remedial activities to comply with 101.110(8) "b" or the alternative measures to comply with 101.110(9) "c." Within 90 days of approval by the department for the proposed alternative methods or techniques or the determination of impracticability, the owner or operator shall implement the proposed alternative methods or techniques meeting the standards of 101.110(8) "b" or implement alternative measures meeting the requirements of 101.110(9) "c"(2) and "c"(3).
- c. If the owner or operator determines that compliance with requirements under 101.110(8) "b" cannot be practicably achieved with any currently available methods, the owner or operator must:
  - (1) Obtain certification of a qualified groundwater scientist and approval by the department that compliance with requirements under 101.110(8) "b" cannot be practicably achieved with any currently available methods.
  - (2) Implement alternate measures to control exposure of humans or the environment to residual contamination, as necessary to protect human health and the environment.
  - (3) Implement alternate measures for control of the sources of contamination or for removal or decontamination of equipment, units, devices, or structures that are:
    1. Technically practicable; and
    2. Consistent with the overall objective of the remedy.
  - (4) Notify the department within 14 days that a report justifying the alternate measures prior to implementation has been placed in the operating record.
- d. All solid wastes that are managed pursuant to a remedy required under 101.110(8), or an interim measure required under 101.110(9) "a"(3), shall be managed in a manner that:
  - (1) Is protective of human health and the environment; and
  - (2) Complies with applicable RCRA, state, and local requirements.
- e. Remedies selected pursuant to 101.110(8) shall be considered complete when:
  - (1) The owner or operator complies with the groundwater protection standards established under 101.110(6) "h" or "i" at all points within the plume of contamination that lie beyond the groundwater monitoring well system established under 101.110(2).
  - (2) Compliance with the groundwater protection standards established under 101.110(6) "h" or "i" has been achieved by demonstrating that concentrations of 40 CFR Part 258, Appendix II, constituents have not exceeded the groundwater protection standard(s) for a period of three consecutive years using the statistical procedures and performance standards 101.110(4) "g" and "h." The department may specify an alternative length of time during which the owner or operator must demonstrate that concentrations of 40 CFR Part 258, Appendix II, constituents have not exceeded the groundwater protection standard(s), taking into consideration:
    1. The extent and concentration of the release(s);
    2. The behavior characteristics of the hazardous constituents in the groundwater;
    3. The accuracy of monitoring or modeling techniques, including any seasonal, meteorological, or other environmental variables that may affect accuracy; and
    4. The characteristics of the groundwater.
  - (3) All actions required by the department to complete the remedy have been satisfied.
- f. Upon completion of the remedy, the owner or operator must notify the department within 14 days that a certification has been placed in the operating record verifying that the remedy has been completed in compliance with the requirements of 101.110(9) "e." The certification must be signed by the owner or operator and by a qualified groundwater scientist and approved by the department.

g. When, upon completion of the certification, the owner or operator determines that the corrective action remedy has been completed in accordance with the requirements under 101.110(9)“e,” the owner or operator shall be released from the requirements for financial assurance for corrective action pursuant to 101.114(5).

**101.110(10) Annual water quality reports (AWQR).** The owner or operator shall submit an annual report to the department detailing the water quality monitoring sampling locations and results, assessments, selection of remedies, implementation of corrective action, and results of corrective action remedies to address SSIs, if any, during the previous year. This report shall include a site map that delineates all monitoring points where water quality samples were taken and plumes of contamination, if any. The report shall contain a narrative explaining and interpreting all of the data collected during the previous year. The report shall be due each year on a date set by the department in the facility’s permit.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.111(455B,455D) Recordkeeping and reporting requirements.** The purpose of the recordkeeping and reporting activities is to verify compliance with this division and to document the construction and operations of the facility. The department can set alternative schedules for recordkeeping and notification requirements as specified in 101.111(1) and 101.111(2), except for the notification requirements in 101.106(2)“a” and 101.110(6)“g”(1)“3.” MSWLFs shall comply with the following recordkeeping and reporting requirements.

**101.111(1) Recordkeeping.** The owner or operator of an MSWLF unit must record and retain near the facility in an operating record or in an alternative location approved by the department the following information as it becomes available.

- a. Permit application, permit renewal, and permit modification application materials pursuant to 567—101.105(455B);
- b. Site exploration and characterization reports pursuant to 101.106(3);
- c. Design and construction plans and specifications, and related analyses and documents, pursuant to 567—101.107(455B). The QC&A final reports, and related analyses and documents, pursuant to 101.107(4)“d”;
- d. Inspection records, training procedures, and notification procedures required in 567—101.108(455B);
- e. Any MSWLF unit design documentation for placement of leachate or gas condensate in an MSWLF unit as required under 101.108(1)“b”(3)“2” and “3”;
- f. Gas monitoring results from monitoring and any remediation plans required by 567—101.109(455B);
- g. Any demonstration, certification, finding, monitoring, testing, or analytical data required by 567—101.110(455B);
- h. Closure and post-closure care plans and any monitoring, testing, or analytical data as required by 567—101.112(455B) and 567—101.113(455B); and
- i. Any cost estimates and financial assurance documentation required by this chapter.

**101.111(2) Reporting.** The owner or operator must notify the department when the documents required in 101.111(1) have been placed in the operating record. All information contained in the operating record must be furnished upon request to the department for inspection.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.112(455B) Closure criteria.** MSWLFs shall comply with the following closure requirements.

**101.112(1)** Owners or operators of MSWLF units must install a final cover system that is designed to minimize infiltration and erosion. The final cover system must be designed and constructed to:

- a. Have a permeability less than or equal to the permeability of any bottom liner system (for MSWLFs with some type of liner) or have a permeability no greater than  $1 \times 10^{-7}$  cm/sec, whichever is less;
- b. Minimize infiltration through the closed MSWLF by the use of an infiltration layer that contains a minimum of 18 inches of compacted earthen material;
- c. Minimize erosion of the final cover by the use of an erosion layer that contains a minimum of 24 inches of earthen material that is capable of sustaining native plant growth;

*d.* Have an infiltration layer and erosion layer that are a combined minimum of 42 inches of earthen material at all locations over the closed MSWLF unit; and

*e.* Have a slope between 5 percent and 25 percent. Steeper slopes may be used if it is demonstrated that a steeper slope is unlikely to adversely affect final cover system integrity.

**101.112(2)** The department may approve an alternative final cover design that includes:

*a.* An infiltration layer that achieves reduction in infiltration equivalent to the infiltration layer specified in 101.112(1) “*a*” and “*b*”; and

*b.* An erosion layer that provides protection from wind and water erosion equivalent to the erosion layer specified in 101.112(1) “*c*” and “*d*.”

**101.112(3)** The owner or operator must prepare a written closure plan that describes the steps necessary to close all MSWLF units at any point during the active life in accordance with the cover design requirements in 101.112(1) or 101.112(2), as applicable. The closure plan, at a minimum, must include the following information.

*a.* A description of the final cover including source, volume, and characteristics of cover material designed in accordance with 101.112(1) or 101.112(2) and the methods and procedures to be used to install the cover;

*b.* An estimate of the largest area of the MSWLF unit requiring a final cover, as required under 101.112(1) or 101.112(2), at any time during the active life;

*c.* An estimate of the maximum inventory of wastes on site over the active life of the landfill facility; and

*d.* A schedule for completing all activities necessary to satisfy the closure criteria in 567—101.112(455B).

**101.112(4)** The owner or operator must notify the department that the closure plan has been placed in the operating record no later than the initial receipt of waste in a new MSWLF unit.

**101.112(5)** At least 180 days prior to beginning closure of each MSWLF unit as specified in 101.112(6), an owner or operator must notify the department of the intent to close the MSWLF unit and that a notice of the intent to close the unit has been placed in the operating record. If the MSWLF facility will no longer be accepting MSW for disposal, then the owner or operator must also notify all local governments utilizing the facility and post a public notice of the intent to close and no longer to accept MSW.

**101.112(6)** The owner or operator must begin closure activities of each MSWLF unit:

*a.* No later than 30 days after the date on which the MSWLF unit receives the known final receipt of wastes; or

*b.* If the MSWLF unit has remaining capacity and there is a reasonable likelihood that the MSWLF unit will receive additional wastes, no later than one year after the most recent receipt of wastes. Extensions beyond the one-year deadline for beginning closure may be granted by the department if the owner or operator demonstrates that the MSWLF unit has the capacity to receive additional wastes and the owner or operator has taken and will continue to take all steps necessary to prevent threats to human health and the environment from the unclosed MSWLF unit.

**101.112(7)** The owner or operator must complete closure activities of each MSWLF unit in accordance with the closure plan within 180 days following the beginning of closure as specified in 101.112(6). Extensions of the closure period may be granted by the department if the owner or operator demonstrates that closure will, of necessity, take longer than 180 days and that the owner or operator has taken and will continue to take all steps to prevent threats to human health and the environment from the unclosed MSWLF unit.

**101.112(8)** Following closure of each MSWLF unit, the owner or operator must submit to the department certification, signed by an independent professional engineer registered in Iowa, verifying that closure has been completed in accordance with the closure plan. Upon approval by the department, the certification shall be placed in the operating record.

**101.112(9)** Following closure of all MSWLF units, the owner or operator must record a notation on the deed to the landfill facility property, or some other instrument that is normally examined during title search in lieu of a deed notification, and notify the department that the notation has been recorded and

a copy has been placed in the operating record. The notation on the deed must in perpetuity notify any potential purchaser of the property that:

- a. The land has been used as a landfill facility, and
- b. Its use is restricted under 101.113(3) "c."

**101.112(10)** The owner or operator may request permission from the department to remove the notation from the deed if all wastes are removed from the facility.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.113(455B) Post-closure care requirements.** MSWLFs shall comply with the following post-closure care requirements.

**101.113(1)** Following closure of each MSWLF unit, the owner or operator must conduct post-closure care. Post-closure care must be conducted for 30 years, except as provided under 101.113(2), and consist of at least the following.

- a. Maintaining the integrity and effectiveness of any final cover, including making repairs to the cover as necessary to correct the effects of settlement, subsidence, erosion, or other events, and preventing run-on and runoff from eroding or otherwise damaging the final cover;

- b. Maintaining and operating the leachate collection system in accordance with the requirements in 101.107(5) "b" and 101.105(9), if applicable. The department may allow the owner or operator to stop managing leachate if the owner or operator demonstrates that leachate no longer poses a threat to human health and the environment;

- c. Monitoring the groundwater in accordance with the requirements of 567—101.110(455B) and maintaining the groundwater monitoring system; and

- d. Maintaining and operating the gas monitoring system in accordance with the requirements of 567—101.109(455B).

**101.113(2)** The length of the post-closure care period may be:

- a. Decreased by the department if the owner or operator demonstrates that the reduced period is sufficient to protect human health and the environment and this demonstration is approved by the department; or

- b. Increased if the department determines that the lengthened period is necessary to protect human health and the environment.

**101.113(3)** The owner or operator of all MSWLF units must prepare a written post-closure plan that includes, at a minimum, the following information:

- a. A description of the monitoring and maintenance activities required in 101.113(1) for each MSWLF unit and the frequency at which these activities will be performed;

- b. Name, address, email, and telephone number of the person or office to contact about the facility during the post-closure period; and

- c. A description of the planned uses of the property during the post-closure period. Post-closure use of the property shall not disturb the integrity of the final cover, liner(s), or any other components of the containment system or the function of the monitoring systems unless necessary to comply with the requirements in this division. The department may approve any other disturbance if the owner or operator demonstrates that disturbance of the final cover, liner, or other component of the containment system, including any removal of waste, will not increase the potential threat to human health or the environment.

**101.113(4)** The owner or operator must notify the department that a post-closure plan has been prepared and placed in the operating record by the date of initial receipt of waste.

**101.113(5)** Following completion of the post-closure care period for each MSWLF unit, the owner or operator must submit to the department a certification, signed by an independent Iowa-licensed professional engineer, verifying that post-closure care has been completed in accordance with the post-closure plan. Upon department approval, the certification shall be placed in the operating record.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.114(455B) Financial assurance requirements.** The owner or operator of an MSWLF must establish financial assurance for closure, post-closure care and corrective action, if applicable, in accordance with Division VIII of this chapter.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.115(455B) Waiver limitations.** Some provisions of this division are minimum standards required by federal law (including but not limited to 40 CFR 258), and waivers to such provisions shall not be granted unless they are as protective as the applicable minimum federal standards.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

These rules are intended to implement Iowa Code section 455B.304.

**567—101.116 to 101.199** Reserved.

DIVISION III  
INDUSTRIAL LANDFILLS

**567—101.200(455B) Purpose.** The purpose of this division is to implement Iowa Code chapter 455B, subchapter IV (solid waste disposal), for the siting, designing, and operating of a sanitary landfill accepting only industrial solid waste or a sanitary landfill accepting only C&D.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.201(455B) Applicability.**

**101.201(1)** This division shall apply to sanitary landfills that are constructed and operated exclusively for the final deposition of industrial solid waste or C&D, known for purposes of this chapter as industrial landfills.

**101.201(2)** Pursuant to Iowa Code section 455B.305(1), an industrial landfill shall not be constructed or operated without first obtaining a permit from the department pursuant to this division, the requirements set forth in 567—Chapter 100, and Division I of this chapter.

**101.201(3)** The issuance of a permit to an industrial landfill pursuant to this division in no way relieves the applicant of the responsibility of complying with all other local; state; or federal statutes, ordinances, and rules or other requirements applicable to the construction and operation of an industrial landfill.

**101.201(4)** All rules, standards, technical guidance, and other similar legal or technical documents referenced in this division shall be the version of those documents in effect on August 1, 2025, unless otherwise noted in these rules, and except for references to the Iowa Code and Iowa Administrative Code, which shall always be the most recent version unless otherwise noted in these rules.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.202(455B) Definitions.** For the purposes of this division, the definitions in 567—Chapter 100 and Iowa Code section 455B.301 shall apply.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.203(455B) Permits.** For purposes of this division, the permit requirements in 567—Chapter 100 shall apply.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.204(455B) Permit applications.** Unless otherwise authorized by the department, a permit applicant shall submit on a form prescribed by the department the requirements in 567—Chapter 100 and Division I of this chapter, as well as the following information.

**101.204(1)** A detailed description of the disposal process to be used. The department may request additional details to ensure compliance with all operation requirements.

**101.204(2)** A table listing the equipment to be used, its design capacities, and expected loads.

**101.204(3)** A closure/post-closure plan that:

*a.* Details how and when the facility will be closed in accordance with applicable requirements of this division.

*b.* Describes the proposed groundwater monitoring plan, leachate control system, and site inspection and maintenance activities necessary to comply with this division.

c. States the name, address, and telephone number of the person or office to serve as a contact with regard to the facility during the post-closure period.

**101.204(4)** Such other information as may be required by the director.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.205(455B) Soil and hydrogeologic investigations.** An industrial landfill shall have a qualified groundwater scientist conduct a soil investigation, hydrogeologic investigation, and evaluation of hydrogeologic conditions. The purpose of these investigations is to obtain data to determine potential routes of contaminant migration via groundwater. Such information is vital for development of the hydrologic monitoring system plan and design. This division sets forth the minimum requirements for this work, including reporting. An industrial landfill shall comply with this division unless the department issues written approval due to specific site conditions.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.206(455B) Soil investigation.**

**101.206(1) Soil borings.**

a. *Number of borings.* A sufficient number of soil borings shall be made to accurately identify the hydrogeologic variations of the landfill site. For new landfill sites, the minimum number of borings required is 10 for landfill sites of less than 10 acres, 20 for landfill sites of 10 to 50 acres, and 20 plus an additional boring for every 10 acres above 50 acres for landfill sites larger than 50 acres. Fewer borings may be needed for existing landfill sites, depending on previous work done at the landfill site. Also, no borings will be required in existing fill areas. The department may require additional borings based on the geological complexity of the landfill site.

b. *Depth of borings.* All borings must extend a minimum of 25 feet deep and at least 10 feet deep below the water table; however, borings in proposed fill areas shall be terminated 10 feet above the uppermost aquifer or be grouted to provide such separation. At least half the borings located outside the existing or proposed fill area shall extend either 10 feet into the uppermost aquifer, 50 feet below the water table, or 10 feet into bedrock. At least one boring shall extend 10 feet into bedrock or 100 feet below the lowest ground surface elevation.

c. *Boring method.* Borings shall comply with the applicable portions of this chapter. The preferred boring method is hollow stem auger, although it may be necessary to use other methods at greater depths and in bedrock. When wet drilling methods are used for boring in which monitoring wells or piezometers are installed, the drilling fluid and methods and development procedures shall be approved by and documented with the department.

d. *Assurance that soil boring samples have been taken at the landfill site.* The soil boring samples must be kept by the permit applicant until the permit is issued and must be made available to the department if the department requests them.

**101.206(2) Soil samples.** Samples shall be collected at five-foot intervals and at every change in stratum. These samples shall be obtained using a split spoon sampler and the procedures of the standard penetration test. A minimum of one undisturbed Shelby tube sample shall be obtained in the uppermost cohesive stratum at or below the lowest depth at which solid waste will be disposed of. Samples shall be clearly marked, preserved, and maintained for future inspection. Samples selected for laboratory analysis shall be properly preserved.

**101.206(3) Laboratory test of discrete soil samples.** Laboratory tests of discrete soil samples shall be conducted to correlate strata between soil borings, obtain permeability data on each stratum, and design monitoring wells.

a. *Hydraulic conductivity tests.* Tests using a constant-head or falling-head permeameter shall be run on a minimum of one sample from each Shelby tube sample. Each sample shall be from a different soil boring representing a different area of the landfill site.

b. *Grain size distribution.* Grain size distribution tests shall be conducted on a minimum of one sample from each distinct stratum.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.207(455B) Hydrogeologic investigation.**

**101.207(1)** *Groundwater level measurements.* The elevation of the water table shall be determined at or near the location of each soil boring that penetrates the water table. The water table may be determined using a completed water table monitoring well, or piezometer. The bottom of a piezometer used to measure water table elevation shall be no more than five feet below the water table. The apparent horizontal groundwater flow direction shall be determined based on water table measurements. Vertical groundwater flow shall then be assessed in at least two profiles approximately parallel to the apparent horizontal flow direction. Vertical groundwater flow shall be assessed using at least two well clusters per profile. Each well cluster shall contain a water table monitoring well or piezometer and additional water level monitoring points based on landfill site conditions as follows.

*a.* If the water table is in the uppermost aquifer, one additional water level monitoring point shall be located near the base of the aquifer or at least 20 feet below the base of the water table monitoring point. This additional monitoring point may not be required if the aquifer is less than 20 feet thick.

*b.* If the uppermost aquifer is less than 50 feet below the water table, an additional water level monitoring point shall be located at the top of the aquifer.

*c.* If the uppermost aquifer is more than 50 feet below the water table, additional water level monitoring points shall be placed at depths of 30 feet and 50 feet below the water table.

*d.* If required, the one deeper soil boring into bedrock shall be used as a landfill site for one well cluster. Water table monitoring points in this cluster shall correspond to the other well cluster used for a profile. In addition, water level monitoring points shall be placed at the bottom of the boring and, if possible, at the top and bottom of the uppermost aquifer. Groundwater level measurements shall be made after the water levels have stabilized in the monitoring point and at least 24 hours after completion and bailing of the monitoring well or installation of the piezometer. The water level in existing wells shall be observed and recorded prior to bailing. Each set of water level measurements shall be made in as short a time frame as possible not to exceed eight hours.

**101.207(2)** *In situ permeability tests.* In situ permeability tests shall be conducted on each monitoring well and piezometer in each well cluster.

*a. Pumping test.*

(1) If more than one monitoring point is located in the uppermost aquifer, a pumping test shall be conducted at one or more upper aquifer monitoring points. A pumping test involves pumping at a constant rate from one well while observing water levels in other wells. The pumping rate shall be as high as possible without dewatering the well. Water level measurements in other uppermost aquifer wells shall be measured at frequent intervals near the start of the test and then at progressively longer intervals. Continuous water level recording is preferable.

(2) Water levels in wells not located in the uppermost aquifer shall be recorded throughout the test at regular intervals. Water levels in all wells shall be measured 24 hours prior to the test and just before the test. The test duration shall be at least four hours and continue until a stabilized drawdown condition is observed. Longer tests may be necessary if other uppermost aquifer monitoring points are slow to respond. Water level readings shall be recorded through the recovery phase of the water table.

*b. Bail and slug tests.* Monitoring wells and piezometers located in materials with low hydraulic conductivities shall be tested using a bail or slug test. These tests involve rapidly removing or adding a known volume of water to a well and then recording water levels in the well as the well recovers to its original level. Typically, the necessary frequency of measurements will be similar to that required of a pumping test. In materials of very low hydraulic conductivities, less frequent measurements are necessary. In materials of higher hydraulic conductivities, more frequent measurements may be necessary.

**101.207(3)** *Existing well research.* A reasonable effort to inventory all active, unused, and abandoned water wells within one mile of the facility and the identification of all water wells within three miles of the permitted waste boundary shall be conducted. Well logs, other available information on well construction, static water levels, and usage shall be obtained. The well inventory shall be based on thorough reviews of state and local collections of well logs and, when possible, interviews or surveys of well owners. Also to be included are maps showing the location of soil borings, other field tests and measurements, and existing wells.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.208(455B) Evaluation of hydrogeologic conditions.**

**101.208(1)** Based on soil boring and other available information, a description of the landfill site geology shall be made. This description shall include preparation of geologic cross sections of sufficient number and spacing (no fewer than four at every landfill site) to adequately define all areas of the landfill site and of sufficient detail to adequately depict major stratigraphic and structural trends and reflect geologic structural features in relation to groundwater flow. Each pair of cross sections must be as near to perpendicular as possible to adequately portray the landfill site geology.

**101.208(2)** A description of the hydrogeologic unit(s) within the saturated zone shall be made, including thickness; depth; hydraulic properties, such as transmissivity and storage coefficient or specific yield; description of the role of each as confining bed, aquifer, or perched saturated zone; and its actual or potential use as a water supply aquifer.

**101.208(3)** All groundwater flow paths from the landfill site shall be identified, including both horizontal and vertical components of flow. A contour map of the water table shall be presented showing horizontal flow paths. A potentiometric surface map of the uppermost aquifer showing horizontal flow paths shall also be presented, if different from the water table. Vertical flow paths shall be shown in at least two profiles approximately parallel to the direction of horizontal flow. Vertical flow paths shall be determined by water level measurements from clustered wells at different depths if possible. An evaluation of vertical groundwater flow based on the hydrologic properties of the various strata encountered at the landfill site, estimated groundwater flow and recharge rates, and known information on hydraulic head shall also be made.

**101.208(4)** The seasonal, temporal, and artificially induced variations in groundwater flow shall be evaluated. Temporal variations occur due to natural events, such as rainfall. The addition of tile lines, removal of overburden, or deposition of wastes would constitute artificially induced variations.

**101.208(5)** Surface water flow paths from the landfill site shall be identified on topographic contour maps.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.209(455B) Monitoring system plan.** A hydrologic monitoring system shall be designed to intercept the groundwater and surface water flow paths from the landfill site, including proposed locations and depths for monitoring wells in accordance with monitoring well siting criteria in 567—101.212(455B). The surface water monitoring plan shall include monitoring points on all standing and flowing bodies of water that will receive surface runoff or groundwater discharge from the landfill site. For streams, sampling points upstream and downstream of areas of potential impact from the landfill site shall be selected. The monitoring system plan shall also include sampling protocols and monitoring well maintenance and performance reevaluation procedures.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.210(455B) Sampling protocol.** At a minimum, the sampling protocol must include the following.

**101.210(1)** Order in which monitoring points are to be sampled, all tests and procedures needed at each monitoring point and the order in which these procedures will be carried out, equipment and containers to be used, procedures and precautions for their use, precautions to avoid introducing contaminants from outside sources into monitoring wells or samples, and how equipment must be cleaned between uses;

**101.210(2)** Procedures for evacuating, if applicable, each monitoring well prior to each water quality sampling;

**101.210(3)** Procedures for handling field blanks and other quality assurance samples at the facility and in transit to and from the laboratory;

**101.210(4)** Procedures for sample preservation;

**101.210(5)** Procedures for sample collection, labeling and handling at the facility and during transport to the laboratory;

**101.210(6)** Procedures for recording field observations and measurements;

**101.210(7)** Procedures for records maintenance and data analysis; and

**101.210(8)** Procedures for sampling surface water monitoring points, including exact sampling locations and depths.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.211(455B) Monitoring well maintenance and performance reevaluation plan.**

**101.211(1)** A monitoring well maintenance and performance reevaluation plan shall be included as part of the hydrologic monitoring system plan. The plan shall ensure that all monitoring points remain reliable.

**101.211(2)** The plan shall provide for the following.

*a.* A biennial examination of high and low water levels accompanied by a discussion of the acceptability of well location (vertically and horizontally) and exposure of the screened interval to the atmosphere.

*b.* A biennial evaluation of water level conditions in the monitoring wells to ensure that the effects of waste disposal or well operation have not resulted in changes in the hydrologic setting and resultant flow paths.

*c.* Annual measurement of well depths to ensure that wells are physically intact and not filling with sediment.

*d.* An in situ permeability test to be conducted every five years on monitoring wells to compare test data with those collected originally to determine if well deterioration is occurring or other methods approved by the department.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.212(455B) Monitoring well siting requirements.**

**101.212(1)** *Downgradient monitoring wells.* Downgradient monitoring wells must be located to provide a high level of certainty that releases of contaminants from the landfill site can be promptly detected. Downgradient monitoring wells shall be placed along the landfill site perimeter, within 50 feet of the planned liner or waste boundary unless landfill site conditions dictate otherwise, downgradient of the facility with respect to the hydrologic unit being monitored. For those facilities that are long-term, multiphase operations, the department may establish temporary waste boundaries in order to define locations for monitoring wells. The convergence of groundwater paths to minimize the overall length of the downgradient dimension may be taken into consideration in the placement of downgradient monitoring wells.

**101.212(2)** *Water table wells.* At least three downgradient water table monitoring wells shall be installed at each facility. The maximum spacing between wells shall be 600 feet.

**101.212(3)** *Uppermost aquifer monitoring wells.* If different from water table monitoring wells, at least three uppermost aquifer monitoring wells shall be installed at each facility. Uppermost aquifer monitoring wells shall be spaced no more than 600 feet apart. If the uppermost aquifer is located more than 50 feet below the water table, the requirement for three wells may be relaxed, although at least one downgradient uppermost aquifer monitoring well will be required.

**101.212(4)** *Other downgradient monitoring wells.* Additional downgradient monitoring wells will be required if the water table and uppermost aquifer monitoring wells do not intercept most vertical flow paths from the landfill site. In such situations, monitoring wells shall be placed at the appropriate depths to intercept the remaining flow paths and shall be spaced at no more than 600 feet apart.

**101.212(5)** *Upgradient monitoring wells.* Upgradient monitoring wells shall not be affected by the landfill site. At least one upgradient monitoring well shall be installed into each stratum being monitored by downgradient monitoring wells. If it is not possible to actually locate a monitoring well upgradient of the landfill site, the well shall be placed as near the landfill site as feasible without being affected by the landfill site.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.213(455B) General requirements.**

**101.213(1)** *Plan requirements.* The plans for industrial landfills shall include the following.

*a.* The map and aerial photograph of sufficient scale to show all homes, buildings, lakes, ponds, watercourses, wetlands, dry runs, rock outcroppings, roads, and other applicable details including topography and drainage patterns. All wells shall be identified on the map or aerial photograph, and a benchmark shall be indicated.

*b.* A plot drawing in appropriate scale of the landfill site and the immediately adjacent area showing dimensions, topography with appropriate contour intervals, drainage patterns, known existing drainage tiles, locations where any geologic samples were taken, all water wells with their uses, and present and planned pertinent features including but not limited to roads, fencing, and borrow areas.

*c.* Detailed engineering drawing of the landfill site showing all initial and permanent roads, buildings, and equipment to be installed; unloading and holding areas; fences and gates; landscaping and screening devices; personnel and maintenance facilities; and sewer and water lines.

*d.* CCR landfills shall have a soil liner consisting of at least four feet of recompacted soil. The description, source and volume of the material to be used for the landfill liner, including the method of installation, must be provided. The hydraulic conductivity must be  $1 \times 10E^{-7}$  cm/sec (0.00028 ft/day) or less as determined by appropriate laboratory analysis. The percent of standard or modified proctor density at moisture contents consistent with expected field conditions and corresponding to a measured hydraulic conductivity equal to or less than  $1 \times 10E^{-7}$  cm/sec shall be determined in the laboratory. The soil shall be placed in lifts not to exceed eight inches in thickness. A minimum of one field moisture and density test shall be performed per lift per acre to verify that the moisture and density determined by the laboratory analysis as correlated to permeability has been achieved. Results of field moisture and density tests shall be submitted to the department prior to the placement of solid waste.

*e.* Alternative liner systems. An alternative liner system may be approved by the director if the design of the liner system is equivalent to the soil liner required in 101.213(1)“*d*” in performance, longevity, and protection of the groundwater, or, based on the specific type of waste to be disposed of, the design of the liner system offers equivalent protection of the groundwater. Undisturbed soil shall not be used as a liner.

*f.* Diversion and drainage structures designed to prevent ponding, infiltration, inundation, erosion, slope failure, and washout from surface runoff due to a 25-year 24-hour rainfall event.

*g.* A leachate collection, storage and treatment and disposal system designed to protect the soils, surface water, and groundwater from leachate contamination. This system shall also be designed to operate during the active life of the landfill site and during the post-closure period.

(1) The design and construction of the system must be in accordance with 101.213(10) and be coordinated with the planned phase development of the landfill site and the timing of leachate generation.

(2) The potential for leachate generation shall be evaluated in determining the design for the facility.

(3) The plan must include proposed quality assurance and quality control testing to be performed during installation and operation of the system. This plan shall include procedures that will be followed during installation of the leachate collection system and during normal landfill operations to ensure the system's integrity and design standards.

*h.* A drawing of the scheme of development shown progressively with time. The methods to be used to ensure compliance with the scheme and to provide vertical and horizontal controls shall be described.

*i.* Cross-sectional drawings showing progressively with time the original and proposed elevation of excavating, trenching, and fill.

*j.* An ultimate land use proposal, including intermediate stages, with time schedules indicating the total and complete land use. Final elevations, grades, permanent drainage structures, monitoring or treatment facilities, and permanent improvements of the completed landfill shall be included. Any supporting drawings to the ultimate land use proposal shall be in appropriate scale.

*k.* Information describing:

(1) Source, volume, and characteristics of cover material;

(2) Area of landfill site in acres.

*l.* A report consisting of information verifying that the portion of the landfill site to be filled is:

(1) Situated to obviate any predictable lateral movement of significant quantities of leachate from the landfill site to standing or flowing surface water or to shallow aquifers that are in actual use or are deemed to be of potential use as a water resource.

(2) At least 50 feet from the adjacent property line unless there is a written agreement with the owner of the abutting property. The report shall verify that the portion to be filled is at least 50 feet from the adjacent property line. The written agreement shall be filed with the county recorder and shall become a permanent record of the property.

(3) Beyond 500 feet from any existing habitable residence unless there is written agreement with the owner of the residence and the landfill site is screened by natural objects, plantings, or fences or by other appropriate means. The residence must be in existence on the date of application for the original permit from the department. The written agreement shall be filed with the county recorder and recorded for abstract of title purposes and a copy submitted to the department.

*m.* Such additional data and information as may be deemed necessary by the director to evaluate a proposed industrial landfill.

*n.* When a new landfill or lateral expansion is located within 200 feet of a fault that has had displacement in Holocene time, the plan must contain a notice that the facility's official files will include demonstration that an alternative setback distance of less than 200 feet will prevent damage to the structural integrity of the landfill site and will be protective of human health and the environment.

*o.* When a new landfill or a lateral expansion is located in seismic impact zones, the plan must contain a notice that the facility's official files will include the following demonstration: that all containment structures, including liners, leachate collection systems, and surface water control systems, are designed to resist the maximum horizontal acceleration in the lithified earth material for the landfill site.

*p.* When a new landfill or lateral expansion is located in an unstable area, the plan must contain a notice that the facility's official files will include the following demonstration: that engineering measures have been incorporated into the landfill site design to ensure that the integrity of the structural components of the landfill site will not be disrupted. The demonstration must consider the on-site or local soil conditions that may result in significant differential settling, on-site or local geologic or geomorphologic features, and on-site or local human-made features or events (both surface and subsurface). For existing facilities located in an unstable area, the owner or operator must prepare the above demonstration required in this paragraph and notify the director that it has been placed in the facility's official files.

**101.213(2) *Operating requirements.*** The plan submitted shall detail how the industrial landfill will comply with these requirements.

*a.* Solid waste shall be unloaded at the working face only when an operator is on duty at that area. Solid waste may be deposited in storage containers inside the facility under the supervision of an attendant or operator.

*b.* A copy of the permit, engineering plans, and reports shall be kept at the facility at all times.

*c.* Each landfill site shall be graded and provided with drainage facilities to minimize flow of surface water onto and into the portion of the landfill site being filled and to prevent soil erosion and ponding of water.

*d.* The finished surface of the landfill site shall be repaired as required, covered with soil, and seeded with native grasses or other suitable vegetation immediately upon completion or promptly in the spring on areas terminated during winter conditions. If necessary, seeded slopes shall be covered with straw or similar material to prevent erosion.

*e.* Each industrial landfill shall be staked as necessary and inspected annually, or as otherwise specified in the permit, by an Iowa-licensed professional engineer. A brief report by the engineer indicating areas of conformance or nonconformance with the approved plans and specifications shall be submitted to the department by the permit holder within 30 days of the inspections. In specifying alternate inspection frequencies or schedules, the department shall consider the types and quantities of waste disposed of, the rate of development of the landfill site, the degree of control over landfill site development inherent in the design and topography of the landfill site, and the quality of prior operation.

*f.* If any pockets, seams or layers of sand or other highly permeable material are encountered at the industrial landfill, the permit holder shall promptly notify the department and shall ensure that a

professional engineer registered in Iowa has certified that all sands encountered were totally excavated or sealed off properly or otherwise handled as explicitly provided for in the permit before solid waste is disposed of in that area of the landfill site.

g. The total volume of leachate collected for each month shall be recorded, and the elevation and thickness of leachate in the landfill shall be provided to the department in accordance with the schedule specified in the permit.

**101.213(3)** *Hydrologic monitoring system.* The owner or operator of a solid waste disposal facility shall operate and maintain a hydrologic monitoring system that includes a sufficient number of groundwater monitoring wells and surface water monitoring points to determine the impact, if any, that the sanitary disposal project is having on the groundwater and surface water.

The hydrologic monitoring systems shall enable early detection of the escape of pollutants from an industrial landfill. The hydrologic monitoring system shall be planned, designed, and constructed in accordance with the provisions of 101.213(3) through 101.213(9), and implemented in accordance with the following schedule.

a. A hydrologic monitoring system plan shall be submitted to the department for review and approval with any application for a new permit. Installation of the approved system shall be completed prior to the deposition of solid waste into the landfill.

b. A hydrologic monitoring system plan shall be submitted with applications for permit renewal.

c. Upon notice by the department, a hydrologic monitoring system plan may be required to be submitted within six months of such notification.

d. Completion of installation and operation of the approved plan shall be completed within one year of the date of department approval.

**101.213(4)** *Hydrologic monitoring system operating requirements.*

a. *Operational sampling requirements.* All sampling shall be conducted in accordance with an approved sampling protocol, components of which are described in 567—101.210(455B).

b. *Groundwater levels.* The elevation of water in each monitoring well shall be measured during sampling events and recorded to the nearest 0.01 foot. Level measurements must be made before a well is evacuated for sample collection.

c. *Surface water levels.* The water level or flow rate of each surface water body sampled shall be measured and recorded at the time of sample collection.

d. *First-year water sampling.* During the first year of operation of the hydrologic monitoring system, a sample shall be collected quarterly from each groundwater monitoring well and surface water monitoring point. The purpose of this sample is to determine baseline water quality information and enable initial estimation of water quality variability. Each sample shall be analyzed for the following parameters in addition to the parameters listed in 101.213(4)“e” and any additional parameter deemed necessary by the department.

- (1) Arsenic.
- (2) Barium.
- (3) Cadmium.
- (4) Chromium, total.
- (5) Lead.
- (6) Mercury.
- (7) Magnesium.
- (8) Zinc.
- (9) Copper.
- (10) Benzene.
- (11) Carbon tetrachloride.
- (12) 1,2-Dichloroethane.
- (13) Trichloroethylene.
- (14) 1,1,1-Trichloroethane.
- (15) 1,1-Dichloroethylene.
- (16) Paradichlorobenzene.

*e. Routine semiannual water sampling.* After the first year, each monitoring point must be sampled semiannually as specified in the facility's operation permit and analyzed for the following parameters.

- (1) Chloride.
- (2) Specific conductance (field measurement).
- (3) pH (field measurement).
- (4) Ammonia nitrogen.
- (5) Iron, dissolved.
- (6) Chemical oxygen demand.
- (7) Temperature (field measurement).
- (8) Any additional parameters deemed necessary by the department.

*f. Routine annual water sampling.* One sample per year from each monitoring point collected in a quarter specified in the facility's operation permit must be analyzed for the following parameters.

- (1) Total organic halogen.
- (2) Phenols.
- (3) Any additional parameters deemed necessary by the department.

**101.213(5) Laboratory procedures.** Analyses for a contaminant regulated under this division must be performed by a laboratory certified for the analyte(s) and applicable method pursuant to 567—Chapter 83.

*a.* All analyses of parameters not covered in the Safe Drinking Water Act (SDWA) must be performed according to methods specified in SW-846 or approved by the United States Environmental Protection Agency. Any analytical method used on non-SDWA parameters deviating from those specified in SW-846 or approved by EPA must be approved by the department.

*b.* All analyses must be recorded on forms that, in addition to the analytical results, show the precision of the data set, bias, and limit of detection.

**101.213(6) Analysis of sampling data.** For each parameter analyzed during the first year of operation of the hydrologic monitoring system, as listed in 101.213(4)“d,” the mean and standard deviation for each upgradient monitoring well shall be determined using the first year of data. For routine semiannual monitoring parameters, as listed in 101.213(4)“e,” mean and standard deviation shall be recalculated annually using all available analytical data. If the analytical results for a downgradient monitoring point do not fall within the control limits of two standard deviations above the mean parameter(s) level in a corresponding upgradient monitoring point, the owner or operator shall submit this information to the department within 30 days of receipt of the analytical results. If the analytical results from an upgradient monitoring point do not fall within two standard deviations of the mean parameter(s) level for that monitoring point, the department shall also be notified within 30 days.

**101.213(7) Additional sampling.** The department will determine if additional sampling is warranted after receipt of information indicating a possible release as required in 101.213(6). The department may require any additional samples to be split and analyzed to determine whether the values obtained outside the control limits were the result of laboratory or sampling error. Any additional analytical results shall be submitted to the department by the owner or operator within seven days of receipt. The department will review the information and determine if additional monitoring or preparation of a groundwater quality assessment plan, in accordance with 101.213(9), is necessary.

**101.213(8) Recordkeeping and recording.**

*a.* The persons conducting the sampling must record the procedures, measurements, and observations at the time of sampling. The field records must be sufficient to document whether the procedures and requirements specified in the sampling protocol have been followed. The records must also contain the names of the persons conducting the sampling, the time and date each monitoring point was sampled, and the required field measurement or test result. The owner or operator must submit copies of these field records to the department upon request.

*b.* The owner or operator shall keep records of analyses and the associated groundwater surface elevations for the active life and post-closure period of the facility. These records shall be kept at the landfill site or in the administrative files of the owner or operator and shall be available for review by the department.

c. The owner or operator shall provide the department with copies of the quarterly monitoring analytical results by the dates specified in the facility's operation permit.

d. An annual report summarizing the effect of the facility on groundwater and surface water quality shall be submitted to the department by November 30 each year. The summary is to be prepared by qualified groundwater scientist and incorporated in the November annual engineer inspection report. The contents of this summary are to include the following items.

(1) A narrative describing the effects of the facility on surrounding surface water and groundwater quality and any changes made or maintenance needed in the monitoring network.

(2) Graphs showing concentrations versus time for all monitoring parameters for each well for as long as records exist for that parameter. Control limits (two standard deviations from the initial background value) must be shown in each graph.

(3) Results of activities and tests required by the well maintenance and performance reevaluation plan described in 567—101.211(455B).

**101.213(9)** *Groundwater quality assessment plan.*

a. If leachate migration occurs, the owner or operator shall develop and submit for approval a specific plan to conduct a groundwater quality assessment study at the facility to determine the rate of migration and the extent and constituent composition of the leachate release. At a minimum, the assessment monitoring plan must contain the following elements.

(1) Discussion of the hydrogeologic conditions at the landfill site with an identification of potential contaminant pathways.

(2) Description of the present detection monitoring system.

(3) A description of the approach the owner or operator will take to substantiate any contention that the contamination may have been falsely indicated.

(4) Description of the investigatory approach used to characterize the rate and extent of leachate migration.

(5) Discussion of the number, location, and depth of wells that will be initially installed, as well as a strategy for installing more wells in subsequent investigatory phases.

(6) Information on well design and construction.

(7) Description of the sampling and analytical program used to obtain and analyze groundwater monitoring data.

(8) Description of data collection and analysis procedures.

(9) Schedule for the implementation of each phase of the assessment study.

b. After the plan has been approved by the department, the owner or operator shall implement the plan according to the schedule in the plan.

c. Within 90 days after the activities prescribed in the groundwater assessment plan have been completed, the owner or operator shall submit a written groundwater quality assessment report to the department.

d. If the department determines that no waste or waste constituents from the facility have entered the groundwater, the owner or operator shall reinstate the routine monitoring program.

e. If the department determines that waste or waste constituents have been released from the facility and have entered the groundwater, the owner or operator shall continue to make the determinations described by the assessment plan and develop a remedial action/mitigation plan to alleviate or reduce contamination to the fullest extent possible.

**101.213(10)** *Leachate control system and liner design.* New industrial landfills or expansions of existing industrial landfills must have a leachate collection, storage, and treatment and discharge system in place prior to accepting waste. This system shall be operated in conformance with the approved design during the active life of the landfill site and during the post-closure period.

a. *Leachate collection system.*

(1) The leachate collection system shall be designed to allow not more than one foot of head above the top of the landfill liner. The collection system must include a method for measuring the leachate head in the landfill at the lowest area(s) of the collection system.

(2) The landfill liner must be graded toward the leachate collection pipe at a minimum slope of two percent and not to exceed 10 percent. The side slopes of the landfill liner must be less than 25 percent.

(3) A drainage layer must be placed immediately above the landfill liner. This drainage layer shall consist of a minimum of 1 foot of soil with a coefficient of permeability of  $1 \times 10^{-3}$  cm/sec (2.8 ft/day) or greater.

(4) Leachate collection pipe shall be surrounded by a gravel protection and drainage layer.

(5) The collection pipe must be perforated of a sufficient internal diameter to handle the expected flow but not less than four inches in diameter; capable of being cleaned throughout the active life of the landfill site and during the post-closure period; chemically resistant to the wastes and the expected leachate; and of sufficient strength to support maximum static and dynamic loads imposed by the overlying wastes, cover materials, and equipment used during the construction and operation of the landfill site. Documentation shall be submitted that includes methods and specifications for cleaning of the pipes, chemical compatibility of the pipes, and calculations and specifications for pipe strength.

(6) The leachate collection system shall be equipped with valves to enable the flow of leachate from the facility to be shut off during periods of maintenance.

(7) The leachate collection system shall be cleaned out once every three years or more frequently if conditions warrant. A report of the methods and results of the cleanout shall be submitted at the time of permit renewal.

b. *Leachate storage system.* The leachate storage system must be:

(1) Capable of storing at least seven days' accumulation of leachate;

(2) Constructed of materials that are compatible with the expected leachate; and

(3) Accessible at all times of the year and under all weather conditions.

c. *Leachate recirculation.* The primary goal of the leachate recirculation system is to help stabilize the waste. The leachate recirculation system shall not contaminate waters of the state, contribute to erosion, damage cover material, harm vegetation, or spray persons. Leachate recirculation shall be limited to areas satisfying the requirements of 101.213(10). The department shall approve areas for leachate recirculation.

d. *Construction certification report.* Prior to inspection and startup, a construction certification report must be submitted discussing quality assurance and quality control testing done to ensure that all materials and equipment for the leachate control system have been placed in accordance with the approved engineering plans, reports, and specifications. The results of all testing must be included, along with documentation of any failed tests, a description of the procedures used to correct the failures, and results of any retesting performed.

**101.213(11) Closure requirements.** The owner or operator of the industrial landfill must close the landfill site in a manner that minimizes the potential for post-closure release of pollutants to the air, groundwater, and surface waters.

a. A minimum of two permanent surveying monuments must be installed by a registered land surveyor from which the location and elevation of wastes, containment structures, and monitoring facilities can be determined throughout the post-closure period.

b. Contents of final cover.

(1) The final cover of an industrial landfill shall consist of:

1. Not less than two feet of compacted soil. The hydraulic conductivity must be  $1 \times 10^{-7}$  cm/sec or less as determined by appropriate laboratory analysis. The percent of standard or modified proctor density at moisture content consistent with expected field conditions and corresponding to a measured hydraulic conductivity equal to or less than  $1 \times 10^{-7}$  cm/sec shall be determined in the laboratory. The soil shall be placed in lifts not to exceed eight inches in thickness. A minimum of one field moisture and density test shall be performed per lift per acre to verify that the density determined by the laboratory analysis as correlated to the hydraulic conductivity has been achieved. Results of field moisture and density tests shall be submitted to the department. The compacted soil shall be keyed into the bottom liner at the waste cell boundary.

2. Not less than two feet of uncompacted soil, containing sufficient organic matter to support vegetation. The thickness of this soil layer must be at least the root depth of the planned vegetative cover

to prevent root penetration into the underlying soil layers. This layer shall be placed as soon as possible to prevent desiccation, cracking, and freezing of the compacted soil layer described in 101.213(11) "b"(1)"1."

(2) A layer of compacted soil, incinerator ash, or similar material permitted by the department may be used to prepare the landfill site for placement of the compacted soil layer described in 101.213(11) "b"(1)"1." The use of such material will not serve as a replacement for the compacted soil layer described in 101.213(11) "b"(1)"1."

(3) Alternate methods and materials may be permitted if shown to provide equivalent or superior performance.

c. The final cover shall be designed and graded to meet the drainage requirements of 101.213(11) "c." The final cover must have a minimum slope of 5 percent and shall not exceed a slope of 25 percent. Those portions of existing landfills demonstrating placement of final cover in conformance with previously approved plans and specifications shall not be required to reconstruct the cover to meet either the minimum or maximum slope established by this subrule.

d. The final cover shall be seeded with native grasses or other suitable vegetation as soon as practical upon completion to prevent soil erosion. If seeding must be delayed due to summer or winter conditions, silt fences or other structures shall be used to minimize erosion of the final cover until the next season suitable for planting. The placement of cover in conformance with 101.213(13) "b" shall not be delayed due to season and shall be placed as soon as the solid waste has reached its maximum design elevation within the cell. Vegetation type shall be based on density and root depth, nutrient availability, soil thickness, and soil type. Alternatives to vegetative cover may be considered to control erosion and promote runoff.

**101.213(12) *Post-closure care.*** Industrial landfills shall comply with the following post-closure care requirements for 30 years.

a. The diversion and drainage system must be maintained to approved specifications to prevent run-on and runoff from eroding or otherwise damaging the final cover.

b. The integrity and effectiveness of the final cover must be maintained by making repairs as necessary to correct the effects of settling, subsidence, erosion, or other events. If damage to the compacted soil layer described in 101.213(11) "b"(1)"1" occurs, repairs shall be made to correct the damage and return it to its original specifications.

c. The vegetative cover shall be reseeded as necessary to maintain good vegetative growth. Any invading vegetation whose root system could damage the compacted soil layer shall be removed or destroyed immediately.

d. The groundwater monitoring system shall be operated and maintained.

e. The leachate collection, removal and treatment systems shall be operated and maintained.

f. The landfill gas monitoring and collection systems shall be operated and maintained.

g. Semiannual reports shall be submitted to the department. These reports shall contain information concerning the general conditions at the landfill site, groundwater monitoring results, amount of leachate collected and treated, information concerning the landfill gas monitoring and collection system, and other information as may be required by the closure permit. In addition, locations and elevations of all permanent monuments, required in 101.213(11) "a," shall be determined at least once every three years or more frequently in the event of obvious disturbance of the monument. The reports are due by April 30 and October 31 for the preceding six-month period.

h. The permanent surveying monuments required in 101.213(11) "a" shall be maintained.

**101.213(13) *Landfill gas.*** This subrule shall not apply to industrial landfills that do not pose a risk to generating explosive gases.

a. Owners or operators of industrial landfills must ensure that:

(1) The concentration of explosive gases generated by the facility does not exceed 25 percent of the lower explosive limit for methane gas in facility structures (excluding gas control or recovery system components); and

(2) The concentration of methane gas does not exceed the lower explosive limit for methane gas at the facility property boundary.

b. Owners or operators of industrial landfills must monitor quarterly for compliance with 101.213(13)“a.” An annual report shall be submitted by November 30 summarizing the methane gas monitoring results and any action taken resulting from gas levels exceeding the limits during the previous year.

c. If methane gas levels exceeding the limits specified in 101.213(13)“a” are detected, the owner or operator must:

- (1) Immediately take all necessary steps to ensure protection of human health and notify the director;
- (2) Within seven days after detection, submit to the director a report stating the methane gas levels detected and a description of the steps taken to protect human health;
- (3) Within 60 days of detection, implement a plan for remediation of the methane gas releases and send a copy of the remediation plan to the director. The plan shall describe the nature and extent of the problem and the proposed remedy.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.214(455B) Operating requirements.**

**101.214(1)** Open burning shall be prohibited within the permitted boundary.

**101.214(2)** No free liquids or waste containing free liquids shall be disposed of in an industrial landfill.

**101.214(3)** Each permit issued by the department will contain facility-specific operating requirements consistent with the type of solid waste and the disposal process.

**101.214(4)** Closure requirements.

a. The owner or operator shall notify the department in writing at least 180 days prior to closure of the facility or suspension of operations.

b. Notice of closure shall be posted at the facility at least 180 days prior to closure indicating the date of closure and alternative solid waste management facilities. Notice of closure shall also be published at least 180 days prior to closure in a newspaper of local circulation. This notice shall include the date of closure and alternative solid waste management facilities if the facility is open to the public.

c. Implementation of the closure/post-closure plan shall be completed within 90 days of the closure of the facility. The owner and an Iowa-licensed professional engineer shall certify that the closure/post-closure plan has been implemented in compliance with the rules, the closure/post-closure plan, and the permit.

d. Upon completion of closure activities, a construction certification report must be submitted discussing quality assurance and quality control testing done to ensure that all materials for the cap have been placed in accordance with the approved engineering plans, reports, and specifications. The results of all testing must be included, along with documentation of any failed tests, a description of the procedures used to correct the failures, and results of any retesting performed. In addition, the following documentation shall be submitted: as-built plans showing changes from the original design plans, a copy of the notation filed with the county recorder, and other forms of documentation as required.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.215(455B) Financial assurance requirements.** The owner or operator of an industrial landfill pursuant to this division must establish financial assurance for closure, post-closure, and corrective action, if applicable, in accordance with Division VIII of this chapter.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

These rules are intended to implement Iowa Code section 455B.304.

**567—101.216 to 101.299** Reserved.

DIVISION IV  
COAL COMBUSTION RESIDUAL LANDFILLS

**567—101.300(455B) Purpose.** The purpose of this division is to implement Iowa Code chapter 455B, subchapter IV (solid waste disposal), for the siting, designing, and operating of a solid waste sanitary landfill accepting only coal combustion residuals.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.301(455B) Applicability.**

**101.301(1)** This division shall apply to sanitary landfills that are constructed and operated exclusively for the final deposition of coal combustion residuals, known for purposes of this chapter as CCR landfills.

**101.301(2)** Pursuant to Iowa Code section 455B.305(1), a CCR landfill shall not be constructed or operated without first obtaining a permit from the department pursuant to this division, the requirements set forth in 567—Chapter 100, and Division I of this chapter.

**101.301(3)** The issuance of a permit to a CCR landfill pursuant to this division in no way relieves the applicant of the responsibility of complying with all other local, state, or federal statutes, ordinances, and rules or other requirements applicable to the construction and operation of a CCR landfill.

**101.301(4)** All rules, standards, technical guidance, and other similar legal or technical documents referenced in this division shall be the version of those documents in effect on August 1, 2025, unless otherwise noted in these rules, and except for references to the Iowa Code and Iowa Administrative Code, which shall always be the most recent version unless otherwise noted in these rules.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.302(455B) Definitions.** For the purposes of this division, the definitions in 567—Chapter 100 and Iowa Code section 455B.301 shall apply.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.303(455B) Permits.** For purposes of this division, the permit requirements in 567—Chapter 100 shall apply.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.304(455B) Permit applications.** Unless otherwise authorized by the department, a permit applicant shall submit on a form prescribed by the department the requirements in 567—Chapter 100, Division I of this chapter, and the following information.

**101.304(1)** A copy of the written agreement under 567—101.306(455B), if any, and documentation that it has been filed with the county recorder.

**101.304(2)** A topographic map of the site extending a minimum of 300 feet beyond the permitted property, with contour intervals not exceeding 10 feet, that shows the location of existing conditions, including but not limited to structures, wells, lakes, roads, drain tiles, or similar items.

**101.304(3)** A minimum of three soil borings for sites of ten acres or less with one additional boring for each additional three acres to determine the hydrogeologic conditions and establish the direction of groundwater flow, the depth to groundwater, and potential contaminant pathways throughout the site.

**101.304(4)** An adequate number of representative groundwater sample results to fully characterize the groundwater quality both temporally and spatially at the site and establish baseline levels for the following analytical parameters: arsenic, barium, beryllium, cobalt, copper, iron, lead, magnesium, manganese, selenium, zinc, chlorides, and sulfate.

**101.304(5)** A groundwater monitoring network that includes sufficient upgradient and downgradient monitoring wells that adequately monitor the potential contaminant pathways throughout the life of the site and the post-closure period.

**101.304(6)** Plans and specifications detailing how the CCR landfill will be constructed, operated, and closed.

**101.304(7)** An operations plan and a post-closure plan in accordance with the rules and the permit.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.305(455B) Design requirements.** In addition to the provisions in 567—100.5(455B,455D) and Division I of this chapter, the design shall include a liner and leachate collection system to protect groundwater and surface water.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.306(455B) Operating requirements.** Unless otherwise specified within a permit, a CCR landfill shall be operated in accordance with the provisions of 567—100.9(455B,455D). No wastes shall be deposited within 300 feet of an inhabitable residence or a commercial enterprise unless there is a written agreement with the property owner(s) allowing a lesser distance that has been filed with the local county recorder under the adjoining property or within 50 feet of the property boundary under any circumstances. An operations plan shall be prepared and submitted to the department that includes the following.

**101.306(1)** An identification of the area(s) to be filled during the period for which a permit is being requested.

**101.306(2)** The method(s) that will be utilized to prevent illicit municipal or putrescible solid wastes from being deposited as a result of mixing with authorized waste brought to the site.

**101.306(3)** The frequency, extent, and method of spreading and compacting the waste; the optimum layer thickness; and the size and slope of the operating face.

**101.306(4)** A description of the operating procedures from the arrival of waste to the site through unloading, placing, and closure to control fugitive dust, erosion, and contact water. If the methods used do not adequately control dust, contact water, and erosion, the department may require site-specific controls including a soil cover.

**101.306(5)** Detailed procedures for the removal of waste from the CCR landfill for beneficial reuse, if applicable.

**101.306(6)** Operating procedures for stormwater, contact water, and leachate management systems.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.307(455B) Groundwater monitoring and reporting.** Unless otherwise specified within a permit, the groundwater at a CCR landfill shall be monitored and reported in accordance with this rule.

**101.307(1)** For all new solid waste units, the groundwater monitoring network shall be installed before waste placement.

**101.307(2)** Quarterly sampling of all monitoring wells and analysis for the parameters specified in 101.304(4) shall commence within one year of initiating waste placement for the purpose of establishing the average baseline concentrations for each well.

**101.307(3)** Annual sampling of all monitoring wells for the parameters specified in 101.304(4) shall commence within one year of completing the quarterly baseline monitoring.

**101.307(4)** Additional sampling or a site assessment may be required by the department when there is an exceedance of any primary or secondary Maximum Contaminant Level (MCL), the Health Advisory Level (HAL), or the Drinking Water Standards and Health Advisories of the federal Environmental Protection Agency.

**101.307(5)** When an MCL or HAL does not exist for a parameter, then the statewide standard for a protected drinking water source shall be used. If no statewide standard exists, then an analysis of available groundwater data for the parameter of concern must be prepared and submitted to the department to determine whether additional sampling or site assessment is required. The analysis shall include a comparison of the most recent sample result to the average of the most recent two years of data or utilize an alternative method approved by the department.

**101.307(6)** A report of the groundwater monitoring results, including a site inspection, shall be submitted to the department by the end of the first year's operation and annually thereafter.

**101.307(7)** A minimum of one sample from each monitoring well shall be collected annually during the post-closure period and analyzed for the parameters specified in the permit. The results shall be included in the annual report.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.308(455B) Closure and post-closure requirements.** Unless otherwise specified within a permit, a CCR landfill shall close in accordance with the following.

**101.308(1)** A closure and post-closure plan shall be prepared and submitted to the department and include the actions that will be taken to close the site, final site contours and final cover design, stormwater controls and management, groundwater monitoring and reporting, permanent survey control, annual inspections, and contact information for post-closure monitoring and maintenance.

**101.308(2)** The final cover shall consist of not less than two feet of compacted soil and one foot of uncompacted soil capable of sustaining the growth of native vegetation. The slope of the final cover after closure shall be not less than 3 percent nor more than 25 percent.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.309(455B) Financial assurance requirements.** The owner or operator of a CCR landfill must establish financial assurance for closure, post-closure, and remedial action/mitigation plan, if applicable, in accordance with Division VIII of this chapter.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

These rules are intended to implement Iowa Code section 455B.304.

**567—101.310 to 101.399** Reserved.

#### DIVISION V SOLID WASTE TRANSFER STATIONS

**567—101.400(455B) Purpose.** The purpose of this division is to implement Iowa Code chapter 455B, subchapter IV (solid waste disposal), for the collection, temporary storage, and transfer of solid waste prior to final disposition.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.401(455B) Applicability.** This division applies to all solid waste transfer stations and solid waste collection and transport vehicles. The registration of a solid waste transfer station or issuance of a solid waste transfer station permit by the department in no way relieves the registrant or applicant of the responsibility of complying with all other local, state, or federal statutes, ordinances, and rules or other requirements applicable to the construction and operation of a solid waste transfer station. All rules, standards, technical guidance, and other similar legal or technical documents referenced in this division shall be the version of those documents in effect on August 1, 2025, unless otherwise noted in these rules, and except for references to the Iowa Code and Iowa Administrative Code, which shall always be the most recent version unless otherwise noted in these rules.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.402(455B) Definitions.** For the purposes of this division, the definitions in 567—Chapter 100 and Iowa Code section 455B.301 shall apply.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.403(455B) Location restrictions.**

**101.403(1) Floodplains.** A solid waste transfer station shall not be located within a 100-year floodplain unless the design includes structures to prevent floodwater inundation from a 100-year flood of any area that comes into contact with solid waste or washwater.

**101.403(2) Inhabitable structure and sensitive populations.** A solid waste transfer station shall not be located within 500 feet of the property line of an educational or health care facility or permanent residence unless screening is utilized to minimize noise and visibility of operations. Such screening shall utilize natural components to the maximum extent possible. This requirement shall not apply if construction of the educational or health care facility or permanent residence began after the department received the solid waste transfer station permit application.

**101.403(3) *Property line setback.*** A solid waste transfer station building or solid waste receptacle (e.g., dumpster, roll-off box) shall be at least 50 feet from an adjacent property line unless otherwise approved by the department in writing.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.404(455B) Registration in lieu of permit.**

**101.404(1) *Exemption requirements.*** A person may construct and operate a solid waste transfer station without a permit issued pursuant to this division if all of the following criteria apply.

- a. The person registers the facility pursuant to this rule;
- b. The facility only receives solid waste from citizens and small businesses that do not utilize solid waste collection vehicles or satellite solid waste collection vehicles;
- c. Solid waste will not be processed at the facility;
- d. The facility will not be used by anyone who has been contracted to do any hauling or disposal of solid waste;
- e. Solid waste will not be placed on the ground or tipping floor of a building as part of the facility's operation; and
- f. The department has not notified the registrant that a permit pursuant to this division is required to protect human health and the environment.

**101.404(2) *Notification requirements.*** A person registering a solid waste transfer station pursuant to this rule shall provide the following, on a form prescribed by the department, prior to accepting waste and shall notify the department in writing at least 30 days prior to any operational change.

- a. The physical location of the solid waste transfer station.
- b. The name, address, email address, and phone number of the site owner.
- c. The name, address, email address, and phone number of the responsible official.
- d. The solid waste comprehensive planning area of the facility and political jurisdictions included within the facility's service area.
- e. The sanitary disposal project(s) designated for final disposal of the collected waste.
- f. An emergency response and remedial action plan pursuant to 567—100.14(455B).
- g. Proof of the applicant's ownership of the site or legal entitlement to use the site as a solid waste transfer station.
- h. Proof that the site complies with local zoning.
- i. A closure cost estimate pursuant to 101.413(2) and the documents establishing financial assurance pursuant to Division VIII of this chapter or documentation of a surety bond in the amount of \$15,000 pursuant to 101.413(3).

**101.404(3) *Inspection prior to startup.*** Registrants shall adhere to the inspection requirements of 567—100.7(455B,455D).

**101.404(4) *Registration renewal.*** A solid waste transfer station registration shall be issued and may be renewed for a period of no longer than five years. Renewal registrations shall be subject to the provisions of all rules of the department in effect at the time of the renewal.

**101.404(5) *Operating requirements.*** In addition to the provisions of 567—100.9(455B,455D), registered solid waste transfer stations shall comply with the following.

- a. Solid waste shall not be accepted from solid waste collection vehicles or loaded into solid waste transport vehicles to facilitate final disposition.
- b. All solid waste received shall be loaded into dumpsters, compactors, or roll-off boxes and removed by solid waste collection vehicles to facilitate final disposition.
- c. Solid waste receptacles shall not be allowed to overflow, and the waste shall be removed as often as necessary to prevent a nuisance or public health hazard.

**101.404(6) *Recordkeeping and reporting requirements.*** Registered solid waste transfer stations that directly dispose of solid waste outside of Iowa shall, on a form prescribed by the department, report the information required in 101.404(6)"a" through "c" to the department quarterly. For registered solid waste transfer stations that directly dispose of solid waste within Iowa, the following records shall be maintained by the owner or operator for a period of three calendar years and be made available at all reasonable times for inspection by the department.

- a. Tons of solid waste disposed of.
- b. The solid waste comprehensive planning area(s) from which the solid waste originated.
- c. Destination of all outgoing solid waste.

**101.404(7) Closure requirements.** In addition to the provisions of 567—100.10(455B,455D), registered solid waste transfer stations shall adhere to the closure requirements in 567—101.411(455B).

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.405(455B) Permits.** Pursuant to Iowa Code section 455B.305(1), and except as provided 567—101.404(455B), no person shall construct or operate a solid waste transfer station without first obtaining a permit from the department pursuant to this division and 567—Chapter 100.

**101.405(1) Plans.** In addition to the provisions of 567—100.5(455B,455D), a solid waste transfer station permit applicant shall address the following on a form prescribed by the department.

a. *Design plan.* An engineering design, including applicable approvals from responsible government agencies and public entities, and engineering plans and specifications completed by the professional engineer listed in 567—subparagraph 100.5(1)“a”(4) detailing how the site will comply with 567—101.403(455B), 567—101.406(455B), and 567—101.408(455B).

b. *Operations plan.* A plan of operations detailing how the site will comply with 567—100.9(455B,455D), 567—101.407(455B), and 567—101.410(455B).

**101.405(2) Duration.** A solid waste transfer station permit shall be issued and may be renewed for a period of no longer than five years. Renewal applications shall be subject to the provisions of all rules of the department in effect at the time of the renewal.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.406(455B) Design requirements.** Unless registered pursuant to 567—101.404(455B) or otherwise specified within a permit, a solid waste transfer station shall be designed and constructed in accordance with this rule.

**101.406(1) Solid waste transfer station building.** A solid waste transfer station shall include a building inside which all solid waste is unloaded from solid waste collection vehicles and loaded into solid waste transport vehicles.

a. All surfaces that come into contact with solid waste shall be enclosed by walls and a roof satisfactory to:

- (1) Minimize dust.
- (2) Prevent litter from exiting the building.
- (3) Keep precipitation out of the building.
- (4) Prevent the attraction or harboring of vectors.

b. All surfaces that come in contact with solid waste or washwater shall be impervious to liquids.

c. The solid waste transfer station building shall have a drainage system that maintains a separation between stormwater and washwater.

d. The solid waste transfer station building shall have a washwater collection system that directs washwater to a storage tank for subsequent disposal, a sanitary sewer system, or equivalent as approved by the department. Unless otherwise approved by the department, storage tanks shall have high-level indicators or gauges.

e. Each area where unloaded solid waste is stored during nonoperating hours shall be clearly marked and include a fire detection system that notifies local emergency responders in case of a fire.

f. If solid waste is to be managed or stored in a surge pit, then effective odor control mechanisms are required and a sprinkler system shall be installed over the area.

g. The solid waste transfer station building shall have adequate indoor and outdoor lighting that minimizes the difference in lighting when entering or exiting the building.

h. The solid waste transfer station building shall have doors at each entrance and exit.

**101.406(2) Other site design requirements.** A solid waste transfer station shall:

a. Provide a secure perimeter fence with lockable gate(s).

b. Use a scale certified by the Iowa department of agriculture and land stewardship. A solid waste transfer station may use a certified scale located off the premises and owned by a separate entity.

c. Provide adequate queuing distance for vehicles entering and exiting the property such that lines of vehicles will not extend onto public streets during peak hours unless approved by the appropriate local or state government authority.

d. Provide signs or pavement markings indicating safe and proper on-site traffic patterns.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.407(455B) Operating requirements.** Unless otherwise specified within a permit, a solid waste transfer station shall be operated in accordance with the provisions of 567—100.9(455B,455D) and this rule.

**101.407(1)** Unless registered pursuant to 567—101.404(455B), all handling, processing, screening, open storage, loading, and similar activities or processes involving solid waste shall be performed inside the solid waste transfer station building.

**101.407(2)** Truck-to-truck transfer of solid waste that is not incidental solid waste transfer is not allowed outside a solid waste transfer station building. A rear-loading solid waste transport vehicle that does not have any other open access and securely abuts the solid waste transfer station building so that minimal amounts of solid waste escape during loading shall qualify as being inside the building.

**101.407(3)** Solid waste transfer station operators shall segregate and manage unacceptable wastes and hot loads in accordance with applicable laws and in a manner as safe and responsible as practical.

**101.407(4)** Solid waste receptacles shall not be allowed to overflow, and the waste shall be removed as often as necessary to prevent a nuisance or public health hazard.

**101.407(5)** Solid waste transfer stations shall not accept special wastes pursuant to 567—Chapter 102, Division VI.

**101.407(6)** Washwater management systems, if applicable, shall not be allowed to overflow and shall be inspected monthly and maintained in proper operating condition.

**101.407(7)** Any breach of a surface that prevents washwater from entering the ground and groundwater shall be repaired within 24 hours to make that surface impervious to liquids. If such repairs cannot be made within 24 hours, the facility shall not allow solid waste or washwater to come into contact with the breached area until repairs are complete. If the facility cannot prevent solid waste or washwater from coming into contact with the breached area, the department may require the facility to shut down until repairs are completed.

**101.407(8)** Unless registered pursuant to 567—101.404(455B), site access shall be controlled and limited to a time when a solid waste transfer station operator is on site and:

a. Has read, understands, and is able to implement the operational requirements of 567—101.407(455B).

b. Has read, understands, and is able to implement the emergency response and remedial action plan pursuant to 567—100.14(455B).

c. Is able to visually recognize universal symbols and markings and indications of unacceptable materials pursuant to 101.407(9).

**101.407(9)** All solid waste accepted by a solid waste transfer station shall, at a minimum, be visually inspected by personnel capable of identifying hot loads and hazardous, infectious, radioactive, and other wastes not acceptable for disposal in a sanitary landfill.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.408(455B) Temporary solid waste storage requirements.** Unless otherwise specified within a permit, a solid waste transfer station shall comply with the following storage requirements.

**101.408(1) Areas permitted for storage.** Solid waste shall be stored in the following manner.

a. Inside a solid waste transfer station building in a clearly marked designated area;

b. Inside a solid waste transfer station building in a surge pit;

c. Inside a secure solid waste transport vehicle, including intermodal container systems, protected from precipitation and vectors; or

d. Inside dumpsters, compactors, roll-off boxes, and other solid waste receptacles adequate to prevent the accidental discharge of its contents and the attraction or harborage of vectors.

**101.408(2) *Storage time requirements.*** Solid waste shall be stored no longer than the following periods of time unless shorter storage times are required by the local government authority to prevent a nuisance or public health hazard.

*a.* Inside a solid waste transfer station building without a surge pit or similar operational structure for not more than four days, excluding Sundays and national holidays.

*b.* Inside a solid waste transfer station building in a surge pit for not more than seven days, including Sundays and national holidays.

*c.* Inside a solid waste transport vehicle designated to travel only via roadway for not more than four days, excluding Sundays and national holidays.

*d.* Inside a solid waste transport vehicle designated to travel via rail or navigable waterway, including intermodal container systems, for not more than seven days, including Sundays and national holidays.

*e.* Inside dumpsters, roll-off boxes, and other solid waste receptacles at registered solid waste transfer stations for not more than four days, excluding Sundays and national holidays.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.409(455B) Recordkeeping and reporting requirements.**

**101.409(1)** Unless registered pursuant to 567—101.404(455B) or otherwise specified within a permit, a solid waste transfer station shall comply with the following recordkeeping requirements.

*a.* A solid waste transfer station shall maintain a copy of the following documents on site:

(1) Current operating permit.

(2) Design plan pursuant to 101.405(1) “*a.*”

(3) Operations plan pursuant to 101.405(1) “*b.*”

(4) Emergency response and remedial action plan pursuant to 567—100.14(455B).

(5) Proof of financial assurance pursuant to 567—101.413(455B).

*b.* A solid waste transfer station shall maintain records of the following information for a period of three calendar years:

(1) Tons of all solid waste disposed of quarterly.

(2) Destination of all outgoing solid waste.

(3) Washwater management system inspection log, if applicable.

(4) Hot loads and hazardous, infectious, radioactive, or other unacceptable wastes found.

**101.409(2)** Unless registered pursuant to 567—101.404(455B) and directly disposing of solid waste within Iowa, or otherwise specified within a permit, a solid waste transfer station shall report the following information, on a form prescribed by the department, to the department on a quarterly basis:

*a.* Tons of solid waste disposed of.

*b.* The solid waste comprehensive planning area(s) from which the solid waste originated.

*c.* Destinations of all outgoing solid waste.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.410(455B) Solid waste collection and transport vehicle construction and operation requirements.** Unless otherwise specified within a permit, solid waste collection vehicles and solid waste transport vehicles shall comply with the following requirements.

**101.410(1)** The portion of a solid waste collection or transport vehicle that contains solid waste shall be designed to prevent the accidental discharge of its contents, the attraction or harborage of vectors, and the infiltration of precipitation. This design shall include a suitable cover, where applicable, that is not easily torn, shredded, broken, or otherwise breached under normal use.

**101.410(2)** Any solid waste collection or transport vehicle that fails to comply the requirements of this rule shall be repaired before it is utilized in the transport or storage of solid waste.

**101.410(3)** A solid waste collection or transport vehicle’s openings shall be securely closed before transport and during solid waste storage so as to prevent the loss of solid waste.

**101.410(4)** A solid waste transport vehicle shall be loaded with solid waste inside a solid waste transfer station building and in a manner that minimizes the spilling of materials. Solid waste spilled from a solid waste transport vehicle during loading shall be collected as often as necessary to minimize litter, dust, or other fugitive debris.

**101.410(5)** All solid waste collection and transport vehicles shall be cleaned at intervals frequent enough to prevent the attraction or harborage of vectors, so as not to create a nuisance or public health hazard.

**101.410(6)** Liquids generated from the cleaning of the areas of solid waste collection or transport vehicles that hold solid waste shall be considered washwater and managed accordingly.

**101.410(7)** If solid waste is spilled from a solid waste collection or transport vehicle during transport to a solid waste disposal facility, the spilled solid waste shall be collected as soon as possible. The solid waste transfer station shall immediately report the spill to the department and the department field office with jurisdiction over the facility and spill location.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.411(455B) Closure requirements.** Unless otherwise specified within a permit, a solid waste transfer station shall be closed in accordance with the provisions of 567—100.10(455B,455D) and this rule. Closure shall not be official until the department has given written certification of the completion of the following activities.

**101.411(1)** Proper disposal of all solid waste and litter at the site.

**101.411(2)** Cleaning of all dumpsters, compactors, roll-off boxes, and other solid waste receptacles that will remain on site, including the rinsing of all surfaces that have come in contact with solid waste.

**101.411(3)** Cleaning the solid waste transfer station building, if applicable, including the rinsing of all surfaces that have come in contact with solid waste or washwater.

**101.411(4)** Cleaning of all solid waste collection and transport vehicles that will remain on site, including the rinsing of all surfaces that have come in contact with solid waste.

**101.411(5)** Removal and proper management of all washwater in the washwater management system.

**101.411(6)** Locking all doors, gates, entrances and exits.

**101.411(7)** Reporting of the completion of these activities to the local political jurisdictions, the department, and the department field office with jurisdiction over the solid waste transfer station.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.412(455B) Emergency solid waste transfer permit.** If a primary sanitary disposal project in a solid waste comprehensive planning area becomes inoperable, the department may issue an emergency solid waste transfer permit for a period of time no longer than necessary for a sanitary disposal project that provides replacement capacity to be constructed and become operational. The department may also issue an emergency solid waste transfer permit for a period of time no longer than necessary for a sanitary disposal project to return to operation or if more solid waste is produced by an extraordinary event (e.g., unforeseen disasters such as storms, fires, floods, tornadoes) than can be managed by a sanitary disposal project. The conditions of an emergency solid waste transfer permit shall be determined by the department and may be used as an alternative to the requirements of this division. The department shall issue an emergency solid waste transfer permit only if the department has determined that solid waste must be transferred from the impacted area(s) in order to protect human health and the environment.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.413(455B) Financial assurance requirements.** The owner or operator of a solid waste transfer station must establish financial assurance for the costs of site closure in accordance with the criteria pursuant to this rule and Division VIII of this chapter.

**101.413(1)** Except as provided in 101.413(3), the owner or operator shall submit a detailed written estimate, in current dollars, certified by an Iowa-licensed professional engineer, of the cost of hiring a third party to properly close the solid waste transfer station in accordance with the closure criteria in 567—101.411(455B).

**101.413(2)** The detailed written estimate shall account for at least the following factors determined by the department to be minimal necessary costs for site closure.

*a.* Third-party labor and transportation costs and total tip fees to properly dispose of all solid waste and litter at the facility equal to twice the maximum storage capacity of the facility. If materials are temporarily stored on site in solid waste collection or transport vehicles or waste receptacles, then this

estimate shall include disposal costs for the maximum number of solid waste collection or transport vehicles and waste receptacles that can be on site at any one time.

b. The cost of hiring a third party to properly clean and decontaminate all equipment, storage facilities, holding areas and drainage collection systems. This estimate shall include the cost of properly disposing of a one-week volume of washwater from the facility. If the facility utilizes a washwater storage tank, then this estimate shall assume that the storage tank is full and add that volume to the one-week volume.

c. The cost associated in maintaining financial assurance pursuant to this rule and Division VIII of this chapter.

**101.413(3)** The owner or operator of a solid waste transfer station that is permitted for or manages no more than 5,000 tons of solid waste annually shall have the option to comply with the financial assurance requirements of this rule and Division VIII of this chapter by executing a surety bond in the sum of \$15,000 pursuant to 567—subrule 101.707(2). In electing this option, the owner or operator shall not be required to submit a detailed written cost estimate for site closure pursuant to 101.413(1). This surety bond shall be unique to the solid waste transfer station and shall not be combined or used to meet the financial assurance obligations of any other permitted facility or activity.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

These rules are intended to implement Iowa Code section 455B.304.

**567—101.414 to 101.499** Reserved.

#### DIVISION VI SOLID WASTE INCINERATOR OPERATOR CERTIFICATION

**567—101.500(455B) Purpose.** The purpose of this division is to implement Iowa Code section 455B.304(12) by providing the criteria for establishing the certification of operators of solid waste incinerators.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.501(455B) Applicability.** The requirements of this division apply to all operators of solid waste incinerators. All rules, standards, technical guidance, and other similar legal or technical documents referenced in this division shall be the version of those documents in effect on August 1, 2025, unless otherwise noted in these rules, and except for references to the Iowa Code and Iowa Administrative Code, which shall always be the most recent version unless otherwise noted in these rules.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.502(455B) Solid waste incinerator operator certification.** Solid waste incinerator operators shall be trained, tested, and certified by a department-approved certification program.

**101.502(1) Operator on duty.** A solid waste incinerator operator shall be on duty during all hours of operation of a solid waste incinerator, consistent with the respective certification.

**101.502(2) Training course; reciprocity.** To become a certified operator, an individual shall complete a basic operator training course that has been approved by the department or alternative, equivalent training approved by the department and shall pass a departmental examination as specified by this division. An operator certified by another state may have reciprocity subject to approval by the department.

**101.502(3) Biennial certification.** A solid waste incinerator operator certification is valid from the date of issuance until June 30 of the following even-numbered year.

**101.502(4) Basic operator training course.** The required basic operator training course for a certified solid waste incinerator operator shall have at least eight contact hours and shall address the following areas at a minimum.

- a. Description of types of wastes;
- b. Incinerator design;
- c. Interpreting and using engineering plans;
- d. Incinerator operations and safety;

- e.* Combustion controls and monitoring;
- f.* Applicable laws and regulations;
- g.* Permitting processes;
- h.* Incinerator maintenance; and
- i.* Ash and residue disposal.

**101.502(5) *Alternative basic operator training.*** Alternative basic operator training must be approved by the department. It shall be the applicant's responsibility to submit any documentation the department may require to evaluate the equivalency of alternative training.

**101.502(6) *Fees.***

- a.* The examination fee for each examination is \$20.
- b.* The initial certification fee is \$8 for each one-half year of a two-year period from the date of issuance to June 30 of the next even-numbered year.
- c.* The certification renewal fee is \$24.
- d.* The penalty fee is \$12.

**101.502(7) *Examinations.***

- a.* The operator certification examinations will be based on the basic operator training course curriculum in 101.502(4).
- b.* All persons wishing to take the examination required to become a certified operator of a solid waste incinerator shall complete an operator certification examination application on a form prescribed by the department. A listing of dates and locations of examinations is available from the department upon request. The application form requires the applicant to indicate the basic operator training course taken. Evidence of training course completion must be submitted with the application for certification. The completed application and the application fee shall be sent to the Iowa Department of Natural Resources, 6200 Park Avenue, Des Moines, Iowa 50321. Application for examination must be received by the department prior to the date of examination.
- c.* A properly completed application for examination shall be valid for one year from the date the application is approved by the department.
- d.* Upon failure of the first examination, the applicant may be reexamined at the next scheduled examination. Upon failure of the second examination, the applicant shall be required to wait a period of 180 days before taking a third examination. If the third examination occurs beyond the one-year time frame in 101.502(7) "c," a new operator certification examination application is required.
- e.* Upon each reexamination when a valid application is on file, the applicant shall submit to the department the examination fee prior to the date of examination.
- f.* Failure to successfully complete the examination within one year from the date of approval of the application shall invalidate the application.
- g.* Oral examinations may be given at the discretion of the department.

**101.502(8) *Certification.***

- a.* All operators will be required to take the basic operator training course and pass the examination in order to become certified.
- b.* Application for certification must be received by the department within 30 days of the date the applicant receives written notification of successful completion of the examination. All applications for certification shall be made on a form prescribed by the department and be accompanied by the certification fee.
- c.* Applications for certification by examination that are received more than 30 days but less than 60 days after notification of successful completion of the examination shall be accompanied by the certification fee and the penalty fee. Applicants who do not apply for certification within 60 days of notice of successful completion of the examination will not be certified on the basis of that examination.
- d.* For applicants who have been certified under a mandatory certification program in another state, the equivalency of which has been previously reviewed and accepted by the department, certification without examination will be recommended.
- e.* For applicants who have been certified under voluntary certification programs in another state, certification will be considered. The applicant must have successfully completed a basic operator training

course and an examination generally equivalent to the Iowa examination. The department may require the applicant to successfully complete the Iowa examination.

*f.* Applicants who seek Iowa certification pursuant to 101.502(8) “*d*” or “*e*” shall submit an application for examination accompanied by a letter requesting certification pursuant to this subrule. Application for certification pursuant to this subrule shall be received by the department in accordance with 101.502(8) “*b*” and “*c*.”

**101.502(9) *Duration and renewal of certification.*** All certificates shall expire every two years, on even-numbered years, and must be renewed every two years to maintain certification. The renewal application and fee are due prior to expiration of certification.

*a.* Late application for renewal of a certification may be made, provided that such late application shall be received by the department or postmarked within 30 days of the expiration of the certification. Such late application shall be on a form prescribed by the department and accompanied by the penalty fee and the certification renewal fee.

*b.* If a certificate holder fails to apply for renewal within 30 days following expiration of the certification, the right to renew the certification automatically terminates. Certification may be allowed at any time following such termination, provided that the applicant successfully completes the examination. The applicant must then apply for certification in accordance with 101.502(8).

*c.* An operator shall not continue to operate a solid waste incinerator after expiration of a certification without renewal thereof.

*d.* Continuing education credits must be earned during the two-year certification period. All certified operators must earn six contact hours per certification during each two-year period. The two-year period will begin upon issuance of certification.

*e.* Only those operators fulfilling the continuing education requirements before the end of each two-year period will be allowed to renew their certifications. The certifications of operators not fulfilling the continuing education requirements shall be void upon expiration unless an extension is granted.

*f.* All activities for which continuing education credit will be granted must be related to the subject matter of the particular certification to which the credit is being applied.

*g.* The department may, in individual cases involving hardship or extenuating circumstances, grant an extension of time of up to three months within which the applicant may fulfill the minimum continuing education requirements. Hardship or extenuating circumstances include documented health-related confinement or other circumstances beyond the control of the certified operator that prevent attendance at the required activities. All requests for extensions must be made prior to expiration of certification.

*h.* The certified operator is responsible for notifying the department of the continuing education credits earned during the period. The continuing education credits earned during the period shall be shown on the application for renewal.

*i.* A certified operator shall be deemed to have complied with the continuing education requirements of this division during periods that the operator serves honorably on active duty in military service, during periods that the operator is a resident of another state or district having a continuing education requirement for operators and meets all the requirements of that state or district for practice there, during periods that the person is a government employee working as an operator and is assigned to duty outside of the United States, or during other periods of active practice and absence from the state approved by the department.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

#### **567—101.503(455B) Discipline of certified operators.**

**101.503(1)** Disciplinary action may be taken on any of the following grounds.

*a.* Failure to use reasonable care or judgment or to apply knowledge or ability in performing the duties of a certified operator. Duties of certified operators include compliance with rules and permit conditions applicable to solid waste incinerator operation.

*b.* Failure to submit required records of operation or other reports required under applicable permits or rules of the department, including failure to submit complete records or reports.

c. Knowingly making any false statement, representation, or certification on any application, record, report, or document required to be maintained or submitted under any applicable permit or rule of the department.

**101.503(2)** The following disciplinary sanctions are allowable.

a. Revocation of a certification.

b. Probation under specified conditions relevant to the specific grounds for disciplinary action. Additional education or training or reexamination may be required as a condition of probation.

**101.503(3)** The procedure for discipline is as follows.

a. The department shall initiate disciplinary action. The commission may direct that the department investigate any alleged factual situation that may be grounds for disciplinary action under 101.503(1) and report the results of the investigation to the commission.

b. A disciplinary action may be prosecuted by the department.

c. Written notice shall be given to an operator against whom disciplinary action is being considered and, as appropriate, to the responsible official of the permitted solid waste incinerator. The notice shall state the informal and formal procedures available for determining the matter. The operator shall be given 20 days to present any relevant facts and indicate the operator's position in the matter and to indicate whether informal resolution of the matter may be reached.

d. An operator who receives notice shall communicate in writing or in person with the department, and efforts shall be made to clarify the respective positions of the operator and department.

e. The applicant's failure to communicate facts and positions relevant to the matter by the required date may be considered when appropriate disciplinary action is determined.

f. If agreement as to appropriate disciplinary sanction, if any, can be reached with the operator and the commission concurs, a written stipulation and settlement between the department and the operator shall be entered into. The stipulation and settlement shall recite the basic facts and violations alleged, any facts brought forth by the operator, and the reasons for the particular sanctions imposed.

g. If an agreement as to appropriate disciplinary action, if any, cannot be reached, the department may initiate formal hearing procedures. Notice and formal hearing shall be in accordance with 7—Chapter 2506 and 561—Chapter 2506 related to contested and certain other cases pertaining to licensee discipline.

**101.503(4)** Upon revocation of a certificate, application for certification may be allowed after two years from the date of revocation. Any such applicant must successfully complete the examination and be certified in the same manner as a new applicant.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.504(455B) Temporary operator designation.** A temporary operator of a solid waste incinerator may be designated for a period of six months when an existing certified operator is no longer available to the facility. The facility must make application to the department, explain why a temporary certification is needed, identify the temporary operator, and identify the efforts that will be made to obtain a certified operator. A temporary operator designation shall not be approved for greater than a six-month period except for extenuating circumstances. In any event, not more than one six-month extension to the temporary operator designation may be granted. Approval of a temporary operator designation may be rescinded for cause as set forth in 567—101.503(455B).

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

These rules are intended to implement Iowa Code section 455B.304(12).

**567—101.505 to 101.699** Reserved.

DIVISION VII  
RESERVEDDIVISION VIII  
FINANCIAL ASSURANCE

**567—101.700(455B) Purpose.** The purpose of this division is to implement Iowa Code sections 455B.304(8) and 455B.306(9) by providing the criteria for establishing financial assurance for closure, post-closure care, and corrective action at sanitary disposal projects, whichever is applicable.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.701(455B) Applicability.**

**101.701(1)** The requirements of this division apply to all owners and operators of sanitary disposal projects, except owners or operators who are state or federal government entities, whose debts and liabilities are the debts and liabilities of a state or the United States.

**101.701(2)** This division does not apply to municipal solid waste sanitary landfills regulated pursuant to Division II of this chapter that ceased accepting solid waste by August 24, 1994, nor to industrial sanitary landfills and coal combustion residual sanitary landfills regulated pursuant to Divisions III and IV of this chapter, respectively, that ceased accepting waste by October 31, 2007.

**101.701(3)** This division does not apply to sanitary disposal projects that are not sanitary landfills and that have completed proper site closure nor to sanitary landfills that have completed post-closure care obligations prior to September 23, 2026.

**101.701(4)** All rules, standards, technical guidance, and other similar legal or technical documents referenced in this division shall be the version of those documents in effect on August 1, 2025, unless otherwise noted in these rules, and except for references to the Iowa Code and Iowa Administrative Code, which shall always be the most recent version unless otherwise noted in these rules.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.702(455B) Definitions.** For the purposes of this division, the definitions in 567—Chapter 100 and Iowa Code section 455B.301 shall apply.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.703(455B) Financial assurance for closure of sanitary disposal projects that are not sanitary landfills.** The owner or operator of a sanitary disposal project must establish financial assurance for the costs of site closure in accordance with the criteria in this division. The owner or operator must provide continuous coverage for site closure until released from this requirement by demonstrating compliance with the closure criteria expressed within each sanitary disposal project's applicable division. Proof of compliance pursuant to 101.703(1) through 101.703(3) shall be submitted to the department by the owner or operator at the time of application for a permit, and with each renewal thereafter, until the owner or operator is released from this requirement by the department.

**101.703(1)** The owner or operator shall submit, on a form prescribed by the department, the amount of the financial assurance required and the current value of the financial assurance instrument(s) at the time of submittal as required by Iowa Code section 455B.306(9).

**101.703(2)** The owner or operator shall submit a copy of the documents establishing the financial assurance instrument(s) in an amount equal to or greater than the amount specified in 567—101.710(455B). Documentation for the instrument(s) used to demonstrate financial assurance shall contain, at a minimum, the items required to be submitted as specified in 567—101.707(455B).

**101.703(3)** The owner or operator shall submit a detailed written estimate, in current dollars, certified by an Iowa-licensed professional engineer, of the cost of hiring a third party to properly close the sanitary disposal project in accordance with the closure criteria expressed within each sanitary disposal project's applicable division.

- a.* The cost estimate must equal the cost of closing the sanitary disposal project at any time during its permitted life when the extent and manner of its operation would make closure the most expensive.
- b.* The costs contained in the estimate for site closure must be accurate and reasonable when compared to the cost estimates used by other similarly situated sanitary disposal projects in Iowa.
- c.* The owner or operator must, at the time of permit renewal or at the time of application for a permit modification that increases closure costs, whichever occurs first, have an Iowa-licensed professional engineer update the closure cost estimate, and update the amount of financial assurance provided if changes to the closure plan or sanitary disposal project conditions increase the maximum cost of closure at any time during the remaining active life of the site.
- d.* The owner or operator may reduce the amount of financial assurance for proper closure of the site if the most recent estimate of the maximum cost of closure at any time during the active life of the site is less than the amount of financial assurance currently provided. Prior to the reduction, the owner or operator must submit to the department the justification for the reduction of the closure cost estimate and the updated documentation required by 101.703(1) through 101.703(3) and receive department approval for the reduction.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.704(455B) Financial assurance for closure of sanitary landfills.** The owner or operator of a sanitary landfill must establish financial assurance for the costs of site closure in accordance with the criteria in this division. The owner or operator must provide continuous coverage for site closure until released from this requirement by demonstrating compliance with the approved closure plan and the closure permit. Proof of compliance pursuant to 101.704(1) through 101.704(5) shall be submitted to the department by the owner or operator yearly by April 1 and approved by the department.

**101.704(1)** The owner or operator shall submit, on a form prescribed by the department, the amount of the financial assurance required, the annual financial statement required by Iowa Code section 455B.306(9)“e,” and the current value of the financial assurance instrument(s) as required by Iowa Code section 455B.306(9).

**101.704(2)** The owner or operator shall submit a copy of the documents establishing the financial assurance instrument(s) in an amount equal to or greater than the amount specified in 567—101.710(455B). Documentation for the instruments(s) used to demonstrate financial assurance shall contain, at a minimum, the items required to be submitted as specified in 567—101.707(455B).

**101.704(3)** The owner or operator shall, except for the allowance granted in 101.704(3)“c,” submit a detailed written estimate, in current dollars, certified by an Iowa-licensed professional engineer, of the cost of hiring a third party to close the sanitary landfill in accordance with the approved closure plan and the closure permit.

*a.* The cost estimate must equal the cost of closing the sanitary landfill at the time the cost estimate is prepared.

*b.* The costs contained in the estimate for closure must be accurate and reasonable when compared to the cost estimates used by other similarly situated sanitary landfills in Iowa.

*c.* During the active life of the sanitary landfill, the owner or operator may, for the duration of the permit cycle or five years, whichever is less, have an Iowa-licensed professional engineer adjust the certified closure cost estimate for inflation by using an inflation factor derived from the most recent annual Implicit Price Deflator for Gross Domestic Product published by the United States Department of Commerce. The inflation factor is the result of dividing the latest published annual deflator by the deflator for the previous year. After applying the inflation factor for the duration of the permit cycle, or five years, whichever is less, the owner or operator shall again submit a detailed written estimate, in current dollars, certified by an Iowa-licensed professional engineer pursuant to 101.704(3).

*d.* The owner or operator must annually or at the time of permit renewal, at the time of application for a permit modification, or due to other requirements that increase closure costs have an Iowa-licensed professional engineer update the detailed written closure cost estimate and update the amount of financial assurance provided if changes to the closure plan or sanitary landfill conditions increase the cost of closure.

*e.* The owner or operator may reduce the amount of financial assurance for proper closure of the site if the most recent estimate is less than the amount of financial assurance currently provided. Prior to

the reduction, the owner or operator must submit to the department the justification for the reduction of the closure cost estimate and the updated documentation required by 101.704(1) through 101.704(5) and receive department approval for the reduction.

*f.* The estimate submitted to the department must include the site area subject to closure (in acres) and account for at least the following factors determined by the department to be the minimal necessary costs for closure.

- (1) Closure and post-closure plan document revisions;
- (2) Site preparation, earthwork, and final grading;
- (3) Drainage control culverts, piping, and structures;
- (4) Erosion control structures, sediment ponds, and terraces;
- (5) Final cap construction;
- (6) Cap vegetation soil placement;
- (7) Cap seeding, mulching, and fertilizing;
- (8) Monitoring well, piezometer, and gas control modifications;
- (9) Leachate system cleanout and extraction well modifications;
- (10) Monitoring well installations and abandonments;
- (11) Facility modifications to effect closed status;
- (12) Engineering and technical services;
- (13) Legal, financial, and administrative services; and
- (14) Closure compliance certifications and documentation.

**101.704(4)** For publicly owned sanitary landfills, the owner or operator shall submit to the department a copy of the owner's or operator's most recent annual audit report in the form prescribed by the office of the auditor of the state of Iowa. In addition to the annual audit report, the owner or operator of a publicly owned sanitary landfill may submit financial institution statements to document the current balance of a trust fund or local government dedicated fund established pursuant to 101.707(1) and 101.707(9) or the closure and post-closure care account(s) pursuant to 567—101.709(455B).

**101.704(5)** Privately owned sanitary landfills shall submit an affidavit from the owner or operator indicating that a yearly review has been performed by an Iowa-licensed certified public accountant to determine whether the privately owned sanitary landfill is in compliance with this division. The affidavit shall state the name of the Iowa-licensed certified public accountant, the dates and conclusions of the review, and the steps taken to rectify any deficiencies identified by the accountant.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.705(455B) Financial assurance for post-closure care of sanitary landfills.** The owner or operator of a sanitary landfill must establish financial assurance for the costs of post-closure care in accordance with the criteria in this division. The owner or operator must provide continuous coverage for post-closure care until released from this requirement by demonstrating compliance with the approved post-closure plan and the closure permit. Proof of compliance pursuant to 101.705(1) through 101.705(5) shall be submitted to the department by the owner or operator yearly by April 1 and approved by the department.

**101.705(1)** The owner or operator shall submit, on a form prescribed by the department, the amount of the financial assurance required, the annual financial statement required by Iowa Code section 455B.306(9) "e," and the current value of the financial assurance instrument(s) as required by Iowa Code section 455B.306(9).

**101.705(2)** The owner or operator shall submit a copy of the documents establishing the financial assurance instrument(s) in an amount equal to or greater than the amount specified in 567—101.710(455B). Documentation for the instrument(s) used to demonstrate financial assurance shall contain, at a minimum, the items required to be submitted as specified in 567—101.707(455B).

**101.705(3)** The owner or operator shall, except for the allowance granted in 101.705(3) "c," submit a detailed written estimate, in current dollars, certified by an Iowa-licensed professional engineer, of the cost of hiring a third party to conduct post-closure care for the sanitary landfill in accordance with the approved post-closure plan and the closure permit.

*a.* The cost estimate must account for the total cost of conducting post-closure care, as described in the plan, for the entire post-closure care period.

*b.* The costs contained in the estimate for post-closure care must be accurate and reasonable when compared to the cost estimates used by other similarly situated sanitary landfills in Iowa.

*c.* During the active life of the sanitary landfill and during the post-closure care period, the owner or operator may, for the duration of the permit cycle or five years, whichever is less, have an Iowa-licensed professional engineer adjust the certified post-closure cost estimate for inflation by using an inflation factor derived from the most recent annual Implicit Price Deflator for Gross Domestic Product published by the United States Department of Commerce. The inflation factor is the result of dividing the latest published annual deflator by the deflator for the previous year. After applying the inflation factor for the duration of the permit cycle, or five years, whichever is less, the owner or operator shall again submit a detailed written estimate, in current dollars, certified by an Iowa-licensed professional engineer pursuant to 101.705(3).

*d.* The owner or operator must, annually or at the time of application for a permit modification, or due to other requirements that increase post-closure care costs, have an Iowa-licensed professional engineer increase the detailed written post-closure cost estimate and update the amount of financial assurance provided if changes in the post-closure plan or sanitary landfill conditions increase the cost of post-closure care.

*e.* The owner or operator may reduce the amount of financial assurance for post-closure care if the most recent estimate of post-closure care is less than the amount of financial assurance currently provided. Prior to the reduction, the owner or operator must submit to the department the justification for the reduction of the post-closure cost estimate and the updated documentation required by 101.705(1) through 101.705(5) and receive department approval for the reduction.

*f.* The estimate submitted to the department must include the site area subject to post-closure care and account for at least the following factors determined by the department to be the minimal necessary costs for post-closure care.

- (1) General site facilities, access roads, and fencing maintenance;
- (2) Cap and vegetative cover maintenance;
- (3) Drainage and erosion control systems maintenance;
- (4) Groundwater to waste separation systems maintenance;
- (5) Gas control systems maintenance, if applicable;
- (6) Gas control systems monitoring and reports, if applicable;
- (7) Groundwater and surface water monitoring systems maintenance;
- (8) Groundwater and surface water quality monitoring and reports;
- (9) Groundwater monitoring systems performance evaluations and reports;
- (10) Leachate control systems maintenance;
- (11) Leachate management, transportation, and disposal;
- (12) Leachate control systems performance evaluations and reports;
- (13) Facility inspections and technical reports;
- (14) Engineering and technical services;
- (15) Legal, financial, and administrative services; and
- (16) Financial assurance, accounting, audits, and reports.

**101.705(4)** For publicly owned sanitary landfills, the owner or operator shall submit to the department a copy of the owner's or operator's most recent annual audit report in the form prescribed by the office of the auditor of the state of Iowa. In addition to the annual audit report, the owner or operator of a publicly owned sanitary landfill may submit financial institution statements to document the current balance of a trust fund or local government dedicated fund established pursuant to 101.707(1) and 101.707(9), or the closure and post-closure care account(s) pursuant to 567—101.709(455B).

**101.705(5)** Privately owned sanitary landfills shall submit an affidavit from the owner or operator indicating that a yearly review has been performed by an Iowa-licensed certified public accountant to determine whether the privately owned sanitary landfill is in compliance with this division. The affidavit shall state the name of the Iowa-licensed certified public accountant, the dates and conclusions of the review, and the steps taken to rectify any deficiencies identified by the accountant.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.706(455B) Financial assurance for corrective action at sanitary landfills.**

**101.706(1)** An owner or operator required to undertake corrective action must have a detailed written estimate, in current dollars, certified by an Iowa-licensed professional engineer, of the cost of hiring a third party to perform the required corrective action. The cost estimate must account for the total cost of conducting the activities described in the corrective action plan for the entire corrective action period. The owner or operator must submit to the department for approval the cost estimate and financial assurance documentation prior to implementation of the corrective action remedy. Proof of continued compliance pursuant to 101.706(1) and 101.706(2) shall be submitted to the department by the owner or operator yearly by April 1 and approved by the department.

*a.* The owner or operator shall submit, on a form prescribed by the department, the amount of the financial assurance required to complete the corrective action remedy and the current value of the financial assurance instrument(s).

*b.* The owner or operator may, for up to three consecutive years, have an Iowa-licensed professional engineer adjust the certified corrective action cost estimate for inflation by using an inflation factor derived from the most recent annual Implicit Price Deflator for Gross Domestic Product published by the United States Department of Commerce. The inflation factor is the result of dividing the latest published annual deflator by the deflator for the previous year. After three consecutive years of applying the inflation factor, the owner or operator shall again submit a detailed written estimate, in current dollars, certified by an Iowa-licensed professional engineer pursuant to this subrule.

*c.* The owner or operator must increase the detailed written corrective action cost estimate and update the amount of financial assurance provided if changes in the corrective action remedy or sanitary landfill conditions increase the maximum cost of corrective action.

*d.* The owner or operator may reduce the amount of the cost estimate and the amount of financial assurance provided if the cost estimate exceeds the maximum remaining costs of the remaining corrective action. Prior to the reduction, the owner or operator must submit to the department the justification for the reduction of the corrective action cost estimate and the updated documentation required by 101.706(1) through 101.706(2) and receive department approval for the reduction.

**101.706(2)** The owner or operator of a sanitary landfill required to undertake corrective action must establish financial assurance for the corrective action remedy by one of the instruments prescribed in 567—101.707(455B). The owner or operator must provide continuous coverage for corrective action until released from financial assurance requirements by demonstrating compliance with the following.

*a.* Upon completion of the corrective action remedy, the owner or operator must submit to the department a certification of compliance with the corrective action plan. The certification must be signed by the owner or operator and by a qualified groundwater scientist.

*b.* Upon department approval of completion of the corrective action remedy, the owner or operator shall be released from the requirement for financial assurance for corrective action pursuant to 567—101.706(455B).

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.707(455B) Allowable financial assurance instruments.** The instruments used to demonstrate financial assurance, as required by Iowa Code sections 455B.304(8) and 455B.306(9), must ensure that the funds necessary to meet the costs of closure, post-closure care, and corrective action for known releases will be available whenever the funds are needed. The instruments used shall not be canceled, revoked, disbursed, released, or allowed to terminate without the approval of the department. Owners or operators must choose from options in 101.707(1) through 101.707(9), as provided for in Iowa Code section 455B.301(9)“c.”

**101.707(1) Trust fund.**

*a.* An owner or operator may demonstrate financial assurance for closure, post-closure care and corrective action, whichever is applicable, by establishing a trust fund that conforms to the requirements of this subrule. The trustee must be an entity that has the authority to act as a trustee and whose trust operations are regulated and examined by a federal or state agency. The owner or operator must submit to the department a copy of the executed trust agreement.

b. For a trust fund used to demonstrate financial assurance for proper closure at a sanitary disposal project that is not sanitary landfill, there is no pay-in period as defined in 101.707(1) "c." Instead, the trust fund shall be in an amount equal to or greater than the amount specified in 101.703(3).

c. Payments into the trust fund must be made annually by the owner or operator over ten years or over the remaining permitted life of the sanitary landfill, whichever is shorter, in the case of a trust fund for closure and post-closure care, or over one-half of the estimated length of the corrective action remedy in the case of response to a known release. This period is referred to as the pay-in period.

d. For a trust fund used to demonstrate financial assurance for closure and post-closure care at a sanitary landfill, the first payment into the fund must be at least equal to the amount specified in 567—101.710(455B) for closure and post-closure care, divided by the number of years in the pay-in period, as defined in 101.707(1) "c." The amount of subsequent payments must be determined by the following formula.

$$\text{Next Payment} = \frac{\text{CE} - \text{B}}{\text{Y}}$$

Where:

"CE" is the amount specified in 567—101.710(455B) for closure and post-closure care (updated for inflation or other changes).

"B" is the balance of the trust fund at the close of the previous fiscal year.

"Y" is the number of years remaining in the pay-in period.

e. Unless otherwise authorized by the department, for a trust fund used to demonstrate financial assurance for corrective action at a sanitary landfill, the first payment into the trust fund must be at least equal to one-half of the amount specified in 101.706(1) for corrective action, divided by the number of years in the corrective action pay-in period, as defined in 101.707(1) "c." The amount of subsequent payments must be determined by the following formula.

$$\text{Next Payment} = \frac{\text{RB} - \text{V}}{\text{Y}}$$

Where:

"RB" is the most recent estimate of the required trust fund balance for corrective action.

"V" is the current value of the trust fund at the close of the previous fiscal year.

"Y" is the number of years remaining in the pay-in period.

f. The initial payment into the trust fund must be made prior to the initial receipt of solid waste at the sanitary landfill or before the cancellation of an alternative financial assurance instrument, in the case of closure and post-closure care; or no later than 120 days after the selection of the corrective action remedy.

g. The owner or operator, or other person authorized to conduct closure, post-closure care, and corrective action activities, may request reimbursement from the trustee for these expenditures, including partial closure, as they are incurred. The owner or operator must submit to the department documentation of the justification for reimbursement and verification that reimbursement has been received.

h. After the pay-in period has been completed for a sanitary landfill, the trust fund shall be adjusted annually to correct any deficiency of the fund with respect to the updated cost estimates and may be adjusted annually should the balance in the fund exceed the updated cost estimates.

i. The trust fund may be terminated by the owner or operator only if the owner or operator substitutes alternative financial assurance as specified in this rule or if the owner or operator is no longer required to demonstrate financial responsibility in accordance with this division.

**101.707(2) Surety bond guaranteeing payment or performance.**

a. An owner or operator may demonstrate financial assurance for closure and post-closure care by obtaining a payment or performance surety bond, which conforms to the requirements of this subrule. An owner or operator may demonstrate financial assurance for corrective action by obtaining a performance bond, which conforms to the requirements of this subrule. The bond must be effective and all required submissions made to the department prior to the initial receipt of solid waste or before the cancellation of an alternative financial assurance instrument, in the case of closure and post-closure care, or, in the case

of corrective action, no later than 120 days after the selection of the corrective action remedy. The owner or operator must submit to the department a copy of the executed surety bond and subsequent proof of continuance in accordance with 567—101.703(455B) through 567—101.706(455B). The surety company issuing the bond must, at a minimum, be among those listed as acceptable sureties on federal bonds in Circular 570 of the U.S. Department of the Treasury.

b. The penal sum of the bond must be in an amount at least equal to the amount specified in 567—101.710(455B) for closure, post-closure care, and corrective action, whichever is applicable.

c. Under the terms of the bond, the surety will become liable on the bond obligation when the owner or operator fails to perform as guaranteed by the bond and also upon notice from the department pursuant to 101.707(2) “f.”

d. The owner or operator must also establish a standby trust fund. The standby trust fund must meet the requirements of 101.707(1), except the requirements for initial payment and subsequent annual payments specified in 101.707(1) “c” through “f.”

e. Payments made under the terms of the bond will be deposited by the surety directly into the standby trust fund. Payments from the trust fund must be authorized by the trustee pursuant to 101.707(1) “g.”

f. Under the terms of the bond, the surety may cancel the bond by sending notice of cancellation by certified mail to the owner or operator and to the department 120 days in advance of cancellation. When such notice is provided, the owner or operator shall, within 90 days, provide to the department adequate proof of alternative financial assurance, notice from the surety of withdrawal of the cancellation, or proof of a deposit into the standby trust fund of a sum equal to the amount of the bond. If the owner or operator has not complied with this paragraph within the 90-day time period, this shall constitute a failure to perform and the department shall notify the surety, prior to the expiration of the 120-day notice period, that such a failure has occurred. The provision of funds by the issuer of the surety bond shall be considered an issuance of a loan to the owner or operator, and the terms of that loan shall be governed by the surety bond or subsequent agreement between those parties.

g. The owner or operator may cancel the bond only if alternative financial assurance is substituted prior to cancellation or if the owner or operator is no longer required to demonstrate financial responsibility in accordance with this division.

**101.707(3)** *Letter of credit.*

a. An owner or operator may demonstrate financial assurance for closure, post-closure care, and corrective action, whichever is applicable, by obtaining an irrevocable standby letter of credit, which conforms to the requirements of this subrule. The letter of credit must be effective and all required submissions made to the department prior to the initial receipt of solid waste or before the cancellation of an alternative financial assurance instrument, in the case of closure and post-closure care, or, in the case of corrective action, no later than 120 days after the selection of the corrective action remedy. The owner or operator must submit to the department a copy of the executed letter of credit, and subsequent proof of continuance in accordance with 567—101.703(455B) through 567—101.706(455B). The issuing institution must be an entity that has the authority to issue letters of credit and whose letter-of-credit operations are regulated and examined by a federal or state agency.

b. A letter from the owner or operator referring to the letter of credit by number, issuing institution, and date, and providing the name and address of the facility and the amount of funds assured, must be included with the letter of credit submitted to the department.

c. The owner or operator must also establish a standby trust fund. The standby trust fund must meet the requirements of 101.707(1), except the requirements for initial payment and subsequent annual payments specified in 101.707(1) “c” through “f.”

d. Payments made under the terms of the letter of credit will be deposited by the issuing institution directly into the standby trust fund. Payments from the trust fund must be authorized by the trustee pursuant to 101.707(1) “g.”

e. The letter of credit must be irrevocable and issued for a period of at least one year in an amount at least equal to the amount specified in 567—101.710(455B) for closure, post-closure care, and corrective action, whichever is applicable. The letter of credit must provide that the expiration date will be

automatically extended for a period of at least one year unless the issuing institution has canceled the letter of credit by sending notice of cancellation by certified mail to the owner or operator and to the department 120 days in advance of cancellation. When such notice is provided, the owner or operator shall, within 90 days, provide to the department adequate proof of alternative financial assurance, notice from the issuing institution of withdrawal of the cancellation, or proof of a deposit into the standby trust fund of a sum equal to the amount of the letter of credit. If the owner or operator has not complied with this paragraph within the 90-day time period, this shall constitute a failure to perform and the department shall notify the issuer of the letter of credit, prior to the expiration of the 120-day notice period, that such a failure has occurred. The provision of funds by the issuer of the letter of credit shall be considered an issuance of a loan to the owner or operator, and the terms of that loan shall be governed by the letter of credit or subsequent agreement between those parties.

*f.* The owner or operator may cancel the letter of credit only if alternative financial assurance is substituted prior to cancellation or if the owner or operator is no longer required to demonstrate financial responsibility in accordance with this division.

**101.707(4) Insurance.**

*a.* An owner or operator may demonstrate financial assurance for closure and post-closure care, whichever is applicable, by obtaining insurance that conforms to the requirements of this subrule. The insurance must be effective and all required submissions made to the department prior to the initial receipt of solid waste or before the cancellation of an alternative financial assurance instrument, in the case of closure and post-closure care. At a minimum, the insurer must be licensed to transact the business of insurance or be eligible to provide insurance as an excess or surplus lines insurer in Iowa. The owner or operator must submit to the department a copy of the executed insurance policy and subsequent proof of continuance in accordance with 567—101.703(455B) through 567—101.706(455B).

*b.* The closure or post-closure care insurance policy must guarantee that funds will be available to close the sanitary disposal project whenever final closure occurs or to provide post-closure care for a sanitary landfill whenever the post-closure care period begins, whichever is applicable. The policy must also guarantee that once closure or post-closure care begins, the insurer will be responsible for the paying out of funds to the owner or operator or other person authorized to conduct closure or post-closure care, up to an amount equal to the face amount of the policy.

*c.* The insurance policy must be issued for a face amount at least equal to the amount specified in 567—101.710(455B) for closure and post-closure care, whichever is applicable. Actual payments by the insurer will not change the face amount, although the insurer's future liability will be lowered by the amount of the payments.

*d.* An owner or operator, or any other person authorized to conduct closure or post-closure care, may receive reimbursements for closure or post-closure care expenditures, including partial closure, whichever is applicable. Requests for reimbursement will be granted by the insurer only if the remaining value of the policy is sufficient to cover the remaining costs of closure or post-closure care. The owner or operator must submit to the department documentation of the justification for reimbursement and verification that the reimbursement has been received.

*e.* Each policy must contain a provision allowing assignment of the policy to a successor owner or operator. Such assignment may be conditional upon consent of the insurer, provided that such consent is not unreasonably refused.

*f.* The insurance policy must provide that the insurer may not cancel, terminate, or fail to renew the policy, except for failure to pay the premium. The automatic renewal of the policy must, at a minimum, provide the insured with the option of renewal at the face amount of the expiring policy. If there is a failure to pay the premium, the insurer may cancel the policy by sending notice of cancellation by certified mail to the owner or operator and to the department 120 days in advance of cancellation. When such notice is provided, the owner or operator shall, within 90 days, provide to the department adequate proof of alternative financial assurance, notice from the insurer of withdrawal of the cancellation, or proof of a deposit of a sum equal to the amount of the insurance coverage into either the closure and post-closure care account(s) established pursuant to Iowa Code section 455B.306(9) "b" or a standby trust fund that meets the requirements of 101.707(1), except the requirements for initial payment and subsequent annual

payments specified in 101.707(1)“c” through “f.” If the owner or operator has not complied with this paragraph within the 90-day time period, this shall constitute a failure to perform and shall be a covered event pursuant to the terms of the insurance policy. A failure by the owner or operator to comply with this paragraph within the 90-day time period shall make the insurer liable for the closure and post-closure care of the covered facility up to the amount of the policy limits, which shall be equal to the most recently submitted cost estimates.

g. For insurance policies providing coverage for post-closure care, commencing on the date that liability to make payments pursuant to the policy accrues, the insurer will thereafter annually increase the face amount of the policy. Such increase must be equivalent to the face amount of the policy, less any payments made, multiplied by an amount equivalent to 85 percent of the most recent investment rate or of the equivalent coupon-issue yield announced by the U.S. Treasury for 26-week Treasury securities.

h. The owner or operator may cancel the insurance policy only if alternative financial assurance is substituted prior to cancellation or if the owner or operator is no longer required to demonstrate financial responsibility in accordance with this division.

**101.707(5) Corporate financial test.** An owner or operator that satisfies the requirements of this subrule may demonstrate financial assurance for closure, post-closure care, and corrective action, whichever is applicable, up to the amount specified below.

a. *Financial component.* The owner or operator must satisfy the requirements of 101.707(5)“a”(1) through “a”(3) to meet the financial component of the corporate financial test.

(1) The owner or operator must satisfy one of the following three conditions.

1. A current rating for its senior unsubordinated debt of AAA, AA, A, or BBB as issued by Standard & Poor’s or Aaa, Aa, A or Baa as issued by Moody’s;

2. A ratio of less than 1.5 comparing total liabilities to net worth (net worth calculations may not include future permitted capacity of a subject landfill as an asset); or

3. A ratio of greater than 0.10 comparing the sum of net income plus depreciation, depletion, and amortization, minus \$10 million, to total liabilities.

(2) The tangible net worth (excluding future permitted capacity of a subject sanitary landfill) of the owner or operator must be greater than:

1. The sum of the current closure, post-closure care, and corrective action cost estimates, whichever is applicable, and any other environmental obligations, including guarantees covered by a financial test, except as provided in 101.707(5)“a”(2)“2.” For sanitary landfill owners or operators, this sum shall include an additional \$10 million.

2. For sanitary landfill owners or operators, a net worth of \$10 million plus the amount of any guarantees that have not been recognized as liabilities on the financial statements, provided that all of the current closure, post-closure care, and corrective action costs and any other environmental obligations covered by a financial test are recognized as liabilities on the owner’s or operator’s audited financial statements and subject to the approval of the department.

(3) The owner or operator must have located in the United States assets (excluding future permitted capacity of a subject sanitary landfill) amounting to at least the sum of current closure, post-closure care, and corrective action cost estimates, whichever is applicable, and any other environmental obligations covered by a financial test as described in 101.707(5)“f.”

b. *Recordkeeping and reporting requirements.* The owner or operator must submit the following records to the department prior to the initial receipt of solid waste or before cancellation of an alternative financial assurance instrument, in the case of closure and post-closure care, or no later than 120 days after the selection of the corrective action remedy.

(1) A letter signed by the owner’s or operator’s chief financial officer that:

1. Lists all the current cost estimates covered by a financial test, including but not limited to cost estimates required by 567—101.703(455B) through 567—101.706(455B); cost estimates required for municipal solid waste landfills pursuant to 40 CFR Part 258, if applicable; cost estimates required for UIC facilities under 40 CFR Part 144, if applicable; cost estimates required for petroleum underground storage tank facilities under 40 CFR Part 280, if applicable; cost estimates required for PCB storage facilities under

40 CFR Part 761, if applicable; and cost estimates required for hazardous waste treatment, storage, and disposal facilities under 40 CFR Parts 264 and 265, if applicable; and

2. Provides evidence demonstrating that the firm meets the conditions of 101.707(5)“a.”

(2) A copy of the Iowa-licensed certified public accountant’s unqualified opinion of the owner’s or operator’s financial statements for the latest completed fiscal year. To be eligible to use the financial test, the owner’s or operator’s financial statements must receive an unqualified opinion from the Iowa-licensed certified public accountant. An adverse opinion or disclaimer of opinion shall be cause for disallowance of this instrument. A qualified opinion related to the demonstration of financial assurance may, at the discretion of the department, be cause for disallowance. If the department does not allow use of the corporate financial test, the owner or operator must provide alternative financial assurance that meets the requirements of 567—101.707(455B).

(3) If the chief financial officer’s letter providing evidence of financial assurance includes financial data showing that the owner or operator satisfies 101.707(5)“a”(1)“2” or “3” that differs from data in the audited financial statements referred to in 101.707(5)“b”(2) or any other audited financial statement or data filed with the U.S. Securities and Exchange Commission, a special report from the owner’s or operator’s Iowa-licensed certified public accountant to the owner or operator. The special report shall be based on an agreed-upon procedures engagement in accordance with professional auditing standards and shall describe the procedures performed in comparing the data in the chief financial officer’s letter derived from the independently audited year-end financial statements for the latest fiscal year with the amounts in such financial statements, the findings of that comparison, and the reasons for any differences.

(4) If the chief financial officer’s letter provides a demonstration that the owner or operator has assured for environmental obligations as provided in 101.707(5)“a”(2)“2,” a report from the Iowa-licensed certified public accountant that verifies that all of the environmental obligations covered by a financial test have been recognized as liabilities on the audited financial statements, that documents how these obligations have been measured and reported, and that verifies that the tangible net worth of the owner or operator is at least the amount of any guarantees provided. For sanitary landfill owners or operators, this sum shall include an additional \$10 million.

*c. Cease submission of information.* The owner or operator may cease the submission of the information required by 101.707(5) only if alternative financial assurance is substituted prior to cancellation or if the owner or operator is no longer required to demonstrate financial responsibility in accordance with this division.

*d. Financial test.* The owner or operator must satisfy the requirements of the financial test at the close of each fiscal year. If the owner or operator no longer meets the requirements of the corporate financial test, the owner or operator must immediately notify the department in writing and, within 90 days following the close of the owner’s or operator’s fiscal year, obtain alternative financial assurance that meets the requirements of 567—101.707(455B) and submit the financial assurance documentation to the department for approval.

*e. Financial condition.* The department may, based on a reasonable belief that the owner or operator may no longer meet the requirements of 101.707(5)“a,” require at any time the owner or operator to provide reports of its financial condition in addition to, or including, current financial test documentation as specified in 101.707(5)“b.” If the department finds that the owner or operator no longer meets the requirements of 101.707(5)“a,” the owner or operator must provide alternative financial assurance that meets the requirements of 567—101.707(455B) within 90 days of written notification by the department.

*f. Calculation of costs to be assured.* When calculating the current cost estimates for closure, post-closure care, corrective action, or the sum of the combination of such costs to be covered, and any other environmental obligations assured by a financial test referred to in 101.707(5), the owner or operator must include cost estimates required for 567—101.703(455B) through 567—101.706(455B) and cost estimates required for the following environmental obligations, if the owner or operator assures them through a financial test: municipal solid waste landfills pursuant to 40 CFR Part 258; UIC facilities under 40 CFR Part 144; petroleum underground storage tank facilities under 40 CFR Part 280; PCB storage facilities under 40 CFR Part 761; and hazardous waste treatment, storage, and disposal facilities under 40 CFR Parts 264 and 265.

**101.707(6) Local government financial test.** An owner or operator that satisfies the requirements of this subrule may demonstrate financial assurance for closure, post-closure care, and corrective action, whichever is applicable, up to the amount specified below.

*a. Financial component.*

(1) The local government owner or operator must satisfy one of the following conditions.

1. If the owner or operator has outstanding, rated general obligation bonds that are not secured by insurance, a letter of credit, or other collateral or guarantee, the owner or operator must have a current rating of Aaa, Aa, A, or Baa, as issued by Moody's, or AAA, AA, A, or BBB, as issued by Standard & Poor's, on all such general obligation bonds; or

2. The owner or operator must satisfy both of the following financial ratios based on the owner's or operator's most recent audited annual financial statement: a ratio of cash plus marketable securities to total expenditures greater than or equal to 0.05 and a ratio of annual debt service to total expenditures less than or equal to 0.20.

(2) The owner or operator must prepare its financial statements in conformity with Generally Accepted Accounting Principles or Other Comprehensive Bases of Accounting for governments and have its financial statements audited by an Iowa-licensed certified public accountant or the office of the auditor of the state of Iowa. The financial statement shall be in the form prescribed by the office of the auditor of the state of Iowa.

(3) A local government is not eligible to assure its obligations under 101.707(6) if it:

1. Is currently in default on any outstanding general obligation bonds;

2. Has any outstanding general obligation bonds rated lower than Baa as issued by Moody's or BBB as issued by Standard & Poor's;

3. Operated at a deficit equal to 5 percent or more of total annual revenue in each of the past two fiscal years; or

4. Receives an adverse opinion or disclaimer of opinion from the Iowa-licensed certified public accountant or office of the auditor of the state of Iowa auditing its financial statement as required under 101.707(6) "a"(2). A qualified opinion related to the demonstration of financial assurance may, at the discretion of the department, be cause for disallowance. If the department does not allow use of the local government financial test, the owner or operator must provide alternative financial assurance that meets the requirements of 567—101.707(455B).

*b. Public notice component.* The local government owner or operator must include disclosure of the closure and post-closure care costs assured through the financial test in its next comprehensive annual financial report, prior to the initial receipt of solid waste or prior to cancellation of an alternative financial assurance instrument, whichever is later. Disclosure must include the nature and source of closure and post-closure care requirements, the reported liability at the balance sheet date, the estimated total closure and post-closure care cost remaining to be recognized, the percentage of landfill capacity used to date, and the estimated landfill life in years, if applicable. A reference to corrective action costs must be placed in the next comprehensive annual financial report after the selection of the corrective action remedy. For the first year the financial test is used to assure costs at a particular facility, the reference may instead be placed in the facility's operating record until issuance of the next available comprehensive annual financial report if timing does not permit the reference to be incorporated into the most recently issued comprehensive annual financial report or budget. For closure and post-closure care costs at municipal solid waste sanitary landfills, conformance with Governmental Accounting Standards Board Statement 18 assures compliance with this public notice component.

*c. Recordkeeping and reporting requirements.*

(1) The local government owner or operator must submit to the department the following items.

1. A letter signed by the local government's chief financial officer that lists all the current cost estimates covered by a financial test, as described in 101.707(6) "d," that provides evidence and certifies that the local government meets the conditions of 101.707(6) "a"(1) through "a"(3) and certifies that the local government meets the conditions of 101.707(6) "b" and "d"; and

2. The local government's independently audited year-end financial statements for the latest fiscal year, including the unqualified opinion of the auditor who must be an Iowa-licensed certified public

accountant or the office of the auditor of the state of Iowa. The comprehensive annual financial report shall indicate compliance with the financial ratios required by 101.707(6)“a”(1)“2,” if applicable, and the requirements of 101.707(6)“a”(2) and 101.707(6)“a”(3)“3” and “4.”

(2) The items required in 101.707(6)“c”(1) must be submitted to the department prior to the initial receipt of solid waste or prior to the cancellation of an alternative financial assurance instrument, in the case of closure and post-closure care, or, in the case of corrective action, not later than 120 days after the selection of the corrective action remedy.

(3) The local government owner or operator may cease the submission of the information required by 101.707(6) only if alternative financial assurance is substituted prior to cancellation or if the owner or operator is no longer required to demonstrate financial responsibility in accordance with this division.

(4) The local government owner or operator must satisfy the requirements of the financial test at the close of each fiscal year. If the owner or operator no longer meets the requirements of the local government financial test, the owner or operator must immediately notify the department in writing and, within 90 days following the close of the owner’s or operator’s fiscal year, obtain alternative financial assurance that meets the requirements of 567—101.707(455B) and submit the financial assurance documentation to the department for approval.

(5) The department may, based on a reasonable belief that the local government owner or operator may no longer meet the requirements of 101.707(6)“a,” require at any time the owner or operator to provide reports of its financial condition in addition to, or including, current financial test documentation as specified in 101.707(6)“c.” If the department finds that the owner or operator no longer meets the requirements of 101.707(6)“a,” the owner or operator must provide alternative financial assurance that meets the requirements of 567—101.707(455B) within 90 days of written notification by the department.

*d. Calculation of costs to be assured.* The portion of the closure, post-closure care, and corrective action costs for which an owner or operator may assure under this subrule is determined as follows.

(1) If the local government owner or operator does not assure other environmental obligations through a financial test, the owner or operator may assure closure, post-closure care, and corrective action costs that equal up to 43 percent of the local government’s total annual revenue.

(2) If the local government owner or operator assures other environmental obligations through a financial test, including those associated with municipal solid waste landfills pursuant to 40 CFR Part 258; UIC facilities under 40 CFR Part 144.62; petroleum underground storage tank facilities under 40 CFR Part 280; PCB storage facilities under 40 CFR Part 761; and hazardous waste treatment, storage, and disposal facilities under 40 CFR Parts 264 and 265, the owner or operator must add those costs to the closure, post-closure care, and corrective action costs it seeks to assure under this subrule. The total that may be assured must not exceed 43 percent of the local government’s total annual revenue.

(3) The owner or operator must obtain an alternative financial assurance instrument for those costs that exceed the limits set in 101.707(6)“d”(1) and “d”(2).

**101.707(7) Corporate guarantee.** An owner or operator that satisfies the requirements of this subrule may demonstrate financial assurance for closure, post-closure care, and corrective action, whichever is applicable, by obtaining a written guarantee.

*a. Affiliation.* The guarantor must be the direct or higher-tier parent corporation of the owner or operator, a firm whose parent corporation is also the parent corporation of the owner or operator, or a firm with a substantial business relationship with the owner or operator. The guarantor must meet the requirements of the corporate financial test in 101.707(5) and must comply with the terms of the written guarantee. A certified copy of the executed guarantee must be placed in the facility’s operating record along with copies of the letter from the guarantor’s chief financial officer and the independent certified public accountant’s opinion(s). If the guarantor’s parent corporation is also the parent corporation of the owner or operator, the letter from the guarantor’s chief financial officer must describe the value received in consideration of the guarantee. If the guarantor is a firm with a substantial business relationship with the owner or operator, this letter must describe this substantial business relationship and the value received in consideration of the guarantee.

*b. Terms of the written guarantee.* The guarantee must be effective and all required submissions made to the department prior to the initial receipt of solid waste or before the cancellation of an alternative

financial assurance instrument, in the case of closure and post-closure care, or, in the case of corrective action, no later than 120 days after the selection of the corrective action remedy. The guarantee must provide that:

(1) If the owner or operator fails to perform closure, post-closure care, and corrective action of a facility covered by the guarantee, or fails to obtain alternative financial assurance within 90 days of notice of intent to cancel pursuant to 101.707(7)“b”(2) and “b”(3), the guarantor will:

1. Perform, or pay a third party to perform, closure, post-closure care, and corrective action as required (performance guarantee); or
2. Establish a fully funded trust fund as specified in 101.707(1) in the name of the owner or operator (payment guarantee).

(2) The guarantee will remain in force for as long as the owner or operator must comply with the applicable financial assurance requirements of this division unless the guarantor sends prior notice of cancellation by certified mail to the owner or operator and to the department. Cancellation may not occur, however, during the 120 days beginning on the date of receipt of the notice of cancellation by both the owner or operator and the department, as evidenced by the return receipts.

(3) If notice of cancellation is given, the owner or operator must, within 90 days following receipt of the cancellation notice by the owner or operator and the department, provide to the department adequate proof of alternative financial assurance, notice from the guarantor of withdrawal of the cancellation, or proof of a deposit into a trust fund pursuant to 101.707(1) of a sum equal to the amount of the corporate guarantee. If the owner or operator fails to comply with the requirements of this subparagraph within the 90-day period, the guarantor must provide that alternative financial assurance prior to cancellation of the corporate guarantee.

*c. Recordkeeping and reporting requirements.*

(1) The owner or operator must submit to the department a certified copy of the executed guarantee along with the items required under 101.707(5)“b.”

(2) The owner or operator shall no longer be required to submit the items specified in 101.707(7)“c” (1) when proof of alternative financial assurance has been submitted to the department or the owner or operator is no longer required to demonstrate financial responsibility in accordance with this division.

(3) If a corporate guarantor no longer meets the requirements of 101.707(5), the owner or operator must immediately notify the department in writing and, within 90 days of notification, submit to the department proof of alternative financial assurance. If the owner or operator fails to obtain alternative financial assurance within the 90-day time period, the guarantor must provide that alternative financial assurance within the next 30 days.

**101.707(8) Local government guarantee.** An owner or operator that satisfies the requirements of this subrule may demonstrate financial assurance for closure, post-closure care, and corrective action, whichever is applicable, by obtaining a written guarantee provided by a local government or jointly provided by the members of an agency established pursuant to Iowa Code chapter 28E.

*a. Financial component.* The guarantor must meet the requirements of the local government financial test in 101.707(6) and must comply with the terms of the written guarantee.

*b. Terms of the written guarantee.* The guarantee must be effective and all required submissions made to the department prior to the initial receipt of solid waste or before the cancellation of an alternative financial assurance instrument, in the case of closure and post-closure care, or, in the case of corrective action, no later than 120 days after the selection of the corrective action remedy. The guarantee must provide that:

(1) If the owner or operator fails to perform closure, post-closure care, and corrective action of a facility covered by the guarantee, or fails to obtain alternative financial assurance within 90 days of notice of intent to cancel pursuant to 101.707(8)“b”(2) and “b”(3), the guarantor will:

1. Perform, or pay a third party to perform, closure, post-closure care, and corrective action as required (performance guarantee); or
2. Establish a fully funded trust fund as specified in 101.707(1) in the name of the owner or operator (payment guarantee).

(2) The guarantee will remain in force for as long as the owner or operator must comply with the applicable financial assurance requirements of this division unless the guarantor sends prior notice of cancellation by certified mail to the owner or operator and to the department. Cancellation may not occur, however, during the 120 days beginning on the date of receipt of the notice of cancellation by both the owner or operator and the department, as evidenced by the return receipts.

(3) If notice of cancellation is given, the owner or operator must, within 90 days following receipt of the cancellation notice by the owner or operator and the department, provide to the department adequate proof of alternative financial assurance, notice from the guarantor of withdrawal of the cancellation, or proof of a deposit into a trust fund pursuant to 101.707(1) of a sum equal to the amount of the local government guarantee. If the owner or operator fails to comply with the requirements of this subparagraph within the 90-day period, the guarantor must provide that alternative financial assurance prior to cancellation of the local government guarantee.

*c. Recordkeeping and reporting requirements.*

(1) The owner or operator must submit to the department a certified copy of the executed guarantee along with the items required under 101.707(6) "c."

(2) The owner or operator shall no longer be required to submit the items specified in 101.707(8) "c" (1) when proof of alternative financial assurance has been submitted to the department or the owner or operator is no longer required to demonstrate financial responsibility in accordance with this division.

(3) If a local government guarantor no longer meets the requirements of 101.707(6), the owner or operator must immediately notify the department in writing and, within 90 days of notification, submit to the department proof of alternative financial assurance. If the owner or operator fails to obtain alternative financial assurance within the 90-day period, the guarantor must provide that alternative financial assurance within the next 30 days.

**101.707(9) Local government dedicated fund.**

*a.* The owner or operator of a publicly owned sanitary disposal project, or local government serving as a guarantor, may demonstrate financial assurance for closure, post-closure care, and corrective action, whichever is applicable, by establishing a dedicated fund that conforms to the requirements of this subrule. The owner or operator must submit to the department a copy of the executed local government dedicated fund agreement.

*b.* The fund shall be dedicated by state constitutional provision or local government statute, charter, ordinance, resolution, or order to pay for closure, post-closure care and corrective action, whichever is applicable, arising from the operation of the sanitary disposal project, and shall be funded for the full amount of coverage or funded for part of the required amount of coverage and used in combination with another instrument(s) that provides the remaining coverage.

*c.* For a local government dedicated fund used to demonstrate financial assurance for proper closure at a sanitary disposal project that is not sanitary landfill, there is no pay-in period as defined in 101.707(9) "d." Instead, the local government dedicated fund shall be in an amount equal to or greater than the amount specified in 101.703(3).

*d.* Payments into the local government dedicated fund must be made annually by the owner or operator over ten years or over the remaining permitted life of the sanitary landfill, whichever is shorter, in the case of a dedicated fund for closure and post-closure care or over one-half of the estimated length of the corrective action remedy in the case of a response to a known release. This period is referred to as the "pay-in period."

*e.* For a local government dedicated fund used to demonstrate financial assurance for closure and post-closure care at a sanitary landfill, the first payment into the dedicated fund must be at least equal to the amount specified in 567—101.710(455B) for closure and post-closure care, divided by the number of years in the pay-in period, as defined in 101.707(9) "d." The amount of subsequent payments must be determined by the following formula:

$$\text{Next Payment} = \frac{\text{CE} - \text{B}}{\text{Y}}$$

Where:

“CE” is the amount specified in 567—101.710(455B) for closure and post-closure care (updated for inflation or other changes).

“B” is the balance of the dedicated fund at the close of the previous fiscal year.

“Y” is the number of years remaining in the pay-in period.

f. Unless otherwise authorized by the department, for a local government dedicated fund used to demonstrate financial assurance for corrective action at a sanitary landfill, the first payment into the dedicated fund must be at least equal to one-half of the amount specified in 101.706(1) for corrective action, divided by the number of years in the corrective action pay-in period, as defined in 101.707(9) “d.” The amount of subsequent payments must be determined by the following formula:

$$\text{Next Payment} = \frac{\text{RB} - \text{V}}{\text{Y}}$$

Where:

“RB” is the most recent estimate of the required dedicated fund balance for corrective action.

“V” is the value of the dedicated fund at the close of the previous fiscal year.

“Y” is the number of years remaining in the pay-in period.

g. The initial payment into the local government dedicated fund must be made prior to the initial receipt of solid waste at a sanitary landfill or before the cancellation of an alternative financial assurance instrument, in the case of closure and post-closure care, or no later than 120 days after the selection of the corrective action remedy.

h. After the pay-in period has been completed for a sanitary landfill, the dedicated fund shall be adjusted annually to correct any deficiency of the dedicated fund with respect to the updated cost estimates and may be adjusted annually should the balance in the dedicated fund exceed the updated cost estimates.

i. The local government dedicated fund may be terminated by the owner or operator only if the owner or operator substitutes alternative financial assurance as specified in this rule or if the owner or operator is no longer required to demonstrate financial responsibility in accordance with this division.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

#### **567—101.708(455B) General requirements.**

**101.708(1)** *Use of multiple financial assurance instruments.* An owner or operator may satisfy the requirements of this division by establishing more than one financial assurance instrument per facility, except that instruments guaranteeing performance rather than payment may not be combined with other instruments. The instruments must be a combination of those instruments outlined in 567—101.707(455B) and 101.709(455B) and must provide financial assurance for an amount at least equal to the current cost estimate for closure, post-closure care, and corrective action, whichever is applicable. The financial test and a guarantee provided by a corporate parent, sibling, or grandparent may not be combined if the financial statements of the two entities are consolidated.

**101.708(2)** *Use of one financial assurance instrument for multiple facilities.* An owner or operator may satisfy the requirements of this division for multiple sanitary disposal projects by the use of one instrument if the owner or operator ensures that the instrument provides financial assurance for an amount at least equal to the current cost estimates for closure, post-closure care, and corrective action, whichever is applicable, for all sanitary disposal projects covered. Evidence of financial assurance submitted to the department shall include, for each sanitary disposal project, the name, address, and permit number and the amount of funds for closure, post-closure care, and corrective action assured by the instrument.

**101.708(3)** *Criteria.* The language of the financial assurance instruments listed in 567—101.707(455B) must ensure that the instruments satisfy the following criteria.

a. The financial assurance instrument must ensure that the amount of funds assured is sufficient to cover the costs of closure, post-closure care, and corrective action for known releases, whichever is applicable;

b. The financial assurance instrument must ensure that funds will be available in a timely fashion, not to exceed three months from department notification, when needed;

c. The financial assurance instrument must be obtained by the owner or operator prior to the initial receipt of solid waste, in the case of closure and post-closure care, or, in the case of corrective action, no later than 120 days after the selection of the corrective action remedy, until the owner or operator is released from the financial assurance requirements; and

d. The financial assurance instrument must be legally valid, binding, and enforceable under Iowa law.

**101.708(4)** *No permit without financial assurance.* The department shall not issue or renew a permit to an owner or operator of a sanitary disposal project pursuant to Iowa Code section 455B.305 until a financial assurance instrument(s) has been submitted to and approved by the department. The department may request that additional information be submitted for review to make a financial assurance compliance decision.

**101.708(5)** *Request for payment.* The department may request payment from any financial assurance provider for the purpose of completing site closure, post-closure care, and corrective action, whichever is applicable, when the owner or operator declares an economic inability to comply with this division either by sending written notification to the department or through an action such as but not limited to filing for bankruptcy.

**101.708(6)** *Financial assurance cancellation and permit suspension.*

a. A financial assurance instrument may be terminated by the owner or operator only if the owner or operator substitutes alternative financial assurance, as specified in 567—101.707(455B), prior to cancellation or if the owner or operator is no longer required to demonstrate financial responsibility in accordance with this division.

b. A financial assurance instrument shall be continuous in nature until canceled by the financial assurance provider or until the department gives written notification to the owner or operator and the financial assurance provider that the covered site has demonstrated compliance with the sanitary disposal project's applicable closure, post-closure care, and corrective action requirements. The financial assurance provider shall give at least 120 days' notice in writing to the owner or operator and to the department in the event of any intent to cancel a financial assurance instrument.

c. Within 90 days of receipt of a written notice of cancellation of a financial assurance instrument, the owner or operator must provide the department with proof of alternative financial assurance or a notice from the issuing institution of withdrawal of the cancellation. If a means of continued financial assurance is not provided within the 90-day time frame, the department shall suspend the permit and call upon the financial assurance instrument(s) prior to the expiration of the 120-day notice period.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.709(455B) Closure and post-closure care account(s).** Except as provided in 101.709(10), the holder of a permit for a sanitary landfill shall maintain the closure and post-closure care account(s) as part of financial assurance pursuant to Iowa Code section 455B.306(9)“b.” The accounts shall be specific to a particular facility.

**101.709(1)** Money in the accounts shall not be assigned for the benefit of creditors, except the state of Iowa.

**101.709(2)** Money in the accounts shall not be used to pay any final judgment against a permit holder arising out of the ownership or operation of the site during its active life or after closure.

**101.709(3)** Withdrawal of funds. Except as provided in 101.709(4), money in the accounts may be withdrawn without departmental approval only for the purpose of funding closure, including partial closure, or post-closure care activities that are in conformance with the sanitary landfill's approved closure and post-closure plans. Withdrawals for activities not in conformance with the approved closure and post-closure plans must receive prior written approval from the department. Permit holders using a trust fund established pursuant to 101.707(1) to satisfy the requirements of this rule must comply with the requirements of 101.707(1)“g” prior to withdrawal.

**101.709(4)** Excess funds. If the balance of the closure and post-closure care account(s) exceeds the current cost estimate for closure or post-closure care at any time, the permit holder may withdraw the excess funds so long as the withdrawal does not cause the balance to be reduced below the amount of the current cost estimate.

**101.709(5)** Proof of establishment of account. A permit holder shall, on a form prescribed by the department, at the time of permit application and renewal, submit a statement of account signed by the permit holder, which indicates that accounts have been established pursuant to 567—101.709(455B).

**101.709(6)** An account established pursuant to 101.707(1) for a trust fund or 101.707(9) for a local government dedicated fund satisfies the requirements of 567—101.709(455B), and the account must comply with Iowa Code section 455B.306(9) “b.”

**101.709(7)** Yearly deposits. Unless otherwise authorized by the department or provided for within this division (i.e., trust fund or local government dedicated fund deposit calculation), deposits into the closure and post-closure care account(s) shall be made yearly in the amount specified in this subrule by the close of the permitted facility’s fiscal year. The closure and post-closure care account(s) shall be fully funded at the time of site closure. For active sanitary landfills not using a trust fund or local government dedicated fund as the sole financial assurance instrument, the minimum yearly deposit to the closure and post-closure care account(s) shall be determined using the following formula:

$$\frac{CE - AB}{RPC} \times TR = \text{Yearly Deposit}$$

Where:

“CE” is the current cost estimate of closure and post-closure care costs.

“AB” is the balance of the closure and post-closure care account(s) at the close of the previous fiscal year.

“RPC” is the remaining permitted capacity, in tons, of the sanitary landfill as of the start of the permit holder’s fiscal year. RPC may include those areas that have yet to be constructed but have received written design approval from the department. Justification for RPC calculations shall be submitted annually pursuant to 567—101.704(455B) and 567—101.705(455B).

“TR” is the number of tons of solid waste disposed of at the site in the permit holder’s prior fiscal year. For closed landfills, the closure and post-closure care account(s) shall remain fully funded throughout the post-closure period. Any account balance deficiency shall be rectified by the end of the permitted facility’s fiscal year in which the account balance deficiency was identified.

**101.709(8)** The closure and post-closure care account(s) may be commingled with other accounts so long as the amounts credited to each account balance are reported separately, pursuant to 101.704(1) and 101.705(1).

**101.709(9)** The department shall have full rights of access to all funds existing in a permitted facility’s closure and post-closure care account(s), at the sole discretion of the department, if the permit holder fails to undertake closure and post-closure care activities after being directed to do so by a final agency action of the department. These funds shall be used only for the purposes of funding closure and post-closure care activities at the site.

**101.709(10)** Pursuant to Iowa Code section 455B.306(12), a sanitary landfill owned by an electric generating facility and used exclusively for the disposal of coal combustion residual shall not be required to maintain a closure and post-closure care account(s) but may demonstrate financial assurance in accordance with this division by any of the instruments described in 567—101.707(455B) or by an alternative method acceptable to the department.

**101.709(11)** Pursuant to Iowa Code section 455B.306(9) “b,” industrial sanitary landfills permitted pursuant to Division III of this chapter and non-utility coal combustion residual sanitary landfills permitted pursuant to Division IV of this chapter prior to September 23, 2026, and for which closure and post-closure accounts have not been established pursuant to 101.709(5), shall submit proof of establishment within six months of September 23, 2026.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.710(455B) Amount of required financial assurance.** A financial assurance instrument established pursuant to and in compliance with 567—101.707(455B) or 567—101.709(455B), if applicable, shall be in the amount of the third-party cost estimates required by 567—101.703(455B)

through 567—101.706(455B). With regard to sanitary landfills, the amount of financial assurance may be reduced by the sum of the cash balance in a trust fund or local government dedicated fund established to comply with 567—101.709(455B), plus the current value of investments held by said trust fund or local government dedicated fund, if invested in one or more of the investments listed in Iowa Code section 12B.10(5).

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

**567—101.711(17A,455A) Waivers.** A request for a waiver to this division shall be submitted to the department in writing pursuant to 7—Chapter 2504. Some provisions of this division are minimum standards required by federal law (40 CFR Part 258, Subpart G), and waivers to such provisions shall not be granted unless they are as protective as the applicable minimum federal standard.

[ARC 0482D, IAB 8/19/26, effective 9/23/26]

These rules are intended to implement Iowa Code sections 455B.304(8) and 455B.306(9).

<sup>2</sup> Effective date of rescission of 101.13(1)“j”(4) delayed 70 days by the Administrative Rules Review Committee at its meeting held September 11, 2007.

CHAPTER 102  
SOLID WASTE MANAGEMENT  
[Prior to 7/1/83, DEQ Ch 27]  
[Prior to 12/3/86, Water, Air and Waste Management[900]]

Chapter rescission date pursuant to Iowa Code section 17A.7: 9/23/31

DIVISION I  
ORGANIC MATERIALS COMPOSTING FACILITIES

**567—102.1(455D) Applicability; compliance.** This division shall apply to the composting of organic material, including yard wastes. Composting facilities may include turned windrows, aerated static piles, aerated in-vessel systems, or other methods approved by the department. This division does not apply to manure composted under 567—Chapter 65 or other provisions of Iowa law, dead animals and raw rendering material disposed under the authority of the department of agriculture and land stewardship (IDALS), materials managed under Iowa Code chapter 200A (bulk dry animal nutrient products), or to the sale or distribution of finished compost covered in Iowa Code chapter 200.

**102.1(1)** Compliance with this division in no way relieves the compost facility of the responsibility of complying with all other local, state, or federal statutes, ordinances, and rules and other applicable requirements.

**102.1(2)** For purposes of this division, tonnages may be calculated by multiplying cubic yardage by bulk density.

**102.1(3)** All rules, standards, technical guidance, and other similar legal or technical documents referenced in this division shall be the version of those documents in effect on August 1, 2025, unless otherwise noted in these rules, and except for references to the Iowa Code and Iowa Administrative Code, which shall always be the most recent version unless otherwise noted in these rules.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.2(455D) Definitions incorporated by reference.** The definitions in Iowa Code sections 455B.301 and 455D.9 and in 567—Chapter 100 shall apply to Division I of this chapter.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.3(455D) Feedstock categories.** Compost feedstock are categorized as follows.

**102.3(1)** *Type A feedstocks.* Type A feedstocks include yard waste, clean wood waste, crop residues, and other vegetative materials determined to pose a low level of risk to human health and the environment, including from physical contaminants and human pathogens.

**102.3(2)** *Type B feedstocks.* Type B feedstocks include source-separated pre- and postconsumer food residuals; food processing residuals; dead animals; raw rendering material; certified compostable products; and animal excreta, manure, animal bedding and litter not regulated under 567—Chapter 65 or other provisions of Iowa law. Type B feedstocks are materials that the department determines pose a moderate level of risk to human health and the environment or have a higher level of risk from physical contaminants and human pathogens compared to Type A feedstocks.

**102.3(3)** *Type C feedstocks.* Type C feedstocks include industrial process waste, sludges, biosolids, diapers, solid or semi-solid material from composting toilets, and industrial by-products not covered in Type B feedstocks. Type C feedstocks consist of materials the department determines pose a higher level of risk to human health and the environment from physical and chemical contaminants and human pathogens compared to Type A and B feedstocks.

**102.3(4)** *Materials prohibited from use as a feedstock.* Materials prohibited from use as a feedstock include asbestos-containing material, biomedical wastes, infectious waste, human remains, petroleum-containing wastes, seed treated with pesticide and industrial waste derived from seed treated with pesticides, toxic wastes as defined in 567—109.3(455B,455D), radiological wastes, hazardous wastes as

defined in Iowa Code section 455B.411, materials containing metals that exceed the concentrations listed in 102.9(5) “b,” and materials that have direct process stream contact with or originate from a process that may release petroleum products, organic solvents, pesticides, or polychlorinated biphenyls (PCBs).

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.4(455D) Exemptions.** The following activities are exempt from this division. These exemptions are not a defense to a nuisance action brought pursuant to Iowa Code chapter 657.

**102.4(1)** Type A or Type B, or both, feedstocks from a single household composted on site by the owner or tenant for use at the owner’s or tenant’s residence.

**102.4(2)** Composting of up to two tons per year of Type A feedstock or Type B feedstock, or both, excluding dead animals, singly or in combination, used on the same premises where it was composted. The feedstock may be generated off premises.

**102.4(3)** Composting of manure that is subject to 567—Chapter 65 and other provisions of Iowa law, unless mixed with wastes regulated pursuant to this chapter other than necessary bulking agents (such as wood chips, straw, cornstalks, bedding, and dry poultry litter).

**102.4(4)** Composting of dead animals, unless mixed with wastes regulated pursuant to this chapter other than necessary bulking agents (such as wood chips, straw, cornstalks, bedding, and dry poultry litter).

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.5(455D) General requirements for all composting activities not exempt.** Any composting facility that is not exempt under 567—102.4(455D) must comply with the following provisions.

**102.5(1) *Siting requirements.***

a. The composting facility shall be located:

(1) At least 500 feet from any existing inhabited residence, not including the residence of a person owning or operating the compost facility, at the time the permit application was received by the department.

(2) At least 200 feet from public wells.

(3) At least 100 feet from private wells.

(4) At least 50 feet from property lines.

(5) At least 100 feet from flowing or intermittent streams, lakes, or ponds.

(6) Outside of wetlands.

b. Composting done within a 100-year floodplain shall be in accordance with all local and department regulations, including 567—71.5(455B). Sediment ponds, engineered wetlands, or other constructed waterways for the purpose of pollution control are excluded from this subrule.

**102.5(2) *Design requirements.***

a. Water shall be prevented from running onto the composting facility from adjacent land.

b. Management or disposal of contact water and stormwater shall be in accordance with 567—Chapter 60 if applicable.

c. Composting facilities shall be designed, constructed, and maintained so as to minimize ponding of water or liquids. Any ponding that does occur shall be corrected through routine facility maintenance within 48 hours after the termination of the event causing the ponding.

d. Composting not done in-vessel shall be done on a surface that will permit accessibility during periods of inclement weather. The receiving, processing, production, and curing shall take place on a surface of asphalt, concrete, compacted granular aggregate, clay, or similar relatively impermeable material. Composting facilities that only compost Type A feedstocks may have a surface of compacted soil. The surface must be maintained in a condition that prevents infiltration to the groundwater.

e. In-vessel composting shall be done in a container that does not leak, prevents access by vectors, and provides adequate aeration.

f. With the exception of in-vessel composting, the high-water table shall be at least 12 inches below the ground surface.

**102.5(3) *Operational requirements.*** Composting facilities shall be operated as follows.

a. Aerobic conditions shall be maintained.

b. Composting facilities shall be free of unsecured trash at the end of each operating day.

- c. Non-compostable waste shall be removed or stored in a container or containment area and recycled or disposed of at a permitted sanitary disposal project.
- d. Organic materials shall be managed to minimize odors, dust, noise, litter, contact water, fire and scavenging by vectors.
- e. Composting shall be performed in a manner that minimizes the formation of contact water.
- f. Storage of cured compost shall be limited to 18 months unless prior written approval from the department is granted for an extension.
- g. Compost shall not be applied to land, sold, or given away unless all of the following conditions are met:
  - (1) Concentration of human-made inert materials such as glass, metal, and plastic is less than 1.5 percent by dry weight,
  - (2) The size of any human-made inert materials is less than 13 mm (0.512 inches).
- h. Finished compost that contains bones that have not fully decomposed may be applied to cropland.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.6(455D) Tier 1 composting facility.** A Tier 1 facility is a compost facility that composts an unlimited amount of Type A, Type B, or both feedstocks generated on the premises and up to a total of 250 tons per year of Type A, Type B, or both feedstocks generated off site.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.7(455D) Tier 2 composting facility.** A Tier 2 facility is a compost facility that composts an unlimited amount of Type A feedstock generated on premises, off premises, or both; an unlimited amount of Type B feedstocks generated on the premises; and up to 250 tons per year of Type B feedstocks generated off the premises. Tier 2 facilities are subject to the following provisions.

**102.7(1)** Before the composting facility commences operation, the facility's operator must notify the department in writing of the following:

- a. The location of the composting facility.
- b. The legal description of the property that contains the facility.
- c. The landowner's name, telephone number, email and mailing address.
- d. The name, telephone number, and email and mailing addresses of the facility's operator and responsible official.
- e. The maximum throughput and capacity of the facility.
- f. The method of composting to be employed at the facility.
- g. The source of the feedstock.
- h. Aerial photography identifying wells, streams, creeks, rivers, ponds, sinkholes, and drainage wells within one-half mile of the closest portion of the facility.

**102.7(2)** The facility's feedstock receiving, processing, and storage areas must be clearly defined.

**102.7(3)** An annual report for the previous fiscal year beginning July 1 and ending June 30 shall be submitted to the department by July 31 of each year. The annual report shall be submitted using a form prescribed by the department. The report shall include:

- a. Confirm that the amount and type of feedstock accepted was within the criteria for a Tier 2 facility.
- b. Method of composting used.
- c. Tons of finished compost sold, given away, or used by the permit holder.
- d. Name of certified operator.

**102.7(4)** Beginning September 23, 2027, the person responsible for daily operations shall be a certified compost operator as described in 567—102.11(455D).

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.8(455D) Tier 3 composting facilities.** A Tier 3 composting facility is a compost facility that composts an unlimited amount of Type A feedstock generated on or off the premises, an unlimited amount of type B feedstock generated on the premises, and up to 1,000 tons per year type B feedstock generated off premises. Tier 3 facilities shall comply with the following provisions.

**102.8(1) Notification.** Before the composting facility commences operation, the department shall be notified in writing of the following.

- a. The location of the composting facility.
- b. Legal description of the facility.
- c. Landowner's name, telephone number, email, and mailing address.
- d. Responsible party's name, telephone number, email, and mailing address.
- e. Maximum throughput and capacity.
- f. Method of composting to be employed.
- g. Source of the feedstock.
- h. Aerial photograph identifying wells, streams, creeks, rivers, ponds, sinkholes, and drainage wells within one-half mile of the closest portion of the facility.

**102.8(2) Operational requirements.** In addition to the operational requirements in 102.5(4), Tier 3 composting facilities shall meet the following operational standards:

- a. Tier 3 composting facilities must develop and follow an operations plan that describes operational procedures. This includes the method of composting; measures to control nuisance odors, vectors, fires, contact water, and stormwater; and plans for using or marketing finished compost. The operations plan must be reviewed annually and updated when there is a change to procedures, equipment, or feedstocks being processed. The operations plan shall be available to the department upon request.
- b. The person responsible for daily operation of the facility shall be certified by a department-approved training program.
- c. Feedstocks with free liquid shall be mixed with drier feedstocks, bulking material, or compost so that the liquid is promptly absorbed and not allowed to flow as free liquid from the compost piles or windrows. Free liquid that is not absorbed shall be managed as contact water.
- d. Contact water shall be directed to a containment, recycling, treatment system, or any combination of the three.
- e. By the end of each operating day, all incoming Type B feedstocks must be processed into the active composting pile, transferred to leak-proof containment, or mixed with bulking material and covered in a manner that minimizes nuisance odors and scavenging by vectors.
- f. Beginning September 23, 2027, the person responsible for daily operations shall be a certified compost operator as described in 567—102.11(455D).

**102.8(3) Reporting.** An annual report for the previous fiscal year beginning July 1 and ending June 30 shall be submitted to the department by July 31 of each year. The report shall be submitted using a form prescribed by the department. The report shall include:

- a. Confirmation that the amount and type of feedstock accepted was within the criteria for a Tier 3 facility.
- b. Method of composting used.
- c. Tons of finished compost sold, given away or used by the permit holder.
- d. Name of certified operator.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.9(455D) Tier 4 composting facility.** A Tier 4 composting facility is a compost facility that composts any amount of Type A, B, and C feedstock. Tier 4 facilities shall comply with the provisions of this rule.

**102.9(1) Permit required.** Tier 4 composting facilities shall not be operated without a permit from the department as described in 567—subrule 100.4(2). A permit application shall be on a form prescribed by the department and include the following in addition to the requirements in 567—subrule 100.5(1):

- a. Aerial photography identifying wells, streams, creeks, rivers, ponds, sinkholes, and drainage wells within one-half mile of the closest portion of the facility.
- b. Design documents prepared by an Iowa-licensed professional engineer that include the following:
  - (1) Dimensions, details, and capacities of the proposed receiving, processing, production, curing, and storage areas, as well as the contact water containment, recycling, or treatment system.
  - (2) Design calculations justifying the size of the composting area for the volume of material to be composted.

- (3) Design plans showing compliance with design requirements in 102.9(3).
- c. A stormwater management plan that prevents run-on to the operating base, as well as controls outside of the operating base for a 25-year 24-hour storm event.
- d. A flow diagram of all steps in the operational procedure.
- e. An operations plan addressing the following:
  - (1) The method of composting, including description of the aeration method and the aeration frequency to be used to maintain aerobic conditions.
  - (2) The duration of composting with a time frame for receiving, processing, production, curing, and storage.
  - (3) A description of storage of feedstock, including quantity and types.
  - (4) A description of the methods to minimize and manage odors, dust, vectors, noise, and litter.
  - (5) A description of the specific procedures to be followed in case of equipment breakdown, maintenance downtime, and fire in equipment, composting material, or buildings, including methods to be used to remove or dispose of accumulated waste and burned or damaged material.
  - (6) Plans for using or marketing the finished compost.
  - (7) The method(s) of managing collected contact water.
  - (8) The method(s) of maintaining contact water management systems to maintain design volume.
  - (9) The description of the monitoring, sampling, and analysis procedures and schedule for testing the composting, including sampling frequency, sample size and number, and sample locations.
- f. A closure plan containing a description of the steps necessary to close the facility in compliance with 567—100.10(455B, 455D).
- g. Documentation that the person responsible for daily operation of the facility is certified by a department-approved program.

**102.9(2) Design requirements.** In addition to the requirements of 102.5(2), Tier 4 composting facilities shall comply with the following.

- a. All operations shall take place on a foundation that will permit accessibility during periods of inclement weather. The foundation shall be maintained and repaired, as needed.
- b. A base/foundation used for receiving, processing, and production of feedstock must meet the following minimum design standards.
  - (1) The base must support the load of the equipment, vehicles, materials, and all operations for the duration of the permit period.
  - (2) The base must have sufficient slope to prevent surface ponding and to transmit contact water to a containment structure to prevent liquids from entering surface water or groundwater.
  - (3) The base must be protected with a wearing surface consisting of asphalt, concrete, compacted granular aggregate, or similar relatively impermeable material and underlain by a liner consisting of a minimum of 12 inches of recompacted clay or other approved material with a hydraulic conductivity of  $1 \times 10^{-5}$  cm/sec or less. The bottom of the liner shall be at least 12 inches above the high-water table.
- c. The containment structure for contact water shall include a liner system consisting of a minimum of 12 inches of recompacted clay or other approved material with a hydraulic conductivity of  $1 \times 10^{-7}$  cm/sec or less. The bottom of the liner shall be at least five feet above the high-water table.
- d. The design of the facility shall include specifications for documentation of quality control and assurance that the construction meets the minimum design standards.
- e. Composting facilities permitted by the department prior to September 23, 2026, shall submit a compliance plan on or before September 23, 2027, that includes a schedule to verify compliance or obtain compliance with this subrule no later than September 23, 2031.
- f. The department may approve alternatives to these design requirements that provides the same level of environmental protection.

**102.9(3) Operating requirements.** In addition, the requirements of 567—102.4(455D), Tier 4 composting facilities shall comply with the following.

- a. Access to the facility shall be limited as follows.
  - (1) Access to the facility shall be restricted with a lockable gate at the entrance to the facility and perimeter access controlled by a fence or natural barrier approved by the department.

(2) Access to the facility shall be allowed only when an employee, agent, or representative of the facility is on duty.

(3) Emergency access to the facility shall be provided. Fire lanes shall be maintained to provide access for firefighting equipment.

b. All putrescible materials received must be incorporated into the composting process within 24 hours of receipt, unless storage of these materials is specified in the operations plan and authorized in the permit.

c. Compost processing time and temperatures shall meet Process to Further Reduce Pathogens (PFRP) requirements in B.1 of 40 CFR Part 503, Appendix B, and produce compost that meets the stability necessary for the intended use. Unless otherwise proposed in the operating plan and authorized in the permit, the permit holder shall test, at a minimum:

(1) Twice weekly temperature readings of compost piles, batches, and windrows.

(2) Weekly moisture levels of compost piles, batches, and windrows.

d. Contact water shall be directed to a containment, recycling, or treatment system that prevents prohibited discharges to the stormwater system or a surface water. A containment system shall have a minimum of one foot of freeboard at all times.

e. The person responsible for daily operations shall be a certified compost operator as described in 567—102.11(455D). The department may require as a condition in the permit that a facility retain a certified compost operator during all regular operational hours.

f. A visual inspection of the facility shall be conducted and documented on a quarterly basis at a minimum. If deficiencies are discovered during the visual inspection, actions taken to correct the deficiency shall be documented. The inspection shall at a minimum include the following.

(1) The condition of the pad. Portions of the pad that are under windrows or piles of curing or finished compost are not required to be inspected.

(2) Verification that ponding is not occurring on the pad.

(3) Verification that contact water is being directed to a containment, recycling, or treatment system and not discharging to the stormwater system or to surface water.

(4) The remaining capacity, amount of freeboard, and general condition of the contact water basin.

(5) The condition of containers and aeration equipment used for in-vessel composting if applicable.

**102.9(4) Product testing.** Prior to the use or sale, finished compost must be sampled and measurements taken for the purpose of product testing in a manner that is representative of the composting activity and consistent with Test Methods for Examination of Composting and Compost (TMECC) (2026) or other applicable standards approved by the department in the permit. Contaminants within finished compost must comply with the following:

a. The density of fecal coliform bacteria shall be less than 1,000 most probable number (MPN) per gram of total solids (dry weight basis) or the density of *Salmonella* sp. bacteria in compost shall be less than three MPN per four grams of total solids (dry weight basis).

b. The concentrations of all metals shall be less than the following:

| Metal         | Concentration mg/kg dry weight |
|---------------|--------------------------------|
| Arsenic (As)  | 41                             |
| Cadmium (Cd)  | 39                             |
| Copper (Cu)   | 1500                           |
| Lead (Pb)     | 300                            |
| Mercury (Hg)  | 17                             |
| Nickel (Ni)   | 420                            |
| Selenium (Se) | 100                            |
| Zinc (Zn)     | 2800                           |

c. Compost shall be tested for stability using one of the methods listed in TMECC 5.08 (2026), Respirometry, or another method approved by the department in the permit.

**102.9(5) *Recordkeeping requirements.*** The following records shall be maintained by the facility for a period of three years, kept at the facility at all times, and submitted to the department upon request:

- a. Analytical results described in 102.9(5).
- b. Types and weight of compostable materials and bulking agent, in tons, accepted at the facility annually.
- c. Weight of compost, in tons, removed from the facility annually.
- d. A copy of the operations plan, the permit and annual reports.
- e. Documentation of the volumes and dates of treatment, recycling, or disposal of unused contact water.
- f. Documentation of visual inspections conducted pursuant to 102.9(4) “f.”

**102.9(6) *Reporting requirements.*** An annual report for the previous fiscal year beginning July 1 and ending June 30 shall be submitted to the department by July 31 of each year. The report shall be submitted using a form prescribed by the department and include the following:

- a. Tons of type A feedstock received.
- b. Tons of type B feedstock received.
- c. Tons of type C feedstock received.
- d. Tons of finished compost sold, given away or used by permit holder.
- e. Method of composting.
- f. Name of certified operator.
- g. Copy of the most recent results of the testing required in 102.9(4).

**102.9(7) *Closure requirements.***

a. A schedule to implement the closure plan in 102.9(2) “f” shall be submitted to the department at least 30 days prior to the proposed termination date for the facility. If needed, a request to modify the closure plan may be submitted at the same time.

b. Unless an alternative schedule is approved by the department, within six months of the facility’s ceasing operation, the facility shall properly dispose of all organic material, solid waste, and litter and remove all finished compost from the premises.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.10(455D) Financial assurance.** Tier 4 composting facilities must obtain and submit a financial assurance instrument to the department. The financial assurance instrument shall provide monetary funds to properly dispose of any preprocessed and postprocessed materials that remain at a facility due to the owner’s or operator’s failure to properly close the site according to the schedule approved by the department in 102.9(9) “a” or within six months of permit suspension, termination, revocation, or expiration if no alternative schedule is approved.

**102.10(1) *No permit without financial assurance.*** The department shall not issue or renew a permit to an owner or operator until a financial assurance instrument has been submitted to and approved by the department.

**102.10(2) *Proof of compliance.*** Proof of the establishment of the financial assurance instrument and compliance with this rule, including a current closure cost estimate, shall be submitted to the department at the time of application for a permit for a new composting facility. The owner or operator must provide continuous coverage for closure and submit proof of compliance, including an updated closure cost estimate, with each permit renewal until released from this requirement by the department.

**102.10(3) *Use of one financial assurance instrument for multiple permitted activities.*** Composting facilities required to maintain financial assurance pursuant to any other provisions of 567—Chapters 100 through 102 may satisfy the requirements of this rule by the use of one financial assurance instrument listed in 102.10(5).

**102.10(4) *Financial assurance amounts required.*** The estimate submitted to the department must be certified by an Iowa-licensed professional engineer and must account for at least the following factors determined by the department to be minimal necessary costs for closure:

- a. Transportation costs, which include the cost to load the material, and total tip fees to properly dispose of the maximum tonnage of received materials that could be managed and stockpiled by the compost facility. Also included shall be the costs of properly removing any wastewater held at the facility.

b. The costs for maintaining financial assurance pursuant to any other provisions of 567—Chapters 100 through 123, if any, in accordance with 102.10(3).

**102.10(5) *Acceptable financial assurance instruments.*** The financial assurance instrument shall be established in an amount equal to the cost estimate prepared in accordance with 102.10(4) and shall not be canceled, revoked, disbursed, released, or allowed to terminate without the approval of the department. The language of the financial assurance instrument shall meet the criteria in 567—subrule 101.708(3). Financial assurance shall be provided by one of the following options:

- a. Trust fund pursuant to 567—subrule 101.707(1).
- b. Surety bond, pursuant to 567—subrule 101.707(2).
- c. Letter of credit, pursuant to 567—subrule 101.707(3).
- d. Corporate guarantee pursuant to 567—subrule 101.707(7).
- e. Local government guarantee pursuant to 567—subrule 101.707(8).
- f. Local government dedicated fund pursuant to 567—subrule 101.707(9).

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.11(455D) Compost operator certification.**

**102.11(1) *General requirements.*** To become a certified compost facility operator, an individual shall complete a compost operator training course that has been approved by the department, then apply for certification by the department. An operator certified by another state may have reciprocity subject to approval by the department.

**102.11(2) *Course approval.*** To be approved by the department, an operator training course for a certified compost facility operator must have at least 24 contact hours and must address the following areas at a minimum:

- a. Basic principles of composting and decomposition.
- b. Composting methods.
- c. Site design and equipment.
- d. Characteristics of various types of feedstocks and recipe development.
- e. Construction of windrows or piles.
- f. Monitoring and troubleshooting.
- g. Uses and markets for compost.
- h. Applicable laws and regulations.

**102.11(3) *Form.*** Applications for certification shall be made on a form prescribed by the department.

**102.11(4) *Duration and renewal of certification.*** The department shall issue all compost operator certifications on a three-year cycle. This rule shall take effect relative solely to certifications on July 1, 2026, and a new cycle shall start at that time. The department may issue a certification at any time during a three-year cycle. Certificates are valid through the expiration date listed on the certification, which shall be the end of the most current cycle.

a. An application for renewal is due prior to expiration of certification. If a certificate holder fails to apply for renewal within 30 days following expiration of the certificate, the applicant must then apply for a new certification in accordance with 102.11(1).

b. To renew a certification, a certified operator must earn eight contact hours during each three-year period, except that a first-time certified operator is not required to earn contact hours prior to the first renewal of the certification. The certificates of operators not fulfilling the continuing education requirements will be void 30 days after the expiration date.

c. All activities for which contact hours will be granted must be related to compost and pre-approved by the department.

d. The certified operator is responsible for submitting an application for renewal that includes documentation of the contact hours completed during the renewal period.

e. The department may, in individual cases involving hardship or extenuating circumstances, grant an extension of time of up to three months within which the applicant may fulfill the contact hour requirements. Hardship or extenuating circumstances include documented health-related confinement or other circumstances beyond the control of the certified operator that prevent attendance at the required activities. All requests for extensions must be made prior to expiration of certification.

*f.* The deadline to apply for renewal and to fulfill continuing education requirements under this rule shall automatically be extended a length of time equal to any period in which the operator served honorably on active duty in military service within the three-year renewal cycle.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.12(455D) Temporary operation without a certified operator.** Notwithstanding any other provision of these rules, the department in its sole discretion may authorize, in writing, a facility to temporarily operate without a certified operator for a period of six months when a certified operator is no longer available to the facility. The facility must make a request in writing to the department, explaining why a temporary authorization is needed and identify the efforts that will be made to obtain a certified operator.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.13 to 102.99** Reserved.

These rules are intended to implement Iowa Code section 455D.9.

## DIVISION II LAND APPLICATION OF WASTE

**567—102.100(455B,17A) Purpose; applicability; compliance.** This division shall apply to the land application of solid waste and industrial sludge, except as follows. It does not apply to sewage or other wastewater regulated by 567—Chapters 60 through 63, domestic septage, sewage sludge, animal manure, animal bedding, crop residue, waste registered as a fertilizer or soil conditioner with IDALS, waste registered as a liming agent with IDALS, or finished compost.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.101(455B) Definitions.** The definitions in Iowa Code section 455B.301 and 567—Chapter 100 shall apply to this division.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.102(455B) Land application of water supply sludge.**

**102.102(1)** Sludges generated from water supply treatment may be applied to lawns, gardens, flower beds, or similar areas associated with residential use and crops that may be consumed by humans without prior heating or processing that are commonly available to the public in raw form (e.g., sweet corn, lettuce, carrots, asparagus, squash).

**102.102(2)** Land application of sludges generated from water supply treatment are exempt from the remainder of this division.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.103(455B) Waste eligible for land application.** Material must conform with the following to land applied pursuant to this division.

**102.103(1)** The material must either meet the definition of solid waste or be a sludge resulting from commercial or industrial wastewater treatment, water supply treatment, or air pollution control facility.

**102.103(2)** The waste shall not contain constituents in excess of the levels specified below measured on a dry weight basis.

| <u>Constituents</u> | <u>Levels</u> | <u>Cumulative Loading Rate</u> |            |
|---------------------|---------------|--------------------------------|------------|
| Arsenic             | 41 mg/kg      | 41 kg/ha                       | 36 lb/ac   |
| Cadmium             | 39 mg/kg      | 39 kg/ha                       | 34 lb/ac   |
| Chromium            | 1200 mg/kg    | 3000 kg/ha                     | 2670 lb/ac |
| Copper              | 1500 mg/kg    | 1500 kg/ha                     | 1335 lb/ac |
| Lead                | 300 mg/kg     | 300 kg/ha                      | 267 lb/ac  |
| Mercury             | 17 mg/kg      | 17 kg/ha                       | 15 lb/ac   |

| Constituents | Levels     | Cumulative Loading Rate |            |
|--------------|------------|-------------------------|------------|
| Molybdenum   | 75 mg/kg   | 75 kg/ha                | 66 lb/ac   |
| Nickel       | 420 mg/kg  | 420 kg/ha               | 373 lb/ac  |
| Selenium     | 36 mg/kg   | 100 kg/ha               | 89 lb/ac   |
| Zinc         | 2800 mg/kg | 2800 kg/ha              | 2490 lb/ac |

**102.103(3)** If the waste has other toxic constituents, the toxic constituents shall not be in excess of levels where there is a threat to human, animal, or plant life as determined by the department.

**102.103(4)** The waste does not have a sodium absorption ratio in excess of levels where there is a threat to plant life. If high sodium absorption ratios are suspected, analytical testing may be required.

**102.103(5)** If the waste contains pathogens, the waste must be treated to reduce pathogen content by methods specified in 567—Chapter 67 prior to land application.

**102.103(6)** The waste shall not have direct process stream contact with or originate from a process that may release the following organic compounds.

- Petroleum products,
- Organic solvents,
- Pesticides,
- Pharmaceuticals,
- Polychlorinated biphenyls (PCBs).

**102.103(7)** The waste assimilates and would not be readily present in a visual analysis of a random sample collected two years following application.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

#### 567—102.104(455B) Application site restrictions.

**102.104(1)** The waste shall not be applied to soils classified as sand, loamy sand, or silt on the United States Department of Agriculture (USDA) textural classification chart, 1951 Soil Survey Manual, USDA Handbook No. 18.

USDA textural classification chart. Sand size particles, 2-0.05 mm; silt-sized particles, 0.05-.002 mm; and clay sized particles, less than .002 mm.

**102.104(2)** Land application sites shall have soil pH maintained above 6.0 unless otherwise specified in a permit. If the soil pH is below these levels, it is acceptable to use agricultural lime to increase the pH to an acceptable level prior to land application of sludge.

**102.104(3)** The waste shall not be applied to ground having greater than 9 percent slope unless specific permit conditions specify otherwise.

**102.104(4)** If the waste is applied to land subject to flooding more frequently than once in ten years, the waste shall be injected or shall be applied to the surface and mechanically incorporated into the soil within 48 hours.

**102.104(5)** Application on frozen or snow-covered ground shall be limited to areas of less than 5 percent slope unless specific permit conditions specify otherwise.

**102.104(6)** Waste shall not be applied within 200 feet of an occupied residence nor within 500 feet of a well that is part of a public water supply, as defined in 567—subrule 40.2(1), or 200 feet of all other wells.

**102.104(7)** Waste shall not be applied to land used for growing crops that may be consumed by humans without prior heating or processing or those that are commonly available to the public in raw form unless crops grown on the land are not harvested for at least 14 months following land application.

**102.104(8)** A site shall not be used for land application of waste from more than one generator in the same growing season or for a spring land application after land application the previous fall.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.105(455B) Operating requirements.** All land application projects shall be operated as follows.

**102.105(1)** If solid waste is applied within 200 feet of a stream, lake, sinkhole, or tile line surface intake located downgradient of the land application site, it shall be injected or applied to the surface and mechanically incorporated into the soil within 48 hours of application.

**102.105(2)** If waste is applied to land where crops being grown will be grazed by or fed to livestock within two months of waste application, or where cereal grains will be harvested within two months of waste application, the waste shall be injected or shall be applied to the surface and mechanically incorporated into the soil unless specific permit conditions specify otherwise. The general public shall not be given access to the disposal site during waste disposal and for a minimum of two months after waste disposal operations have ceased.

**102.105(3)** If the waste is putrescible, it shall be injected or mechanically incorporated within 24 hours or otherwise managed to prevent runoff and odor problems.

**102.105(4)** Land application shall not take place during or immediately preceding expected rains or other occasions when runoff may result unless subsurface injection methods are utilized. Additionally, land application shall not take place during periods of high groundwater conditions or during flooding.

**102.105(5)** The application of nitrogen available from the waste and any other sources shall not exceed the acceptable agronomic application rates for the vegetation to be grown on the site over the next year. The total application of phosphorus and potassium shall not exceed the acceptable agronomic application rates for the site and crops involved.

**102.105(6)** Waste may be staged prior to application at the application site pursuant to the following.

- a. Putrescible waste shall not be staged for more than 48 hours.
- b. Non-putrescible waste shall not be staged for longer than two weeks.
- c. Waste shall not be staged within 200 feet of an occupied residence nor within 500 feet of a well that is part of a public water supply, as defined in 567—subrule 40.2(1), or 200 feet of all other wells.
- d. The waste shall not be staged on soils classified as sand, loamy sand, or silt on the USDA textural classification chart shown in 567—subrule 102.104(6).
- e. Runoff from the waste must be controlled at all times.
- f. If weather or extenuating circumstances prevent application from taking place, the generator must notify the department.

**102.105(7)** When waste is supplied to other persons for land application, the generating facility shall do the following:

- a. Inform the recipient of the applicable requirements of the waste disposal program.
- b. If the generating facility determines that the recipient is not complying with applicable requirements of the waste disposal program or the land application criteria, the generating facility shall work with the recipient to obtain compliance with the requirements. If subsequent compliance cannot be achieved, the generating facility shall not supply additional waste to the person.

c. Inform all persons involved in waste disposal operations of the potential health hazards associated with waste disposal, including informing them of the cautions and recommended practices that should be followed to minimize these hazards.

**102.105(8)** The generator shall maintain records of the following:

- a. Analysis of waste to document compliance with 102.103(2).
- b. Records of land application for each site, which shall be maintained for five years; be made available to the department upon request; and include dates of application, application rate, and quantity of waste applied.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.106(455B) General permit.** Land application of waste at a rate that does not exceed two dry tons per acre per year and that meets the requirements of 567—102.103(455B), 567—102.104(455B), and 567—102.105(455B) may be land applied in accordance with this rule.

**102.106(1)** The maximum application rate shall be reduced if analysis of the waste indicates that a two ton per acre per year rate would provide nutrient levels in excess of crop nutrient requirements or would provide heavy metals concentrations in the soil at levels that may be detrimental to crop production or hazardous to human health.

**102.106(2)** All material must be staged on ground eligible for land application.

**102.106(3)** Before the initial land application, the applicator must notify the department in writing. This notice shall contain the following:

- a. The name and address of the generator of the waste.
- b. Contact information for the responsible official.
- c. A description of the waste including the process to generate it, chemical analyses showing compliance with 102.103(2), and any additional analysis that the department may require to adequately define the waste. Chemical analysis shall be done by a laboratory certified pursuant to 567—Chapter 83.
- d. Quantities of waste to be land applied.
- e. Application rate.
- f. Legal description of the site.
- g. An aerial photo with the site outlined and any areas ineligible for application marked off.
- h. Number of acres eligible for land application at the site.
- i. The landowner's name and contact information.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.107(455B) Permit.** Prior to any land application of solid waste not exempted in 567—102.102(455B) or 567—102.106(455B), a solid waste management permit pursuant to 567—subrule 100.4(2) must be obtained by the waste generator.

**102.107(1) Permit application.** In lieu of the permit application requirements in 567—subrule 100.5(1), all permit applications for land application shall include:

- a. The name, address, email, and telephone number of:
  - (1) The permit applicant (generator of the waste).
  - (2) Official responsible for operation of the project.
  - (3) Agronomist affiliated with the project.
- b. Type, source, and expected volume or weight of waste to be handled per day, week, and year.
- c. Information on the source, quantity, and method of treatment of the waste prior to disposal.
- d. Chemical analyses showing compliance with 102.103(2) and any additional analysis that the department may require to adequately define the waste. Chemical analysis shall be done by a laboratory certified pursuant to 567—Chapter 83.
- e. A detailed description of the land application process to be used, including the method and rate of application, and information indicating how the operational requirements of 567—102.105(455B) will be met.
- f. A table of all application sites that includes the name of the site, legal description, county, acres eligible for land application, and the name of the landowner.
- g. For each land application site, the following:

- (1) An aerial photograph of sufficient scale to show all homes, buildings, lakes, ponds, watercourses, wetlands, dry runs, roads, and other applicable details.
- (2) A map or aerial photo showing all wells located within 500 feet of the site.
- (3) A soil map.
- (4) Water table levels of the site, including the frequency and duration of any expected high-water table or flooding.
- (5) Proof of the applicant's ownership of the site or legal entitlement to use the site for the disposal of waste.
- h.* Other information as required by the department.

**102.107(2) Reporting requirements.**

*a.* A permit holder shall have a certified professional agronomist perform an annual inspection of all sites utilized in the previous year to ensure soil properties and constituents being applied are suitable and will not exceed agronomic rates for the crop that will be produced the following summer. The agronomist will review soil test results to ensure that the application of the waste will not cause buildup of nutrients in the soil. The results of this inspection shall be submitted to the department's main office by April 1 each year.

*b.* A permit holder shall submit an annual report summarizing the records required in 102.105(8) "b" to the department's main office on a form provided by the department. The report will be for July through June and is due by October 1 of each year.

*c.* Sampling and analyses of the permitted waste shall be performed and submitted to the department according to a schedule stipulated in the permit. At a minimum, an analysis shall be submitted with each permit renewal.

**102.107(3) Temporary storage.**

*a.* The permit may allow for storage of stabilized sludge and solid waste at application sites subject to the following conditions:

(1) Waste shall not be stored within 200 feet of an occupied residence nor within 500 feet of a well that is part of a public water supply, as defined in 567—subrule 40.2(1), or 200 feet of all other wells.

(2) The waste shall not be stored on soils classified as sand, loamy sand, or silt on the USDA textural classification chart shown in 102.104(6).

(3) Amount stored may not exceed the amount needed for the next application window for that site.

(4) All material stored must be land applied the next application season.

(5) If weather or extenuating circumstances prevent application from taking place, the applicant must notify the department.

(6) Runoff shall be controlled at all times.

(7) Financial assurance in accordance with 567—102.108(455B) has been obtained.

*b.* The permit may allow for storage of stabilized sludge and solid waste at a consolidation point subject to the following conditions:

(1) Waste shall not be stored within 200 feet of an occupied residence nor within 500 feet of a well that is part of a public water supply, as defined in 567—subrule 40.2(1), or 200 feet of all other wells.

(2) The storage surface shall be made of asphalt, concrete, compacted granular aggregate, clay, or similar relatively impermeable material.

(3) All material stored must be land applied the next application season.

(4) If weather or extenuating circumstances prevent application from taking place, the applicant must notify the department.

(5) Runoff from the waste shall be controlled at all times.

(6) Financial assurance in accordance with 567—102.108(455B) has been obtained.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.108(455B) Financial assurance.** The holder of a solid waste management permit for the land application of wastes that has received authorization to temporarily store waste at the application site(s) or a consolidation point must obtain and submit a financial assurance instrument to the department. The financial assurance instrument shall provide monetary funds for the purpose of properly disposing of or

having a third-party land apply any stored wastes due to the permit holder's failure to properly land apply wastes in accordance with this division and the applicable permit provisions.

**102.108(1) *Proof of compliance.*** Proof of the establishment of the financial assurance instrument and compliance with this rule, including a current closure cost estimate, shall be submitted by at the time of application for a permit to land apply solid wastes. The owner or operator must provide continuous coverage for closure and submit proof of compliance, including an updated closure cost estimate, with each permit renewal thereafter until released from this requirement by the department.

**102.108(2) *Financial assurance amounts required.*** The estimate submitted to the department must be certified by a professional engineer and account for at least the following factors determined by the department to be minimal necessary costs for closure.

*a.* Third-party labor and transportation costs and total tip fees to properly dispose of all solid wastes equal to the maximum storage capacity of all approved storage areas, or

*b.* Third-party labor costs to land apply all solid wastes equal to the maximum storage capacity of all approved storage areas.

**102.108(3) *Acceptable financial assurance instruments.*** The financial assurance instrument shall be established in an amount equal to the cost estimate prepared in accordance with 102.10(4) and shall not be canceled, revoked, disbursed, released, or allowed to terminate without the approval of the department. The language of the financial assurance instrument shall meet the criteria in 567—subrule 101.708(3). Financial assurance shall be provided by one of the following options.

*a.* Trust fund pursuant to 567—subrule 101.707(1).

*b.* Surety bond pursuant to 567—subrule 101.707(2).

*c.* Letter of credit pursuant to 567—subrule 101.707(3).

*d.* Corporate guarantee pursuant to 567—subrule 101.707(7).

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.109 to 102.199** Reserved.

These rules are intended to implement Iowa Code sections 455B.173 and 455B.304.

### DIVISION III LANDFARMING OF PETROLEUM-CONTAMINATED SOIL

**567—102.200(455B) Purpose.** The purpose of this division is to establish rules for the safe and effective remediation and disposal of petroleum-contaminated soil (PCS) through landfarming.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.201(455B) Applicability; compliance.**

**102.201(1)** These rules apply to the landfarming of soils contaminated with biodegradable petroleum products including but not limited to gasoline, diesel fuel, kerosene, jet fuel, motor oil, hydraulic fluid, or some combination thereof. All PCS landfarming activities in which three or more cubic yards of PCS are excavated shall comply with this division. Uncontaminated soil that is excavated during the removal of the PCS shall not be counted toward the three-cubic-yard applicability threshold.

**102.201(2)** These rules do not apply to PCS that is being disposed of at a sanitary landfill.

**102.201(3)** The issuance of a landfarm permit by the department in no way relieves the generator or permit holder of the responsibility of complying with all other local, state, or federal statutes, ordinances, and rules and other applicable requirements.

**102.201(4)** These rules do not apply to hazardous waste.

**102.201(5)** All rules, standards, technical guidance, and other similar legal or technical documents referenced in this division shall be the version of those documents in effect on August 1, 2025, unless otherwise noted in these rules, and except for references to the Iowa Code and Iowa Administrative Code, which shall always be the most recent version unless otherwise noted in these rules.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.202(455B) Definitions.** The definitions set out in Iowa Code section 455B.301 shall be considered to be incorporated by reference in these rules. For the purposes of this division, the definitions found in 567—Chapter 100 shall apply.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.203(455B) Landfarming application permits.**

**102.203(1) Permit required.** PCS shall not be landfarmed without a solid waste management permit for landfarm application from the department pursuant to 567—subrule 100.4(2).

**102.203(2) Landfarm application permit.** Upon issuance of a landfarm application permit, the permit holder is authorized to apply PCS to the land to create one or more landfarms. This permit requires that landfarms be used for only one application of a particular source and type of PCS. This permit requires that no other PCS be applied within 15 feet of the area of land used as a landfarm until the landfarm is closed pursuant to 567—102.211(455B).

**102.203(3) Construction and operation.** Landfarms shall be constructed and operated according to these rules, any plans and specifications approved by the department, and the conditions of the permit. Any approved plans and specifications shall constitute a condition of the permit.

**102.203(4) Duration of permits.** Landfarm application permits shall be issued and may be renewed for a three-year term.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.204(455B) Application information.** To apply for a landfarm application permit, the applicant shall submit the following information to the department in addition to the requirements of 567—subrule 100.5(1):

**102.204(1)** The name, address, and telephone number of:

- a. Owner(s) of the agency.
- b. Individual responsible for recordkeeping and reporting.
- c. An emergency contact person.

**102.204(2)** A plan of operations that complies with the requirements of 567—102.208(455B) and 567—102.210(455B).

**102.204(3)** An emergency response and remedial action plan (ERRAP) pursuant to 567—102.209(455B).

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.205(455B) PCS analysis and characterization.**

**102.205(1) Source identification.** The name and address of the contaminated site from which the PCS originated and the spill or underground storage tank (UST) registration number shall be recorded.

**102.205(2) Type classification.** The PCS shall be classified by type according to the petroleum product's trade name (e.g., gasoline, diesel fuel) or according to the trade names if there is a mixture of petroleum products.

**102.205(3) Chemical testing.** The following analyses shall be performed.

- a. Benzene, toluene, ethylbenzene, and xylene (BTEX) testing. The PCS shall be tested for BTEX.
- b. Total extractable hydrocarbons as diesel (TEH-diesel) testing. The PCS shall be tested for TEH-diesel.
- c. Total metals testing. If the history of the petroleum-contaminated site is known to have included solvents, batteries, leaded fuel, waste oil, or a gas station in operation prior to 1985, then the PCS shall be tested for total Resource Conservation and Recovery Act (RCRA) metals.

**102.205(4) Department-supervised emergency cleanups.** PCS originating from the cleanup of a spill or expedited over-excavation at a tank closure or upgrade under department jurisdiction shall be characterized and tested as follows before being landfarmed. Such PCS may be landfarmed prior to chemical testing, pursuant to the application rate in 102.208(7) and reporting requirements of 567—102.210(455B), if permission is obtained from department emergency response personnel or the department field office with jurisdiction over the landfarm site.

**102.205(5) *Other cleanups.*** PCS not originating from a department-supervised emergency cleanup pursuant to 102.205(4) shall be characterized and tested as follows before being landfarmed. PCS originating from a cleanup pursuant to 567—Chapter 135 may utilize those test results as applicable.

**102.205(6) *Tar balls.*** PCS that has the potential to produce tar balls shall not be landfarmed. Such PCS may be disposed of in a sanitary landfill.

**102.205(7) *Other tests.*** The department may require testing of the PCS for other chemicals of concern.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.206(455B) Site exploration and suitability requirements for landfarms.** All landfarms shall meet the following site exploration and suitability requirements.

**102.206(1) *Previous use.*** The landfarm applicator shall obtain written confirmation from the site owner of one of the following requirements:

a. That any other landfarm created in the past three years within 15 feet of the proposed landfarm plot has been closed pursuant to 567—102.211(455B).

b. That no area within 15 feet of the proposed landfarm plot has been used as a landfarm in the past three years.

**102.206(2) *Wells.*** PCS shall not be landfarmed or stored within 500 feet of a well that is being used or could be used for human or livestock consumption. The department may also exempt from this requirement extraction wells utilized as part of a remediation system. PCS shall not be landfarmed or stored within 500 feet of an agricultural drainage well.

**102.206(3) *Sinkholes.*** PCS shall not be landfarmed or stored within 500 feet of a sinkhole.

**102.206(4) *Surface waters of the state.*** PCS shall not be landfarmed or stored within 200 feet of a stream, lake, pond, wetland, or other surface water of the state. The department may waive the setback requirement for surface waters that have been constructed for pollution control purposes.

**102.206(5) *Tile lines.*** PCS shall not be landfarmed or stored within 200 feet of a tile line surface intake.

**102.206(6) *Housing and sensitive populations.*** PCS shall not be landfarmed or stored within 200 feet of an occupied residence, recreational area, child care facility, educational facility, or health care facility.

**102.206(7) *Floodplains.*** PCS shall not be landfarmed or stored within a 100-year floodplain.

**102.206(8) *Slope.*** PCS shall not be landfarmed or stored on slopes greater than 5 percent. This requirement may be satisfied by utilizing USDA soil maps.

**102.206(9) *Soil properties for landfarm plot.*** All soils in the landfarm plot of the landfarm shall comply with the following requirements.

a. *USDA textural soil classification.* Soils in the landfarm plot of landfarms shall be clay, sandy clay, sandy clay loam, sandy loam, silty clay, silty clay loam, clay loam, loam, or silt loam as classified by the USDA Textural Classification Chart for soils.

b. *Stones and debris.* Soils in the landfarm plot shall be free of stones and debris larger than four inches in diameter.

c. *Soil pH.* Soils in the landfarm plot shall have a pH greater than or equal to 6 and less than or equal to 9.

d. *Bedrock separation.* The landfarm plot shall have a minimum of six feet of soil over bedrock.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.207(455B) PCS storage areas.** PCS shall be stored on an impervious surface, under a roof of tarp to minimize the infiltration of precipitation, or in an area with minimal potential for stormwater run-on.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.208(455B) Landfarm operating requirements.** All landfarms shall comply with the following operating requirements.

**102.208(1) *Standard PCS.*** Only standard PCS may be land applied or stored at a landfarm without a permit amendment from the department.

**102.208(2) Nonstandard PCS.** A permit amendment from the department, pursuant to 567—subrule 100.5(4) shall be obtained for each particular source and type of nonstandard PCS before that PCS may be land applied or stored at a landfarm. The permit amendment application shall include a justification of how the PCS can be safely and effectively remediated by landfarming.

**102.208(3) Saturated or slurry PCS.** PCS in a saturated or slurry condition shall not be applied to the land or stored at a landfarm. PCS in such a condition shall be bulked with other biodegradable materials (e.g., compost, mulch) until it is no longer saturated or in a slurry before it is applied to the land or stored at a landfarm.

**102.208(4) Storage.** PCS shall be stored during the non-landfarm season, except as allowed by 102.208(4). PCS may be stored for up to seven days during landfarm season.

**102.208(5) Non-landfarm season.**

a. PCS shall only be applied to the land during non-landfarm season if the PCS must be applied to the land as part of an emergency cleanup supervised by the department pursuant to 102.205(4) or all of the following conditions exist:

- (1) The landfarm plot is free of snow.
  - (2) The slope of the landfarm plot is less than 3 percent.
  - (3) The PCS is incorporated into the soil as soon as site conditions allow.
- b. There is no precipitation.

**102.208(6) PCS plot requirements.** One application of a particular source and type of PCS may be applied to a landfarm plot. A landfarm may only apply a subsequent application of PCS to a previously utilized landfarm plot if such application is in compliance with the following:

a. The plot has been tested pursuant to 102.205(2)“c”(1), “c”(2), and “c”(3), and the results demonstrate that petroleum constituent concentrations are less than 0.54 mg/kg for benzene, 42 mg/kg for toluene, 15 mg/kg for ethylbenzene, 3800 mg/kg for TEH-diesel, and 0.02 mg/kg for MTBE.

b. A subsequent application of a particular source and type of PCS may not be applied within 15 feet of an area used as a single-use landfarm until the single-use landfarm is closed pursuant to 102.211(2).

**102.208(7) PCS application rates.** PCS shall be land applied at a rate that is as uniform as practical over an area sufficient to satisfy the greater of the following area requirements. However, PCS from an emergency cleanup supervised by the department pursuant to 102.205(4) may instead be land applied at a rate of 162 ft<sup>2</sup> of landfarm area per cubic yard (yd<sup>3</sup>) of PCS, that is as uniform as practical, and in which no layer of unincorporated PCS is thicker than two inches.

a. *Petroleum constituents.* PCS shall be land applied over the largest area required by the following:

(1) PCS contaminated with benzene shall be land applied in accordance with Table 1. The average concentration of benzene in the PCS shall be used to determine the landfarm area (ft<sup>2</sup>) required per cubic yard (yd<sup>3</sup>) of PCS to be land applied. The average concentration of benzene shall be calculated from all soil boring test results that are within the PCS excavation area. The application shall be as uniform as practical over the area required.

| Table 1       |                     |          |                     |
|---------------|---------------------|----------|---------------------|
| 0< mg/kg ≤10  | 81 ft <sup>2</sup>  | 4 inches | 537 yd <sup>3</sup> |
| 10< mg/kg ≤20 | 162 ft <sup>2</sup> | 2 inches | 268 yd <sup>3</sup> |
| 20< mg/kg     | 324 ft <sup>2</sup> | 1 inch   | 134 yd <sup>3</sup> |

(2) PCS that is not contaminated with benzene or MTBE, but is contaminated with toluene, ethylbenzene, xylene, TEH-diesel, or some combination thereof, shall be land applied at a rate of 81 ft<sup>2</sup> of landfarm area per cubic yard (yd<sup>3</sup>) of PCS. The application shall be as uniform as practical, and no layer of unincorporated PCS shall be thicker than four inches.

b. *Total RCRA metals.* PCS that has been tested for heavy metals pursuant to 102.205(1)“c”(3) shall be applied at a rate that is as uniform as practical, that results in no layer of PCS thicker than four inches, and that upon incorporation produces a landfarm soil that satisfies the following requirements. This analysis requires prior testing of background levels of RCRA metals at the proposed landfarm site.

- (1) Total RCRA metals are less than 2,500 milligrams per kilogram (mg/kg).

(2) Any particular concentration of a RCRA metal is less than the appropriate statewide standard for soil developed pursuant to 567—Chapter 105, Division III.

**102.208(8) *Flagging.*** The landfarm plot(s) upon which PCS is land applied shall be delineated with flags for one year after land application or until the landfarm is closed pursuant to 567—102.211(455B), whichever is shorter.

**102.208(9) *Removal of solid waste and rubble.*** All solid waste that is not PCS shall be removed and properly disposed of prior to the landfarming of PCS. All rubble, stones, and debris larger than four inches in diameter, or that interfere with incorporating and turning the PCS, shall also be removed and properly disposed of.

**102.208(10) *PCS incorporation.*** PCS shall be incorporated into the soil by tilling, disking, or other suitable means within 48 hours of being land applied or before the next precipitation event, whichever is sooner. PCS shall not be incorporated deeper than 12 inches.

**102.208(11) *Turning the PCS.*** After incorporation, the PCS shall be turned by tilling, disking, or other suitable means at least once per month for the first three months during landfarm season.

**102.208(12) *No crops for consumption.*** Landfarms shall not grow crops within 15 feet of a landfarm plot that is flagged pursuant to 102.208(7). Crops for human and livestock consumption may be grown at a single-use landfarm after the landfarm plot is no longer required to be flagged pursuant to 102.208(7).

**102.208(13) *Removal of PCS from a landfarm.*** PCS shall not be removed from a landfarm until the landfarm is closed pursuant to 567—102.211(455B) or the following conditions are met:

a. One sample from each 2,500 ft<sup>2</sup> (e.g., 50-foot × 50-foot area) of landfarm plot is analyzed pursuant to 102.205(2)“c”(1), “c”(2), and “c”(3). A minimum of one sample per landfarm plot shall be obtained. All samples shall be obtained from between the top two to six inches of soil.

b. The results of the tests in 102.211(2)“a” demonstrate that petroleum constituent concentrations for benzene, toluene, ethylbenzene, TEH-diesel, and MTBE are below the detection limits required by 567—Chapter 135.

c. Records of the lab results, amount of PCS removed, and the exact final location of the PCS shall be maintained by the landfarm.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

#### **567—102.209(455B) Emergency response and remedial action plans.**

**102.209(1) *ERRAP.*** An ERRAP as described in 567—100.14(455B) shall be maintained as part of the landfarming application permit.

**102.209(2) *Access.*** ERRAP documents shall be readily available. Landfarm applicators shall ensure that employees have either physical or digital access to the ERRAP document when conducting landfarm operations.

**102.209(3) *Employee training.*** At a minimum, all employees shall receive annual training sufficient to understand and utilize ERRAP documents.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

#### **567—102.210(455B) Reporting and recordkeeping requirements.**

**102.210(1) *Reporting.*** The following information shall be submitted to the department on a form provided by the department. All reporting submissions shall include the name, address, and telephone number of the landfarm and permit holder, as well as the permit number.

a. *Storage notification.* Landfarms shall submit the following information to the department and department field office with jurisdiction over the landfarm before receipt of the PCS for storage; however, at least 30 days’ notification is encouraged. PCS storage information from an emergency cleanup supervised by the department pursuant to 102.205(4), however, shall be reported within seven days of the emergency cleanup.

(1) The date the PCS is expected to be delivered for storage at the landfarm.

(2) Where the PCS will be stored at the landfarm.

(3) The spill number, UST registration number, and leaking UST (LUST) number, as applicable.

b. *Land application notification.* Landfarms shall submit the following information to the department and department field office with jurisdiction over the landfarm before land application; however, at least

30 days' notification is encouraged. PCS information from an emergency cleanup supervised by the department pursuant to 102.205(4), however, shall be reported within seven days of the emergency cleanup.

(1) The date the PCS is expected to be applied to the land. If the PCS is not applied on this date, the department shall be informed of the actual application date.

(2) A physical address or parcel identification number for the landfarm location, a legible topographic map or aerial photo, a USDA soil map with key, and a map of the 100-year floodplain illustrating and labeling where the PCS is to be applied.

(3) Application rate calculations pursuant to 102.208(6).

(4) The spill number, UST registration number, and LUST number, as applicable.

*c. PCS analysis and characterization.* Information on the analysis and characterization of the PCS pursuant to 567—102.205(455B) shall be submitted to the department before receipt of the PCS for storage or land application; however, at least 30 days' notification is encouraged. PCS analysis and characterization information from an emergency cleanup supervised by the department pursuant to 102.205(4), however, shall be reported within 60 days of the emergency cleanup.

**102.210(2) Recordkeeping.** All landfarm applicators shall maintain records of all information related to compliance with this division and the permit throughout the life of the landfarm and for three years after landfarm closure pursuant to 567—102.211(455B). This information shall be available to the department upon request. Applicable information includes but is not limited to the following material.

*a.* Permit application information pursuant to 567—102.204(455B).

*b.* PCS analysis and characterization pursuant to 567—102.205(455B).

*c.* Site suitability information pursuant to 567—102.206(455B).

*d.* Specific design requirements pursuant to 567—102.207(455B).

*e.* Operations information pursuant to 567—102.208(455B), in particular, application rate calculations pursuant to 102.208(6).

*f.* ERRAP documents pursuant to 567—102.209(455B).

*g.* Reports submitted pursuant to 102.210(1).

*h.* Closure information pursuant to 567—102.211(455B).

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.211(455B) Landfarm closure.**

**102.211(1)** A landfarm shall be closed three years after the application of PCS unless otherwise authorized or required by this rule.

**102.211(2)** A landfarm may be closed if, at least six months after the application of PCS, documentation has been submitted and acknowledged in writing by the department that each landfarm plot has been tested as follows.

*a.* One sample from each 10,000 ft<sup>2</sup> (e.g., 100-foot × 100-foot area) of landfarm plot is analyzed pursuant to 102.205(2)“c”(1), “c”(2), and “c”(3). A minimum of one sample per landfarm plot shall be obtained. All samples shall be obtained from between the top two to six inches of soil.

*b.* The results of the tests in 102.211(2)“a” demonstrate that petroleum constituent concentrations are less than 0.54 mg/kg for benzene, 42 mg/kg for toluene, 15 mg/kg for ethylbenzene, 3800 mg/kg for TEH-diesel and 0.02 mg/kg for MTBE.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.212(455B) Financial assurance requirements for landfarms.** The holder of a sanitary disposal project permit for a landfarm must obtain and submit a financial assurance instrument to the department in accordance with this rule. The financial assurance instrument shall provide monetary funds for the purpose of conducting closure activities at the landfarm plot(s) due to the permit holder's failure to properly close the site as required in accordance with 567—102.211(455B) within 30 days of permit suspension, termination, revocation, or expiration.

**102.212(1) No permit without financial assurance.** The department shall not issue or renew a permit to an owner or operator of a landfarm until a financial assurance instrument has been submitted to and approved by the department.

**102.212(2) *Proof of compliance.*** Proof of the establishment of the financial assurance instrument and compliance with this rule, including a current closure cost estimate, shall be submitted at the time of application for a permit for a landfarm application permit. The owner or operator must provide continuous coverage for closure and submit proof of compliance, including an updated closure cost estimate, with each permit renewal thereafter until released from this requirement by the department.

**102.212(3) *Financial assurance amounts required.*** The estimate submitted to the department must be certified by a professional engineer and account for at least the following factors determined by the department to be minimal necessary costs for closure pursuant to 567—102.211(455B):

*a.* Third-party costs to conduct soil sampling and properly clean all equipment and storage areas at the landfarm plot(s).

*b.* If PCS is temporarily stored on site prior to incorporation, then this estimate shall include third-party labor and transportation costs and total tip fees to properly dispose of all PCS equal to the maximum storage capacity on site.

**102.212(4) *Acceptable financial assurance instruments.*** The financial assurance instrument shall be established in an amount equal to the cost estimate prepared in accordance with 102.212(3) and shall not be canceled, revoked, disbursed, released, or allowed to terminate without the approval of the department. Financial assurance may be provided by one of the following options:

- a.* Trust fund pursuant to 567—subrule 101.707(1).
- b.* Surety bond pursuant to 567—subrule 101.707(2).
- c.* Letter of credit pursuant to 567—subrule 101.707(3).
- d.* Corporate guarantee pursuant to 567—subrule 101.707(7).
- e.* Local government guarantee pursuant to 567—subrule 101.707(8).
- f.* Local government dedicated fund pursuant to 567—subrule 101.707(9).

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.213 to 102.299** Reserved.

These rules are intended to implement Iowa Code sections 455B.301A, 455B.304, and 455B.383.

DIVISION IV  
BENEFICIAL USE

**567—102.300(455B) Purpose.** The purpose of this division is to establish rules for determining when the utilization of a solid by-product constitutes beneficial use rather than the disposal of solid waste. Solid by-products determined by the department not to be a solid waste through a beneficial use determination will not be subject to regulation as disposal of solid waste. This division encourages the utilization of solid by-products, consistent with accepted engineering practices, when such utilization improves, or at a minimum does not adversely affect, human health and the environment.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.301(455B) Applicability and compliance.**

**102.301(1)** These rules establish a method for predetermination by the department that a proposed utilization of a solid by-product will not be regulated as solid waste disposal when utilized in the manner approved by the department. These rules apply to industrial, commercial, and institutional generators and users or proposed users of solid by-products that before receiving a beneficial use determination by the department were disposing of solid by-products as solid waste. These rules encourage environmentally sound materials management practices to maximize the use of recoverable materials and to foster resource recovery. The department reserves the authority to modify or revoke any beneficial use determination authorized under these regulations.

**102.301(2)** These rules do not pertain to organic materials composting. Division I of this chapter contains rules pertaining to organic materials composting.

**102.301(3)** These rules do not pertain to the land application of solid waste. Division II of this chapter contains rules pertaining to the land application of solid waste.

**102.301(4)** These rules do not pertain to the beneficial use of waste tires. Division V of this chapter contains rules pertaining to the beneficial use of waste tires.

**102.301(5)** These rules do not pertain to alternative cover material. 567—Chapter 101, Division II, contains rules pertaining to sanitary landfills utilizing or desiring to utilize solid by-products as alternative cover material.

**102.301(6)** These rules do not apply to solid by-products that are directly incorporated into a manufacturing process to make a commercial product unless the use of a solid by-product as an ingredient in an industrial process or as a substitute for a commercial product may present a threat of harm to human health and the environment that is similar to the harm that would occur from the improper disposal of the solid by-product.

**102.301(7)** Beneficial use determinations granted by the department before September 23, 2026, shall remain in effect unless specifically addressed by these rules or by written notification pursuant to 567—102.307(455B).

**102.301(8)** The issuance of a beneficial use determination by the department affirms that the proposed use is not subject to regulation as solid waste disposal to the extent the use and solid by-product conforms to the beneficial use application and determination. The issuance of a beneficial use determination by the department in no way relieves the generator or user of the responsibility of complying with all other local, state, and federal statutes, ordinances, and rules or other applicable requirements.

**102.301(9)** Respondents in actions to enforce these regulations who raise a claim that a certain solid by-product is not a solid waste or is conditionally exempt from regulation shall demonstrate that there is a known market or disposition for the solid by-product and that they meet the terms of the exemption. Documentation (such as contracts showing that a second person or entity utilizes the solid by-product as an ingredient in a production process) is needed to demonstrate that the solid by-product is not a solid waste or is exempt from regulation.

**102.301(10)** To ensure that all solid by-product applications do not pose a threat to human health and the environment, the department has the authority to determine if a proposed use is beneficial and to approve or deny applications if such a benefit is not evident. Proposed beneficial uses in which the primary purpose is as a land disposal mechanism, and any beneficial use would be incidental in nature, will be denied in accordance with 567—102.308(455B).

**102.301(11)** All rules, standards, technical guidance, and other similar legal or technical documents referenced in this division shall be the version of those documents in effect on August 1, 2025, unless otherwise noted in these rules, and except for references to the Iowa Code and Iowa Administrative Code, which shall always be the most recent version unless otherwise noted in these rules.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.302(455B) Definitions.** For the purposes of this division, the definitions in 567—Chapter 100 and Iowa Code section 455B.301 shall apply.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.303(455B) Universally approved beneficial use determinations.** The following solid by-products are hereby approved as the beneficial use of a solid by-product when utilized in the specific manners listed provided that such utilization is in compliance with 567—102.305(455B) and 567—102.306(455B). Unless an entity is otherwise notified by the department pursuant to 567—102.307(455B), such utilization does not require further approval from the department.

**102.303(1) *Asphalt shingles.*** Asphalt shingles that are certified, consistent with federal regulations (Reference: Appendix E, Subpart E, 40 CFR Part 763, Section 1, Polarized Light Microscopy), as not containing more than 1 percent asbestos may be used as follows:

- a. Subbase for hard-surface pavement construction.
- b. Road surfacing granular material.
- c. Asphalt pavement material.

**102.303(2) *Cement kiln dust.*** Cement kiln dust may be used as follows:

- a. Subbase for hard-surface pavement construction.
- b. A soil amendment pursuant to 21—Chapter 44 and other IDALS rules.

- c. A stabilizer for manure and waste sludge.
- d. For soil stabilization purposes.
- e. Structural fill or fill material.

**102.303(3)** *Coal combustion residual.*

- a. Coal combustion fly ash, bottom ash, or boiler slag may be used as follows:

- (1) Subbase for hard-surface pavement construction.
- (2) For soil stabilization purposes.
- (3) Structural fill or fill material.

- b. Coal combustion bottom ash or boiler slag may also be used as follows:

- (1) Sandblasting or other abrasive.
- (2) Granules for roofing shingles.

c. Coal combustion flue gas desulfurization, flue gas pollution control by-products, including but not limited to lime, activated carbon and synthetic gypsum, may be used as follows:

- (1) For soil stabilization purposes.

(2) Soil amendment pursuant to 21—Chapter 44 or an agricultural liming material pursuant to 21—Chapter 43 and other IDALS rules.

**102.303(4)** *Foundry sand.* Foundry sand from steel and ferrous casting may be used as follows:

- a. Leachate control drainage material at a sanitary landfill.
- b. Subbase for hard-surface pavement construction.
- c. Structural fill or fill material.
- d. Emergency flood control use for sandbags.
- e. Sandblasting or other abrasive.

**102.303(5)** *Glass.* Uncontaminated, unleaded glass may be used as follows:

- a. Leachate control drainage material at a sanitary landfill.
- b. Subbase for hard-surface pavement construction.
- c. Structural fill or fill material.
- d. Sandblasting or other abrasive.
- e. Filter media.

**102.303(6)** *Gypsum and gypsum wallboard.* Gypsum and gypsum wallboard that have not been treated to be water-resistant or flame-retardant may be used as a soil amendment pursuant to 21—Chapter 44 and other IDALS rules.

**102.303(7)** *Lime.* Lime produced as a by-product of public water supplies may be used as a soil amendment pursuant to 21—Chapter 44 or an agricultural liming material pursuant to 21—Chapter 43 and other IDALS rules.

**102.303(8)** *Lime kiln dust.* Lime kiln dust may be used as follows:

- a. Subbase for hard-surface pavement construction.
- b. A soil amendment pursuant to 21—Chapter 44 or an agricultural liming material pursuant to 21—Chapter 43 and other IDALS rules.

- c. A stabilizer for manure and waste sludge.
- d. For soil stabilization purposes.
- e. Structural fill or fill material.

**102.303(9)** *Paper mill sludge.* Uncontaminated, dewatered paper mill sludge may be used as follows:

- a. A fuel or energy source.
- b. Bulking agent or carbon source for composting.
- c. Animal bedding.

**102.303(10)** *Rubble.* Uncontaminated rubble such as dirt, stone, brick, or similar inorganic materials may be used for beneficial fill, landscaping, excavation, or grading or as a substitute for conventional aggregate at places other than a sanitary disposal project. Asphalt, however, shall not be approved for any of these uses if such use will cause the asphalt to be placed in a waterway or wetland, in any waters of the state, or within a floodplain.

**102.303(11)** *Sandblasting abrasives.* Sandblasting abrasives that do not contain heavy metal-based paint may be used as follows:

- a. Subbase for hard-surface pavement construction.
- b. Structural fill or fill material.
- 102.303(12)** *Wastewater filter sand.* Wastewater filter sand free of pathogens may be used as follows:
  - a. Subbase for hard-surface pavement construction.
  - b. Leachate control drainage material at a sanitary landfill.
  - c. Structural fill or fill material.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.304(455B) Application requirements for beneficial use determinations.** Unless the beneficial use is approved pursuant to 567—102.303(455B), applicants will need to submit the following information on a form prescribed by the department. The department may request that additional information be submitted in order to make a beneficial use determination. The department may also require specific conditions on a beneficial use determination and issue a temporary determination on a trial basis.

A generator, user, or proposed user of a solid by-product may apply to the department in writing for a beneficial use determination. If the department finds the application information to be incomplete, then it shall notify the applicant in writing of that fact and of the specific deficiencies and return the application materials to the applicant within 30 days of such notification. The applicant may reapply without prejudice.

**102.304(1)** The name, address, email, and telephone number of:

- a. Owner of the site where the project will be located.
- b. Applicant for the beneficial use determination.
- c. Official responsible for the operation of the project.
- d. Professional engineer (P.E.) licensed by the state of Iowa and retained for the project, if any. The department may, at its sole discretion, require the applicant to retain a professional engineer for the project or specific parts thereof in order to obtain a beneficial use determination.
- e. Agency to be served by the project, if any.
- f. Responsible official of agency to be served, if any.

**102.304(2)** Scaled map or aerial photograph locating the boundaries of the proposed beneficial use site, if applicable, and identifying:

- a. North and other principal compass points.
- b. Section lines and other legal boundaries.
- c. Zoning and land use within 750 feet.
- d. Homes and buildings within 750 feet.
- e. Haul routes to and from the site, including load limits or other restrictions on those routes.

**102.304(3)** A description of the solid by-product under review and its proposed use, including the process that will be used to transport and handle the solid by-product, including any equipment.

**102.304(4)** The chemical and physical characteristics of the solid by-product under review.

**102.304(5)** A demonstration that there is a known or reasonably probable market for the intended use of the solid by-product under review by providing one or more of the following:

- a. A contract to purchase or utilize the solid by-product for the use proposed.
- b. A description of how the solid by-product will be used.
- c. A demonstration that the solid by-product complies with industry standards and specifications for that product.
- d. Applications submitted by persons other than the generator must be accompanied by written consent for the proposed use from the generator.
- e. Other documentation that a market for the solid by-product exists.

**102.304(6)** A demonstration that the proposed use of the solid by-product will not adversely affect human health and the environment. On a form prescribed by the department, the demonstration may include but is not limited to a toxicity characteristics leaching procedure analysis and total metals testing of a representative sample of the solid by-product.

**102.304(7)** A solid by-product management plan pursuant to 102.305(3).

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.305(455B) Requirements for beneficial use determinations.**

**102.305(1)** *Solid by-products applied to land.* Unless otherwise approved by the department, all beneficial uses, including those listed in 567—102.303(455B) other than uncontaminated rubble and soil, shall meet the following requirements if the beneficial use entails the solid by-product being used as a fill material, structural fill, or subbase for hard-surface pavement construction or for soil stabilization purposes:

*a.* Leachate characteristics of the solid by-product to be measured by the toxicity characteristics leaching procedure (TCLP, Environmental Protection Agency (EPA) Method 1311) and be consistent with federal regulations (Reference: Table 1, Subpart C, 40 CFR 261, Maximum Concentration of Contaminants for the Toxicity Characteristic).

*b.* Leachate characteristics of the solid by-product to be measured by the synthetic precipitation leaching procedure (SPLP, EPA Method 1312) and shall be less than or equal to ten times the maximum contaminant levels (MCL) for drinking water (Reference: Subpart G, 40 CFR 141, National Primary Drinking Water Regulations). Applicants may limit the SPLP analytes to total metals for drinking water.

*c.* Total metals testing of the solid by-product (Total Metals, EPA Method 6010) shall comply with the department's current statewide standards for soil (reported on dry weight basis) pursuant to 567—Chapter 105, Division III. Levels shall be consistent with the statewide standards for soil or the naturally occurring (i.e., background) levels of the soil, whichever are greater.

*d.* The department may establish additional constituent standards from those outlined in this rule for a solid by-product. The department will review regulatory limits on a quarterly basis and post updates to the department website. It is the responsibility of each generator, applicant and end user to ensure solid by-products comply with the most current regulatory limits.

*e.* The solid by-product shall produce a material that has a pH:

(1) Greater than or equal to 5 and less than or equal to 8 if the solid by-product may be used as growing media either now or in the future.

(2) Greater than or equal to 5 and less than 12 if the solid by-product is specifically intended not to be used as growing media either now or in the future. In this category, solid by-products with a pH equal to or greater than 10 but less than 12 shall be used only in areas where direct physical contact by humans for long periods of time is not expected to occur.

(3) For applications where only the surface may serve as growing media either now or in the future, then at a minimum the top three feet shall have a pH greater than or equal to 5 and less than or equal to 8. Solid by-products below the top three feet shall have a pH greater than or equal to 5 and less than or equal to 12.

*f.* The solid by-product shall not be placed in a waterway or wetland or any waters of the state or extend below or within five feet of the high water table.

*g.* The solid by-product shall not be placed within a 100-year floodplain unless in accordance with all local and department regulations, including 567—Chapter 71.

*h.* The solid by-product shall not be placed closer than 200 feet to a sinkhole or to a well that is being used or could be used for human or livestock water consumption.

*i.* The solid by-product shall not be placed closer than 100 feet of any property line unless written consent is obtained from the adjacent landowner(s).

*j.* The solid by-product shall not be putrescible.

*k.* Any project utilizing a solid by-product being applied to land, not including uncontaminated rubble and soil, that has not received a beneficial use determination shall be presumed to constitute the illegal disposal of solid waste.

**102.305(2)** *Determination.* The department may make a determination that a solid by-product that has received approval to be used beneficially ceases to be a solid waste if it is used in accordance with the terms and conditions of the beneficial use determination. Unless otherwise determined for the particular solid by-product under review, the point at which a solid by-product ceases to be a solid waste occurs when it is used in a manufacturing process to make a product, used as an effective substitute for a commercial product, or used as a fuel for energy recovery.

**102.305(3) Solid by-product management plans.** Recipients of beneficial use determinations granted pursuant to 567—102.304(455B) and those beneficial uses listed in 102.305(1) shall develop and maintain a solid by-product management plan (SBMP) that satisfies the following:

- a. Lists the source(s) of the solid by-product.
- b. Outlines procedures for periodic testing (not less than semiannually) of the solid by-product to confirm the proposed use continues to be adequately protective of human health and the environment and that the solid by-product continues to possess the physical characteristics and chemical properties that make it suitable for the approved beneficial use. Testing results from a certified laboratory pursuant to 567—Chapter 83 are to be submitted as part of the SBMP on a form prescribed by the department.
- c. Provides a description of storage procedures including:
  - (1) Storage location(s).
  - (2) Maximum anticipated inventory, including dimensions of any stockpiles.
  - (3) Run-on and runoff controls, which may include a storm water National Pollutant Discharge Elimination System (NPDES) permit.
  - (4) Management practices to minimize uncontrolled dispersion of the solid by-product.
  - (5) Maximum storage time, not to exceed six months unless authorized in writing by the department.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.306(455B) Recordkeeping and reporting requirements.** Recipients of beneficial use determinations granted pursuant to 567—102.304(455B) and those beneficial uses listed in 102.305(1) shall comply with the following recordkeeping and reporting requirements.

**102.306(1) Recordkeeping.** An entity subject to this rule must maintain all records related to the solid by-product management plan for a minimum duration of five years after project completion.

**102.306(2) Reporting.** Unless otherwise directed by the department, solid by-product management plans are to be filed with the department's central office as follows:

- a. An entity subject to this rule shall submit to the department a copy of the solid by-product management plan prior to reuse of the solid by-product, whenever that plan is revised, and within 60 days of the end of the calendar year, whichever is earlier.
- b. An entity subject to this rule whose solid by-product is being applied to land pursuant to 102.305(1) shall also submit to the department the following information for each beneficial use project or activity:
  - (1) The location of the project.
  - (2) The tons of solid by-product utilized for the project.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.307(455B) Revocation of beneficial use determinations.** The department may revoke any beneficial use determination if it finds one or more of the following.

**102.307(1)** The matters serving as the basis for the department's determination were incomplete or incorrect or are no longer valid.

**102.307(2)** The department finds that there has been a violation of any law, rule, permit, or other authorization in its jurisdiction.

**102.307(3)** The department has reasonable cause to suspect, based upon information not previously considered or available as part of the application, demonstrating that management of the solid by-product under the approved beneficial use determination may present a significant risk to or adverse effect on human health and the environment.

**102.307(4)** The solid by-product is used in a manner inconsistent with the terms under which it was determined to no longer be a solid waste. The department may consider the placement, dumping, or other use of a solid by-product in a manner inconsistent with the beneficial use determination to be illegal disposal of solid waste, and the applicant, generator, distributor, or end user may be subject to enforcement action by the department pursuant to Iowa Code section 455B.307.

**102.307(5)** The applicant has requested the revocation of the determination or other legal grounds exist for such revocation.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.308(455B) Denial of beneficial use determination applications.** For applications that are found to be inconsistent with these regulations by the department, the following conditions apply.

**102.308(1)** The department will notify the applicant in writing of the denial, including supporting rationale, within 90 days of receipt of application.

**102.308(2)** Solid by-products for which a beneficial use determination is denied by the department are considered solid waste and remain subject to all applicable state and federal statutes, ordinances, and regulations.

**102.308(3)** Applicants may appeal the denial of a beneficial use determination to the department within 60 days of notification of denial. Such appeal shall be made in a manner consistent with 7—Chapter 2506 and 561—Chapter 2506.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.309 to 102.399** Reserved.

These rules are intended to implement Iowa Code section 455B.304(19).

DIVISION V  
WASTE TIRE MANAGEMENT

**567—102.400(455D) Purpose.** The purpose of this division is to establish guidelines for the proper management of waste tires, including collection, hauling, storage, processing, disposal, and beneficial reuse of waste tires and processed waste tire materials. This division shall not be construed to exempt a waste tire stockpile site, processing facility, or waste tire hauler from compliance with more stringent local ordinances, fire codes, or other applicable statutes. All rules, standards, technical guidance, and other similar legal or technical documents referenced in this division shall be the version of those documents in effect on August 1, 2025, unless otherwise noted in these rules, and except for references to the Iowa Code and Iowa Administrative Code, which shall always be the most recent version unless otherwise noted in these rules.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.401(455D) Definitions.** For the purposes of this division, the definitions in 567—Chapter 100 and Iowa Code sections 455D.11 and 455D.11I shall apply. In addition, “stockpile” as used in this division shall mean the storage or collection of waste tires in anticipation of final disposal.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.402(455D) Registration of waste tire haulers.** A waste tire hauler shall register with and obtain a certificate of registration from the department in accordance with this division before hauling waste tires in Iowa. Waste tire haulers that pick up tires within Iowa or that bring waste tires to Iowa for disposal, stockpiling, or processing shall be required to register.

**102.402(1) *Registration exemption.*** A waste tire hauler shall not be required to register under the following circumstances:

*a.* The waste tire hauler only travels through the state with waste tires as a part of interstate commerce and does not pick up, deposit, transfer, store, or dispose of any waste tires in Iowa.

*b.* The waste tire hauler is a municipal, county, state, or other public agency; the vehicles used for transport of the waste tires are owned and licensed by the public agency; and the agency hauls no more than 10,000 waste tires within a 12-month period.

**102.402(2) *Annual registration.***

*a.* A waste tire hauler registration shall be valid for one year, and the waste tire hauler must annually renew the waste tire hauler registration in order to continue to provide waste tire hauling services within the state.

*b.* Initial registration of a waste tire hauler shall be valid upon the date of issuance by the department and shall be effective for a minimum 12-month period thereafter, with expiration of the initial registration to occur on either January 1 or July 1, whichever date occurs most closely after the initial 12-month registration period.

c. Subsequent annual renewal of the waste tire hauler's registration shall then occur on either January 1 or July 1, subject to the date of the original expiration as referenced in 102.402(2) "b."

**102.402(3) Registration form.** A waste tire hauler shall submit the following information on a form prescribed by the department for application for or renewal of registration as a waste tire hauler.

a. The name of the waste tire hauler and any other names under which the waste tire hauler may do business.

b. The principal address of the waste tire hauler and any other address at which the waste tire hauler may do business.

c. A business telephone number.

d. The name and address of the principal officer of a corporate waste tire hauler or the principal owner or owners of a waste tire hauler operating a proprietorship or partnership.

e. The following information for each motor vehicle used by the waste tire hauler for hauling waste tires:

(1) The name and address of the owner of the vehicle.

(2) The vehicle identification number of the vehicle.

(3) The year, make, and model of the vehicle.

(4) The license plate number of the vehicle.

(5) The name of the state in which the vehicle is registered.

f. A statement that the waste tire hauler agrees to comply with the vehicle identification requirements contained in this division.

g. The name of the permitted facility for waste tire disposal, stockpiling, or processing or of another site of end use where the waste tires will be transported.

h. A statement that the waste tire hauler shall pay all amounts due to any individual or group of individuals when due for damages caused by improper disposal of waste tires by the waste tire hauler or the waste tire hauler's employee while acting within the scope of employment.

i. A statement that the waste tire hauler agrees to notify the department within 30 days of any change in the information contained in the registration form.

j. The signature of the waste tire hauler.

**102.402(4) Waste tire hauler registration fee.** An application for initial registration or renewal shall be accompanied by a fee of \$50.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

#### **567—102.403(455D) Waste tire hauler bond.**

**102.403(1)** An application for registration or renewal shall not be approved by the department until the waste tire hauler has provided a surety bond in the sum of a minimum of \$150,000, as provided for in Iowa Code section 455D.111(6).

**102.403(2) Bond requirements.**

a. The bond shall be on a form prescribed by the department, and executed by a surety company authorized by the commissioner of insurance to do business in Iowa. The bond provided to the department shall be an original, or copy thereof.

b. The surety shall name the state of Iowa as the obligee for the bond.

c. The bond shall be continuous in nature until canceled by the surety. The surety shall provide at least 30 days' notice in writing to the waste tire hauler and the department in the event of any intent to cancel the bond and the effective date of the cancellation.

d. The waste tire hauler shall provide the department with a statement from the surety with each waste tire hauler registration renewal application, noting that the bond is paid and current for the annual period for which the waste tire hauler has applied for registration renewal.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.404(455D) Marking of equipment.** The following information shall be displayed on each side of equipment used by a registered waste tire hauler for the hauling of waste tires in letters and figures large enough to be read easily at a distance of 50 feet and in a color in contrast to the background.

1. The name of the registered waste tire hauler under whose authority the equipment is being operated.
2. The address of the registered waste tire hauler (city and state).
3. The registration number of the waste tire hauler, as assigned by the department. The hauler shall apply the letters and symbol “IA TH#” preceding the assigned registration number.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.405(455D) Disposition of waste tires collected.**

**102.405(1)** All tires collected by a waste tire hauler for which a fee has been collected or is to be charged shall be defined as solid waste and shall be regulated as such.

**102.405(2)** Upon receipt of waste tires from a person or business, the waste tire hauler shall handle the waste tires as follows:

- a. The waste tires shall be directly transported to a tire collector, tire processor, or waste tire stockpile site as permitted and approved by the department or applicable local or state agencies.
- b. The waste tires must be transported to a permitted site within 72 hours of initial pickup from the generator of the waste tires.
- c. The waste tire hauler may not establish or operate any intermediate stockpiling, waste sorting, transfer, or processing activities regarding the waste tires collected unless such activities occur at a facility or site for which a waste tire stockpile permit or processing permit has been issued in accordance with Iowa Code section 455D.11, 567—102.407(455D), and 567—102.409(455D).

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.406(455D) Waste tire hauler reporting requirements.** A registered waste tire hauler shall submit a semiannual report to the department on a form prescribed by the department. The report shall provide the department with appropriate information to ensure that waste tires recovered by the waste tire hauler have been handled properly for disposal or processing. Failure of a registered waste tire hauler to submit a timely report will result in denial of the waste tire hauler’s renewal of registration.

**102.406(1)** *Reporting period.* A waste tire hauler shall submit semiannual reports to the department according to the following schedule:

- a. For waste tires collected during the six-month period beginning January 1 through June 30, the hauler shall submit a report by the following September 1.
- b. For waste tires collected during the six-month period beginning July 1 through December 31, the hauler shall submit a report by March 1 of the following year.

**102.406(2)** *Information required.* The semiannual report shall include the following information. All waste tire quantities determined by count or weight shall be reported in passenger tire equivalents.

- a. Quantity of waste tires collected by the waste tire hauler from within Iowa for the reporting period.
- b. Quantity of waste tires that are brought to Iowa by the waste tire hauler from out-of-state sources for the reporting period.
- c. Final disposition of all the waste tires collected during the reporting period by listing each tire collector, tire processor, waste tire stockpile site, or other beneficial site of end use, as approved by the department, and the total quantities of waste tires that the hauler has delivered to each.

**102.406(3)** *Documentation and recordkeeping.* A waste tire hauler shall keep appropriate records, including but not limited to receipts, invoices, or manifests, to document all quantities of waste tires hauled and disposed of by the waste tire hauler for the reporting period. These records shall be kept by the waste tire hauler for a minimum of three years and shall be available for audit or inspection at the request of the department.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.407(455D) Waste tire stockpiling.**

**102.407(1)** *Quantity limitations.*

- a. No business or individual shall stockpile more than 500 passenger tire equivalents without obtaining a permit for a waste tire stockpile pursuant to 102.407(2).

b. Businesses or individuals may temporarily stockpile up to 1,500 passenger tire equivalents without obtaining a waste tire stockpile permit, subject to the following requirements:

(1) The waste tires are stockpiled only in a mobile container, truck, or trailer provided or serviced by a registered waste tire hauler.

(2) The waste tires are removed by a registered waste tire hauler or delivered to a permitted waste tire processor at least every 60 days.

(3) The waste tire generator has a written copy of a contract or service agreement for waste tire disposal services from a registered waste tire hauler.

c. A permitted sanitary disposal project shall be allowed to stockpile up to 1,500 passenger tire equivalents without a permit if the waste tires are removed at least every 120 days and are stockpiled in a manner to minimize the collection of water.

d. Persons who use waste tires for an approved beneficial use shall not be required to obtain a waste tire stockpile permit, subject to their compliance with the provisions of 567—102.411(455D).

**102.407(2)** *Waste tire stockpile permits.*

a. Any tire collector, business, or individual stockpiling more than 500 passenger tire equivalents on any one site must obtain a waste tire stockpile permit. An authorized vehicle recycler, as licensed by the Iowa department of transportation, may store up to 3,500 passenger tire equivalents without a waste tire stockpile permit; any storage beyond this amount shall require full compliance with this subrule. This subrule is applicable to the indoor, outdoor, and underground storage of waste tires. If the site cannot meet the conditions to obtain a waste tire stockpile permit, all waste tires must be removed from the site and properly disposed of within 30 days of notification by the department.

b. Any tire collector, business, or individual seeking to construct a waste tire stockpile under this subrule must obtain a permit from the department prior to initiating operations. The permit shall be issued to the owner of the site or the designated tire collector that will be operating the stockpile.

c. Waste tire stockpile permits shall have an annual fee of \$850, payable to the department upon the application for a permit, and due annually beginning each July 1 thereafter at the rate of \$850. Permit fees shall not be prorated. The permit shall be valid for a period of three years from date of issuance. Failure to remit the annual renewal fee to the department shall be cause for revocation pursuant to 567—100.13(455B,455D).

d. Application for a permit shall be on a form prescribed by the department and include, at a minimum, the following:

(1) The name, address, and telephone number of the individual who directly owns the stockpile site.

(2) The name, address, and telephone number of the tire collector at the stockpile site, if different from the owner.

(3) A scaled map showing all areas proposed to be used for the stockpiling of waste tires, all property boundaries of the site, and the location of all buildings and major improvements on the site and within 300 feet of the property boundary.

(4) A vector control plan to prevent infestations of mosquitoes and rodents for aboveground storage. The plan shall be prepared by a firm that provides professional vector management services. Upon request, the permittee must provide documentation to show implementation and monitoring of the approved vector control plan.

(5) A site closure plan describing the actions that would be taken to properly dispose of all waste tire materials at the site 30 days prior to any intent to discontinue operations, so that upon discontinuance of operations, no violation of waste tire or solid waste disposal laws will exist.

(6) An emergency response and remedial action plan, developed and implemented according to 567—100.14(455B). The applicant shall provide documentation that an opportunity for input and review of the plan was extended to the local fire department and local emergency management coordinator.

(7) A financial assurance instrument in compliance with 567—102.410(455D).

(8) A certified check for \$850 made payable to the Iowa department of natural resources.

**102.407(3)** *Permitted stockpiling requirements.*

a. A permitted waste tire stockpile site in an open area shall meet the following minimum permit conditions:

- (1) The site shall not contain more than 250,000 passenger tire equivalents.
- (2) A single waste tire pile shall not contain more than 50,000 cubic feet of waste tires.
- (3) The vertical dimension of a waste tire pile shall not exceed ten feet.
- (4) A single waste tire pile shall not be more than 100 feet in length.
- (5) The surface area covered by a waste tire pile shall not exceed 5,000 square feet; the pile may not be constructed upon any waste tire materials or other flammable materials.
- (6) A 50-foot fire lane must be maintained between any two waste tire piles.
- (7) All waste tire piles shall be located at least 50 feet from any building.
- (8) Trees and brush shall be cleared within 50 feet of any waste tire pile.
- (9) Combustible materials or volatile chemicals shall not be stored within 50 feet of any waste tire pile unless stored in approved fire-resistant containers or cabinets.
- (10) A 20-pound Class ABC dry chemical fire extinguisher shall be available within 100 feet of any one portion of the waste tire stockpile area.
- (11) The site must be graded to prevent any standing pools of water and to limit the runoff and run-on of precipitation in all areas where waste tires are stockpiled.
- (12) A waste tire pile must be at least 200 feet from any well, lake, pond, river, stream, sinkhole, or tile line surface intake unless appropriate grading, or the construction of a barrier, dike, or berm, is completed to intercept surface water flows that may impact such interceptors. This distance may then be reduced to 50 feet.
- (13) The stockpile site must be secured by a fence or barrier of a minimum of six feet in height to impede unauthorized vehicle and personal access. All gates and entry points shall be secured and locked when site personnel are not present.
- (14) No open burning of any type shall be allowed at the permitted stockpile site. All fueling of vehicles and equipment and any other work or activity that may release sparks or flame shall be conducted at least 50 feet from any waste tire stockpiling area.
- (15) Signs shall be posted every 100 feet on site, placed for visibility of personnel on site, that state: "Open burning on-site prohibited." The perimeter of the site shall be posted with signs every 100 feet, placed for visibility to those offsite, that state: "Highly flammable materials on-site. Burning in area not recommended."
- (16) All waste tire piles shall be located at least 300 feet from any property line, street, or public right-of-way.
  - b.* A permitted waste tire stockpile site in an enclosed area shall meet the minimum permit conditions in 102.407(3) "a"(2) through "a"(6), as well as the following:
    - (1) To qualify as an enclosed area, the area must be enclosed in a structure with a permanent roof and lateral protection to prevent precipitation from accumulating within the waste tires.
    - (2) An enclosed stockpiling structure shall not contain more than 50,000 passenger tire equivalents.
    - (3) Combustible materials other than waste tires or volatile chemicals shall not be stored in a structure permitted for waste tire stockpiling unless stored in approved fire-resistant containers or cabinets.
    - (4) A 20-pound Class ABC dry chemical fire extinguisher shall be available within 50 feet of any one portion of the waste tire stockpiling area.
    - (5) The structure must be secured from unauthorized access.
    - (6) No open burning of any type shall be allowed at the permitted stockpile site. All fueling of vehicles and equipment and any other work or activity that may release sparks or flame shall be conducted at least 50 feet from any waste tire stockpiling area. The exterior of the enclosed stockpiling area shall be posted with signs, placed every 100 feet, that state: "Highly flammable materials stored inside. Burning on-site prohibited."

**102.407(4) Reporting requirements.** The holder of a permit for a waste tire stockpile facility shall submit a semiannual report to the department on a form prescribed by the department. The report shall state the following:

- a.* Quantity of waste tires stockpiled at the facility at the time of reporting determined by count or weight and reported in passenger tire equivalents.
- b.* Quantity of waste tires received from in-state sources for the reporting period.

- c. Quantity of waste tires received from out-of-state sources for the reporting period.
- d. For any waste tires removed from the permitted waste tire stockpile facility during the reporting period, quantity given by equivalent count or weight of such waste tires removed. Documentation shall be provided to denote how the reported quantity of tires were disposed of at a permitted facility, processed, or reused.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.408(455D) Used tires.**

**102.408(1)** *Used tire storage.* A used tire other than a waste tire shall be stored in a manner that provides for the following:

- a. Prevention of the collection of water, dirt, or debris within the tire.
- b. Organized storage through stacking, rows, and sorting that provides for accurate descriptions and counts of the types and sizes of tires.
- c. Storage conforms to applicable local and state fire codes.

**102.408(2)** *Quantity limitations.* Used tires stored for more than one year without documentation of active resale or reuse, of tire inventory in a proportion equal to 75 percent of the amount stored, shall be considered waste tires and shall be subject to the applicable waste tire stockpiling and disposal rules of this division.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.409(455D) Waste tire processing.**

**102.409(1)** *Waste tire processing permits.*

a. Any business or individual operating a tire processing facility shall obtain a waste tire processing permit prior to initiating operations. The permit shall be issued to the owner of the site or the individual that will be operating the waste tire processing facility.

b. A permitted sanitary disposal project that accepts waste tires to cut, grind, or compact only for final disposal shall not be required to obtain a waste tire processing permit. Such facilities shall not store any cut or shredded waste tire materials for more than 30 days prior to final disposal.

c. Businesses or individuals operating mobile waste tire processing equipment shall be required to obtain a waste tire processing permit. The permit shall authorize the operator to provide waste tire processing services statewide; however, mobile operations shall not be allowed to store any processed or whole waste tires at any facility or site owned or operated by the permittee unless specifically authorized in writing by the department.

d. Businesses or individuals who cut, grind, or compact for disposal waste tires generated directly from operations at their own on-site manufacturing operation or vehicle or equipment service facility shall not be required to obtain a waste tire processing permit provided all waste tire materials processed on site are disposed of at least every 30 days at a permitted facility.

e. Processing permits shall have an annual fee of \$850, payable to the department upon the application for a permit, and due annually beginning each July 1 thereafter at the rate of \$850. Permit fees shall not be prorated. The permit shall be valid for a period of three years from date of issuance. Failure to remit the annual renewal fee shall be cause for revocation pursuant to 567—100.13(455B,455D).

f. A permitted waste tire processing facility shall have a site closure plan. The plan shall describe the actions that would be taken to properly dispose of all waste tire materials, in whole or processed form, at the site 30 days prior to any intent to discontinue operations so that, upon discontinuance of operations, no violation of waste tire or solid waste disposal laws exist.

g. A permitted processing facility shall have an emergency response and remedial action plan, developed and implemented according to 567—100.14(455B). The applicant shall provide documentation that an opportunity for input and review of the plan was extended to the local fire department and local emergency management coordinator.

h. A permitted waste tire processing facility shall obtain financial assurance in accordance with 567—102.410(455D), as necessary.

i. Application for a permit shall be on a form prescribed by the department and include, at a minimum, the following:

(1) The name, address, and telephone number of the individual who directly owns the tire processing facility.

(2) The name, address, and telephone number of the operator of the waste tire processing facility, if different from the owner.

(3) The type of processing operations to be conducted, including descriptions of processing equipment and its hourly capacity, operating hours of the facility, and types of processed tire materials to be produced.

(4) A scaled map showing all areas proposed for waste tire stockpiling and processing operations, all property boundaries of the site, and the location of all buildings and major improvements on the site and within 300 feet of the property boundary.

(5) A site closure plan as referenced in 102.409(1) “f.”

(6) An emergency response and remedial action plan as referenced in 102.409(1) “g.”

(7) A certified check for \$850 made payable to the Iowa Department of Natural Resources.

(8) A financial assurance instrument as referenced in 102.409(1) “h.”

**102.409(2) Permitted processing requirements.** A permitted waste tire processing facility shall meet the following minimum permit requirements.

a. The site must be graded to prevent any standing pools of water and to limit the runoff and run-on of precipitation in all areas where waste tires are stockpiled or processed tire material is staged prior to sale.

b. The processing facility site must be secured by a fence or barrier of a minimum of six feet in height to impede unauthorized vehicle and personal access. All gates and entry points shall be secured and locked when site personnel are not present.

c. No open burning of any type shall be allowed at the permitted waste tire processing facility. All fueling of vehicles and equipment and any other work or activity that may release sparks or flame shall be conducted at least 50 feet from any waste tire stockpiling area.

d. Signs shall be posted every 100 feet on site, placed for visibility of personnel on site, and state: “Open burning on-site prohibited.” The perimeter of the site shall be posted with signs every 100 feet, placed for visibility to those offsite, that state: “Highly flammable materials on-site. Burning in area not recommended.”

**102.409(3) Preprocessed whole waste tire stockpiling.**

a. Permitted stockpiling of whole waste tires on site prior to processing shall be limited to the quantity of waste tires that the facility has the ability to process within a three-day period. This quantity shall be determined by multiplying the actual number of working hours that processing is normally to occur during a typical three-day period by 80 percent of the manufacturer’s specifications of hourly capacity of the processing equipment. After one year of the facility’s operation, documented actual hourly production shall be used for this permit determination in lieu of the manufacturer’s equipment specifications.

b. A permitted waste tire processor may stockpile an additional three-day capacity of preprocessed whole waste tires, above the initial three-day capacity, using the same quantity determination as stated in 102.409(3) “a,” subject to the tire processor’s obtaining and maintaining financial assurance for these additional waste tires to be stockpiled prior to processing in accordance with 567—102.410(455D).

c. Under no circumstance shall a permitted waste tire processor be allowed to stockpile more than 75,000 preprocessed whole waste tires, measured as passenger tire equivalents, through any combination of processing performance or financial assurance. All waste tires on site, including those stored indoors or outdoors or in trucks, trailers, or mobile cages, shall be counted in determining compliance with this subrule.

d. Any single waste tire shall not be stockpiled at the processing facility for more than 30 days before the tire is processed.

e. Preprocessed whole waste tires stockpiled outdoors shall comply with 102.407(3) “a”(2) through “a”(16), and any waste tires stockpiled in trucks, trailers, or mobile containers must be at least ten feet from any property line or building.

f. Indoor stockpiling of whole waste tires shall not be allowed within 20 feet of any waste tire processing or handling equipment. All waste tires being actively unloaded and fed into processing equipment, including those being off-loaded from trucks, trailers, or mobile containers, shall be cleared at least 20 feet away from the processing equipment by the end of the last working shift of the day. Any

remaining indoor stockpiling shall comply with the requirements of 102.407(3)“b”(3) through “b”(6) and the following:

- (1) No more than 25,000 passenger tire equivalents shall be stockpiled indoors.
- (2) Combustible materials or volatile chemicals shall not be stored within 25 feet of any waste tire stockpile area unless they are stored in approved containers pursuant to applicable fire codes.
- (3) A 20-pound Class ABC dry chemical fire extinguisher shall be available within 50 feet of any one portion of indoor tire stockpile area.
- (4) The stockpiling structure must be secured from unauthorized access.

**102.409(4)** *Processed waste tire storage.*

a. Storage of processed waste tire materials at a waste tire processing facility shall be limited to the volume of material in aggregate that the processor manufactures within a consecutive 60-day period, using the facility’s daily average capacity for processing whole waste tires as determined in 102.409(3)“a.” The department shall have the final authority for determining the allowable quantities of processed tire materials to be stored.

b. Under no circumstances shall the equivalent of more than 500,000 processed tires, or 5,000 tons of material, be stored at the permitted waste tire processing site.

c. All processed waste tire material at the site of processing shall be stored as follows:

(1) Processed tires shall be stored in piles no more than 15 feet in height, 100 feet in length, and 50 feet in width and shall contain no more than 75,000 cubic feet of product by volume.

(2) A 50-foot fire lane must be maintained between piles of processed tire material, with the base of the lane kept free from the accumulation of waste tire-derived residuals or materials or other debris.

(3) All processed waste tire material shall be stored at least 50 feet from any property line, street, public right-of-way, or building.

(4) Trees and brush shall be cleared within 50 feet of the storage of all processed waste tire material.

(5) A 20-pound Class ABC dry chemical fire extinguisher shall be available within 100 feet of any one portion of processed waste tire stockpile area.

d. For indoor storage of more than 5,000 cubic feet of processed waste tire material, the material shall be stored on concrete floors and all retaining walls, bins, barriers, and roofing material for the material storage shall be constructed of nonflammable materials.

e. The processor must demonstrate a reasonable market demand for all types and quantities of processed product stored at the waste tire processing facility. Market demand for processed waste tire products shall be demonstrated by the processor through at least one of the following criteria:

(1) Active contracts, purchase orders, or supply agreements with an end user, noting quantities of material required by the end user, specifications of the quality of the product required by the end user, and monthly or annual demand of product by the end user from the processor. This information shall be made available for review by the department as required to determine compliance with this subrule.

(2) Historic, ongoing demand for product by an end user or type of end user within the state or surrounding region.

(3) Information and evidence that any proposed new product or use for processed waste tires produced by the tire processor will be marketed in a timely fashion, with sufficient demand and consumption by end user markets.

f. The department shall have the final authority in determining storage limitations, including prohibition, for processed waste tire products when active markets are not evident from information provided by the waste tire processor.

**102.409(5)** *Reporting requirements.* The holder of a permit for a waste tire processing facility shall submit a semiannual report to the department on a form prescribed by the department. The report shall state the following:

- a. Quantity of waste tires received by the facility during the reporting period.
- b. Quantity of waste tires received by the facility from in-state sources.
- c. Quantity of waste tires received by the facility from out-of-state sources.
- d. Quantity of unprocessed waste tires on hand at the facility at the time of reporting.

*e.* Quantity of waste tires processed and delivered to end users during the reporting period, by product type, with determinations of quantities of product delivered to identified in-state and out-of-state markets or sites.

*f.* Quantity of processed tire material currently stored at the facility, by product type.

**102.409(6)** *Disposal of solid wastes.*

*a.* All waste materials, residuals, and scraps derived from waste tire processing operations shall be regulated as solid waste. These materials include but are not limited to tire bead rings, metal wire, synthetic fibers, and cording.

*b.* All of these solid wastes must be disposed of at least every 60 days at a permitted sanitary disposal project, scrap recycler, or location, as approved by the department.

*c.* Documentation of the disposal of these solid wastes must be kept at the waste tire processing facility for a period of three years and shall be available for audit or inspection at the request of the department.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.410(455D) Financial assurance requirements.** Permitted waste tire processing sites and waste tire stockpile sites must obtain and submit a financial assurance instrument to the department in accordance with Iowa Code section 455D.11A and this rule.

**102.410(1)** *No permit without financial assurance.* The department shall not issue or renew a permit to an owner or operator of a waste tire processing or stockpile site until a financial assurance instrument(s) has been submitted to and approved by the department, as necessary.

**102.410(2)** *Financial assurance amounts required.*

*a.* Waste tire stockpile sites shall have financial assurance coverage equal to \$2.50 per passenger tire equivalent collected and stockpiled.

*b.* Waste tire processing sites shall have financial assurance coverage equal to \$2.50 per passenger tire equivalent stockpiled above the permitted three-day processing capacity, in accordance with 102.409(3) “*b.*”

**102.410(3)** *Allowable financial assurance instruments.* The instruments used to demonstrate financial assurance must ensure that the funds necessary to properly dispose of any waste tires that may remain at a permitted waste tire stockpile or waste tire processing site due to the owner’s or operator’s failure to properly close the site within 30 days of permit termination, revocation, or expiration. The financial assurance instrument must be legally valid, binding, and enforceable under Iowa law and shall not be canceled, revoked, disbursed, released, or allowed to terminate without the approval of the department. Owners or operators must choose from options in 102.410(3) “*a*” through “*e*,” as provided for in Iowa Code section 455D.11A(3).

*a. Cash.* Cash payments shall be provided by a certified check, made payable to the Iowa Department of Natural Resources.

*b. Surety bond.* An owner or operator may demonstrate financial assurance for closure by obtaining a payment or performance surety bond, which conforms to the requirements of this paragraph. The surety bond agreement shall be on a form prescribed by the department and executed by a surety company authorized by the commissioner of insurance to do business in Iowa. The owner or operator shall provide the department with a statement from the surety with each permit renewal application, noting that the bond is paid and current for the period for which the applicant has applied for permit renewal. The executed surety bond provided to the department shall be an original, or copy thereof, that addresses the following:

(1) The penal sum of the bond must be in an amount at least equal to the amount specified in 102.410(2).

(2) Under the terms of the bond, the surety will become liable on the bond obligation when the owner or operator fails to perform as guaranteed by the bond and upon notice from the department pursuant to 102.410(8) “*e*.”

(3) The owner or operator must also establish a standby trust fund. The standby trust fund must meet the requirements of 102.410(3) “*d*.”

(4) Payments made under the terms of the letter of credit will be deposited by the issuing institution directly into the standby trust fund. Payments from the trust fund must be authorized by the trustee pursuant to 102.410(3) "d"(3).

*c. Letter of credit.* An owner or operator may demonstrate financial assurance for closure by obtaining an irrevocable standby letter of credit, which conforms to the requirements of this paragraph. The letter of credit agreement shall be on a form prescribed by the department, and the issuing institution must be an entity that has the authority to issue letters of credit and whose letter-of-credit operations are regulated and examined by a federal or state agency. The owner or operator shall provide the department with a statement from the issuing institution with each permit renewal application, noting that the letter of credit is paid and current for the period for which the applicant has applied for permit renewal. The executed letter of credit provided to the department shall be an original, or copy thereof, that addresses the following:

(1) The letter of credit must be irrevocable and issued for a period of at least one year in an amount at least equal to the amount specified in 102.410(2).

(2) The provision of funds by the issuer of the letter of credit shall be considered an issuance of a loan to the owner or operator, and the terms of that loan shall be governed by the letter of credit or subsequent agreement between those parties.

(3) A letter from the owner or operator referring to the letter of credit by number, issuing institution, and date; providing the name and address of the facility; and providing the amount of funds assured must be included with the letter of credit submitted to the department.

(4) The owner or operator must also establish a standby trust fund. The standby trust fund must meet the requirements of 102.410(3) "d."

(5) Payments made under the terms of the letter of credit will be deposited by the issuing institution directly into the standby trust fund. Payments from the trust fund must be authorized by the trustee pursuant to 102.410(3) "d"(3).

*d. Trust fund.* An owner or operator may demonstrate financial assurance for closure by establishing a trust fund that conforms to the requirements of this paragraph. The trust fund agreement shall be on a form prescribed by the department, and the trustee must be an entity that has the authority to act as a trustee and whose trust operations are regulated and examined by a federal or state agency. The executed trust fund provided to the department shall be an original, or copy thereof, that addresses the following:

(1) The trust fund shall be in an amount least equal to the amount specified in 102.410(2).

(2) The owner or operator shall provide the department with a statement from the trustee with each permit renewal application, documenting the current value of the trust fund complies with 102.410(2).

(3) The owner or operator, department, or other person authorized to conduct closure may request reimbursement from the trustee for these expenditures as they are incurred. Requests for reimbursement will be granted by the trustee only if sufficient funds are remaining in the trust fund to cover the remaining costs of proper site closure. The owner or operator, or other person authorized to conduct closure, must submit to the department documentation of the justification for reimbursement and verification that reimbursement has been received.

*e. Corporate guarantee.* An owner or operator that satisfies the requirements of this paragraph may demonstrate financial assurance for closure by obtaining a written guarantee.

(1) *Affiliation.* The guarantor must be the direct or higher-tier parent corporation of the owner or operator, a firm whose parent corporation is also the parent corporation of the owner or operator, or a firm with a substantial business relationship with the owner or operator. A certified copy of the executed guarantee must be placed in the facility's operating record along with copies of the letter from the guarantor's chief financial officer and the independent certified public accountant's opinion(s). If the guarantor's parent corporation is also the parent corporation of the owner or operator, the letter from the guarantor's chief financial officer must describe the value received in consideration of the guarantee. If the guarantor is a firm with a substantial business relationship with the owner or operator, this letter must describe this substantial business relationship and the value received in consideration of the guarantee.

(2) Terms of the written guarantee. The guarantee must be effective and all required submissions made to the department prior to the initial receipt of waste tires or before the cancellation of an alternative financial assurance instrument, in the case of closure. The guarantee must provide that:

1. If the owner or operator fails to perform proper closure of a site covered by the guarantee, or fails to obtain alternative financial assurance within 90 days of notice of intent to cancel pursuant to 102.410(8), the guarantor will:

- Perform, or pay a third party to perform, proper closure as required (performance guarantee); or
- Establish a fully funded trust fund as specified in 102.410(3) “d” in the name of the owner or operator (payment guarantee);

2. The guarantee will remain in force for as long as the owner or operator must comply with the applicable financial assurance requirements of this rule unless the guarantor sends prior notice of cancellation by certified mail to the owner or operator and to the department pursuant to 102.410(8).

(3) The department may, based on a reasonable belief that the corporate guarantor may no longer assure the funds of the written guarantee, require at any time the corporate guarantor to provide reports of its financial condition. If a corporate guarantor can no longer assure the funds of the written guarantee, the owner or operator must submit to the department proof of alternative financial assurance within 90-days of written notification by the department.

**102.410(4) *Use of multiple financial assurance instruments.*** An owner or operator may satisfy the requirements of 567—102.410(455D) by establishing more than one financial assurance instrument per site, except that instruments guaranteeing performance rather than payment may not be combined with other instruments. The instruments must be a combination of those instruments outlined in 102.410(3) and must provide financial assurance for an amount sufficient to satisfy the requirements of 102.410(2).

**102.410(5) *Exemption.*** The requirement for financial assurance shall not apply to waste tire stockpiling or processing sites operated by a city or county or operated in conjunction with a permitted sanitary landfill.

**102.410(6) *Benefit of creditors; final judgment.*** The financial assurance instrument shall not be assigned for the benefit of creditors with the exception of the state and shall not be used to pay any final judgment against a permit holder arising out of the ownership or operation of the site.

**102.410(7) *Failure to undertake closure activities.*** The department shall have full rights of access to all funds existing in a permitted facility’s financial assurance instrument(s), at the sole discretion of the department, if the permit holder fails to undertake closure activities after being directed to do so by a final agency action of the department. These funds shall be used only for the purposes of funding closure activities at the site.

**102.410(8) *Financial assurance cancellation and permit suspension.***

a. A financial assurance instrument may be terminated by the owner or operator only if the owner or operator substitutes alternative financial assurance prior to cancellation or if the owner or operator is no longer required to demonstrate financial responsibility in accordance with this rule.

b. A financial assurance instrument shall be continuous in nature until canceled by the financial assurance provider, or until the department gives written notification to the owner or operator and the financial assurance provider, that the covered site has demonstrated compliance with the applicable closure requirements. The financial assurance provider shall give at least 90 days’ notice in writing to the owner or operator and to the department in the event of any intent to cancel a financial assurance instrument, as evidenced by the return receipts.

c. Within 30 days of receipt of a written notice of cancellation of a financial assurance instrument, the owner or operator must provide the department with proof of alternative financial assurance or notice from the issuing institution of withdrawal of the cancellation. If a means of continued financial assurance is not provided within the 30-day time frame, the department shall suspend the permit.

d. The owner or operator shall perform proper closure within 30 days of the permit suspension, termination, revocation, or expiration. For the purpose of this subrule, proper closure means removal of all waste tires and related products from the site or facility through acceptable disposal or processing options.

e. If the owner or operator does not properly close the site within the 30-day period allowed, this shall constitute a failure to perform and the department shall file a claim with the financial assurance

instrument provider to collect the amount of funds necessary to properly close the site prior to the expiration of the 90-day notice period.

*f.* Any financial assurance instrument provided to the department must remain in continuous effect until the department gives written notification to the owner, operator, and financial assurance provider that the covered site has been properly closed. An owner or operator who elects to terminate a permitted activity, whose renewal application has been denied, or whose permit has been suspended or revoked for cause must submit within 30 days of the termination of the permit a schedule for completing proper closure of the terminated activity. Closure completion cannot exceed 180 days from the date of termination of the permit.

*g.* The department may request payment from any financial assurance provider for the purpose of completing proper site closure when the owner or operator declares an economic inability to comply with this rule either by sending written notification to the department or through an action such as but not limited to filing for bankruptcy.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

### **567—102.411(455D) Beneficial use of waste tires.**

**102.411(1)** *Role of the department.* In order to ensure that proposed uses of whole or processed waste tires do not pose a threat to the environment or to the public health, welfare, and safety, the department shall have the authority to determine if a proposed use is beneficial and shall have the authority to approve or deny applications if such a benefit is not evident. Proposed beneficial uses in which the primary purpose of the project is as a land disposal mechanism shall not be approved.

**102.411(2)** *Beneficial uses for whole waste tires.* The following applications shall be considered acceptable beneficial uses for whole waste tires:

- a.* Tire swings, sandboxes, or other equipment for child play areas on residential lots or at schools, care centers, and recreational areas;
- b.* Dock bumpers at vehicle loading/unloading docks or marine docks;
- c.* Crash barriers at racetracks;
- d.* Agricultural uses to hold down covers over hay, silage, and other agricultural commodities. When not in use, the tires should be neatly stacked.

**102.411(3)** *Required notifications and approval for whole waste tire uses.* Prior to the installation or placement of waste tires for a beneficial use as allowed in 102.411(2), the owner or operator of the site of end use shall properly notify or seek approval from the department for the proposed beneficial use under the following circumstances. These circumstances apply to the total combined amount of waste tire material that already is, or is intended to be, used at the site:

- a.* For applications of less than 250 whole waste tires, notification to the department is not required.
- b.* For applications of 250 to 500 whole waste tires, the department shall be notified in writing no less than 30 days prior to the construction or placement of waste tires for a proposed beneficial use, with the following information provided:

- (1) The name, address, and telephone number of the owner, operator, or individual responsible for the beneficial use application at the site of end use;
- (2) The address of the site of beneficial end use;
- (3) The estimated total number of waste tires to be used;
- (4) A description of the beneficial use application;
- (5) A project timeline, including proposed project start and end dates; and
- (6) A statement that explains how the site owner shall properly dispose of such waste tires in the event that the beneficial use is discontinued or dismantled.

*c.* For applications of more than 500 waste tires, approval by the department shall be obtained prior to any such applications. Approval requests shall be made to the department in writing and shall contain all information as requested in 102.411(3)“b,” as well as a scaled plan of the site of end use with areas noted where whole waste tires are to be placed, including locations of the site of end use property lines and the location of any structures within 300 feet of the site of end use.

**102.411(4)** *Prevention of public health risks for whole waste tire uses.* All beneficial uses of whole waste tires as approved in this rule shall have incorporated into their design and construction measures to

prevent the retention and stagnation of water in the event that such conditions are likely to exist. These measures shall include, at a minimum, the piercing or drilling of holes in whole waste tires to allow for water drainage. Such measures shall be designed to minimize risks to public health and safety caused by the breeding of disease-carrying insects and rodents.

**102.411(5)** *Beneficial uses for processed waste tires.* This subrule establishes acceptable beneficial uses for waste tires that have been processed and required design criteria that shall be observed in the placement of processed waste tires at the site of end use. The following applications shall be considered acceptable beneficial uses for processed waste tires:

*a.* On-site wastewater treatment and disposal system construction, to include use of processed waste tires in lateral trenches and as fill to cover distribution pipes under the following conditions:

(1) The on-site wastewater treatment and disposal system is constructed and permitted according to the requirements of 567—Chapter 69;

(2) Processed waste tires used in the system have a minimum dimension of one inch on any one side and a maximum dimension of three inches on any one side; and

(3) The administrative authority responsible for issuance of the permit approves the beneficial use. The authority shall have the sole discretion to deny use of processed waste tires in system construction based on any engineering or design principle concerns.

*b.* Lightweight fill in public roads, public road embankment construction, and other public civil engineering applications if all of the following conditions are met:

(1) The waste tire pieces are of uniform composition and sizing;

(2) The waste tire pieces are not mixed with other solid wastes, vegetation, composted materials, or other processed waste tire products, including separated tire bead wire, steel cording, or nylon fibers;

(3) The waste tires are not placed in direct contact with surface water or groundwater;

(4) The processed waste tires are isolated from overburden materials by a protective membrane or liner to prevent intrusion and settling of overburden; and

(5) An Iowa-licensed professional engineer designs and supervises the incorporation of processed waste tires.

*c.* Structural foundation drainage material used in a project as approved through a local building permit.

*d.* A bulking agent for composting operations at permitted composting facilities, with processed waste tire pieces no larger than three inches on any one side.

*e.* Leachate drainage medium at a permitted sanitary landfill, provided that the medium meets engineering and design requirements for the landfill's operating permit pursuant to 567—Chapter 101, Divisions I through IV.

*f.* Agricultural uses to hold down covers over hay, silage, and other agricultural commodities.

*g.* Traffic control devices for use in public roadway construction projects.

*h.* Portable surfaces manufactured from tire sidewalls or tread.

*i.* Tire sidewalls used for underturf water conservation and turf growth enhancement systems at golf courses.

**102.411(6)** *Requests for approval of other beneficial use applications.* The department shall have the authority to approve or deny requests for beneficial use applications for waste tires and waste tire material not specifically addressed within this rule. Requests for such use determinations shall be made to the department on a form prescribed by the department. The department may request project descriptions and supporting scientific and engineering data to determine if a request for a beneficial use determination is warranted. The department shall have the sole authority to deny a beneficial use request if the department determines that any one of the following conditions exists:

*a.* The requested beneficial use application poses a risk to the environment or to the public health, welfare, and safety;

*b.* The requested beneficial use application is determined to have the primary purpose as a land disposal mechanism, and any beneficial use would be incidental in nature; or

*c.* The requested beneficial use application would not be in accordance with other applicable federal, state, or local laws, regulations, and ordinances.

**102.411(7)** *Storage of waste tires prior to beneficial use.* Waste tires to be used for a beneficial use may be stored at the site of end use, subject to the following requirements:

- a. Such waste tire materials shall be stored for no longer than 60 days prior to the date of application, except for whole waste tires for agricultural uses as specified in 102.411(2)“d.”
  - b. All storage of such waste tire materials shall be conducted in accordance with the uniform fire code and the requirements of 102.409(3) and 102.409(4)“c” as applicable.
  - c. Any storage of waste tires associated with a proposed beneficial reuse project at a site of end use for longer than 60 days without implementation of completion of a beneficial reuse project shall be subject to the waste tire storage permitting requirements as contained in 567—102.407(455D).
- [ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.412 to 102.499** Reserved.

These rules are intended to implement Iowa Code sections 455D.11, 455D.11A, 455D.11B, and 455D.11I.

DIVISION VI  
SPECIAL WASTE AUTHORIZATIONS

**567—102.500(455B,455D) Purpose.** The purpose of this division is to implement Iowa Code section 455B.304 by providing rules for the disposal of special waste.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.501(455B,455D) Applicability.**

**102.501(1)** This division shall apply to generators of special waste and municipal solid waste landfills that accept special waste. No special wastes shall be delivered to or accepted by a MSWLF unless disposal is authorized by a special waste authorization (SWA) issued by the department or is general special waste pursuant to 567—102.508(455B,455D). Wastes for which an SWA has been issued shall be disposed of in accordance with the instructions, conditions, and limitations contained in the SWA. Any amendment requests shall be handled under these rules.

**102.501(2)** All rules, standards, technical guidance, and other similar legal or technical documents referenced in this division shall be the version of those documents in effect on August 1, 2025, unless otherwise noted in these rules, and except for references to the Iowa Code and Iowa Administrative Code, which shall always be the most recent version unless otherwise noted in these rules.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.502(455B,455D) Definitions.** For the purposes of this division, the definitions in Iowa Code section 455B.301 and 567—Chapter 100 shall apply.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.503(455B,455D) Restrictions.** Special wastes regulated by this division shall comply with the following provisions.

**102.503(1)** The waste shall not contain free liquids.

**102.503(2)** The waste shall not be a listed hazardous waste or meet the criteria for characteristic hazardous waste pursuant to the federal Resource Conservation and Recovery Act (RCRA).

**102.503(3)** Wastes with PCB concentrations equal to or greater than 50 ppm shall not be authorized for disposal at an MSWLF unless the waste is defined as PCB bulk product waste in 40 CFR 761.3.

**102.503(4)** Wastes that are used beneficially at an MSWLF are not special wastes.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.504(455B,455D) Issuance of SWA.**

**102.504(1)** Generators of special waste shall initiate an application for a SWA by providing the following to the receiving MSWLF.

- a. Appropriate chemical analysis of the waste,

- b. Description of the process that generates the waste and verification that no RCRA listings in 40 CFR 261 apply,
- c. Toxicity characteristic leaching procedure (TCLP) test results when appropriate, which show that none of the federal limits in 40 CFR Part 261 are exceeded,
- d. Physical form of the waste,
- e. Weight or volume of the waste,
- f. Safety data sheet (SDS) for the waste or for the materials from which the waste is generated, if applicable,
- g. A description of the review of the alternatives to landfilling for each waste for which an SWA is requested, including details as to the extent the waste could be recycled, reduced, or reused so that landfilling is not necessary, and
- h. Any other information requested by the department or the MSWLF.

**102.504(2)** The receiving MSWLF shall review the submitted materials. If after review it is determined that the waste is a special waste and the MSWLF is willing to accept the waste, the MSWLF shall develop a special waste acceptance criteria (SWAC) that includes instructions for disposal of waste. The MSWLF shall submit the SWAC and materials provided by the waste generator to the department for approval.

**102.504(3)** An SWA may be issued for a period not to exceed three years.

**102.504(4)** The holder of an SWA must apply for a renewal prior to the expiration of the SWA.

**102.504(5)** The department may revoke an SWA for cause at any time. Such cause may include but is not limited to evidence that indicates that the characteristics of the authorized quality of the waste vary from the authorized values, evidence that the continued disposal of the waste as authorized may pose a threat to the public health or the environment, or failure to comply with any condition in the SWA or the MSWLF's SWAC.

**102.504(6)** The issuance of an SWA does not obligate any waste disposal facility to accept the waste nor does it preclude the facility from imposing conditions or restrictions other than those listed in the SWA.

**102.504(7)** The issuance of an SWA does not exempt the waste generator or the MSWLF from any local, state, or federal laws or regulations.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.505(455B,455D) MSWLF responsibilities.**

**102.505(1)** MSWLFs shall submit special waste acceptance criteria to the department with each special waste request.

**102.505(2)** MSWLFs are required to ensure that special wastes delivered to the facility conform to the SWAC on file with the department.

**102.505(3)** Each MSWLF shall provide to the department, on a quarterly basis, a report of SWA activity including each SWA number and the quantities of waste disposed of during the reporting period. This information shall be submitted on a form prescribed by the department.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.506(455B,455D) Special waste generator responsibilities.** Special waste generator responsibilities shall include the following in addition to any requirements in the SWA or SWAC.

**102.506(1)** The generator shall adhere to the solid waste management hierarchy unless otherwise approved in an SWA. Alternatives include volume reduction at the source; recycling and reuse, including composting and land application; and other approved techniques of solid waste management including but not limited to combustion with energy recovery and combustion for waste disposal.

**102.506(2)** The generator shall ensure that waste regulated by a SWA arrives at the receiving MSWLF as a separate load and is not commingled with any other waste.

**102.506(3)** The generator shall make a waste determination as required by federal regulations and submit it and analytical results supporting an SWA to the MSWLF at a frequency to be determined by the MSWLF.

**102.506(4)** The generator must contact the designated MSWLF for instructions on delivering the waste and instructions for adhering to the MSWLF's SWAC.

**102.506(5)** The generator shall notify the department and MSWLF, prior to disposal, of any change in the characteristics of the special wastes being disposed.

**102.506(6)** Generators shall notify the MSWLF in writing when a one-time disposal under an SWA has been completed. This requirement is for one-time disposals only.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.507(455B,455D) Additional requirements for specific types of special wastes.**

**102.507(1)** *Sewage sludge.* Sewage sludge, including stabilized septic tank pumpings, shall not be disposed of in a MSWLF if it meets the criteria for Class I or II sewage sludge in 567—Chapter 67, except for use in daily, interim, or final cover according to the approved plan for the landfill. Class III sewage sludge may be disposed of at a MSWLF if stabilized according to 567—Chapter 67.

**102.507(2)** *Infectious waste.* Infectious waste may be placed with municipal solid waste if it is rendered nonpathological; it does not contain free liquids; and sharps are shredded, blunted, granulated, incinerated, or mechanically destroyed. The generator of the infectious waste must notify the waste hauler and the MSWLF that infectious waste is being placed with the regular municipal solid waste and, with the notice, certify that the infectious waste is properly treated in accordance with the requirements of this rule.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.508(455B,455D) Conditions and requirements for the disposal of general special wastes.**

Disposal of general special waste shall be in accordance this rule. An SWA is not required for general special wastes. The following wastes are approved as general special wastes: asbestos-containing material (ACM), stabilized grit, bar screenings, and grease skimmings.

**102.508(1)** *Asbestos-containing material.* The MSWLF permit holder shall comply with the following conditions and requirements whenever asbestos-containing waste materials are accepted and disposed of in an MSWLF.

- a. ACM wastes with 1 percent or less asbestos can be disposed of at the working face.
- b. ACM wastes that contain greater than 1 percent asbestos are regulated under federal asbestos National Emission Standards for Hazardous Air Pollutants (NESHAP) and shall be managed in accordance with federal regulations defined in 40 CFR Part 61, Subpart M. Testing to determine asbestos content shall utilize the method specified in 40 CFR Part 763, Section 1, Subpart F, Appendix A.
- c. Upon arrival at the MSWLF, the transporter shall present to the landfill operator the ACM waste shipment records, which shall include a determination whether the ACM waste is friable or nonfriable, if known. The landfill operator must through visual inspection or testing verify whether the ACM waste is friable or nonfriable. If the waste is friable or the inspection or testing cannot verify that the ACM is nonfriable, the waste must be handled as friable ACM waste.
- d. Any federal NESHAP-regulated ACM waste shipments that show evidence of visible dust emissions or that are not properly containerized, wrapped, wetted, and covered shall be rejected upon arrival at the landfill.
- e. ACM wastes with greater than 1 percent asbestos content that are nonfriable when received at the landfill may be disposed of at the working face. Care shall be taken when unloading and covering the waste so that it does not become friable at the working face.
- f. ACM wastes with greater than 1 percent asbestos content that are confirmed as friable when received at the landfill shall be disposed of in an area separate from the regular working face. The wastes shall be covered carefully with a minimum of six inches of soil cover and compacted by no later than the end of the operating day. Care shall be taken at all times during disposal and covering to prevent rupture of asbestos-containing containers and wrapped waste systems. Covered ACM waste areas shall be protected from erosion at all times.
- g. Upon delivery, friable ACM wastes must be wet and contained in labeled, leak-tight containers or wrapping that prevents asbestos from becoming airborne. Bulk demolition wastes with friable ACM need not be placed in leak-tight containers but must remain wet at all times and be properly labeled and wrapped to prevent asbestos from becoming airborne during transport and disposal and covering at the landfill.

*h.* Care shall be taken at all times when transporting, depositing, and covering federal NESHAP-regulated ACM waste to control the evolution of dust and airborne asbestos fibers and to not allow the rupture of asbestos containers and wraps.

*i.* After landfill acceptance, if any federal NESHAP-regulated ACM waste becomes dry prior to disposal, rewetting or an approved alternative means of dust emissions control is mandatory. When disposed of, the wet ACM waste must be properly covered before it can dry again.

*j.* In the event that any visible dust emissions from federal NESHAP-regulated ACM waste occur, protective safety equipment, consistent with federal NESHAP and OSHA regulations, shall be immediately utilized by landfill operating staff.

*k.* Daily records of the acceptance and disposal of all ACM wastes shall be maintained. Landfill records for each NESHAP-regulated ACM waste shipment shall include the following:

- (1) The date of ACM waste receipt.
- (2) The names, addresses, and telephone numbers of the originating waste generation site, facility owner, agent responsible for performing removal and the waste transporter.
- (3) The description of ACM wastes, quantity in cubic yards, weight and the number and type of containers or systems received.
- (4) The waste shipment record and any accompanying asbestos content laboratory test and friable status documentation.
- (5) The operational log notation relative to the landfill operator's visual confirmation of waste type compared to waste shipment records and the friable or nonfriable status for each federal NESHAP-regulated ACM waste shipment.
- (6) The operational log notation of any rejected ACM waste and the reasons for rejection by landfill staff.
- (7) The site operational area, coordinates location, and vertical elevation keyed to site mapping and the quantity of buried waste in cubic yards for each federal NESHAP-regulated waste shipment disposed of within the disposal site.

*l.* Records for all federal NESHAP-regulated ACM wastes accepted at the landfill in accordance with 40 CFR Part 61, including required federal and state asbestos NESHAP program operational and site closure reports, shall be maintained. All records, except for waste shipment records, shall be maintained through site closure. Waste shipment records shall be retained for at least two years.

*m.* A copy of an Affidavit Explanatory of Title that has been file stamped by the county recorder shall be submitted to the department within 60 days of site closure. The affidavit shall appear at part of the property deed record and shall indicate that:

- (1) The landfill has been used for the disposal of ACM waste.
- (2) The survey plot and all records of the location and quantity of regulated ACM wastes have been filed with federal and state NESHAP program officials. Such documentation must be filed with the department, along with the notification.
- (3) The site is subject to the regulations under 40 CFR Part 61, Subpart M, and the site closure permit requirements issued by the department.

*n.* Strict adherence to federal NESHAP asbestos regulations under 40 CFR Part 61 is mandatory for all federal regulated ACM wastes.

**102.508(2)** *Stabilized grit, bar screenings, and grease skimmings.* The MSWLF operator, the generator, and the hauler shall comply with the following conditions and requirements whenever stabilized grit, bar screenings, or grease skimmings are disposed of in a MSWLF.

- a.* The generator shall stabilize the grit, bar screenings, and grease skimmings prior to their disposal at the landfill in order to destroy any pathogenic organisms. Stabilization shall be done by addition of lime to raise the pH to at least 12 for two hours. In lieu of stabilization for bar screenings, a system that flushes organic matter then dewateres and bags the screenings may be utilized.
- b.* The generator shall prearrange a delivery schedule with the landfill operator.
- c.* Upon arrival at the landfill, the hauler shall identify the waste to the landfill attendant.
- d.* The landfill operator shall direct the hauler to the working face.

e. The waste shall be deposited at the working face, covered with regular refuse or soil and compacted.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.509 to 102.599** Reserved.

These rules are intended to implement Iowa Code section 455B.304.

DIVISION VII  
DISCARDED APPLIANCE DEMANUFACTURING

**567—102.600(455D) Purpose; applicability; compliance.** This division is to ensure the proper removal and disposal of electrical parts containing polychlorinated biphenyls (PCBs), components containing mercury, and refrigerants (e.g., CFCs and HCFCs) from discarded appliances.

**102.600(1)** All discarded appliances must be demanufactured pursuant to this division before being disposed of or recycled. This division does not apply to the service, repair, reuse, or rebuilding of appliances or components for their original purpose. These rules do not apply to the removal of capacitors, refrigerants, or components containing mercury during the maintenance or service of equipment containing such items.

**102.600(2)** Compliance with this division in no way relieves the appliance demanufacturer of the responsibility of complying with all other local, state, or federal statutes, ordinances, and rules and other applicable requirements.

**102.600(3)** All rules, standards, technical guidance, and other similar legal or technical documents referenced in this division shall be the version of those documents in effect on August 1, 2025, unless otherwise noted in these rules, and except for references to the Iowa Code and Iowa Administrative Code, which shall always be the most recent version unless otherwise noted in these rules.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.601(455B,455D) Definitions.** The definitions in Iowa Code section 455B.301 and 567—Chapter 100 apply to this division.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.602(455D) Storage and handling of appliances prior to demanufacturing.**

**102.602(1)** Any person collecting and storing discarded appliances must store the appliances so as to prevent electrical capacitors, refrigerant lines and compressors, and mercury-containing components from being damaged and allowing a release into the environment.

**102.602(2)** No method of handling discarded appliances may be used that in any way damages, cuts, or breaks refrigerant lines; crushes compressors, capacitors, or mercury-containing components; or may cause a release of refrigerant, PCBs, or mercury into the environment.

**102.602(3)** No more than 1,000 discarded appliances may be stored at a location prior to demanufacturing.

**102.602(4)** Discarded appliances may not be stored for more than 270 days before being demanufactured.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.603(455D) Appliance demanufacturing permits.**

**102.603(1) Permit required.** A person must obtain a Solid Waste Management permit pursuant to 567—subrule 100.4(2) for appliance demanufacturing from the department before conducting any demanufacturing activities.

**102.603(2) Types of permits.**

a. A person may request a permit that excludes appliances that contain a particular type of material (e.g., refrigerants, sodium chromate, PCBs, or mercury switches). Persons may not demanufacture or place their unique mark on an appliance that once contained a material that is excluded from their permit. An appliance demanufacturing facility must clearly post the types of appliances the facility does not accept.

b. Permits may be issued for both fixed facilities and mobile operations.

**102.603(3) *Factors in permit issuance decisions.*** The department may request that additional information be submitted for review to make a permit issuance decision. The department may review and inspect the facility, its agents and operators, and compliance history. The department may review whether a good-faith effort to maintain compliance and protect human health and the environment is being made and whether a compliance schedule is being followed. The department may issue a permit on a trial basis. After review of the permit application or a trial period, the department may require financial assurance as a condition of a permit. Any such condition will be consistent with those types detailed in Iowa Code section 455B.301(9).

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.604(455D) Appliance demanufacturing permit application requirements.** In addition to the permit application requirements in 567—100.5(455B,455D), the applicant shall submit the following:

1. Type, source and expected number or weight of appliances to be handled per year.
2. For a fixed facility, schematic site plans of the facility, including the schematic floor plans of any buildings showing where activities will take place and where waste is stored.
3. For mobile operations, schematic plans, or a description and photographs of the mobile van or trailer.
4. The EPA-approved refrigerant removal equipment that will be used.
5. Operation plan: a detailed summary of the activities that will be performed on each type of appliance considered for demanufacturing. This summary must include step-by-step activities of the demanufacturing process.
6. A contingency plan detailing the specific procedures to be used in case of equipment breakdown or fire, including methods to be used to remove or dispose of accumulated waste.
7. A copy of the NPDES Stormwater General Permit Authorization number, if applicable.
8. A copy of EPA Notification of PCB Activity Form 7710-53 and a return response from EPA.
9. Documentation showing compliance with 567—102.606(455D).
10. A copy of the unique mark to be applied to each discarded appliance after demanufacturing.
11. Documentation that a permanent appliance demanufacturing facility meets local zoning requirements.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.605(455D) Operations.** The following removal and disposal requirements must be met by both fixed facilities and mobile operations.

**102.605(1)** Demanufacturing of appliances must take place on an impervious floor, including but not limited to concrete, ceramic tile, or metal, but not including wood. Any spills must be contained and picked up with proper equipment and procedures and be disposed of properly.

**102.605(2)** The point of demanufacturing must be located at least 50 feet from a well and any water of the state.

**102.605(3)** The facility must be located above the 100-year floodwater elevation.

**102.605(4)** A permanent facility must meet local zoning requirements.

**102.605(5)** Every operation must have a unique mark that signifies all refrigerants, PCB-containing articles, and mercury-containing components have been removed. The unique mark must be a minimum of nine inches by nine inches. The unique mark must be applied to appliances after demanufacturing.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.606(455D) Training.**

**102.606(1)** At least one owner or employee of an appliance demanufacturing facility must have a training certificate from a department-approved demanufacturer training course. A person who has completed the department-approved training course must be on site at all times when discarded appliances are being demanufactured.

**102.606(2)** To be approved by the department, the training must, at a minimum, cover the following topics.

- a. State and federal regulations for the removal, storage, transportation, and disposal of refrigerant, PCB-containing articles, and mercury-containing components from appliances.
- b. Recordkeeping requirements.
- c. Safety precautions for handling appliances and hazardous materials.
- d. Spill prevention and cleanup procedures appropriate for appliance demanufacturing.
- e. The proper methods of loading and unloading discarded appliances.
- f. General demanufacturing procedures.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.607(455D) Refrigerant removal requirements.**

**102.607(1)** All demanufacturers of refrigerant containing appliances shall comply with 40 CFR 82.155 as amended March 7, 2025.

**102.607(2)** The removal of refrigerant from refrigeration appliances must take place in an area where the temperature of the surrounding air and of the appliance being demanufactured is 45°F or greater.

**102.607(3)** Facilities that are not EPA-certified refrigerant reclaimers must transport recovered refrigerant to an EPA-certified reclamation facility or properly dispose of the refrigerant at an EPA-permitted facility. Reclamation may take place on site only if the appliance demanufacturing facility is certified as a reclaimer by the EPA.

**102.607(4)** The following rules apply to the demanufacturing of appliances containing compressor oil.

a. Compressor oil from refrigeration unit compressors may be removed during the demanufacturing process, and any oil removed must be stored in accordance with 40 CFR 279.22 as amended March 3, 2025.

b. Compressor oil is not hazardous and may be burned in used oil-fired space heaters, provided the heaters have a capacity of 0.5 British thermal units (BTUs) per hour or more.

c. Compressor oil may be sold to a marketer of used oil.

**102.607(5)** The following rules apply to the demanufacturing of ammonia gas-operated refrigerators and air conditioners.

a. Ammonia gas must be vented into water.

b. Sodium chromate must be removed from refrigeration equipment containing sodium chromate.

c. Sodium chromate liquid is a hazardous waste and must be disposed of at an EPA-permitted facility.

d. Removal of sodium chromate liquid must take place on an impervious surface. In case of a spill, the spilled liquid and the material used as absorbent must be handled as a hazardous waste and disposed of as a hazardous waste.

e. Sodium chromate must be stored in a department of transportation-approved (DOT-approved) container that shows no sign of damage. The container must be labeled with a proper EPA-approved chromium label stating “chromium” or “hazardous waste” as required by 40 CFR 262.32 as amended March 3, 2025, and 49 CFR 172.304 as amended March 3, 2025, in both English and the predominant language of any non-English-reading workers.

f. Prior to shipment, sodium chromate must be packaged to prevent leakage and all containers must be sealed.

g. A person generating sodium chromate waste must maintain records to determine if the person is a very small quantity generator (VSQG), small quantity generator (SQG), or large quantity generator (LQG) of hazardous waste.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.608(455D) Mercury-containing component removal and disposal requirements.**

**102.608(1)** All components containing mercury shall be removed from appliances. Precautions shall be taken to prevent breakage of the mercury-containing components and the release of mercury.

**102.608(2)** All mercury-containing component storage containers must be labeled with the proper EPA-approved mercury label stating: “Universal Waste—Mercury Containing Equipment” or “Waste Mercury-Containing Equipment” or “Used Mercury-Containing Equipment” in both English and the predominant language of any non-English-reading workers.

**102.608(3)** The date when the first mercury-containing component was placed in the container shall be affixed to the container.

**102.608(4)** Mercury-containing components may be stored for no longer than one year.

**102.608(5)** Accumulation of mercury-containing components shall not exceed 5,000 kg (11,025 lbs) at any time.

**102.608(6)** All mercury containers must be sealed prior to shipment.

**102.608(7)** All components containing mercury must be disposed of at an EPA-approved mercury recycling/recovery facility.

**102.608(8)** Fluorescent tubes, lamps, bulbs, and similar items must be placed in a container and packaged to prevent breakage for shipment to an EPA-approved recycler or must be processed in a manner that complies with state and federal regulations.

**102.608(9)** All mercury-containing components must be managed in accordance with 40 CFR 273 as amended March 3, 2025, and all state and federal regulations.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.609(455D) Capacitor removal requirements.**

**102.609(1)** All capacitors must be removed from discarded appliances unless the appliance manufacturer certifies in writing that no PCBs were used in the manufacture of the appliance.

**102.609(2)** Capacitors that meet one or more of the following criteria may be disposed of or recycled as solid waste. The capacitor:

- a. Is proven to be free of PCBs by an approved laboratory.
- b. Is imprinted by the manufacturer with the words “No PCBs” on the body of the capacitor.
- c. Is certified in writing by the manufacturer of the capacitor not to contain PCBs.
- d. Does not contain dielectric fluid.

**102.609(3)** The following rules apply to the storage and disposal of PCB-containing items. PCB-containing items must be stored and transported according to the Toxic Substances Control Act (TSCA) and 40 CFR 761 as amended March 3, 2025, and disposed of at a TSCA-permitted disposal facility. Facilities used for the storage of PCB-containing items designated for disposal must meet the following storage requirements:

- a. Facilities shall register with the EPA and receive an EPA identification number.
- b. PCB-containing items must be stored in a manner that provides adequate protection from the elements and adequate secondary containment. This storage must take place on an impervious material above the 100-year floodwater elevation.
- c. The point of demanufacturing must be located above the 100-year floodwater elevation.
- d. All capacitors containing or suspected of containing PCBs must be placed in a DOT-approved container that shows no signs of damage. The bottom of the container must be filled to a depth of two inches with absorbent material such as sand, oil-dry, or kitty litter.
- e. All DOT-approved containers must be affixed with the large PCB mark as described in 40 CFR 761.45 as amended March 3, 2025.
- f. The date when the first PCB-containing item was placed in the container shall be placed on the container.
- g. Nonleaking small PCB capacitors may be stored for up to 30 days from the date of removal in an area that does not comply with the requirements in 102.609(4) “a” through “f” provided a notation is placed on the PCB capacitor indicating the date the item was removed from the appliance.
- h. PCB-containing items may be stored for no more than 270 days. The storage area must be labeled with the PCB M<sub>L</sub> mark. The storage area must be inspected every 30 days, and the inspection must be documented.
- i. If a demanufacturer stores more than 45 kg (99.4 lbs) at any one time, the demanufacturer must maintain annual written records and the annual document log as required by 40 CFR 761.180 as amended March 3, 2025.

**102.609(4)** All capacitors not meeting the criteria in 102.609(2) must be disposed of as follows:

- a. Appliance demanufacturers may dispose of PCB capacitors by one of two means. If the facility is a VSQG, the demanufacturer may send the properly marked and dated container of capacitors to a regional

collection center (RCC) licensed under 567—Chapter 103 for disposal. If the facility is not a VSQG, the capacitors must be manifested and shipped for disposal in accordance with 40 CFR 761.65 as amended March 3, 2025.

*b.* Disposal through an RCC. Shipments from a VSQG to an RCC shall be considered equivalent to disposal as municipal solid waste for the purposes of 40 CFR 761.60(b)(2)(iii) as amended March 3, 2025; capacitors may not be disposed of in a landfill. An RCC may accept PCB capacitors without having to provide a certificate of disposal. The RCC shall provide the appliance demanufacturer with a receipt specifying the name of the RCC, the appliance demanufacturer from which the capacitors were received, the weight or number of capacitors, and the date the capacitors were received. Copies of this document must be retained for three years at both locations. The date that capacitors are received shall be considered the date the capacitors are determined to be PCB-containing waste for the purposes of 40 CFR 761.65(a)(1) as amended March 3, 2025. Capacitors may be consolidated in DOT-approved shipping containers for transport for disposal.

*c.* Disposal through EPA-approved facility for the disposal of PCB waste. The labeled and dated DOT-approved container must be transported by a transporter with a valid EPA identification number, using an EPA Uniform Hazardous Waste Manifest Form. All containers must be sealed prior to shipment. The demanufacturer has one year from the date the first PCB-containing item is placed in the container to properly dispose of the contents by incineration, recycling, or another approved method pursuant to 40 CFR 761.60(b) as amended March 3, 2025, or 761.60(c) as amended March 3, 2025. Disposal must be documented and the record kept by the demanufacturer for three years from the date the PCB-containing waste was accepted by the initial transporter.

*d.* PCB-containing items shall be properly disposed of within one year of removal from the appliance. The generator shall obtain a certificate of disposal within 30 days of the date that disposal of the PCB-containing items was completed at a PCB disposal facility. If a certificate of disposal is not obtained within 30 days, the EPA regional administrator must be notified pursuant to 40 CFR 761.218(d) as amended March 3, 2025.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

#### **567—102.610(455D) Spills.**

**102.610(1)** Any spills from leaking or cracked capacitors must be handled by placing the capacitor and any contaminated rags, clothing, and soil into a container for shipment to an EPA-approved waste disposal facility. Spills of liquid PCBs that occur outside a DOT-approved container must be cleaned and the cleanup verified by sampling as described at 40 CFR 761.130 as amended March 3, 2025. Detailed records of such cleanups and sampling must be maintained as described at 40 CFR 761.180 as amended March 3, 2025.

**102.610(2)** Mercury spill kits (with a mercury absorbent in the kits) must be on hand and used in the event of a mercury spill. Any waste from the cleanup of a mercury spill must be disposed of as a hazardous waste.

**102.610(3)** In the event a spill results in a hazardous condition, the facility must follow the requirements in 567—Chapter 105, Division I.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

#### **567—102.611(455D) Recordkeeping and reporting.**

**102.611(1)** Annual reports with the information required in 102.611(2) are:

- a.* To be submitted to the solid waste and contaminated sites section of the department's main office;
- b.* Due January 31 each year for the activities of the previous calendar year;
- c.* To be submitted on forms provided by the department; and
- d.* To be retained by the permit holder for at least three years.

**102.611(2)** Annual reports shall contain the following information for the previous calendar year.

- a.* Number of appliances demanufactured in each of the following categories:
  - (1) Refrigerators and freezers.
  - (2) Commercial coolers.
  - (3) Air-conditioning units.

- (4) Dehumidifiers.
- (5) Gas water heaters.
- (6) Furnaces.
- (7) Clothes washers and clothes dryers.
- (8) Dishwashers.
- (9) Microwave ovens.
- (10) Other items containing mercury, refrigerant or PCB-containing articles.
  - b.* Number of mercury switches removed from appliances.
  - c.* Number of mercury thermocouples removed from appliances.
  - d.* Date the first item was placed in the mercury storage drum that is in use on December 31.
  - e.* Number of fluorescent tubes removed from appliances.
  - f.* Number of sodium chromate-containing appliances shipped to another demanufacturer.
  - g.* Amount of refrigerant removed.
  - h.* Number of PCB capacitors removed.
  - i.* Number of PCB ballasts removed.
  - j.* Date the first PCB-containing item was placed in the storage drum that is in use on December 31.

**102.611(3)** A permitted appliance demanufacturing facility shall retain the following records on site for a minimum of three years.

- a.* All hazardous waste manifests and bills of lading for shipments of refrigerant, mercury switches, PCB-containing materials, and any hazardous waste.
- b.* Receipts for any sodium chromate-containing units that were sent to another facility for processing.
- c.* Documentation of destruction or receipt from a regional collection center for all PCB materials shipped.
- d.* Documentation of inspections of the PCB storage area as required by 102.607 “*h.*”
- e.* Annual written records and annual document log if required by 102.607(4) “*i.*”
- f.* Copy of the annual report as required in 102.609(1).

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.612(455D) Appliance demanufacturing facility closure requirements.** In addition to the requirements in 567—100.10(455B), an appliance demanufacturing facility shall do the following prior to closure:

- 1. Remove all appliances that have not been demanufactured.
- 2. Properly dispose of all refrigerant, PCBs, mercury, and all hazardous materials.
- 3. Submit an annual report covering January 1, through the last disposal of hazardous materials, PCBs, and refrigerant.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.613(455D) Shredding of appliances.**

**102.613(1)** Facilities shredding demanufactured appliances shall sample the fluff from the shredding of demanufactured appliances at least quarterly and analyze the fluff for the presence of PCBs, and according to the TCLP for arsenic, barium, cadmium, chromium, lead, mercury, selenium, and silver. The waste shall be sampled once a day for seven consecutive working days to make a composite sample. If the concentrations of heavy metals do not exceed concentrations listed in 40 CFR 261.24 as amended March 3, 2025, the fluff may be landfilled in Iowa. Results must be retained on site for a minimum of three years and be submitted to the department within 30 days of the end of each quarter.

**102.613(2)** Fluff from the shredding of demanufactured appliances may be sampled and tested by the department at any time.

**102.613(3)** A person or facility engaged in demanufacturing in the state may not shred, crush, or bale any appliances that have not been demanufactured. A person or facility located in Iowa that does not engage in demanufacturing but accepts appliances from demanufacturers for recycling or disposal may shred, crush, or bale only appliances that have been demanufactured in accordance with federal regulations and the laws of the state from which the appliances are received.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.614 to 102.699** Reserved.

These rules are intended to implement Iowa Code section 455D.6(4).

DIVISION VIII  
CATHODE RAY TUBE RECYCLING

**567—102.700(455D) Purpose.** The purpose of this division is to implement rules for the recycling of discarded CRTs and the disassembly and removal of toxic parts from discarded CRTs in a manner that is safe for human health and the environment.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.701(455D) Applicability and compliance.** This division applies to discarded CRTs that are collected for recycling and to CRT glass processed for recycling. This division does not apply to CRTs collected for disposal.

**102.701(1)** This division applies to facilities and short-term CRT collection events that perform CRT recycling functions including but not limited to the collection, demanufacturing, and processing of discarded CRTs.

**102.701(2)** This division does not apply to CRT reuse activities, CRT service and repair activities, or CRT refurbishing activities that do not otherwise qualify as CRT recycling.

**102.701(3)** The issuance of a permit or registration by the department in no way relieves the applicant of the responsibility of complying with all other local, state, or federal statutes, ordinances, and rules or other requirements applicable to the construction, operation, and closure of a CRT collection facility or CRT recycling facility.

**102.701(4)** All discarded CRTs collected for recycling, including those generated by a household, once collected by a CRT collection facility or CRT recycling facility, shall be managed in accordance with 40 CFR 261.39 and this division. If there is a conflict, the more stringent regulation applies.

**102.701(5)** All rules, standards, technical guidance, and other similar legal or technical documents referenced in this division shall be the version of those documents in effect on August 1, 2025, unless otherwise noted in these rules, and except for references to the Iowa Code and Iowa Administrative Code, which shall always be the most recent version unless otherwise noted in these rules.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.702(455D) Definitions.** For the purposes of this division, the definitions in 567—Chapter 100 and Iowa Code section 455B.301 and chapter 455D shall apply.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.703(455D) Short-term CRT collection events.** All short-term CRT collection events shall be conducted in a manner that complies with this rule. Short-term CRT collection event organizers are not required to register the event as a CRT collection facility.

**102.703(1)** Within one week of collection, all discarded CRTs and CRT glass shall be transported to a properly permitted CRT recycling facility or registered CRT collection facility.

**102.703(2)** During the period between collection and transport, all broken CRTs and CRT glass shall be stored in one of the following ways:

- a. In a fully enclosed building with a roof, floor, and walls, or
- b. In a container that is constructed, filled, and closed to minimize releases to the environment of CRT glass (including fine solid materials).

**102.703(3)** During the period between collection and transport, intact discarded CRTs shall be stored in one of the following ways:

- a. In a fully enclosed building with a roof, floor, and walls, or
- b. In a secure container (e.g., package or vehicle) that is constructed and maintained to minimize breakage of electronic waste and to prevent releases of hazardous materials to the environment.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.704(455D) Registration for CRT collection facilities.** A CRT collection facility shall register with the department using a form provided by the department.

**102.704(1)** The registration application shall include proof of the applicant's ownership of the property or legal entitlement to use the property for CRT collection. If the facility is leased, the application shall also include a statement, signed by the property owner, stating that the property owner is aware that CRT collection is taking place at the site and that the property owner may be held liable for wastes abandoned at the property.

**102.704(2)** Registration will expire March 1 of each year if renewal has not been made and approved.

**102.704(3)** Annual registration renewal occurs by complying with the reporting requirements in 567—102.710(455D). Once a complete report is received and confirmed complete in writing by the department, the facility's registration will be renewed until March 1 of the following year.

**102.704(4)** The department may deny or revoke CRT collection facility registration if one or more of the following is determined by the department:

- a. The registration application is incomplete.
- b. There is a violation of a requirement of this division, including but not limited to failing to submit accurate and timely reports as required in 567—102.710(455D).
- c. There is or was a misrepresentation made in obtaining a registration or registration renewal under this division.
- d. The registrant fails to correct a condition as agreed to in an agreed order with the department or fails to come into compliance with this division within the time frame established in the agreed order.
- e. The permittee has lost legal entitlement to use the property identified in the registration.
- f. Upon notice to the department by the permittee that the permittee no longer wishes to retain the registration for future operation.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.705(455D) CRT recycling facility permits.**

**102.705(1)** *Permit required.* A CRT recycling facility shall not be operated without a solid waste management permit for CRT recycling from the department as per 567—subrule 100.4(2).

**102.705(2)** *Notification of change in status.* CRT recycling facilities must notify the department 30 days prior to any significant change of status of the operation, including any change in the ownership or operation of the facility or location of the facility.

**102.705(3)** *Denial or revocation of permit.* The department may deny, revoke, or limit the length of a permit if one or more of the following is determined:

- a. The department has revoked the applicant's previous permit under this division.
- b. There is a violation of a requirement of this division or a condition of the permit.
- c. There is a failure to disclose all relevant facts in obtaining a permit under this division.
- d. There is a misrepresentation made in obtaining a permit under this division.
- e. There is a misrepresentation in the annual report required in 567—102.710(455D).
- f. The permittee fails to meet the requirements for a permit.
- g. The permittee fails to correct a condition as agreed to in an agreed order with the department or fails to come into compliance with the permit or this division within the time frame established in the agreed order.
- h. The permittee has lost legal entitlement to use the property identified in the permit.
- i. Upon notice to the department by the permittee that the permittee no longer wishes to retain the permit for future operation.

**102.705(4)** *Permit conditions.* The department may place conditions on any permit deemed necessary by the department to ensure compliance with this division and to protect human health and the environment.

**102.705(5)** *Effect of revocation.* If a permit held by any public or private agency is revoked by the director, then no new permit shall be issued to that agency for that CRT recycling facility for a period of

one year from the date of revocation. Such revocation shall not prohibit the issuance of a permit for the facility to another public or private agency.

**102.705(6)** *Permits without expiration date.* CRT recycling permits that were issued prior to September 23, 2026, that do not have an expiration date will expire September 23, 2031. The permit holder shall file an application for renewal as per 567—paragraph 100.4(2) “a.”

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.706(455D) CRT recycling facility permit application requirements.** In addition to the requirements in 567—subrule 100.5(1), a CRT recycling facility permit applicant shall submit the following information to the department.

**102.706(1)** The physical location of any collection sites if separate from the main facility.

**102.706(2)** If the facility is leased, a signed statement from the property owner stating that the property owner is aware that CRT collection or recycling is taking place at the property and that the property owner may be held liable for wastes left at the property.

**102.706(3)** A brief description of the facility and the CRT processing that will take place.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.707(455D) Discarded CRT management requirements.** CRT collection facilities and CRT recycling facilities shall manage all discarded CRTs in accordance with 40 CFR 261.39 and 40 CFR 40 CFR 260.43.

**102.707(1)** Discarded CRTs and processed CRT glass shall not be speculatively accumulated pursuant to 40 CFR 261.1(c)(8).

**102.707(2)** Broken CRTs and processed CRT glass shall be stored either:

- a. In a building with a roof, floor, and walls, or
- b. In a container (e.g., a package or a vehicle) that is constructed, filled, and closed to minimize releases to the environment of CRT glass (including fine solid materials).

**102.707(3)** Intact discarded CRTs shall be stored either:

- a. In a building with a roof, floor, and walls, or
- b. In a secure container (e.g., package or vehicle) that is constructed and maintained to minimize breakage of electronic waste and to prevent releases of hazardous materials to the environment.

**102.707(4)** Each container of broken CRTs or CRT glass must be labeled or marked clearly with one of the following phrases: “Used cathode ray tube(s)-contains leaded glass. Do not mix with other glass materials” or “Leaded glass from televisions or computers. Do not mix with other glass materials.” Each container shall also be labeled with the first date that material began to be accumulated in the container.

**102.707(5)** Each container or pallet of intact discarded CRTs shall be labeled with the first date that any material began to accumulate in the container or on the pallet.

**102.707(6)** Broken CRTs must be transported in a container meeting the requirements of 102.707(2).

**102.707(7)** CRT collection facilities or CRT recycling facilities that export broken CRTs shall also comply with 40 CFR 261.39(a)(5).

**102.707(8)** All processing of CRTs shall be processed according to 40 CFR 261.39(b).

**102.707(9)** Failure to comply with this rule and the referenced CFR sections is grounds for termination of any permit or registration authorized by this rule.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.708(455D) Recordkeeping requirements for CRT collection facilities.**

**102.708(1)** All CRT collection facilities shall maintain the following records on a calendar year basis:

- a. The name and address of the facility receiving a shipment that left the CRT collection facility and contact information for the receiving facility.
- b. The type of service the receiving facility will provide to the CRT collection facility.
- c. A description of the shipment contents.
- d. All bills of lading.
- e. All hazardous waste manifests.

**102.708(2)** Records must be maintained at the facility, must be submitted to the department upon request, and may be destroyed after three years.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.709(455D) Recordkeeping requirements for CRT recycling facilities.**

**102.709(1)** All CRT recycling facilities shall maintain the following records on a calendar year basis:

a. The total aggregate weight and receipt date of each shipment of discarded CRTs received from businesses, institutions, CRT collection facilities, short-term CRT collection events, and other permitted CRT recycling facilities.

b. The name, address, and contact information for shipments reported pursuant to 102.710(2).

c. The total aggregate weight and date of each shipment leaving the CRT recycling facility.

d. The name and address of the facility receiving a shipment that left the CRT recycling facility, contact information for the receiving facility, and a description of the shipment contents including all applicable bills of lading.

e. The type of service the receiving facility will provide to the CRT recycling facility.

f. All hazardous waste manifests.

**102.709(2)** Records must be maintained at the facility, must be available for review by the department on demand, and may be destroyed after three years.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

**567—102.710(455D) Reporting requirements.** CRT collection facilities and CRT recycling facilities shall report the following information, on a form provided by the department, to the department by February 1 of each year for the previous calendar year.

**102.710(1)** The amount, either by weight or volume, of discarded CRTs and processed CRT glass on site on January 1.

**102.710(2)** The amount, either by weight or by volume, of discarded CRTs and CRT glass recycled or transferred for recycling during the calendar year.

**102.710(3)** The amount, either by weight or by volume, of discarded CRTs and processed CRT glass on site on December 31.

**102.710(4)** Indication of whether the CRTs received over the past year were generated by households, businesses, or both households and businesses.

[ARC 0483D, IAB 8/19/26, effective 9/23/26]

These rules are intended to implement Iowa Code section 455D.6(5).

IAB 8/19/26, effective 9/23/26]

CHAPTER 103  
FINANCIAL AND OPERATING LICENSE REQUIREMENTS FOR  
REGIONAL COLLECTION CENTERS AND SATELLITE FACILITIES  
[Prior to 7/1/83, DEQ Ch 28]  
[Prior to 12/3/86, Water, Air and Waste Management [900]]

Chapter rescission date pursuant to Iowa Code section 17A.7: 9/23/31

**567—103.1(455F) Purpose.** The purpose of this chapter is to implement financial and operating license requirements for regional collection centers and satellite facilities that provide for the collection and proper disposal of household hazardous materials and hazardous waste from very small quantity generators. The costs and accessibility of hazardous materials management can be improved by the establishment and maintenance of a system of regional collection centers and satellite facilities for the safe and proper management of household hazardous materials and hazardous materials from very small quantity generators. Therefore, the department may provide financial assistance for costs associated with establishing or improving regional collection centers and satellite facilities when such funding is available. The department may also provide financial assistance for ongoing collection and disposal activities that result in eligible pounds when such funding is available. All rules, standards, technical guidance, and other similar legal or technical documents referenced in this chapter shall be the version of those documents in effect on August 1, 2025, unless otherwise noted in these rules, and except for references to the Iowa Code and Iowa Administrative Code, which shall always be the most recent version unless otherwise noted in these rules.

[ARC 0484D, IAB 8/19/26, effective 9/23/26]

**567—103.2(455B,455D,455F) Definitions.** For the purposes of this chapter, the following definitions; definitions found in 567—Chapter 100; and definitions found in Iowa Code chapters 455B, 455D and 455F shall apply:

*“Applicant for regional collection center or satellite facility financial assistance”* means a regional collection center or satellite facility operated by a private agency, a local government or a public agency representing local governments pursuant to Iowa Code chapter 28E.

*“Eligible pounds”* means household hazardous waste or hazardous waste from very small quantity generators that is disposed of or recycled by a licensed hazardous waste contractor. Very small quantity generator hazardous waste for which a regional collection center is required to charge a fee under Iowa Code section 455F.8A is considered eligible pounds if there is a corresponding disposal charge from a hazardous waste contractor. “Eligible pounds” means net weight as shown on final disposition documents. A manifest shows an estimated weight and cannot be used to determine eligible pounds. Very small quantity generator hazardous waste or household hazardous waste that has no disposal cost, or for which regional collection centers receive compensation or charge a fee, is not eligible pounds. Materials such as cathode ray tubes, electronics, and used oil that are not destined for final disposal, but are instead recycled for reuse of components, are not eligible pounds.

*“Financial assistance”* means monetary assistance including grants, cash payments, or support by other financial means.

*“Hazardous waste contractor”* means a private company that provides proper management (e.g., disposal, recycling) of hazardous waste. “Hazardous waste contractor” does not include regional collection centers.

*“Regional collection center mobile unit”* or *“mobile unit”* means a truck or trailer owned and operated under the direction of a regional collection center that can be moved to different sites within a region. A mobile unit is used to perform collection events and to transport collected materials to a regional collection center for sorting and consolidation.

*“Very small quantity generator”* means a generator that generates less than or equal to the following amounts in a calendar month:

1. 100 kilograms (220 pounds) of non-acute hazardous waste;
2. 1 kilogram (2.2 pounds) of acute hazardous waste listed in 40 CFR 261.31 or 40 CFR 261.33(e);

3. 100 kilograms (220 pounds) of any residue or contaminated soil, water or other debris resulting from the cleanup of a spill, into or on any land or water, of any acute hazardous waste listed in 40 CFR 261.31 or 40 CFR 261.33(e).

[ARC 0484D, IAB 8/19/26, effective 9/23/26]

**567—103.3(455F) Regional collection center license and license renewal.** A license or license renewal will be issued under the following conditions.

**103.3(1) License.**

a. A regional collection center shall not operate without a license issued by the department. Regional collection centers in existence prior to January 14, 2019, will automatically be issued an operating license.

b. A satellite facility shall not be required to obtain a license.

**103.3(2) Compliance.** A regional collection center and satellite facility must be in compliance with current local, state and federal statutes and regulations regarding the management, storage, transportation and disposition of household hazardous materials, household hazardous waste and hazardous waste from very small quantity generators.

**103.3(3) Construction.** A regional collection center shall not be constructed without review of the site plan and written approval of the site plan by the department. The approved plans and specifications shall constitute a condition of the initial operating license.

**103.3(4) Inspection prior to commencing initial operation.** The department shall be notified before a regional collection center or satellite facility begins operations. No household hazardous materials or hazardous waste from very small quantity generators shall be accepted by the regional collection center or satellite facility until the facility has been inspected and approved by the department.

**103.3(5) Duration and renewal of license.** The initial license issued may be renewed for a period of five years. If the license applicant is a private agency under contract with a local government, the license shall not extend past the end date of the contract. An entity designated as an environmental management system pursuant to Iowa Code section 455J.7 may opt out of the license renewal requirement provided the entity is in compliance with 103.3(2) and there has been no change in the provisions of the current license. Any change in the provisions of the current license requires written notification to the department as described in 103.3(7).

**103.3(6) Request and approval of initial license or license renewal.** A new regional collection center shall file a request for a license on a form provided by the department. An established regional collection center shall file a request for license renewal 45 calendar days prior to the expiration of the current license on a form provided by the department. The facility must be in compliance with Iowa Code chapters 455B, 455D and 455F and the conditions of its current license.

**103.3(7) License modification.** A regional collection center shall request to modify its license by notifying the department of changes to any provision of its license. A regional collection center shall notify the department within 30 calendar days of a planned change to the provisions of its license and within 7 calendar days of an unplanned change to the provisions of its license. Upon request to modify a regional collection center license, the facility must be in compliance with Iowa Code chapters 455B, 455D and 455F and the conditions of its current license.

[ARC 0484D, IAB 8/19/26, effective 9/23/26]

**567—103.4(455F) Site, structure, storage and staff qualifications.** Regional collection centers, satellite facilities and mobile units shall each meet the following criteria.

**103.4(1) Siting.** A site selected for a regional collection center, satellite facility or mobile unit shall meet the following criteria:

a. A regional collection center, satellite facility or mobile unit used for the collection of very small quantity generator waste and household hazardous materials shall be sited on public property or on private property if an agreement exists that guarantees public access. Documentation of the private property agreement for regional collection centers and satellite facilities shall be provided to the department upon request or upon application and renewal for license.

b. The site shall provide adequate secondary containment in case of a spill or other possible on-site contamination.

- c. The site shall meet all applicable zoning requirements.
- d. The site shall be adequately sized to accommodate all structures, units and activities that will take place on the site.
- e. Regional collection centers and satellite facilities shall each have adequate security to prevent unauthorized access. Adequate security may include but is not limited to a fence and locking gate.
- f. All mobile units and the containers used to package collected materials shall comply with applicable Iowa department of transportation rules and guidelines. At each mobile unit site, the mobile unit shall rest on a pad of a chemical-resistant, impervious, smooth material that provides secondary containment in case of a spill. A temporary surface created by securing an impervious tarp to the unloading/receiving area will meet the requirements of an impervious surface. A plan for conducting mobile unit collection events must consider the possibility of inclement weather, ensure that collected household hazardous materials and very small quantity generator hazardous waste has protection from the elements and ensure that the risk of environmental contamination is minimized.

**103.4(2) Structures.** Regional collection center structures or satellite facility structures shall each meet the following criteria:

- a. All structures shall be sized to adequately accommodate the collection, sorting, bulking and lab packing, packaging for disposal, and temporary storage of household hazardous materials and hazardous waste from very small quantity generators.
- b. All permanent structures shall meet the requirements of applicable fire codes and building codes.
- c. Regional collection center structures and satellite facility structures shall each be designed to prevent run-on entering from adjacent areas.
- d. All receiving areas shall have a storage capacity of at least one day's processing capacity. All receiving, sorting, bulking, transfer and storage area surfaces shall be constructed of a chemical-resistant, impervious, smooth material so designed to be easily cleaned, nonreactive with the waste, and with proper drainage, in the form of sloped flooring, plastic-lined pits or concrete sumps, according to applicable codes. Areas used for the receiving, bulking, transferring, lab packing and storing of household hazardous materials, household hazardous waste and very small quantity generator hazardous waste shall be provided with secondary containment and protection from exposure to the weather.

**103.4(3) Storage.** All full containers of household hazardous waste and hazardous wastes from very small quantity generators must be stored in a building designed in accordance with Group H occupancy requirements and local, state and federal fire codes. It is required that hazardous waste or household hazardous waste accumulated for disposal not be accumulated on site for more than 180 days. Once the capacity limit of a collection site or time limit is reached, all waste collected shall be collected by a licensed hazardous waste contractor.

**103.4(4) Staff qualifications.** Prior to handling any household hazardous materials, hazardous waste regional collection center and satellite facility staff shall each have received applicable training conducted by trainers who meet Occupational Safety and Health Administration (OSHA) instructor qualification standards. Training shall include but is not limited to the following:

- a. OSHA 24-hour health and safety training as described in 29 CFR 1910.120.
- b. Annual eight-hour refresher training as described in 29 CFR 1910.120.
- c. Hazardous materials chemistry.
- d. Personnel and site safety.
- e. Proper lab packing techniques.
- f. Proper transporting of hazardous materials.
- g. When applicable, U.S. Department of Transportation hazardous materials training for the operation of a mobile unit used in the collection and transportation of household hazardous materials and hazardous waste from very small quantity generators.

[ARC 0484D, IAB 8/19/26, effective 9/23/26]

## **567—103.5(455F) Operations plans and procedures.**

**103.5(1)** Regional collection centers and satellite facilities must each prepare and maintain on site a current plan of operations.

**103.5(2)** Operations plan. The operations plan shall include, at a minimum, the following information:

- a.* Schedule of operations, including hours of operation for regional collection centers or satellite facilities.
- b.* Site selection procedures for mobile unit collections.
- c.* Standard receiving procedures for household hazardous materials and very small quantity generators.
- d.* Procedures for managing unknown materials.
- e.* Procedures for handling open or leaking containers.
- f.* Procedures for managing large quantities of wastes.
- g.* Recycling and reuse procedures for usable materials.
- h.* Disposal of nonhazardous waste.
- i.* Personal protection equipment.
- j.* Initial training requirements and continuing education of staff.
- k.* An emergency response plan, such as the facility's response to spills, fires or weather-related events.

[ARC 0484D, IAB 8/19/26, effective 9/23/26]

**567—103.6(455F) Closure notification.** Regional collection centers and satellite facilities shall each notify the department in writing at least 60 calendar days prior to ceasing operations.

**103.6(1)** The notification shall include, at a minimum, the following information:

- a.* A description of how the regional collection center or satellite facility will notify the public within its service area that the regional collection center or satellite facility is closing and how household hazardous materials and hazardous waste from very small quantity generators should be managed after closure of the facility.
- b.* A description of how all household hazardous materials, household hazardous waste and hazardous waste from very small quantity generators will be removed from the regional collection center or satellite facility and properly managed within 60 calendar days of the regional collection center or satellite facility ceasing operations.
- c.* A description of how final waste disposal costs will be paid.

**103.6(2)** After removal of household hazardous waste and very small quantity generator hazardous waste, a final inspection may be conducted by department staff.

[ARC 0484D, IAB 8/19/26, effective 9/23/26]

**567—103.7(455F) Regional collection center reporting requirements.** On a form supplied by the department, each regional collection center shall submit to the department a correctly completed regional collection center semiannual report. The report shall include but not be limited to the pounds of materials managed through a reuse program, by hazardous waste contractors, and by nonhazardous waste contractors. All hazardous waste contractor invoices shall be attached. Such invoices shall depict hazardous material types, net weight of hazardous materials, and associated collection and disposal costs charged by the hazardous waste contractor to the regional collection center. Regional collection center semiannual reports shall be submitted by September 15 for the portion of the current calendar year January 1 through June 30, and by March 15 for the portion of the previous calendar year July 1 through December 31.

[ARC 0484D, IAB 8/19/26, effective 9/23/26]

**567—103.8(455E,455F) Funding sources.** Funds appropriated by Iowa Code section 455E.11(2) “a”(2)(d) and 455E.11(2) “c” may be used to achieve the purpose of this chapter.

[ARC 0484D, IAB 8/19/26, effective 9/23/26]

**567—103.9(455E,455F) Regional collection center and satellite facility financial assistance.**

**103.9(1)** An applicant for regional collection center and satellite financial assistance shall submit to the department a completed application on a form provided by the department.

**103.9(2)** The department shall coordinate the evaluation of proposals. Applications will be evaluated based on selection criteria contained in the application form. Prior to receiving financial assistance from the

department, a regional collection center must obtain a regional collection center license. A satellite facility shall provide documentation of a contractual arrangement with a licensed regional collection center for removal of the waste to be collected.

**103.9(3)** The applicant must be in compliance with applicable federal and state statutes and regulations.

[ARC 0484D, IAB 8/19/26, effective 9/23/26]

**567—103.10(455E,455F) Regional collection center collection and disposal support funding.**

**103.10(1)** All regional collection centers are eligible to receive funding support, when available, from the department to properly manage eligible pounds of very small quantity generator hazardous waste and household hazardous waste. To receive funding, a regional collection center must be in compliance with applicable federal and state statutes and regulations. The source for this funding is described in Iowa Code section 455E.11(2)“a”(2)(d) and (e).

**103.10(2)** To be eligible to receive support and disposal-funding assistance, a regional collection center must:

*a.* Have household hazardous waste and very small quantity generator hazardous waste removed by a licensed hazardous waste contractor.

*b.* Correctly complete the hazardous materials collection semiannual report on a form supplied by the department.

*c.* Attach the following documentation:

(1) Hazardous waste contractor invoices depicting cost and hazardous waste types.

(2) The net weight calculations of household hazardous waste and very small quantity generator hazardous waste obtained by subtracting container weight from final disposal weight, not the manifest weight.

(3) Documentation that all household hazardous waste and very small quantity generator hazardous waste was disposed of by a licensed hazardous waste contractor.

(4) Documentation of materials shipped using final disposal receipts.

*d.* Submit regional collection center semiannual reports by September 15 for the portion of the current calendar year January 1 through June 30, and by March 15 for the portion of the previous calendar year July 1 through December 31. Reports submitted after the due date without prior approval by the department are not eligible for funding.

**103.10(3)** Fall collection and disposal funding will be based on the regional collection center semiannual report due September 15 and on available funding. A regional collection center will receive a percentage of the available funding in an amount proportional to the amount of eligible pounds the regional collection center recycled or disposed of through a hazardous waste contractor, as reported on the regional collection center semiannual report form, compared to the total amount of eligible pounds recycled or disposed of by all regional collection centers as reported on the regional collection center semiannual report form.

Spring collection and disposal funding will be based on the total eligible pounds reported for the calendar year and on available funding. A regional collection center will receive a percentage of the available funding for the calendar year minus the amount received for the fall payment, in an amount proportional to the amount of eligible pounds the regional collection center recycled or disposed of through a hazardous waste contractor, as reported on the regional collection center semiannual report form for the calendar year, compared to the total amount of eligible pounds recycled or disposed of by all regional collection centers as reported on the regional collection center semiannual report form.

[ARC 0484D, IAB 8/19/26, effective 9/23/26]

These rules are intended to implement Iowa Code chapters 455E and 455F.

CHAPTER 104  
SOLID WASTE COMPREHENSIVE PLANNING AND  
ENVIRONMENTAL MANAGEMENT SYSTEM REQUIREMENTS

Chapter rescission date pursuant to Iowa Code section 17A.7: 9/23/31

**567—104.1(455B,455D,455J) Purpose.** The purpose of these rules is to provide general definitions and direction for comprehensive integrated solid waste management planning for every city and county of this state and to provide an orderly and efficient process for the assessment and collection of fees for the disposal of solid waste at a sanitary landfill. This chapter also establishes methods and criteria for the environmental management system program, a voluntary alternative to comprehensive planning for planning areas or service areas. All rules, standards, technical guidance, and other similar legal or technical documents referenced in this chapter shall be the version of those documents in effect on August 1, 2025, unless otherwise noted in these rules, and except for references to the Iowa Code and Iowa Administrative Code, which shall always be the most recent version unless otherwise noted in these rules.

[ARC 0485D, IAB 8/19/26, effective 9/23/26]

**567—104.2(28E,455B,455D,455J) Definitions.** For the purposes of this chapter, the following definitions; the definitions in 567—Chapter 100; and the definitions in Iowa Code chapters 28E, 455B, 455D and 455J shall apply.

*“Annual compliance report”* or *“annual report”* means the required submittal to the department that documents an environmental management system’s compliance with the requirements of Iowa Code section 455J.3.

*“Solid waste agency”* means an established private or public, or private and public, agency for the purpose of managing solid waste, implementing integrated solid waste management systems on behalf of cities and counties, or both.

[ARC 0485D, IAB 8/19/26, effective 9/23/26]

**567—104.3(455B,455D) Duties of cities and counties.**

**104.3(1)** Notwithstanding any requirements in the Iowa Code, including Iowa Code section 455B.302, all cities, counties and solid waste agencies shall demonstrate compliance with the provisions of this chapter by either participating in a comprehensive plan approved by the department or being within the planning or service area of an environmental management system.

**104.3(2)** If a planning agency refuses any particular solid waste type for management or disposal, the planning agency must identify another municipal solid waste sanitary disposal project for that waste within the planning area. If no other municipal solid waste sanitary disposal project exists within the planning area, the planning agency must, in cooperation with the waste generator, establish or arrange for access to another municipal solid waste sanitary disposal project. Municipal solid waste sanitary disposal projects are required to maintain written approval from both the department and the planning agency in the planning area of origin in order to accept any Iowa-generated waste from outside the planning area.

[ARC 0485D, IAB 8/19/26, effective 9/23/26]

**567—104.4(455B,455D,455J) State volume reduction and recycling goals.** The goal of the state is to reduce the amount of materials in the waste stream, existing as of July 1, 1988, by an intermediate goal of 25 percent, and by a final goal of at least 50 percent, through the practice of waste volume reduction at the source and through recycling. The updated goal progress calculations provided by the department for each planning area shall be used by the department in reporting to the general assembly on the state’s progress toward meeting the 25 and 50 percent goals. The specific methodology for determining goal progress is outlined in 567—104.5(455B,455D). A planning area designated as an environmental management system pursuant to Iowa Code section 455J.7 is exempt from the waste stream reduction goals of this rule.

[ARC 0485D, IAB 8/19/26, effective 9/23/26]

**567—104.5(455B,455D) Base year adjustment method.** Planning agencies may request that the department complete a goal progress recalculation once per fiscal year to resolve any discrepancies and

to further evaluate progress toward the state's waste volume reduction and recycling goals. At the time of approval of a comprehensive plan or comprehensive plan update, the department will use the most current complete fiscal year data set available to complete goal progress calculations, which will be used to meet the requirements outlined in 567—104.8(455B,455D).

**104.5(1)** The base year adjustment method (see Formula 1) controls for population, employment and taxable sales to more accurately determine progress toward the state's waste volume reduction and recycling goals. Factors included within the base year adjustment method include:

- a. Base year residential waste disposal tonnage.
- b. Base year commercial waste disposal tonnage.
- c. Base year population data (U.S. Bureau of the Census).
- d. Base year employment data—total nonfarm (Iowa department of workforce development).
- e. Base year taxable sales data (Iowa department of revenue).
- f. Base year consumer price index.
- g. Most current complete fiscal year data set available for waste disposal tonnage.
- h. Most current complete fiscal year data set available for population (U.S. Bureau of the Census).
- i. Most current complete fiscal year data set available for employment—total nonfarm (Iowa department of workforce development).
- j. Most current complete fiscal year data set available for taxable sales (Iowa department of revenue).
- k. Most current complete fiscal year data set available for consumer price index.

Formula 1

$$100\% - \left[ \frac{A \left[ \frac{H}{C} + \frac{\frac{I}{D} + \frac{J - \frac{F}{K}}{E}}{2} \right] + B \left[ \frac{I}{D} + \frac{J - \frac{F}{K}}{E} \right]}{2} \right] \times 100\%$$

**104.5(2)** Planning agencies must document the amount of waste disposed of in both the base year and the most current fiscal year where a complete data set is available. If no changes have occurred within the planning area that would affect the base year, then only data for the most current fiscal year for which a complete data set is available need to be presented in the comprehensive plan update, since information on each planning area's base year tonnage is presented in prior comprehensive plan submittals. Tonnage data sources that each planning agency must identify include but are not limited to:

- a. Landfill(s) within the planning area and its respective service area(s).
- b. Transfer station(s) or hauler(s) transporting waste into or out of the planning area for final disposal.
- c. Incineration with or without energy recovery of waste within the planning area.
- d. Allowable base year adjustment method exemptions, including exceptional events, waste originating from out of state, and solid waste generated outside the planning area.

**104.5(3)** Waste generated as part of an exceptional event or contaminated site cleanup should not negatively affect a planning area's goal progress calculation. Requests for goal progress calculation exemptions must be made to the department within six months after initial disposal. The determination to exempt tonnages from goal progress calculations shall be made solely by the department.

a. Exceptional events include but are not limited to disasters proclaimed by the governor. Requests to exempt exceptional event debris from goal progress calculations shall be made on a form provided by the department.

b. Requests from the municipal solid waste sanitary disposal project or planning agency to exempt contaminated site cleanup waste from goal progress calculations shall be made on a form provided by the department.

[ARC 0485D, IAB 8/19/26, effective 9/23/26]

**567—104.6(455B,455D) Forms of comprehensive plan submittals to be filed.** Notwithstanding any of the requirements of Iowa Code section 455B.306, there are three forms of comprehensive plan submittals: initial, updates and amendments.

**104.6(1) *Initial comprehensive plan.*** An initial comprehensive plan shall be submitted as determined by the department, including but not limited to when a new planning area is established or a new solid waste landfill or municipal solid waste incinerator is sited. Initial comprehensive plans shall be submitted on a form provided by the department.

**104.6(2) *Comprehensive plan updates.*** A comprehensive plan update shall be submitted according to planning cycle due dates established by the department. Comprehensive plan updates shall be submitted on a form provided by the department.

**104.6(3) *Comprehensive plan amendments.*** If a municipal solid waste sanitary disposal project or city or county requests to be included in a planning area after completion of an initial comprehensive plan or a comprehensive plan update but before the next comprehensive plan update is due, the department may determine that a comprehensive plan amendment may be submitted and approved to fulfill requirements until the beginning of the next planning cycle. Comprehensive plan amendments shall be submitted to the department on a form provided by the department.

[ARC 0485D, IAB 8/19/26, effective 9/23/26]

**567—104.7(455J) Environmental management systems.** Notwithstanding any other requirements, a planning or service area that has been designated as an environmental management system and that seeks to continue to be so designated in this voluntary program is exempt from filing its comprehensive plan. By September 1 of each year, an annual report shall be submitted to the department on a form provided by the department.

**104.7(1) *Annual report evaluation criteria.*** The department shall review the annual report based on the following:

*a.* Completeness in terms of addressing all of the elements set forth in the form provided by the department.

*b.* Clear demonstration of continuous improvement in terms of progress toward achieving the objectives and targets set forth in the environmental management system.

**104.7(2) *Annual report evaluation outcomes.***

*a.* If the department determines that the annual report adequately demonstrates compliance with the requirements of Iowa Code section 455J.3, the planning or service area shall remain designated as an environmental management system and shall continue to be qualified for the incentives set forth in Iowa Code section 455J.5.

*b.* The annual report should clearly demonstrate continuous improvement in terms of progress toward achieving the objectives and targets set forth in the environmental management system. If the department determines that the annual report clearly demonstrates that the planning or service area's environmental management system is no longer in compliance with Iowa Code section 455J.3, the department may recommend to the environmental protection commission the revocation of the environmental management system designation. If the commission concurs with the department's recommendation, the planning or service area shall adhere to comprehensive planning requirements.

*c.* Failure by a planning or service area to submit an annual report by September 1 in any year will result in revocation of the environmental management system designation, following which the planning or service area shall adhere to the comprehensive planning requirements.

[ARC 0485D, IAB 8/19/26, effective 9/23/26]

**567—104.8(455B,455D) Fees for disposal of solid waste at sanitary landfills.**

**104.8(1) *Authority, purpose and applicability.***

*a. Authority.* Pursuant to Iowa Code section 455B.310, the department has the authority to collect fees for the disposal of solid waste at sanitary landfills. All tonnage fees received by the department under this rule shall be deposited in the solid waste account of the groundwater protection fund created under Iowa Code section 455E.11(1).

*b. Purpose.* The purpose of this rule is to provide an orderly and efficient process for the assessment and collection of fees for the disposal of solid waste at a sanitary landfill. This rule clarifies the applicability of the fees and sets forth a fee schedule, means of filing and recordkeeping requirements.

*c. Applicability.* Except as provided in 104.8(2), operators of all sanitary landfills located within Iowa and subject to the permitting requirements of the department shall pay a fee for each ton of solid waste disposed of in the landfill.

**104.8(2) Exclusion.** Fees do not apply to wastes that will not be buried at a sanitary landfill if such material is salvaged or recycled in accordance with the provisions of the landfill permit.

**104.8(3) Fee schedule.**

*a.* The base tonnage fee is \$4.25 per ton of solid waste.

*b.* The statewide goal progress average is 36 percent, as determined by the department on July 1, 1999.

*c.* If at any time the department notifies a planning agency or municipal solid waste sanitary disposal project(s) that the planning area has either failed to meet the 25 percent goal or has met or exceeded the 25 percent goal, the 36 percent statewide average or the 50 percent goal, all municipal solid waste sanitary disposal projects within that planning area that are required to remit state tonnage fees shall collect, remit and retain tonnage fees according to Table 1 in this subrule, starting with the next scheduled fee payment. Moneys due to the department under this paragraph shall be remitted until such time as evidence of a change in the planning area's progress toward meeting the state's waste volume reduction and recycling goals is documented and approved in writing by the department.

*d.* A solid waste planning or service area designated as an environmental management system pursuant to Iowa Code section 455J.7 shall qualify, pursuant to Iowa Code section 455J.5, for a reduced tonnage fee of \$3.65 per ton, of which \$2.10 shall be remitted to the department.

Table 1 sets forth the solid waste tonnage fee schedule.

| Table 1                                                                                                                                                  |                                                                                                                                                           |
|----------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| Planning areas with less than 25% diversion level:                                                                                                       |                                                                                                                                                           |
| Collect                                                                                                                                                  | \$4.75 per ton                                                                                                                                            |
| Remit                                                                                                                                                    | \$3.30 per ton to the department                                                                                                                          |
| Retain                                                                                                                                                   | \$1.45 per ton (\$0.95 per ton for implementing planning, \$0.50 per ton for environmental protection, comprehensive plan development and implementation) |
| Planning areas over 25% diversion, under the state average, and under 50%:                                                                               |                                                                                                                                                           |
| Collect                                                                                                                                                  | \$3.65 per ton                                                                                                                                            |
| Remit                                                                                                                                                    | \$2.20 per ton to the department                                                                                                                          |
| Retain                                                                                                                                                   | \$1.45 per ton (\$0.95 per ton for implementing planning, \$0.50 per ton for environmental protection, comprehensive plan development and implementation) |
| Planning areas over 25% diversion, over the state average and under 50%, and planning or service areas designated as an environmental management system: |                                                                                                                                                           |
| Collect                                                                                                                                                  | \$3.65 per ton                                                                                                                                            |
| Remit                                                                                                                                                    | \$2.10 per ton to the department                                                                                                                          |
| Retain                                                                                                                                                   | \$1.55 per ton (\$1.05 per ton for implementing planning, \$0.50 per ton for environmental protection, comprehensive plan development and implementation) |
| Planning areas over 50% diversion:                                                                                                                       |                                                                                                                                                           |
| Collect                                                                                                                                                  | \$3.25 per ton                                                                                                                                            |
| Remit                                                                                                                                                    | \$1.95 per ton to the department                                                                                                                          |
| Retain                                                                                                                                                   | \$1.30 per ton (\$0.80 per ton for implementing planning, \$0.50 per ton for environmental protection, comprehensive plan development and implementation) |

*e.* Retained tonnage fees collected pursuant to this subrule shall be approved by the department and used for implementation of programs and services designed to satisfy the requirements of this chapter.

f. For purposes of calculating tonnage fees, sanitary landfills shall utilize scales and shall base the fee assessment on the net scale weight of solid wastes disposed of at the landfill during the reporting period.

g. If special conditions existing at a sanitary landfill make it impractical to use the landfill's scales to determine waste tonnages, the landfill may propose for department review and approval an alternate method for determining the weight of disposed solid waste.

**104.8(4)** *Form, manner, time and place of filing.*

a. *Form.* Any person to whom or entity to which this rule applies shall submit a form provided by the department.

b. *Manner, time and place.* Fees are to be paid on a quarterly basis. Sanitary landfills serving more than one planning area, as expressed in Iowa Code section 455B.306(1) and 455B.306(2), shall submit separate Quarterly Solid Waste Fee Schedule and Retained Fees Reports for each planning area. The fees and report on retained fees will be due January 1, April 1, July 1, and October 1 for the quarters ending September 30, December 31, March 31, and June 30, respectively. The completed form shall be submitted with the appropriate fees to Budget and Finance Bureau, Department of Natural Resources, 6200 Park Avenue, Des Moines, Iowa 50321.

**104.8(5)** *Reporting and recordkeeping.*

a. *Operating records.* Those sanitary landfill operators who are subject to the fee assessment requirements of this rule shall maintain adequate records to determine and document the weight of solid waste received at and disposed of in the sanitary landfill during the calendar year. Planning areas entering into an agreement pursuant to Iowa Code section 455B.306(2) shall submit documentation to the department, and a planning area receiving the solid waste under such an agreement shall, in addition, submit evidence to the department demonstrating that required retained fees were returned in a timely manner to other planning area(s) under the agreement.

b. *Retention of records.* All records used in determining the solid waste fee assessment must be kept for a period of at least three years from the end of the calendar year that the records represent.

c. *Availability of records.* All records required under this rule must be furnished upon request and be made available at all reasonable times for inspection to any officer, employee or representative of the department who is duly designated by the director.

**104.8(6)** *Failure to pay fees.* If it is found that a person or entity has failed to pay the fees assessed by this rule, the director shall enforce the collection of the delinquent fees. A person or entity required to pay fees as required by Iowa Code section 455B.310 that fails or refuses to pay the fees by the due date shall be assessed a penalty of 2 percent of the quarterly fee due, to be assessed on January 2, April 2, July 2, and October 2, and on a monthly basis on the first day of each month thereafter, until paid. A person or entity required to retain fees as required by Iowa Code section 455B.310 that fails or refuses to report the use of the retained fees by the due date shall be assessed a penalty of 2 percent of the retained fees due to the department, with said penalty to be assessed on January 2, April 2, July 2, and October 2, and on a monthly basis on the first day of each month thereafter, until paid. All penalties shall be paid in addition to the fees due.

[ARC 0485D, IAB 8/19/26, effective 9/23/26]

These rules are intended to implement Iowa Code sections 455B.301A, 455B.302, 455B.306, 455B.310 and 455D.3 and chapter 455J.

[Filed ARC 0485D (Notice ARC 9929C, IAB 1/7/26), IAB 8/19/26, effective 9/23/26]

## CHAPTER 105 HAZARDOUS CONDITIONS

Chapter rescission date pursuant to Iowa Code section 17A.7: 9/23/31

### DIVISION I NOTIFICATION REQUIREMENTS

**567—105.1(455B) Purpose.** The purpose of this division is to implement Iowa Code sections 455B.383 and 455B.386 by providing detail on the notification requirements for reporting a hazardous condition.  
[ARC 0486D, IAB 8/19/26, effective 9/23/26]

**567—105.2(455B) Applicability.** The requirements of this division apply to all persons manufacturing, storing, handling, transporting, or disposing of a hazardous substance, or discovering contamination from a previously unknown hazardous condition, and to the sheriff or police chief who has been notified of a hazardous condition.  
[ARC 0486D, IAB 8/19/26, effective 9/23/26]

**567—105.3(455B) Definitions.** For the purposes of this division, the definitions set out in Iowa Code section 455B.381 apply.  
[ARC 0486D, IAB 8/19/26, effective 9/23/26]

**567—105.4(455B) Exemptions to reporting requirements.** Spills of hazardous substances are exempt from 567—105.5(455B) if all the following criteria are met.

**105.4(1)** The spilled hazardous substance is one or more of the following:

- a. Less than 25 gallons of petroleum products.
- b. Less than 100 pounds of anhydrous ammonia.

**105.4(2)** The spilled hazardous substance will not pose an actual or potential threat to waters of the state, groundwater, water wells, stormwater, tile lines, or ambient air quality if cleaned up within 24 hours.

**105.4(3)** The spilled hazardous substance is cleaned up within 24 hours of the spill.

**105.4(4)** The spilled hazardous substance is not an ongoing or repeated spill by the same responsible party, in the same area, within the last 90 days.

[ARC 0486D, IAB 8/19/26, effective 9/23/26]

**567—105.5(455B) Report of hazardous conditions.**

**105.5(1) Initial report.** Any person manufacturing, storing, handling, transporting, or disposing of a hazardous substance shall report a hazardous condition to the department and either the local police department or the office of the sheriff of the county where the hazardous condition occurred. The initial report shall be made as soon as possible but not later than six hours after the onset or discovery of the hazardous condition. The initial report shall provide information on as many items listed in 105.5(2) as available data will allow.

**105.5(2) Follow-up report.** The responsible party shall submit a follow-up report of a hazardous condition to the department within 30 days of the initial report. The follow-up report may be submitted electronically or via hard copy. The follow-up report shall contain the following information:

- a. The exact location of the hazardous condition.
- b. The time and date of onset or discovery of the hazardous condition.
- c. The name of the material, the manufacturer's name, the volume of each material involved in the hazardous condition, and any contaminants within the material that, by themselves, could cause a hazardous condition.
- d. The medium (land, water or air) in which the hazardous condition occurred or exists.
- e. The name, address and phone number of the person responsible for the hazardous condition.
- f. The time and date of the initial report to the department of the hazardous condition.

- g. The weather conditions at the time of the hazardous condition onset or discovery.
- h. The name, mailing address, email address and phone number of the person reporting the hazardous condition.
- i. The name and phone number of the person closest to the scene of the hazardous condition who can be contacted for further information and action.
- j. Any other information, such as the circumstances leading to the hazardous condition, visible effects and containment measures taken, that may assist in proper evaluation by the department.

**105.5(3) *Reporting of subsequent findings.*** All subsequent findings and laboratory results shall be reported and submitted electronically or in writing to the department as soon as available.  
[ARC 0486D, IAB 8/19/26, effective 9/23/26]

**567—105.6 to 105.99** Reserved.

These rules are intended to implement Iowa Code sections 455B.383 and 455B.386.

DIVISION II  
CLEANUP ACTIONS AND RESPONSIBLE PERSONS

**567—105.100(455B,455E) Purpose.** The purpose of this division is to establish the procedures and criteria the department uses to determine the person(s) responsible and cleanup actions necessary to meet the goals of the state pertaining to the protection of groundwater.

[ARC 0486D, IAB 8/19/26, effective 9/23/26]

**567—105.101(455B,455E) Applicability.**

**105.101(1)** These rules pertain to the cleanup of groundwater and soils and surface water where groundwater may be impacted. They may also be used as guidelines in other environmental protection activities authorized by Iowa Code chapter 455B. Where specific federal or state programs or funds exist to address situations that are also governed by these rules, the rules and standards of the specific programs or funds will be integrated and utilized to achieve an equitable, expeditious and environmentally sound resolution of the particular contamination situation. These rules apply specifically to point source contamination only.

**105.101(2)** These rules apply specifically to cleanup actions required to abate, prevent or remediate a hazardous condition, the presence of a hazardous substance or waste, the release of a regulated substance, or the discharge of a pollutant.

**105.101(3)** These rules shall not limit the department's authority to require remedial or preventative action, or to take remedial or preventative action, as necessary to protect public health, safety, or the environment. The department will make its evaluation on a case-by-case basis, considering site characteristics, and where more than one contaminant is present or there is no established action level, will consider the toxicity, mobility and persistence of contaminants involved. The evaluation may include the potential synergistic, antagonistic or cumulative effects of the contaminants involved in a particular case.

**105.101(4)** Persons subject to these rules retain all applicable appeal rights provided in Iowa Code chapter 455B.

**105.101(5)** This chapter is applicable to releases of petroleum from underground storage tanks subject to regulation under Iowa Code chapter 455B, division IV, part 8, to the extent they are not inconsistent with the corrective action provisions in 567—135.6(455B) through 567—135.17(455B). This subrule is not intended to limit the authority of the department to establish liability against the responsible person(s) other than owners and operators as defined in Iowa Code section 455B.471(5) and 455B.471(6).

**105.101(6)** All rules, standards, technical guidance and other similar legal or technical documents referenced in this division shall be the version of those documents in effect on August 1, 2025, unless otherwise noted in these rules, and except for references to the Iowa Code and Iowa Administrative Code, which shall always be the most recent version unless otherwise noted in these rules.

[ARC 0486D, IAB 8/19/26, effective 9/23/26]

**567—105.102(455B,455E) Definitions.** In addition to the definitions in Iowa Code sections 455B.381, 455B.411, and 455E.2, the following definitions shall apply to this division:

*“Action level”* means, for any contaminant:

1. The MCL if one exists;
2. The HAL if one exists and there is no MCL; or
3. The action level established by the department based on current technical literature and recommended guidelines of the United States Environmental Protection Agency (EPA) and recognized experts, if there is no MCL or HAL.

*“AFS”* means the Special Publication 30, “Investigation and Monetary Values of Fish and Freshwater Mussel Kills,” published by the American Fisheries Society.

*“Aggravated risk”* means a contamination situation that presents a potentially catastrophic or an immediate and substantial risk of harm to human life or health or to the environment. Examples include exposure of humans, animals or the food chain to acutely toxic substances, contamination of a drinking water supply, threat of fire or explosion, or similar situations.

*“Air or air resources”* means those naturally occurring constituents of the atmosphere, including those gases essential for human, plant, and animal life.

*“Background”* means groundwater quality unaffected by human activities, and generally shall be determined by historical data of the geological services bureau or other government agencies for the type of aquifer or location involved in a given case. If available data is not adequate, background may be established by groundwater samples upgradient of a source or potential source of a substance that is detected in or has a reasonable probability of entering the groundwater.

*“Best available technology”* means those processes that most effectively remove, treat, or isolate contaminants from groundwater or associated environment, as determined through professional judgment considering actual equipment or techniques currently in use, published technical articles and research results, engineering reference materials, consultation with known experts in the field, and guidelines or rules of other regulatory agencies.

*“Best management practices”* means maintenance procedures, schedules of activities, prohibition of practices, and other management practices, or a combination thereof, that after problem assessment and evaluation of alternatives is determined to be the most effective means of preventing or abating contamination at a location.

*“Biological resources”* means fish, wildlife and other biota belonging to, managed by, held in trust by, appertaining to, or otherwise controlled by the state of Iowa, the United States, or local government. Fish and wildlife include freshwater aquatic and terrestrial species; game, nongame, and commercial species; and threatened and endangered species. Other biota encompass shellfish, terrestrial and aquatic plants, and other living organisms not otherwise listed in this definition.

*“Code of Federal Regulations”* or *“CFR”* means the federal administrative rules adopted by the United States as amended through August 1, 2025.

*“Contaminant”* means any chemical, ion, radionuclide, synthetic organic compound, microorganism, waste or other substance that does not occur naturally in groundwater or that occurs naturally at a lower concentration, and includes but is not limited to all hazardous substances as defined in 42 U.S.C. 9601 (2018), and any element, compound, mixture, solution or substance designated pursuant to 40 CFR 302.4.

*“Damages”* means the costs of restoration, rehabilitation, and replacement of resources, or acquisition of equivalent resources, as determined in accordance with this chapter; the reasonable and necessary costs of the assessment, to include the cost of performing the assessment and administrative costs and expenses necessary for, and incidental to, the assessment; lost services to the public; and, in the event the damages claim is not resolved within six months after the incident leading to the damages, interest at the current rate published in the Iowa Administrative Bulletin by the department of revenue pursuant to Iowa Code section 421.7. The interest amount shall be computed from the date the amount of the claim is confirmed by a final ruling of the commission in a contested case decision.

*“Drinking water supply”* means any raw or finished water source that is or may be used by a public water system, as defined in Iowa Code section 455B.171, or as drinking water by one or more individuals.

*“Geologic resources”* means those elements of Earth’s crust such as soils, sediments, rocks, and minerals, including petroleum and natural gas, that are not included in the definitions of groundwater and surface water resources.

*“Groundwater resources”* means water in a saturated zone or stratum beneath the surface of land or water and the rocks or sediments through which groundwater moves. It includes groundwater resources that meet the definition of drinking water supplies.

*“HAL”* means a lifetime health advisory level for a contaminant, established by the EPA. Health advisories represent the concentration of a single contaminant, based on current toxicological information, in drinking water that is not expected to cause adverse health effects over lifetime exposure.

*“MCL”* means the enforceable maximum contaminant level established by the EPA pursuant to the Safe Drinking Water Act.

*“Natural resources”* or *“resources”* means land, fish, wildlife, biota, air, water, groundwater, drinking water supplies, and other such resources belonging to, managed by, held in trust by, appertaining to, or otherwise controlled by the United States, the state of Iowa, or local government. These natural resources have been categorized into the following five groups: surface water resources, groundwater resources, air resources, geologic resources, and biological resources.

*“Point source”* means any building, structure, installation, equipment, pipe or pipeline (including any pipe into a sewer or publicly owned treatment works), well, pit, pond, lagoon, impoundment, ditch, landfill, storage container, motor vehicle, rolling stock, or aircraft, or any site or area where a contaminant has been deposited, stored, disposed of, or placed, or otherwise come to be located.

*“Preventative”* or *“prevention”* refers, in the context of these rules, to actions or efforts to minimize or stop further contamination in a situation where contamination already exists or is imminent.

*“Remedial action plan”* means a written report that includes all relevant information, findings, and conclusions from a site assessment, including all analytical results and identification of contaminant migration pathways; identification and evaluation of cleanup alternatives, including both active and passive measures using best available technology and best management practices; a recommended cleanup action or combination of action, including identification of expected cleanup levels consistent with the cleanup goal of 105.104(3)“b”; a monitoring network and schedule to document cleanup levels; and a proposed schedule of implementation.

*“Responsible person”* means any person who is legally liable for the contamination in question or who is legally responsible for abating contamination under any applicable law, including Iowa Code chapters 455B and 455E, and the common law. This may include the person causing, allowing or otherwise participating in the activities or events that cause the contamination, persons who have failed to conduct their activities so as to prevent the release of contaminants into groundwater, property owners who are obligated to abate a condition, or persons responsible for or successor to such persons.

*“Significant risk”* means:

1. The presence in groundwater of a contaminant in excess of an action level;
2. The presence of a contaminant in the soils, surface water, or other environment in proximity to groundwater that may reasonably be expected to contaminate the groundwater to an action level; or
3. The presence of a contaminant or contaminants in the groundwater, or in the soils, surface water or other environment in proximity of groundwater that may be expected to contaminate groundwater in quantities, concentrations, or combinations that may have a significant adverse impact on public health, safety, environment, or quality of life. This criterion would normally be applied where there is no established action level or where combinations of more than one contaminant are present.

*“Site assessment plan”* means a written proposal for study of a contamination situation to determine the types, amounts, and sources of contaminants present, hydrogeological characteristics of the site, and the vertical and horizontal extent of contamination, with a goal of developing an adequate remedial action plan. The proposal must include: recommendations for collection of relevant historical data such as site management practices, inventory records, literature searches, photographs and personal interviews; a methodology for obtaining groundwater flow information including well placements, construction and elevation, bore logs, static groundwater table measurements, groundwater elevations, groundwater gradients (isopleth), and information on soil transmissivity, porosity and permeability; and a methodology

for identifying contaminant plumes, including additional monitoring wells to identify the horizontal and vertical extent of contamination, a site plot showing the estimated configuration of contamination, and a sampling schedule and list of constituents to be analyzed. The plan development may require preliminary field investigations.

“*Surface water resources*” means the waters of the state, including the sediments suspended in water or lying on the bank, bed, or shoreline. This term does not include groundwater or water or sediments in ponds, lakes, or reservoirs designed for waste treatment under applicable laws regulating waste treatment.

[ARC 0486D, IAB 8/19/26, effective 9/23/26]

**567—105.103(455B,455E) Documentation of contamination and source.**

**105.103(1)** *Certified laboratory.* Analyses for a contaminant regulated under this division must be performed by a laboratory certified for the analyte(s) and applicable method pursuant to 567—Chapter 83.

**105.103(2)** *Department determination of contamination.* When the department receives or obtains evidence of groundwater contamination or the release or presence of contaminants in the environment associated with groundwater, where contamination of the groundwater may reasonably be expected, the department shall make reasonable efforts to document the source of contamination, and shall require responsible person(s) to take appropriate preventative, investigatory and remedial actions. Evidence of contamination may include but is not limited to the following:

- a. Water samples indicating the presence of a contaminant at levels above background.
- b. Soil or surface water samples indicating the presence of a contaminant at levels above background, where release to the groundwater is likely.
- c. Known releases of contaminants into the environment in quantities and locations that could reasonably be expected to cause groundwater contamination.
- d. Other events the department determines could potentially cause groundwater contamination.

The amount and type of evidence necessary to document contamination or potential contamination will vary with the circumstances of each case, including the amount and type of contaminant involved, site topography and geologic conditions, and potential adverse effects. Normally, a reasonable number of water and soil samples will be taken or analyses obtained by the department. However, where a significant quantity of contaminants is known to have been released into the environment, for example from a spill, that could reach groundwater, the department is not required to collect samples.

**105.103(3)** *Department determination of source.* The department shall determine whether the contamination is or likely was caused by a particular source or sources, for example a known spill of a contaminant or current or past facilities or activities in the vicinity that involved products or substances that could be a likely source. If no such person or event can be identified, the department shall make reasonable efforts to determine whether there is a relatively restricted area of more concentrated contaminant in the vicinity that is or is likely to be a source of the contamination. This subrule does not require the department to identify a specific person or persons responsible for the contamination, but to determine whether the contamination has or has likely come from a relatively defined source.

**105.103(4)** *Determination of responsible persons.* Where a source or likely source of contamination is identified, the person or persons responsible for that source or sources shall conduct necessary preventative, investigatory and remedial actions.

a. *Identification.* The persons responsible or potentially responsible initially shall be identified by the department through such measures as on-site observations; interviews with witnesses and local officials; review of public records, including department files; and interviews with or information obtained from potentially responsible persons. Where there may be more than one source, or the source is otherwise not conclusively identified, persons who handle or have handled materials or wastes in the vicinity of the contamination, which could be the source, shall investigate and provide information satisfactory to the department to confirm or disaffirm that their activities are a source of the contamination. Investigation by the responsible or potentially responsible person may include inspection of inventory or other records, and soil and groundwater monitoring to better define the source. Such monitoring shall conform to the requirements of 105.104(3) “a,” provided that a full-scale assessment may not be required for this purpose.

b. *Notification.* The department shall notify in writing the person determined responsible under the above procedures, and include a brief statement of the facts upon which the department concluded that

the person is the responsible person, and the actions required; provided that where immediate action is necessary, verbal notification may be given, followed up with written notification. The person notified may provide information disputing or supplementing the information relied on by the department, which shall be considered by the department.

c. Responsible persons may be jointly and severally liable, and the department is not required to name all potentially responsible person(s) in directing responsive actions to contamination.

[ARC 0486D, IAB 8/19/26, effective 9/23/26]

**567—105.104(455B,455E) Response to contamination.**

**105.104(1)** *Prevention of further contamination.* In all cases where an active source of contamination is identified, such as leaking tanks or current practices, that may be readily corrected, the source shall be removed, repaired or otherwise contained, or the contaminating practices ceased, immediately upon discovery of the source. In addition, readily accessible contaminants, for example concentrated contaminants spilled on the ground or accessible through a recovery well or system, shall be promptly removed to avoid or minimize further contamination in the groundwater.

**105.104(2)** *Aggravated risk.* Where the contamination presents an aggravated risk, the preventative, investigatory and remedial measures provided in 105.104(1) and 105.104(3) shall be expedited to remove such risk. Additionally, the following actions shall be taken by the responsible person(s), if necessary, to protect the public health or environment:

- a. Provide alternate water supplies.
- b. Install security fencing or other measures to limit access.
- c. Conduct necessary measures to control the source of release.
- d. Remove the contaminant to an approved site for storage, treatment or disposal.
- e. Place physical barriers to deter the spread of the release.
- f. Recommend to appropriate authorities the evacuation of threatened individuals.
- g. Use other materials to restrain the spread of the contaminant or to mitigate its effects.
- h. Execute damage control or salvage operations.

**105.104(3)** *Significant risk.* In cases of significant risk, the following investigatory and remedial measures shall be implemented:

a. *Investigation.* The responsible person shall determine the extent and levels of contamination through a site assessment conducted under the supervision of an Iowa-licensed professional engineer, an expert in the field of hydrogeology, or other qualified person. A site assessment plan shall be submitted to the department within 45 days of notice by the department, unless a shorter time is required or a longer time is authorized by the department. The plan shall be approved by the department prior to initiation of the assessment, unless otherwise approved by the department. The site assessment shall be conducted within a time frame that is approved by the department. The department may require further investigation by the responsible person to adequately assess the extent of contamination and may require the remedial action plan if necessary. If a remedial action plan is required by the department, the remedial action plan shall be submitted to the department within the time approved by the department.

b. *Required cleanup actions.*

(1) Groundwater. The goal of groundwater cleanup is use of best available technology and best management practices as long as it is reasonable and practical to remove all contaminants, and in any event until water contamination remains below the action level for any contaminant, and the department determines that the contamination is not likely to increase and no longer presents a significant risk. Where site conditions and available technology are such that attainment of these goals would be impractical, the department may establish an alternative cleanup level or levels, including such other conditions to adequately protect public health, safety, or the environment.

(2) Other. Where significant amounts of contaminants are documented as being present in the soils or other environment, such that groundwater contamination is occurring or is likely, active cleanup of the contaminated soils or other environment shall be implemented to the extent reasonable and necessary to prevent or minimize release to the groundwater; passive cleanup may be allowed in extraordinary circumstances.

**105.104(4) *Nonsignificant risk.*** Where significant risk is not currently present, the responsible person may be required to monitor the groundwater and implement reasonable management or other preventative measures to minimize further contamination.

[ARC 0486D, IAB 8/19/26, effective 9/23/26]

**567—105.105(455B,455E) Report to commission.** Department actions taken pursuant to this division shall be reported to the commission.

[ARC 0486D, IAB 8/19/26, effective 9/23/26]

**567—105.106(455B) Compensation for damages to natural resources.**

**105.106(1) *Applicability.*** This rule applies to persons who, by release of a hazardous substance to the environment, cause injury to, destruction of, or loss of natural resources held in trust by the state for the public. In most cases this would involve the destruction of aquatic life or other wildlife under the ownership of the state, as provided in Iowa Code section 481A.2. This rule relates to the compensation to the state and public for the natural resource damages and is in addition to any other legal recourse for the event or action that caused the destruction or damage.

**105.106(2) *Liability to the state.*** Pursuant to Iowa Code section 455B.392(1) “c,” this rule establishes the methodologies and criteria for evaluating the extent and value of the damage and establishes the methods of compensation. If the person and the department cannot agree to the proper resolution of a particular case, the issues of liability, damage and compensation will be established through contested case proceedings, as provided by 7—Chapter 2506 and 561—Chapter 2506.

**105.106(3) *Assessment.*** When natural resources are destroyed or damaged by an identifiable source, the degree and value of the losses shall be assessed by collecting, compiling, and analyzing relevant information, statistics, or data through prescribed methodologies to determine damages, as set forth in this rule.

*a. General.* Except as specified otherwise in this rule, the definitions, methodologies, and criteria in 43 CFR Part 11 may be used to assess natural resource damages.

*b. Fish loss.* Assessment of damages for fish kills shall be in accordance with the following:

(1) Normally investigators will follow the methods prescribed by AFS to determine numbers of fish killed, by species and size.

(2) During periods of ice cover, where local conditions prevent using these methods, or in other appropriate circumstances, for example when the resources are known to have been diminished by prior incidents, investigators will utilize the best information available to determine numbers of fish killed by species and size. Information may include existing or prior data on population levels in the affected water body or nearby water bodies with similar characteristics, including any historical fish kill data.

(3) The monetary valuation of fish shall be the replacement values as published in AFS for all fish lost except the following: channel catfish, flathead catfish, blue catfish, northern pike, muskellunge, northern pike/muskellunge hybrid, rainbow trout, brown trout, brook trout, white bass, yellow bass, white bass/striped bass hybrid, largemouth bass, smallmouth bass, spotted bass, crappie, rock bass, bluegill, redear sunfish, warmouth, pumpkinseed, freshwater drum, yellow perch, walleye, sauger, and walleye/sauger hybrid. The value of these fish shall be \$15 each, unless AFS establishes a higher value. Notwithstanding the above, the value of each fish classified by the department as an endangered or threatened species shall be \$1,000.

(4) The value of lost services to the public shall be the number of fishing trips lost over the period of the resource loss, as determined through local creel survey information or through interpolation from the most recent statewide creel survey. Each trip shall be valued at \$30.

(5) The cost of the investigation shall include salaries plus overhead for staff time, including support staff, involved in investigating the fish kill and performing the assessment; meals and lodging for staff while in the field conducting the assessment; mileage, valued at the current rate established pursuant to Iowa Code section 8A.363; costs borne by the department associated with containment or cleanup operations; and any other costs directly associated with the investigation and assessment.

**105.106(4) *Compensation.*** The department will extend to the responsible person the opportunity to reach voluntary agreement as to the amount of damages and the compensation method. If the person

disputes liability or the damage amount, the department will make a demand for payment and the person may appeal and demand contested case procedures under 7—Chapter 2506 and 561—Chapter 2506. The method of compensation shall be solely in the discretion of the department.

*a. Direct monetary payment.* Compensation will normally be by direct monetary payment to the department. The money received will be used to replace, restore or rehabilitate the lost or damaged resources. Resource enhancement projects, support of educational programs relating to resource protection or enhancement, or resource acquisition of equal or greater value also may be funded. If practical, such alternatives should provide similar services to the public and should be in the vicinity of the loss.

*b. Indirect monetary payment.* In appropriate cases, an equal or greater amount of compensation may be made by monetary payment to another government agency or private nonprofit group in the natural resource field for the same purposes as provided in 105.106(4)“a.”

*c. Direct funding of projects.* With the approval and oversight of the department, the person may be allowed to contract directly for the same purposes as provided in 105.106(4)“a.”

[ARC 0486D, IAB 8/19/26, effective 9/23/26]

**567—105.107 to 105.199** Reserved.

These rules are intended to implement Iowa Code chapter 455B, subchapter III, part 1, and subchapter IV, part 4, and Iowa Code section 455E.5.

### DIVISION III IOWA LAND RECYCLING PROGRAM AND RESPONSE ACTION STANDARDS

**567—105.200(455H) Purpose.** This division is adopted under the authority of Iowa Code chapter 455H. These rules establish the policy and procedures for the voluntary enrollment of contaminated property in the land recycling program. These rules also establish the response action standards that participants must meet in order to qualify for a no further action certificate and the statutory protections and immunities that follow from it. Consistent with the declaration of policy stated in Iowa Code section 455H.104, these rules are intended to achieve the dual objective of addressing the current and future risks associated with contaminated property and thereby enhancing the market conditions that can lead to development of these properties into their highest productive use. These objectives can in part be met through a program that encourages voluntary participation by persons who may have a legal duty to address, in whole or in part, the contamination within an affected area, as well as persons who might not have a legal obligation but who have an interest in development of enrolled sites. These rules attempt to provide a degree of certainty in the response action process as an incentive to participants and as a means of assisting participants in quantifying their financial investment.

**105.200(1)** It is the objective of these rules to establish a collaborative process between the participant(s) and the department as the most effective means of achieving consensus and resolving disputes on issues that are not or cannot be fully defined and anticipated by rule.

**105.200(2)** Although participation in this program is voluntary, these rules establish minimum standards that must be met in order to obtain regulatory closure from the department through issuance of a no further action certificate.

**105.200(3)** Although the scope of the response actions addressed under these rules may not in every case address all known or unknown releases within an affected area, it should be the objective of both the department and the participant(s) to work together and to use all resources available to address all known releases within an affected area in the interest of protecting public health and safety and the environment as well as achieving regulatory finality.

[ARC 0486D, IAB 8/19/26, effective 9/23/26]

**567—105.201(455H) Applicability.**

**105.201(1)** These rules apply only to releases of contaminants that are being addressed at enrolled sites. The department may in its discretion, to facilitate compliance with other provisions of this chapter, apply the response action requirements of 567—105.204(455H) through 567—105.210(455H) to releases

of contaminants at sites that are not enrolled. These rules do not in any way limit the statutory liabilities of participants or nonparticipants except as expressly provided within the context of enrollment and Iowa Code chapter 455H. Consistent with Iowa Code section 455H.505, these rules do not limit the authority of the department or the responsibility of statutorily responsible persons to provide notice of hazardous conditions under division I of this chapter or to respond to new releases and undertake emergency response actions under division II of this chapter. For sites that are not enrolled, division II of this chapter will remain in effect, and for enrolled sites, division II of this chapter shall apply to the extent it is not inconsistent with this division.

**105.201(2)** All rules, standards, technical guidance, and other similar legal or technical documents referenced in this division shall be the version of those documents in effect on August 1, 2025, unless otherwise noted in these rules, and except for references to the Iowa Code and Iowa Administrative Code, which shall always be the most recent version unless otherwise noted in these rules.

[ARC 0486D, IAB 8/19/26, effective 9/23/26]

**567—105.202(455H) Definitions.** For the purposes of this division, these definitions and the definitions in Iowa Code section 455H.103 shall apply:

*“ASTM standards”* means the standards as specified in these rules and most recently adopted by ASTM International as of August 1, 2025, unless otherwise noted in these rules.

*“Background standard”* means a standard that represents concentrations of contaminants that are naturally occurring or are generally present and not related to a readily identifiable release.

*“Carcinogenic health risk”* means the incremental risk of a person developing cancer over a lifetime (70 years) as a result of exposure to a hazardous substance, expressed as a probability such as one in a million (10<sup>-6</sup>). The contaminant level for the probability value is derived from application of certain designated exposure assumptions and a slope factor.

*“Code of Federal Regulations”* or *“CFR”* means the federal administrative rules adopted by the United States as amended through August 1, 2025, unless otherwise noted in these rules.

*“Contaminant”* means any hazardous substance found in the various media of the environment.

*“Contaminant of concern”* means specific hazardous substances that are identified for evaluation in the risk assessment process. Identification can be based on their historical and current use at the site, detected concentrations in environmental media and their mobility, toxicity, and persistence in the environment.

*“Cumulative risk”* means a summation of cancer and noncancer risks, determined separately, based on exposure to multiple contaminants from the same medium and exposure of the same individual to contaminants in multiple media.

*“Enrolled site”* means any property as defined by a legal description, a parcel number, or similar description that sufficiently defines the property in question, that has been or is suspected to be the site of or affected by a release and that has been enrolled pursuant to this division by a participant.

*“Environmental protection easement”* means an institutional control created under Iowa Code section 455H.206 that is a statutorily authorized restriction on land use.

*“Exposure pathway”* means the course a contaminant of concern may take from its source area to an exposed organism. Each exposure pathway includes a source or release from a source, a point of exposure, and an exposure route.

*“Exposure route”* means the manner in which a contaminant of concern comes in contact with an organism (including but not limited to ingestion, inhalation, dermal contact).

*“Free product”* means a hazardous substance that is present as a nonaqueous phase liquid (e.g., liquid not dissolved in water) or is present as a solid in its original form as a product or waste material.

*“Gross contamination”* means contamination present at concentrations in an amount sufficient to reasonably expect that institutional or technological controls will not be adequately protective of human health or the environment.

*“Group A, B, C, D and E chemicals”* means hazardous substances that have been classified based on the weight of evidence of human carcinogenicity. Group A substances are carcinogenic to humans. Group B substances are likely to be carcinogenic to humans. Group C substances have suggestive evidence of human carcinogenicity, but not sufficient evidence to assess human carcinogenic potential. Data are

inadequate to assess human carcinogenic potential for Group D substances. Group E substances are not likely to be carcinogenic to humans.

*“Hydraulic conductivity”* means a measure of the capacity of a porous medium (rock or soil) to transmit water. It is expressed as the volume of water that will flow through a unit length of a unit cross-sectional area of the porous medium in a unit time with a unit head loss.

*“Institutional controls”* means a nonphysical action that restricts land use to reduce or eliminate exposure to the contaminants of an affected area.

*“Lifetime health advisory level”* or *“HAL”* means a lifetime health advisory level for a contaminant, established by the United States Environmental Protection Agency (EPA). Health advisories represent the concentration of a single contaminant, based on current toxicological information, in drinking water that is not expected to cause adverse health effects over lifetime exposure.

*“Maximum contaminant level”* or *“MCL”* means the enforceable maximum contaminant level established by the EPA pursuant to the Safe Drinking Water Act.

*“No further action certificate”* means the same as no further action letter as described in Iowa Code section 455H.301. It is a document issued by the department to the participant certifying no further response action is required at an enrolled site for those conditions classified as no further action except the monitoring or the maintenance of institutional or technological controls when required.

*“No further action certification”* means the department has determined an enrolled site has met all standards applicable for the identified hazardous substances and no further response action is required except the monitoring or the maintenance of institutional or technological controls when required.

*“Nonresidential land-use area”* means any area that is not a residential land-use area.

*“Participant”* means any person who applies for the program or enrolls property pursuant to this chapter. A participant is a participant only to the extent the participant complies with the requirements of this chapter.

*“Point of compliance”* means a location selected within the affected area where the concentration of contaminants of concern must be at or below the target levels established for that point.

*“Point of exposure”* means the location at which an individual or population may come in contact with a contaminant of concern from the enrolled site.

*“Receptor”* means an individual or population that is or may be affected by a release from the enrolled site.

*“Reference dose,”* expressed in units of milligrams per day exposure to the contaminant per kilogram of body weight of the exposed individual, means the amount of contaminant that an individual can ingest on a daily basis for a lifetime that is not likely to result in adverse noncancer health effects. A reference dose is protective of the entire human population, including sensitive subpopulations.

*“Residential land-use area”* means an area zoned for residential use or an area where residential use currently exists, is planned, or is not otherwise precluded. In addition, a residential land-use area includes other areas where frequent, long-term, close contact with soils is likely to occur (e.g., playgrounds, sport fields, gardens, child care facilities).

*“Risk evaluation/response action document”* means a document based on the site assessment for the enrolled site that includes a risk evaluation, proposed response action, and proposed compliance verification strategy for the enrolled site.

*“Site assessment plan”* means the optional plan submitted to the department that lays out the rationale and the steps to be followed in the conduct of a site assessment for the enrolled site.

*“Site assessment report”* means the report of the site assessment that defines the nature and extent of contamination, identifies likely exposure pathways, and allows for characterizing potential and current exposure risks posed by the enrolled site.

*“Site-specific standard”* means a standard for a specific site that represents a concentration of a contaminant in a media of an affected area at which exposure through a specific pathway is considered unlikely to pose a threat to human health, safety, or the environment given site-specific factors related to contaminant transport and likely exposure.

*“Slope factor”* means an upper bound estimate that approximates a 95 percent confidence limit of the increased cancer risk from a lifetime exposure to a contaminant. This estimate is expressed in units of the

proportion of a population that is affected per milligram per day exposure to the contaminant per kilogram of body weight of the exposed individual.

*“Statewide standard”* means a standard that represents a concentration of a contaminant in a specific media of an affected area at which normal, unrestricted exposure through a specific exposure pathway is considered unlikely to pose a threat to human health, safety, or the environment.

*“Surface water”* means general use segments as provided in 567—paragraph 61.3(1)“a” and designated use segments of water bodies as provided in 567—paragraph 61.3(1)“b” and 567—subrule 61.3(5).

*“Target level”* means a concentration of a contaminant of concern required to establish compliance with background, statewide or site-specific standards.

*“Target organ”* means the biological organ(s) most adversely affected from exposure to the contaminant of concern. A “reference dose” used to calculate noncancer health risk is normally established based on adverse impact to a target organ or organs from exposure to the contaminant of concern.

*“Technological control”* means a physical action whose main purpose is to reduce or eliminate exposure to the contaminants of an affected area.

[ARC 0486D, IAB 8/19/26, effective 9/23/26]

### **567—105.203(455H) Enrollment in the Iowa land recycling program.**

**105.203(1)** *Property eligible for enrollment.* Unless excluded by statute or this rule and subject to eligibility conditions specified in this division, property that has been or is suspected to be the site of or affected by a release of a hazardous substance as defined in Iowa Code section 455H.103 is eligible for enrollment.

**105.203(2)** *Property ineligible for enrollment.* The following sites shall not be enrolled in the Iowa land recycling program:

a. Property with petroleum releases associated with underground storage tanks subject to regulation under Iowa Code chapter 455B, division IV, part 8, and 567—Chapter 135. However, property affected by releases of regulated substances from underground storage tanks other than petroleum as defined in 567—135.2(455B) subject to regulation under 567—Chapter 135 may be enrolled under this division. Property enrolled and affected by a release from underground storage tanks of regulated substances other than petroleum will be subject to the response action standards in this division in lieu of those in 567—135.8(455B) through 567—135.12(455B).

b. Property that has been placed or is proposed to be included on the national priorities list established pursuant to the federal Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), 42 U.S.C. Section 9601 et seq. A property will be considered proposed at the time that a public notice of intent to list the property on the national priorities list is published in the Federal Register in accordance with 40 CFR 300.425.

c. An animal feeding operation structure as defined in Iowa Code section 459.102.

d. Properties subject to administrative or judicial enforcement action by the department or the EPA or subject to an administrative or judicial consent order addressing environmental conditions. These properties may be eligible for enrollment only with the written approval of and under such terms as determined by the enforcing agency.

e. Eligible properties that are or may be affected by or commingled with ineligible releases or conditions will be evaluated on a case-by-case basis to determine their appropriateness for enrollment. Only the eligible property and participant(s) will be afforded the benefits and immunities available under Iowa Code chapter 455H. Any protections provided by issuance of a no further action certificate will be limited by and may be subject to reopening due to future conditions associated with the ineligible release. Considerations for enrollment or exclusion include but are not limited to the following:

(1) The extent to which eligible releases and site conditions can be assessed and response action(s) designed and implemented independent of the ineligible releases and property.

(2) The extent to which the liability and other protections offered by Iowa Code chapter 455H and the conditions of a no further action certificate can reasonably be defined to apply to the eligible site without consideration of or dependence on future conditions associated with the ineligible release and property.

(3) The extent to which a participant is willing to conduct all response action(s) necessary to address the health, safety and environmental conditions implicated by both eligible and ineligible releases and conditions. The extent to which a nonparticipant responsible for the ineligible release and property can establish an intention and ability to cooperatively address and share costs associated with the commingled conditions and satisfy both the standards in this division and any other regulatory standards applicable to the ineligible release or condition.

**105.203(3)** *Enrollment policy and procedures.* Prior to enrollment, the participant may conduct a sufficient preliminary site investigation and project planning to be prepared to show that a site is eligible for enrollment and the participant(s) is ready and capable of initiating and completing a response action in accordance with these rules. The participant(s) must submit a completed program application and participation agreement on a form prescribed by the department. The program application shall contain at least the following information:

*a.* An acknowledgment of accessor control of the site signed by the fee titleholder in the affected property. If acknowledgment of access cannot be obtained, the participant must describe efforts to obtain access and reasons why it has been refused.

*b.* The name, address and other relevant information of each current and anticipated participant(s). The description should include a brief statement of the reasons for each person's participation including but not limited to that person's interest in and legal relationship to the property enrolled and the expected role and scope of any participation. Other persons who are not participants but who may have an interest in the project should be identified, such as state and local development agencies, community groups, and financing sources.

*c.* The participant(s) must demonstrate the presence of hazardous substances at concentrations that warrant response action(s) under the standards in this division. At a minimum, the environmental condition to be addressed must be documented by the submission of a report that includes the following:

(1) Analyses for a contaminant regulated under this division must be performed by a laboratory certified for the analyte(s) and applicable method pursuant to 567—Chapter 83.

(2) A description of the current and historical uses of the property based on a reasonable and diligent inquiry. This must include a description of the following: known sources and probable locations of hazardous substances and probable location of the sources at the property that the participant proposes to address as part of the project; a general description of the historical uses of the property and probable hazardous substances that could reasonably be associated with past land use; and a general description of the surface characteristics of the property and surrounding areas such as current zoning, residential, commercial and industrial uses, and current uses of adjoining properties.

*d.* Any assessments or other reports relating to contamination at the property in excess of a statewide standard or reportable under division I of this chapter that are known to and within the control of the participant shall be submitted. If the participant intends to claim that information constitutes a privileged environmental audit as provided in Iowa Code chapter 455K, the participant must notify the department of the claim and resolve the issue of privilege prior to submittal. The participant shall not submit to the department a report or any part of a report that it claims to be privileged and any information submitted under this paragraph shall be deemed a nonprivileged submittal as provided in Iowa Code section 455K.6(1)“a.” This provision does not relieve the participant of any obligation to notify the department of a hazardous condition as provided in Iowa Code section 455B.386 and rules under division I of this chapter.

*e.* A statement of the project objectives that includes the current use of the property, proposed development activities, and an expected time frame for meeting these objectives. The statement should include a general description of the scope of the proposed environmental condition to be addressed and a proposed schedule for initiation and submittal of site assessment activities pursuant to 567—105.208(455H). The statement should describe any foreseeable barriers toward achieving project objectives such as access to property, financing uncertainties, legal actions, and allocation of responsibility amongst parties.

*f.* A list of all known permits and regulatory actions and directives associated with an environmental condition at the site. If any parcel of the proposed enrolled site is subject to any federal regulatory

corrective action directives, administrative orders or judicial actions, these must be explained. The participant must submit written proof that the appropriate federal regulatory agency has been notified of the participant's desire to participate in the Iowa land recycling program. Objections, concerns or issues that could lead to disputes regarding dual or conflicting jurisdiction should be resolved prior to application, if possible, and before admission.

g. The department will respond in writing within 60 days of receipt of the enrollment application. The department will notify the participant(s) whether the site has been accepted and an expected time line for assignment of the project to a manager. If the site is not accepted, the department will notify the participant of the reason(s). Upon notification of admission, the property shall be considered enrolled. Once the department has assigned the enrolled site to a project manager, the department will enter into a participation agreement with the participant(s).

**105.203(4)** *Enrollment fees and oversight costs.* A nonrefundable enrollment fee of \$750 must be submitted with the program application. This fee is intended to cover the department's cost of reviewing the program application and a minimum amount of subsequent oversight costs. Subsequent fees in excess of the minimum \$750 may be assessed for actual oversight costs incurred by the department as provided in this division. Department oversight activities may include but are not limited to review of documents, meetings with the participant(s), site visits, sampling, and laboratory costs related to verification of submitted materials. The total fees for oversight costs shall not exceed \$7,500 per enrolled site enrolled prior to July 1, 2018. For sites enrolled on or after July 1, 2018, the fee shall not exceed \$25,000 per enrolled site. Fees shall be assessed and collected as follows:

a. *Hourly billing rate.* Project oversight fees shall be based on an hourly rate to cover wages and overhead costs of personnel employed by the department in the Iowa land recycling program. The department shall calculate and publish on an annual basis an hourly billing rate at which oversight fees shall be calculated.

b. *Quarterly payments.* The department shall bill the participant(s) on a quarterly basis for additional oversight costs beyond the review of the application incurred by the department. The participant(s) shall pay the department within 30 days after receiving the department's quarterly fee statement. If there is more than one participant, each shall be jointly and severally responsible for payment. The department will provide split billings if provided with an enforceable written contract allocating the fees amongst the participants.

c. *Failure to pay required fees.* If the participant(s) fails to pay department oversight fees that are required under this subrule, the department shall cease to provide oversight to the participant(s) and terminate enrollment of the site as described in 105.203(7).

**105.203(5)** *Participation agreement.* All participants shall enter into a participation agreement. This agreement shall be executed at the time the project is assigned to a project manager. At a minimum, the agreement shall establish the following:

a. A requirement that the participant(s) agree and provide necessary documentation to ensure reasonable access to the affected property by department staff and other authorized representatives of the department.

b. A requirement that the participant(s) reimburse the department for the actual costs assessed as provided in 105.203(3).

c. A requirement that the participant(s) certify that they have the financial means to complete the project based on an initial estimate of completion costs. The department may require modification and amendment of the financial certification at any stage in the project and may require the participant(s) to provide financial documentation as necessary to support the certification.

d. A requirement that the participation agreement include a general description of the scope of the project and the goals to be achieved, a general time frame for submission and review of documents in accordance with this division, allocation of responsibility amongst multiple participants and other appropriate milestones. Either the participant(s) or the department may request a meeting to develop a statement describing the scope, goals, and time frames for the project.

**105.203(6)** *Prioritization.* Eligible sites will be enrolled in the order in which they are received. The department reserves the right to elevate the priority of a given site if it determines the public health and

safety and the environment or environmental conditions in combination with the development objectives consistent with Iowa Code section 455H.104 is significantly greater than those of sites with an earlier enrollment date.

**105.203(7) *Withdrawal procedures.*** Enrollment and continued participation in the program are voluntary. The participant(s) may withdraw the enrolled site and individual participants may withdraw from further participation in the Iowa land recycling program at any time upon written notice to the department. Any participant who withdraws an enrolled site from further participation in the program shall not be entitled to any refund or credit for the \$750 enrollment fee and shall be liable for any oversight costs actually incurred by the department up to the cap of \$7,500 per enrolled site enrolled prior to July 1, 2018, and \$25,000 per enrolled site enrolled after July 1, 2018. A participant who withdraws a site prior to completion of all response action(s) required by this division and issuance of a no further action certificate in accordance with 567—105.211(455H) forfeits all benefits and immunities provided by this division and Iowa Code chapter 455H. Prior to withdrawal, the participant(s) shall submit a plan, which must be approved by the department, for stabilization of conditions at the site or a justification for why further action to stabilize the site is not necessary. Participants shall be required to take such actions as the department determines necessary to stabilize conditions at the site, including but not limited to securing or properly abandoning monitoring wells, removing or otherwise properly disposing of all contaminated soil excavations, removing or properly disposing of exposed or exhumed contaminants, filling or properly fencing open excavations, and posting safety notices.

**105.203(8) *Termination of enrollment.*** Enrollment of the participant(s) may be terminated based on a finding of material noncompliance with department rules and statutory requirements including but not limited to the following:

- a.* Significant failure, after written notice, to comply with schedules for completion and submission of reports and implementation of response action(s) required by these rules or otherwise agreed upon in writing by the department and participants. Written requests for reasonable schedule extensions may be granted upon a showing of extenuating circumstances beyond the control of the participant(s) and the participant(s) agent or contractor.
- b.* Failure to proceed in a timely manner after written notice in performing the additional response action required due to a failure of technological and institutional controls pursuant to 567—105.207(455H).
- c.* Material misstatement or omission of fact in reports submitted to the department by the participant or agents of the participant.
- d.* Evidence that the site falls under one of the exclusion categories in 105.203(2).
- e.* Failure to pay required fees to the department as required in 105.203(3).

**105.203(9) *Appeal rights.*** The department will notify participant(s) of a denial of enrollment or of an intent to terminate enrollment and provide a statement of reasons. The participant(s) shall have a right to appeal the decision to deny enrollment or to terminate enrollment. Upon timely appeal, contested case procedures shall be initiated pursuant to 7—Chapter 2506 and 561—Chapter 2506.

[ARC 0486D, IAB 8/19/26, effective 9/23/26]

#### **567—105.204(455H) Background standards.**

**105.204(1) *Purpose.*** This rule defines the basis and procedure for establishing background standards in groundwater, soil, surface water and air. Background standards represent concentrations of contaminants that are naturally occurring or generally present and not related to a readily identifiable release. Background standards provide a baseline for assessing impacts of contaminant releases from within the affected area.

**105.204(2) *Determination of background standards.*** Background standards shall be based on sampling at appropriate site-specific background locations. Background sampling locations shall be outside the influence of any possible contamination associated with releases occurring on the property in which the enrolled site is located. Sufficient supporting information shall be provided to demonstrate the appropriateness of background sampling locations. Appropriateness for background sampling locations has two aspects that shall be addressed:

*a.* Background samples shall be collected from a location that represents a true background condition with respect to the enrolled site. A background groundwater sample shall be collected from an upgradient location relative to groundwater movement.

*b.* Background samples will represent conditions that are comparable to the contaminated media being addressed. In the case of soils, samples from the affected area and the background areas will be comparable in physical, chemical, and biological attributes.

Sampling conducted for the purpose of establishing a background standard shall meet quality criteria specified for the site assessment, 567—105.208(455H). The minimum number of samples to be collected from the medium of concern for which a background standard is being established shall be consistent with 567—105.210(455H), regarding demonstration of compliance.

[ARC 0486D, IAB 8/19/26, effective 9/23/26]

#### **567—105.205(455H) Statewide standards.**

**105.205(1) Purpose.** This rule defines the basis and procedure for establishing statewide standards for contaminants in groundwater, soil, and surface water. Statewide standards for groundwater and soil represent concentrations of contaminants in these media at which normal exposure via ingestion and dermal contact with soil is considered unlikely to pose a threat to human health. Statewide standards for surface water are based on protection of aquatic life and protection of human health. This rule also describes how air standards are to be addressed.

**105.205(2) Scope.** Statewide standards described herein address what are considered to be the most likely, normal exposure situations within the state of Iowa. Statewide standards for groundwater address direct exposure via ingestion to individual contaminants in the media of concern only. Statewide standards for soil address direct exposure to individual contaminants via ingestion and dermal contact in the media of concern only. In the event exposure to multiple contaminants may occur or exposure from more than one medium may occur, statewide standards alone may not be protective of human health; therefore, cumulative risk standards must be met in accordance with 105.210(7). In addition, the department may deny the use of the statewide standards prescribed herein and require the use of site-specific standards based on site-specific conditions pursuant to 105.206(10). Examples of exposure concerns not anticipated by the statewide standards include but are not limited to:

- a.* Significant plant uptake of contaminants from soil or groundwater;
- b.* Contaminants entering drinking water lines from contact with soil or groundwater;
- c.* Ecological concerns, other than for surface water;
- d.* Groundwater in a nonprotected groundwater source that is used or likely to be used for drinking water or other use.

**105.205(3) Establishment of risk-based contaminant concentrations.**

*a. Risk-based concentration formula.* Risk-based contaminant concentrations for soil and groundwater, except lead, shall be computed using the following formula, where appropriate:

(Formula I)

$$C = \frac{RF \times AT \times 365 \text{ days/year}}{Abs \times [(ER_c \times EF_c \times ED_c) \div BW_c + (ER_a \times EF_a \times ED_a) \div BW_a] \times CF}$$

NOTE: When a risk-based concentration is computed for two routes of exposure to the same medium (e.g., soil oral exposure and soil dermal exposure), the composite risk-based concentration equals the multiple of the risk-based concentration for each route of exposure divided by the sum of the risk-based concentration for each route of exposure.

Where: C = Concentration of contaminant (soil: mg/kg, water: mg/l)

RF = Risk factor

For protection from cancer health risks:

RF = TR ÷ SF

Where: TR = Target cancer risk (unitless)

SF = Slope factor [(mg/kg)/day]<sup>-1</sup> for a route of exposure; see 105.205(3) “c” for source.

For protection from noncancer health risks:

$$RF = THQ \times RfD$$

Where: THQ = Target hazard quotient (unitless)

RfD = Reference dose (mg/kg)/day for a route of exposure; see 105.205(3) "c" for source.

AT = Averaging time (years); time over which exposure is averaged and potential adverse effects may occur

Abs = Absorption factor (unitless); portion of exposed contaminant absorbed by the body

ER<sub>c</sub> = Exposure rate by a child (soil: mg/day, water: l/day)

EF<sub>c</sub> = Exposure frequency by a child (days/year)

ED<sub>c</sub> = Exposure duration by a child (years)

BW<sub>c</sub> = Body weight of exposed child (kg)

ER<sub>a</sub> = Exposure rate by an adult (soil: mg/day, water: l/day)

EF<sub>a</sub> = Exposure frequency by an adult (days/year)

ED<sub>a</sub> = Exposure duration by an adult (years)

BW<sub>a</sub> = Body weight of exposed adult (kg)

CF = Conversion factor: 10<sup>-6</sup> kg/mg for soils; 1 (unitless) for water

b. *Carcinogenic classification of chemicals.* The potential carcinogenicity of chemicals will be based on the weight-of-evidence classification system utilized by the EPA. Risk-based concentrations will be based on cancer health effects for individual chemicals that are classified as Group A or Group B. The risk-based concentration for an individual chemical will be based on noncancer health effects for chemicals that are classified as Group C, Group D or Group E. In the absence of such classification for a chemical, the Group D classification will be assumed. Noncancer risks for a Group A or Group B chemical will be included in the determination of cumulative noncancer risk in accordance with 105.210(7), if a reference dose exists for that chemical. Cancer risk associated with a Group C chemical shall be included in the determination of cumulative cancer risk in accordance with 105.210(7), if a cancer slope factor exists for that chemical.

c. *Source of toxicity values.* EPA's Integrated Risk Information System (IRIS) shall be the primary source of information on toxicity factors (e.g., oral reference doses and oral slope factors), carcinogenic classification for chemicals, and the target organs. Such information that is not available on IRIS shall be obtained from other sources consistent with current EPA guidelines. The Iowa department of health and human services (HHS) shall be consulted regarding toxicity values not available on IRIS. Absorption factors for dermal soil exposure shall be based on best available information, which will usually be obtained from EPA guidance documents.

**105.205(4) Statewide standards for groundwater.**

a. *Protected groundwater source.* Statewide standards for groundwater in a protected groundwater source will be the enforceable MCL established by the EPA pursuant to the Safe Drinking Water Act as amended in 1996, if an MCL exists. If no enforceable MCL exists, the statewide standard for chemicals will be the HAL as provided in the Drinking Water Regulations and Health Advisories by the EPA's Office of Water. Interim or provisional HALs can also be used. If no MCL or HAL exists, the statewide standard for a chemical will be calculated using Formula I and input variables for groundwater ingestion in accordance with Table I.

b. *Groundwater in a nonprotected groundwater source.* The statewide standard for a chemical in groundwater in a nonprotected groundwater source will be five times the statewide standard for the chemical in a protected groundwater source or a risk-based concentration using Formula I with input variables specified in Table I, whichever is larger. The statewide standards for groundwater in a nonprotected groundwater source are based on groundwater ingestion only.

Table I  
Input Variables for Risk-Based Statewide Standards for Groundwater  
from Protected and Nonprotected Groundwater Sources

| Parameter | Units    | Cancer Group | Protected            | Nonprotected         |
|-----------|----------|--------------|----------------------|----------------------|
| TR        | unitless | A, B         | 5 × 10 <sup>-6</sup> | 1 × 10 <sup>-4</sup> |

| <u>Parameter</u> | <u>Units</u>                       | <u>Cancer Group</u> | <u>Protected</u> | <u>Nonprotected</u> |
|------------------|------------------------------------|---------------------|------------------|---------------------|
| SF               | $[(\text{mg/kg})/\text{day}]^{-1}$ | A, B, C             | Chem.-spec.      | Chem.-spec.*        |
| THQ              | unitless                           | C                   | 0.02             | 0.1/1*              |
|                  |                                    | D, E                | 0.2              | 1                   |
| RfD              | (mg/kg)/day                        | C, D, E             | Chem.-spec.      | Chem.-spec.         |
| AT               | years                              | A - E               | 70               | 70                  |
| Abs              | unitless                           | A - E               | 1                | 1                   |
| ER <sub>c</sub>  | l/day                              | A - E               | 1                | 1                   |
| EF <sub>c</sub>  | days/yr                            | A - E               | 0                | 0                   |
| ED <sub>c</sub>  | years                              | A - E               | 6                | 6                   |
| BW <sub>c</sub>  | kg                                 | A - E               | 15               | 15                  |
| ER <sub>a</sub>  | l/day                              | A - E               | 2                | 2                   |
| EF <sub>a</sub>  | days/yr                            | A - E               | 365              | 365                 |
| ED <sub>a</sub>  | years                              | A - E               | 70               | 70                  |
| BW <sub>a</sub>  | kg                                 | A - E               | 70               | 70                  |
| CF               | unitless                           | A - E               | 1                | 1                   |

\*The risk-based concentration using Formula I for Cancer Group C chemicals that have an SF value established per 105.205(3) “c” will be the larger of a value based on the risk factor for protection from noncancer health risks with a THQ = 0.1 or the risk factor for protection from cancer health risks. Risk-based concentrations using Formula I for Cancer Group C chemicals that do not have an SF value established per 105.205(3) “c” will be a value based on the risk factor for protection from noncancer health risks with a THQ = 1.

**105.205(5)** *Statewide standards for soil.* Statewide standards for chemicals in soil, except lead, will be calculated using Formula I based on incidental ingestion of soil and dust and dermal contact with soil with input variables in accordance with Table II. The statewide standard for lead in soil shall be 400 mg/kg.

Table II  
Input Variables for Statewide Soil Standards

| <u>Parameter</u> | <u>Units</u>                       | <u>Cancer Group</u> | <u>Route of Exposure</u> |                    |
|------------------|------------------------------------|---------------------|--------------------------|--------------------|
|                  |                                    |                     | <u>Oral</u>              | <u>Dermal</u>      |
| TR               | unitless                           | A, B                | $5 \times 10^{-6}$       | $5 \times 10^{-6}$ |
| SF               | $[(\text{mg/kg})/\text{day}]^{-1}$ | A, B, C*            | Chem.-spec.              | Chem.-spec.        |
| THQ              | unitless                           | C*                  | 0.1/1                    | 0.1/1              |
|                  |                                    | D, E                | 1                        | 1                  |
| RfD              | (mg/kg)/day                        | C, D, E             | Chem.-spec.              | Chem.-spec.        |
| AT               | years                              | A, B                | 70                       | 70                 |
|                  |                                    | C, D, E             | 6                        | 6                  |
| Abs              | unitless                           | A - E               | 1                        | Chem.-spec.        |

\*The risk-based concentration using Formula I for Cancer Group C chemicals that have an SF value established per 105.205(3) “c” will be the larger of a value based on the risk factor for protection from noncancer health risks with a THQ = 0.1 or the risk factor for protection from cancer health risks. Risk-based concentrations using Formula I for Cancer Group C chemicals that do not have an SF value

established per 105.205(3) “c” will be a value based on the risk factor for protection from noncancer health risks with a THQ = 1.

**\*\*Dermal exposure rate is based on 2,800 cm<sup>2</sup> of exposed skin on a child with 0.2 mg/cm<sup>2</sup> of soil adhering to the child’s skin and 5,700 cm<sup>2</sup> of exposed skin on an adult with 0.07 mg/cm<sup>2</sup> of soil adhering to the adult’s skin per each dermal exposure event. A dermal exposure event is assumed to be one event per day of exposure.**

**105.205(6) *Statewide standards for surface water.*** Water quality standards pursuant to 567—Chapter 61 shall be considered statewide standards for surface water. If a promulgated water quality standard does not exist for a contaminant of concern, the department may establish an appropriate standard in a manner consistent with 567—Chapter 61.

**105.205(7) *Statewide standards for air.*** Ambient air quality standards pursuant to 567—Chapter 22 constitute statewide standards for air. Air emission sources must meet air quality emission standards as set forth in 567—Chapters 21 through 33 inclusively, as applicable. Any relevant air quality standard that is subsequently promulgated by statute or rule shall become a statewide standard for air upon the effective date of adoption by the state. In the absence of applicable, adopted standards, site-specific air standards must be met, in accordance with 105.206(9), when air quality issues are addressed at a site.

**105.205(8) *Point of exposure for statewide standards.*** The point of exposure associated with the use of only statewide standards in the determination of compliance will be assumed to be anywhere and everywhere, except for surface water. The point of exposure associated with the use of statewide standards for surface water will be assumed to be the point of groundwater or other site runoff immediately before it discharges to the surface water body.

**105.205(9) *Practical quantification limits.*** In no case will the statewide standard be less than the practical quantification limit, as determined by the department.

**105.205(10) *Maintenance of statewide standards.*** The toxicity values, absorption factors for dermal exposure to soils, and promulgated standards that are a basis for statewide standards are subject to periodic revision due to actions not governed under this rule. The department in conjunction with the HHS will maintain a current list of toxicity values, absorption factors for dermal exposure to soils, target organs for cumulative noncarcinogenic health risks, promulgated standards, and the resultant statewide standards that will be readily available to the public. This guidance document will reference all the sources of the information. In the absence of a dermal slope factor or a dermal reference dose for a chemical, the oral slope factor or oral reference dose will be used with adjustments made to account for differences in oral and dermal absorption rates in accordance with current EPA guidance. Statewide standards for individual sites will be locked in at the beginning of the site assessment process pursuant to 567—105.208(455H). If a statewide standard does not exist for a chemical, it will be the department’s responsibility to establish a statewide standard, pursuant to 105.205(4) and 105.205(5), for groundwater and soil, and to add the newly established statewide standard to the comprehensive list of statewide standards in the guidance document maintained by the department.

[ARC 0486D, IAB 8/19/26, effective 9/23/26]

#### **567—105.206(455H) Site-specific standards.**

**105.206(1) *Purpose.*** As opposed to statewide standards, site-specific standards are derived by applying exposure and risk assumptions applicable to the conditions at a particular site. Like statewide standards, site-specific standards must always be shown to be protective of public health and safety and the environment. Statewide standards may be used in combination with site-specific standards to address different exposure pathways. Site-specific standards may be required to address exposure pathways that the department determines must be evaluated to be protective of human health, safety and the environment and for which statewide standards have not been established under 567—105.205(455H). Site-specific standards may involve development of target levels for contaminants of concern based on site-specific exposure assumptions for use in lieu of background or statewide standards. Site-specific standards may also include consideration of the actual or potential location where exposure to contaminants occurs or may occur, the likelihood of an exposure occurring, and the overall magnitude and extent of contamination. Site-specific standards may involve use of site-specific target levels for contaminants of concern alone or in conjunction with other site-specific criteria, such as the location where the standard is applied.

**105.206(2)** *General provisions.*

*a.* This rule establishes a minimum protocol that must be met at all enrolled sites that have not established compliance by application of background or statewide standards. Groundwater ingestion and soil ingestion pathway standards under this rule must be evaluated. Surface water and air quality standards under 105.206(8) and 105.206(9) must be met whenever exposure concerns are evident and the participant or the department determines these pathways may present an unacceptable risk for current or future exposures. This rule is not intended to preclude the department or the participant from addressing other exposure pathways, and the department expressly reserves the right to require evaluation of other exposure pathways and compliance with site-specific standards developed for them, such as dermal contact, ingestion of vegetables containing contaminants from soil or irrigation water, migration of contaminants from groundwater or soil into water distribution lines or into air in a confined space, migration of contaminants from soil to groundwater, and migration of contaminants in a nonprotected groundwater source to a protected groundwater source. Participants must establish compliance with standards applicable to all exposure pathways required by the department under this rule in order to qualify for no further action classification under 567—105.211(455H) unless granted a waiver as provided in Iowa Code section 455H.205.

*b.* Site-specific standards are subject to the approval of the department. Assurances in the form of technological or institutional controls in accordance with 567—105.207(455H) will be required, as needed, to ensure continued protectiveness of site-specific standards.

*c.* 105.206(3) through 105.206(11) provide options for site-specific standards. The participant may select any of these options, or combinations thereof, for use as site-specific standards.

**105.206(3)** *Site-specific groundwater point of exposure.* A site-specific groundwater standard may be an appropriate target level applied at groundwater points of exposure that are limited by technological or institutional controls.

*a.* A point of exposure for groundwater is a location within the affected area where a well exists or could be placed (potential point of exposure). Where technological or institutional controls are determined to effectively restrict the placement of groundwater wells, the points of exposure apply outside the area of restriction. A sufficient number of points of exposure may be established for determining compliance such that compliance with appropriate target levels at these points will ensure compliance at all points of exposure. A compliance point of exposure will be a location at the boundary of the area restricted by an institutional control where a groundwater well could be installed that would have the highest contaminant concentration, unless otherwise approved by the department. More than one compliance point of exposure must be established due to uncertainties within the environment such as spatial and temporal variabilities in groundwater flow and contaminant occurrence, unless the department approves otherwise.

*b.* Target levels. The point of exposure target level for drinking water wells is the statewide standard applicable to groundwater ingestion or an alternative site-specific target level approved under 105.206(10) or 105.206(11). The point of exposure target level for non-drinking water wells is the statewide standard applicable to nonprotected groundwater or an alternative site-specific target level approved under 105.206(10) or 105.206(11). The point of exposure target level for nonused groundwater meeting the conditions in 105.206(5) is the statewide standard for a nonprotected groundwater source.

*c.* Nonprotected groundwater sources. A nonprotected groundwater source that is affecting or likely to affect an existing drinking water well shall be required to meet the same site-specific standards, including point of exposure target level(s), as applied to a protected groundwater source.

*d.* Unless conditions can be demonstrated to be stable, predictive techniques in accordance with 105.209(4) must be used to determine the future effects of groundwater contamination on existing drinking and non-drinking water wells and to determine the area predicted to exceed the point of exposure target level(s) where wells could be installed. When using predictive techniques, determining the location(s) where the applicable point of exposure target level is expected to be exceeded may involve comparison of the appropriate numerical standard to the predicted contaminant concentration at a passive monitoring well at the groundwater point of exposure. Alternatively, predictive techniques using site-specific models pursuant to 105.209(4) “*b*” may involve simulation of pumping at a well located at the point of exposure, in which case the pumping rate used in the simulation shall be the rate that is reasonably possible for the

area that yields water with the highest contaminant concentration. In absence of site-specific justification for doing otherwise, long-term pumping will be assumed to be at a rate of 100 gallons per day; the sustainable yield, if less than 100 gallons per day; or a reasonable, higher rate, if such a rate results in higher contaminant concentration.

e. Institutional controls. For a protected groundwater source or a nonprotected groundwater source as described in 105.206(3) “b,” institutional controls must be shown to effectively prohibit the installation of wells for the period of time in which contaminant concentrations might otherwise be expected to result in an exceedance of the appropriate target levels. For a nonprotected groundwater not described in 105.206(3) “b,” a less stringent standard of effectiveness as well as the type of future well installation to be restricted may be utilized for those areas of potential concern. Unless there is a history of usage of what might otherwise be considered nonprotected groundwater or there is uncertainty as to the uniformity in the hydraulic characteristics of the nonprotected groundwater source, notice to the authority responsible for permitting private wells under 567—Chapters 39 and 49 may be adequate, especially if combined with a municipal or county ordinance prohibiting installation of private wells based on the availability of a public water supply.

**105.206(4) *Site-specific groundwater point of compliance.*** A site-specific standard may be established for a site-specific groundwater point of compliance that is different from a compliance point of exposure. A site-specific groundwater point of compliance must be used in conjunction with all groundwater compliance points of exposure pursuant to 105.206(3) to provide an alternative monitoring location. Target levels for contaminants of concern at a site-specific groundwater point of compliance must be established using predictive techniques as specified in 105.209(4). A target level established for a groundwater point of compliance must ensure that the appropriate target level at the groundwater compliance points of exposure will be achieved. A groundwater point of compliance shall be located on the contaminant migration path from the contaminant source to the point of exposure to the maximum extent practicable.

**105.206(5) *Nonused groundwater in a protected water source.***

a. Statewide standards for groundwater in a nonprotected groundwater source, pursuant to 105.205(4) “b,” may be used as target levels for contaminants in an otherwise protected groundwater source when groundwater in the affected area is not used and is not likely to be used in the future in accordance with the following. It must be demonstrated to the satisfaction of the department that contaminants from the enrolled site do not currently, and likely will not in the future, have an impact on any existing water supply well. Any detection, or predicted detection above the practical quantification limit, of a chemical that can be attributed to a release from the enrolled site will be considered to constitute an impact. In addition, it must be demonstrated to the satisfaction of the department that the impacted or potentially impacted aquifer is not a locally significant water resource. Factors that will go into this determination may include but are not limited to:

1. Existence of a nonimpacted public water supply in the potentially affected area;
2. General availability of other water resources in the vicinity;
3. Plans for development of public water supplies in the vicinity;
4. Potential for use of the impacted aquifer as a water supply (e.g., yield, natural water quality); and
5. Identification of the aquifer(s) commonly used for water supply in the vicinity.

b. A local ordinance prohibiting installation of private drinking water wells or notification to the local water utility and water permitting authority, or both, may constitute acceptable institutional controls for site-specific standards under this subrule.

c. The target levels that may be used in accordance with this subrule are based solely on groundwater ingestion. Compliance with this site-specific standard will not guarantee that contaminants in groundwater may not cause unacceptable exposure via other pathways (e.g., groundwater to air in a confined space, groundwater to surface water, or groundwater to a water distribution line).

**105.206(6) *Site-specific soil standards based on land use and soil depth.*** Site-specific soil standards based on land use and soil depth in conjunction with institutional controls may be used. Predetermined site-specific soil exposures based on land use and soil depth are provided in the following paragraphs. Lists of resulting site-specific soil standards for individual contaminants for these land-use and soil-depth

categories will be maintained by the department in a guidance document and made readily available to the public. Use of these site-specific soil standards must be supported by appropriate institutional controls. Site-specific soil standards based on land use and soil depth, as described herein, address ingestion of and dermal contact with soil. Compliance with these standards will not guarantee that contaminants in soils may not cause unacceptable exposure via other pathways (e.g., ecological exposure, soil to groundwater, subsurface movement of vapors from soil to indoor air). In addition, the risk factors that form the bases for site-specific soil standards for individual contaminants, with the exception of some Group C chemicals, are the same as acceptable cumulative risk factors allowed for exposure to multiple contaminants in the same medium and multiple media. Therefore, compliance with site-specific soil standards for individual contaminants may not result in compliance with cumulative risk requirements pursuant to 567—105.210(455H).

*a. Deep soil in a residential land-use area.* Site-specific soil standards for deep soils equaling ten times the statewide standard for soils, except for lead, may be used. The site-specific standard for lead in deep soil in a residential land-use area shall be calculated using the EPA's Exposure Model for Assessing Risk Associated with Adult Exposures to Lead in Soil (U.S. EPA, 1996). Soils at a depth of ten feet and greater will normally be classified as deep soils. The department may deny the use of a deep soil standard associated with a residential land use or require a modification to the standard due to site-specific considerations including topography, development potential, and actual development plans. The use of a site-specific standard for deep soil in a residential land-use area shall be supported by an institutional control that permanently records the existence of contaminants above statewide standards in deep soils and restricts excavation resulting in deep soils being placed on the surface.

*b. Nonresidential land use.* The nonresidential land-use designation will be applicable to areas that are not classified as residential. Site-specific soil standards, except for lead, for nonresidential areas may be based on Formula I using the risk and exposure factors shown in Table III. A value of 1,100 mg/kg may be used as a site-specific soil standard for lead in soils less than 2 feet deep in a nonresidential land-use area. In lieu of this default site-specific lead standard, a site-specific standard for lead in soil less than 2 feet deep may be calculated using the EPA's Exposure Model for Assessing Risk Associated with Adult Exposures to Lead in Soil (U.S. EPA, 1996). The site-specific standard for lead in soils greater than 2 feet deep in a nonresidential land-use area shall be calculated using the EPA's Exposure Model for Assessing Risk Associated with Adult Exposures to Lead in Soil (U.S. EPA, 1996). The use of a nonresidential land-use classification must be supported by an environmental protection easement that prevents a change in land use to residential.

Table III  
Input Variables for Site-Specific Soil Standards for Individual  
Contaminants for Nonresidential Area Land-Use Designation

| Parameter       | Units                              | Cancer Group | Soil Depth (ft.)   |                    |

NOTE: Oral and dermal factors are the same unless otherwise noted.

\*The risk-based concentration using Formula I for Cancer Group C chemicals that have an SF value established per 105.205(3) "c" will be the larger of a value based on the risk factor for protection from noncancer health risks with a THQ = 0.1 or the risk factor for protection from cancer health risks. Risk-based concentrations using Formula I for Cancer Group C chemicals that do not have an SF value established per 105.205(3) "c" will be a value based on the risk factor for protection from noncancer health risks with a THQ = 1.

\*\*Dermal exposure rate is based on 3,300 cm<sup>2</sup> of exposed skin on an adult with 0.2 mg/cm<sup>2</sup> of shallow soil adhering to the skin and 0.3 mg/cm<sup>2</sup> of deep soil adhering to the skin per each dermal exposure event. A dermal exposure event is assumed to be one event per day of exposure.

**105.206(7)** *Site-specific cumulative risk for residential exposures to soil.* A cumulative risk standard may be used as a site-specific standard for soil in lieu of statewide standards that are provided in 105.205(5) for individual chemicals and soil. Cumulative risk will be determined using the toxicity values and exposure factors (i.e., the input variables less TR and THQ) from Table II in 105.205(5). Criteria for compliance with the cumulative risk standard are specified in 105.210(7). No institutional control will be required with the use of this site-specific standard.

**105.206(8)** *Site-specific surface water standards.* The department will establish site-specific surface water standards at the request of the participant. The participant shall provide the department with information necessary to make this determination upon request from the department. Site-specific surface water standards will be generally equivalent to effluent limitations under a National Pollutant Discharge Elimination System (NPDES) permit pursuant to 567—Chapter 62. Mixing zones and allocation of contaminant loads in a surface water body will be considerations in attainment of in-stream water quality standards. If the site-specific surface water quality standards are met, best practical control technology currently available will not be imposed.

**105.206(9)** *Site-specific air standards.* If there are air quality concerns at a site, they will be addressed with site-specific standards until such time as ambient air quality or source-specific standards are adopted for hazardous air pollutants, unless an alternative method is approved by the department.

*a. Explosivity.* In no case shall contaminants from the enrolled site cause an explosivity level in a confined space of greater than 10 percent of the lower explosivity limit.

*b. Background.* In addition to the establishment of a background standard pursuant to 567—105.204(455H), a site-specific air standard may be set at twice the typical background level based on published information for a comparable setting, if approved by the department.

*c. Health risk.* Site-specific standards for air in a confined space shall be risk-based using the chemical-specific toxicity values of inhalation unit risk (UR) and inhalation reference concentration (RfC) determined in accordance with 105.205(3) "c." Formulas II and III shall be used to calculate risk-based, site-specific air standards based on carcinogenic and noncarcinogenic effects, respectively, where C is the risk-based contaminant concentration in air. If a value for both RfC and UR exists for a compound, the risk-based site-specific standard will be the smaller of C resulting from Formulas II and III.

(Formula II)

$$C = AF \times TR \div UR$$

$$\begin{aligned} & \text{(Formula III)} \\ & C = AF \times RfC \end{aligned}$$

The UR and RfC toxicity values are based on a continuous exposure of 20 cubic meters per day by a 70 kg adult. The adjustment factor (AF) in Formulas II and III may be used to adjust for site-specific exposure conditions. A target cancer risk (TR) of  $10^{-4}$  shall be used unless another value is approved by the department.

*d. Institutional or technological controls.* Institutional or technological controls may be used to prevent future exposure to contaminants in air in confined spaces and will be required to prevent residential use of the affected area when a nonresidential air standard is used.

**105.206(10)** *Site-specific standards based on site-specific factors.* Numerical site-specific standards (i.e., target levels) for groundwater or soil may be established using site-specific exposure factors in Formula I. Site-specific pumping rates greater than specified in 105.206(3) “d” herein may be used when approved by the department. Site-specific exposure factors must be approved by the department. For the department to approve any such site-specific factor there must be well documented rationale for doing so and appropriate institutional or technological controls must be provided.

**105.206(11)** *Site-specific standards or approaches not anticipated by this rule.* Nothing in this rule precludes the use of site-specific standards derived in some way not anticipated by this rule, provided that the rationale is adequately presented and the approach is both approved by the department and provides a level of protection comparable to standards set forth under this rule.

[ARC 0486D, IAB 8/19/26, effective 9/23/26]

#### **567—105.207(455H) Technological and institutional controls.**

**105.207(1)** *Technological controls.* The purpose of a technological control is to effectively sever a pathway by use of technologies such that an applicable receptor could not be exposed to hazardous substances above an applicable target risk level. Subject to limitations in this division, technological controls are an acceptable response action either alone or in combination with other remediation systems and institutional controls. The purpose of technological controls may be to control plume migration through use of containment technologies, barriers, or other methods, as an interim or permanent response action or to permanently sever a pathway to a receptor. Technological controls may also be appropriate to treat or control contamination at the point of exposure. Any technological control proposed as a permanent response action option without meeting the reduction in contaminant concentrations objectives must establish that the pathway to a receptor will be permanently severed or controlled. The effectiveness of a technological control must be monitored under a department-approved plan. The department may require reasonable proof of financial assurance when necessary to ensure that a technological control remain effective.

**105.207(2)** *Institutional controls.* The purpose of an institutional control is to restrict access to or use of an affected area such that an existing or future receptor could not be exposed to hazardous substances addressed by the controls for as long as the target level is exceeded at applicable points of exposure and compliance.

**105.207(3)** *Institutional and technological controls.* Single or multiple institutional controls may be used alone or in combination and may also be employed with technological controls and response action to effectively achieve, maintain and enforce an approved level of risk reduction and risk management. The following enumeration of types of institutional and technological controls is not a finding that each is per se an effective control. The effectiveness of any institutional or technological control or combination of controls must be evaluated on a case-by-case basis and in accordance with specified conditions in this division. Institutional and technological controls include:

- a.* A state or federal law or regulation that can be shown to effectively achieve, maintain and enforce the required land-use restrictions and controls.
- b.* An ordinance of any political subdivision of the state that can be shown to effectively achieve, maintain and enforce the required land-use restrictions and controls.
- c.* A contractual obligation recorded and executed in a manner satisfying Iowa Code chapter 558. Recorded notices and affidavits, including a no further action certificate as provided in

567—105.211(455H), which do not create rights or obligations or restrict land use but serve to put current and future property owners on notice of present or future conditions within the affected area.

*d.* A control that the participant demonstrates to the department reduces or manages the risk from a release through the period necessary to comply with the applicable standards, including but not limited to, informational devices such as public notices, informational registries, notices to regulatory authorities and continuing site activities such as periodic inspections, equipment repair and maintenance, and soil and groundwater monitoring.

*e.* An environmental covenant established in accordance with Iowa Code chapter 455I and section 455H.206.

**105.207(4)** *No further action certificates.* Any no further action certificate shall contain a specific reference to any applicable institutional and technological control and shall meet the requirements in 567—105.211(455H). The reference must identify the location of any recorded instrument, contractual agreement or other documents applicable to the control, provide a brief description of the terms of the control and, where appropriate, site diagrams.

**105.207(5)** *Failure of an institutional and technological control(s).* The effectiveness of institutional and technological controls may be jeopardized for several reasons including situations where the technological controls are no longer effective in achieving their technical objectives, the validity of technological or institutional control is challenged due to a pending or final administrative or judicial action or legislative action changing its regulatory effect (e.g., change in an ordinance), or persons fail to comply with the terms of the institutional or technological control. The effect of the failure of a technological or institutional control to achieve its intended purpose is to remove the no further action classification and put all interested parties in the same position had the no further action classification not been made. When the department has reason to believe a technological or institutional control is jeopardized or determines that the control is no longer effective, the following policy and procedure shall apply:

*a.* The department shall make reasonable efforts to provide notice of the failure or noncompliance to the participant(s), protected parties, persons having legal standing to enforce the terms of the controls, other persons who may be legally responsible for contamination at the site and persons legally obligated to comply with the terms of the controls. The notice shall inform these parties of the consequences of failure of the controls and provide the opportunity for one or more of them to correct the deficiency by taking further response action or undertaking enforcement action to obtain compliance with the terms of the controls.

*b.* The participant(s) and other persons legally responsible for contamination at the site shall have primary responsibility to correct deficiencies or seek enforcement of the terms of controls, if they wish to maintain a no further action classification and any attendant statutory protections. The department may in its discretion seek enforcement of controls where persons fail to comply with the terms when it determines there is a strong likelihood of success, other participant(s) or legally responsible persons are unable or unwilling to undertake enforcement, and utilization of the controls remains consistent with these rules and site conditions currently in effect at the site. However, the department is not obligated to seek enforcement of the terms of any technological or institutional controls nor does the election not to undertake enforcement constitute a defense to further action by responsible parties or a basis for challenging the rescission of the no further action classification.

*c.* The department may also elect to require statutorily responsible parties to correct the deficiency as an alternative to rescinding the no further action classification.

*d.* Failure of a participant to timely undertake additional response action may result in termination of enrollment and loss of benefits under these rules and Iowa Code chapter 455H. Any person found to have intentionally violated an environmental protection easement or other institutional or technological control, whether included in a no further action certificate or as part of an approved response action, may lose any of the benefits under these rules or Iowa Code chapter 455H.

**105.207(6)** *Modification and termination of institutional and technological controls.* A participant or successor in interest to a participant, or an owner of property subject to an institutional or technological control, may seek approval from the department for the removal, discontinuance, modification or termination of an institutional or technological control. The person must demonstrate that the control in

its present form is no longer required to ensure compliance with applicable standards. The person seeking revision must undertake sufficient risk assessment and provide sufficient assessment data to establish that the applicable compliance standards can be met based on the proposed modification. The department may also determine based on a revised assessment that the applicable controls are no longer effective to meet compliance standards and may require other response action. The department shall issue an amendment to any previously issued no further action certificate specifying the approved modification of the institutional or technological controls. Modification and termination of an environmental covenant shall be consistent with these rules and shall conform with Iowa Code chapter 455I.

[ARC 0486D, IAB 8/19/26, effective 9/23/26]

**567—105.208(455H) Site assessment.**

**105.208(1) Purpose.** A participant must create a site assessment for every enrolled site. A participant may submit a site assessment to the department to characterize the attributes related to the enrolled site and facilitate the risk evaluation/response action. The purpose of the site assessment is to define the nature and extent of contamination, along with identifying likely exposure pathways, with the aim of characterizing potential, current and future risks and making an informed decision concerning an appropriate response in the context of probable future land uses at the site and in the surrounding area. Assessment is to be conducted with the recognition that contaminant fate and transport may alter the current areal extent and depth of contamination. It is recognized that the scope of such an assessment may be appropriately varied dependent upon interrelated factors including the nature and severity of the contamination, the complexity of specific details of the site and its setting, and the nature of the chosen response, if known.

**105.208(2) Site assessment plan; notice of proceeding without plan.**

a. The participant may submit for department review a site assessment plan prior to proceeding with the site assessment. Participants choosing to initiate site assessment without department review and approval of a work plan shall notify the department in writing of their intentions. Likewise, participants choosing to proceed to the risk evaluation/response action phase in accordance with 567—105.209(455H) without seeking review of the site assessment report shall give prior notice to the department of their intentions. The notice shall include a schedule for implementation and completion, a description of the area to be assessed and the scope of the proposed assessment to be undertaken, any planned construction activities in the affected area and a proposed date for submission of the site assessment report for department review.

b. The plan is intended to lay out the rationale to be followed in the conduct of the site assessment and to provide an opportunity for the participant and the department to reach a consensus regarding the appropriate scope of the site assessment.

c. In order to accomplish this, the plan should address relevant, known characteristics related to the site and its history, including the results of any preliminary investigations performed at the site, as well as plans for addressing pertinent details spelled out in the subsequent sections on the site assessment and the site assessment report. Departmental review of the site assessment plan may result in suggestions regarding perceived shortcomings or proposed activities that are deemed to be unnecessary.

**105.208(3) Site assessment details.** An acceptable site assessment shall address one or more of the following items, as applicable, and any other objective the department deems necessary to characterize the attributes related to the enrolled site and its setting.

a. Identify and address the medium or media of concern associated with the contamination situation for which the site is enrolled. The regulatory classification or jurisdiction of contaminants shall be indicated if applicable and, if known, whether the compound is regulated under the Resource Conservation and Recovery Act (RCRA), Toxic Substances Control Act (TSCA), or Federal Insecticide, Fungicide and Rodenticide Act (FIFRA).

b. Characterize the nature, extent, and degree of contamination in both horizontal and vertical dimensions. This should involve appropriate sample numbers and locations within the contaminated area and beyond the area contaminated in excess of the background or statewide standard. Analyses shall be conducted for the contaminants of concern, breakdown products, and other contaminants likely to be present at significant levels. The department may also require analyses for additional contaminants that are not the focus of enrollment in the program, but that may be of special concern. Special concerns might

include waste handling or treatment problems posed by the additional contaminants, or unacceptable risks remaining unaddressed within the affected area, due to the presence of the additional contaminants. In the case of groundwater, attention should also be given to the possibility of contaminant accumulation in strata overlying confining layers and to the possible presence of non-aqueous phase liquids (NAPL). In the case of groundwater, more than one round of sampling shall be incorporated, appropriately separated in time. In the case of soils, particular attention should be given to characterizing shallow soil contamination, from zero to six inches in depth.

*c.* Characterize the nature of the source of contamination or propose a conceptual model explaining the presence of the contamination of concern.

*d.* Characterize local contamination maxima or hot spots for the purposes of evaluation against relevant standards and to identify handling or treatment concerns that they may pose.

*e.* Characterize the stratigraphy. This should be done to a depth extending to the first significant confining layer below the deepest contamination. Descriptions should rely primarily on results gathered in the site assessment, but relevant reference materials or geologic logs from other sources may be incorporated as a supplement.

*f.* Characterize the hydrologic properties of the site and its vicinity to a distance appropriate to the fate, transport and exposure concerns associated with the site. This characterization should consider both horizontal and vertical components of groundwater movement as well as other influences on groundwater hydrology such as pumping wells, injection wells, surface water bodies, effects of seasonal or precipitation-driven variability, and possible aquifer interconnections, including those related to existing or abandoned wells. Water level measurements, related to a common datum, screening of appropriate depth intervals, and determination of hydraulic conductivity will generally be considered as necessary.

*g.* Characterize physical and chemical properties of the site and its environs associated with contaminant fate and transport, e.g., percent organic matter, redox potential, soil bulk density, and transmissivity.

*h.* Characterize topographic and cultural features of the site and its immediate vicinity. Cultural features may include but not be limited to buildings, basements, paved areas, roadways, utilities, storage tanks and associated piping, piles, impoundments, wells, and waste disposal systems.

*i.* Evaluate concerns related to whether the contamination situation is dynamic or stable; if dynamic, address fate and transport and breakdown products appropriately.

*j.* Identify and characterize receptor or exposure concerns. This most clearly involves concerns for drinking water and exposures to contaminated soils, as suggested by the statewide standards, but additional concerns should be identified and addressed by the participant or the department, as the situation warrants, e.g., vapors to basements, threats to water supply lines, threats to surface waters, or environmental threats.

*k.* Characterize current and probable future uses of the site and its surroundings. If probable future uses differ significantly from current uses, then characterize them separately and conduct the assessment in a fashion that addresses concerns arising from the possible change in use.

*l.* Evaluate the potential for contaminants to migrate from one medium to another. The following subparagraphs prescribe requirements for assessing potential migration of contamination from one medium to another. Requirements in the following subparagraphs may be waived if it can be demonstrated in accordance with procedures established in 567—Chapter 135 or ASTM standards E1903-19 related to the Phase II environmental site assessment process that migration of contamination from one medium to another will not cause a violation of the applicable standard in the receiving medium. The assessment activities prescribed in the following subparagraphs are intended to determine if significant migration of contamination from one medium to another has occurred. If evidence of significant migration of contamination from one medium to another (i.e., generally a contaminant concentration in the receiving medium in excess of the statewide standard) is discovered, full-scale characterization of the receiving medium may be required.

(1) The water from any pond or lake on the site or within 300 feet of the site shall be sampled and analyzed for the contaminants of concern, if it is reasonably possible that contaminants from the site could impact the pond or lake. Any surface stream that runs through the site or within 300 feet of the site shall be sampled at a location downstream of any potential impact from the site and analyzed for the contaminants

of concern. Depending on the characteristics of the contaminants (e.g., solubility), associated sampling and analysis of sediments may be required.

(2) Groundwater at the location most likely to be impacted by each known substantial area of soil contamination shall be sampled and analyzed for the contaminants of concern. If the area of soil contamination exceeds 10,000 square feet, additional groundwater samples may be required.

(3) Soil vapors in each area that is most likely to be impacted by known groundwater or soil contamination shall be sampled and analyzed for the contaminants of concern. If the area of soil or groundwater contamination exceeds 10,000 square feet, additional soil vapor samples may be required. If vapors may be impacting an existing enclosed space, a soil vapor sample shall be collected from a location that is most likely to have vapor contamination adjacent to the enclosed space.

1. If the potential for the existence of problematic concentrations of the vapors in the enclosed space cannot be dismissed based on soil vapor sampling, sampling and analysis of vapors inside the enclosed space may be conducted to determine whether or not a problem exists. Appropriate measures for distinguishing between contaminant vapors originating from within the enclosed space versus those from the external sources that are under investigation may be made with the approval of the department.

2. Ambient air sampling may be required if a very large area or extremely high concentrations of highly volatile contaminants exist in shallow soil or evidence of vapor contamination exists, such as odors or a high vapor reading on a vapor-screening instrument.

(4) If a water line exists within the zone of known contamination of soil, groundwater or soil vapor and the potential for significant diffusion of contaminants into the water line cannot otherwise be dismissed, a sample from the water line shall be collected at the nearest location where any impact may exist and that sample shall be analyzed for the contaminants of concern. All such samples should be collected at times following minimum movement within the water line (e.g., early morning following a weekend).

**105.208(4) *Site assessment report.*** The site assessment report shall include the presentation of all information gathered during the site assessment, arranged in appropriate sections of the report. It shall include a summary of preliminary information on which the site assessment is based, including but not limited to background and site history. The report shall discuss the sampling strategy and methods used in the assessment. The department encourages the use of innovative or screening techniques to expedite investigations and to control costs, provided that such techniques are approved by the department before implementation and are supported through verification by accepted scientific practices. The report shall also include a description of the quality assurance/quality control (QA/QC) protocols followed during the investigation. QA/QC protocols shall be consistent with accepted scientific practices.

The presentation shall be organized so as to facilitate the assimilation of information by the reader. Maps to be presented, as appropriate, might include maps illustrating the location of the site in a larger geographical context; maps showing cultural features associated with the site and its environs; maps illustrating the contamination extent and concentration in three dimensions; maps illustrating the site hydrology in three dimensions; and maps illustrating receptors, potential receptors, and relevant pathways of exposure. Cross-sectional diagrams shall be included to illustrate stratigraphy, geological boring information, and hydrologic and contaminant factors with depth. Tables and graphs shall be designed for the purpose of summarizing data in a meaningful fashion, including information about successive rounds of sampling. Appendices shall include well logs, copies of laboratory analytical reports, and raw data used to calculate parameters presented elsewhere in the report. Appended material shall be labeled in a fashion permitting the cross-referencing of appended materials and the body of the report.

**105.208(5) *Approval of site assessment report.*** Unless notice has already been given prior to initiation of the site assessment, participants choosing to proceed to the risk evaluation/response action phase without department review and approval of the site assessment report must notify the department in advance as provided in 105.208(2).

**105.208(6) *Public notification.*** Before or upon completion of the site assessment, the participant shall provide the department with the names and addresses of the owners and occupants of all property adjacent to the site enrolled in the Iowa land recycling program and any additional properties where contaminants from the enrolled site have migrated or are likely to migrate in the future. The department shall notify by

direct mailing all such property owners and occupants, the city or county in which the property is located, and officials of any potentially impacted public water supply of the site's enrollment in the Iowa land recycling program and of the scope of work described in the participation agreement. The department shall give the notified parties the opportunity to obtain updates regarding the status of activities relating to the site that is enrolled in the Iowa land recycling program. The department may also require the participant of a site enrolled in the Iowa land recycling program to publish public notice in a local newspaper if the department determines that widespread interest in the site exists or is likely to exist. The department may provide additional opportunities for public participation if, after consultation with the participant, the department determines such opportunities are warranted.

[ARC 0486D, IAB 8/19/26, effective 9/23/26]

**567—105.209(455H) Risk evaluation/response action.**

**105.209(1)** *Purpose; notice of proceeding without department review of assessment.* The purpose of risk evaluation/response action is to utilize information from the site assessment as a basis for:

*a.* Determining whether current exposures result in excessive risks, based on evaluation against appropriate background, statewide, or site-specific standards.

*b.* Determining whether future exposures may result in excessive risks, based on evaluation against appropriate background, statewide, or site-specific standards. This will likely include:

(1) Evaluation of potential changes in usage, e.g., installation of a new well, change in land use, or other activities, that result in unacceptable, potential exposures not evaluated as current exposures, and

(2) Evaluation of exposure concerns related to the movement of contamination such that potential exposures might arise that are not considered under current exposure assumptions, e.g., groundwater plume migration creating a potential for future contamination of existing wells or creating newly contaminated areas in which new well installation may result in unacceptable exposures.

*c.* Proposing an appropriate and acceptable response action or strategy to address the identified, unacceptable exposures or potential exposures.

*d.* Establishing the test criteria to be applied under 567—105.210(455H) for determining final compliance with the selected standard. In some cases this may consist of proving that standards are currently met; in other cases it may result in an assessment of whether the response action succeeds in bringing about compliance with a selected standard.

The risk evaluation/response action is intended only for application to the specific contaminants and situations for which the site is enrolled. Participants choosing to proceed to the risk evaluation/response action phase without seeking review of the site assessment report shall give prior notice to the department of their intentions. The notice shall include the information required in 105.208(2), a general description of the site assessment results, a schedule for submission of the risk evaluation/response action document, and the reasons for not requesting department review and approval of the site assessment report.

**105.209(2)** *Risk evaluation/response action document submission.* A risk evaluation/response action document shall be submitted for review and approval by the department. When considered in conjunction with the site assessment report, these documents shall present a complete picture of the site from its characterization, through the evaluation of risk, to the development of a strategy to address the situation. An effort shall be made to ensure that the reviewer, or other interested parties, can gain an understanding of the existing situation and proposed actions. The risk evaluation/response action document shall include a summary of findings regarding present risks and potential future risks; a pathway-specific identification of the standards to be applied, including the supporting rationale, if appropriate; a discussion of the proposed response actions, including remedial actions to be taken and institutional or technological controls to be implemented; and a discussion of the proposed verification strategy. Any modeling used for purposes of assessing future risk or establishing site-specific standards shall be presented in sufficient detail to permit evaluation of the results by the department.

**105.209(3)** *Department review and approval.* It is recommended that the risk evaluation/response action be submitted for review and approval prior to proceeding with implementation of the response action. The final, department-approved document shall be the basis for assessing subsequent activities at the site. Parties choosing to proceed with response actions without prior review and approval by the

department proceed at their own risk and may not assume the response action implemented will result in a no further action certificate.

*a.* Parties choosing to implement a response action without prior review and approval by the department shall submit to the department a proposed risk evaluation/response action document accompanied by an explanation of the reason(s) for proceeding without prior approval. Documentation shall also include a schedule for implementation, a description of construction or other activities to be undertaken, and date for submission of the final report demonstrating compliance, as described in 567—105.210(455H).

*b.* The department shall provide opportunity to comment on proposed response actions to any party that is potentially impacted by off-site migration of contaminants for which notification is required in accordance with 105.208(6). The department shall consider reasonable comments from potentially impacted parties in determining whether to approve or disapprove a proposed response action or site closure.

**105.209(4)** *Risk evaluation.* The risk evaluation/response action document shall identify all locations or areas, and associated exposure pathways, where exposure currently exceeds a statewide standard or where a statewide standard may be exceeded in the future, due to either a change in exposure-related usage or contaminant migration. Current and future exposure pathways shall be evaluated and presented separately. This evaluation shall not be limited to exposure pathways for which the department has formulated risk-based values in 567—105.205(455H) or 567—105.206(455H) but should include any pathway related to the situation for which the site is enrolled, for which a no further action certificate is sought, or for which an unacceptable risk may now or in the future exist, including but not limited to high concentrations of volatile compounds in proximity to a confined space, high concentrations of solvents in proximity to a water distribution line, or environmental concerns unrelated to human health.

*a.* In a case where a background standard is to be applied and there is no violation of a statewide standard, it will be necessary to identify only locations or areas where the background standard is exceeded.

*b.* A risk evaluation may be appropriately abbreviated from the preceding description based on the specific details of the contamination and the proposed response action.

**105.209(5)** *Establishing cleanup standards.* The risk evaluation/response action document shall identify the cleanup standards to be applied in accordance with 567—105.204(455H), 567—105.205(455H), or 567—105.206(455H), outlining respectively the background, statewide, or site-specific standards. These standards may be applied in any combination to address specific components of the contamination problem for which the site is enrolled. If cleanup standards other than those specifically formulated under the statewide standard (567—105.205(455H)) are to be applied, then the rationale behind the determination of such standards shall be justified, in the document, to the department's satisfaction.

**105.209(6)** *The use of models.* Models may be necessary in order to evaluate potential future exposures and may be used to develop target levels.

*a.* *Standard models.* Standard models may be used to predict future contaminant concentrations at potential points of exposure to contaminants or at other locations used for determining compliance when such models are appropriate, as determined by the department. Applicable Tier 2 models approved for use in accordance with 567—Chapter 135 for underground storage tanks (USTs) and applicable Tier 2 models provided in ASTM standards are acceptable standard models. Models that provide a two-dimensional representation of groundwater flow will not be considered to be appropriate when significant three-dimensional components to groundwater flow are anticipated. Default values for input parameters for ASTM and UST Tier 2 models, as provided in applicable ASTM standards and approved for use in accordance with 567—Chapter 135, may be utilized without approval by the department. The department shall maintain a guidance document that includes a list of other chemical-specific default values for all chemicals having statewide standards.

*b.* *Site-specific models.* Site-specific models may be used to predict future contaminant concentrations at potential points of exposure to contaminants or at other locations used for determining compliance when such models are appropriate, as determined by the department. Site-specific models may include standard models with site-specific input parameters or models utilizing more sophisticated

analytical techniques. A site-specific groundwater model shall have proven reliability and be able to simulate, as needed:

- (1) A fixed contaminant source,
  - (2) Groundwater and contaminant flow in three dimensions,
  - (3) Groundwater and contaminant flow through as many distinct geologic layers as necessary for the site in question,
  - (4) Effects of pumping,
  - (5) Effects of groundwater recharge and discharge,
  - (6) Impacts of hydrologic boundaries,
  - (7) Contaminant advection, dispersion and chemical reactions, as appropriate for the site in question,
- and
- (8) Other site-specific variables as appropriate.

Default values for input parameters approved for standard models will be approved for use in site-specific models. Otherwise, input parameters used in site-specific models are subject to the department's approval.

**105.209(7) *Response action.*** The risk evaluation/response action document shall include a proposal for a response action or strategy to achieve and maintain compliance with the selected standard(s). This may consist of activities designed to remove or treat contaminants; prevent exposure to unacceptable levels of contamination through technological controls, institutional controls or monitoring; or a combination thereof. If the response action involves the use of a standard that is less stringent than the statewide standard, it will be necessary to implement institutional controls to prevent the type of exposure on which the statewide standard is based unless otherwise authorized by the department. It is the intent of the department to permit the participant to identify and carry out those options by which this may be accomplished, insofar as the department deems the selected options to be reasonable, protective of the public health and safety and the environment, and consistent with provisions of this rule.

**105.209(8) *Free product and gross contamination.***

*a.* Contaminants presented as free product and gross contamination shall not be addressed through the implementation of institutional or technological controls. For purposes of this rule, gross contamination will be considered to be contamination present at concentrations in excess of a standard by an amount sufficient to reasonably expect that institutional or technological controls will not be adequately protective of the public health and safety and the environment.

*b.* If treatment or removal of free product or gross contamination is not feasible, the participant may request a waiver of this subrule, subject to all provisions of Iowa law related to waivers.

**105.209(9) *Compliance verification strategy.*** The risk evaluation/response action document shall outline a strategy for determining whether the relevant standards are met by the site and will continue to be met in the future. For response strategies that call for longer-term monitoring, standard-based values shall be identified that, if exceeded, would indicate a failure of the response action and necessitate the development and implementation of a new response action. The terms under which monitoring may cease may be proposed. The proposed strategy shall be consistent with 567—105.210(455H) related to demonstration of compliance and shall indicate the standard to be applied and the point of compliance at which it is to be applied, consistent with 567—105.204(455H), 567—105.205(455H), and 567—105.206(455H).

[ARC 0486D, IAB 8/19/26, effective 9/23/26]

## **567—105.210(455H) Demonstration of compliance.**

**105.210(1) *Purpose.***

*a.* The purpose of the demonstration of compliance is to provide a mechanism by which to verify that:

- (1) Appropriate and acceptable standards are complied with and that compliance can be reasonably expected to continue in the future;
  - (2) Any and all remedial measures proposed under 567—105.209(455H) have achieved their purpose;
- and

(3) Appropriate institutional and technological controls, or monitoring mechanisms, have been successfully implemented.

*b.* In some cases, the demonstration of compliance may mark the final step, taken by the participant prior to the issuance of an unconditional no further action certificate by the department. In other cases, it may mark the transition to the longer term closure activities associated with the site, such as monitoring, maintenance of technological controls, and continuing enforcement of institutional controls. In this latter case, demonstration of compliance activities may or may not result in the issuance of an unconditional no further action certificate, depending on the approach proposed in the response action. In some cases, it may be necessary to successfully complete a monitoring program or to fulfill other agreed-upon obligations prior to the issuance of the no further action certificate.

*c.* In all cases, sampling of environmental media shall comply with QA/QC requirements addressed in 567—105.208(455H).

**105.210(2)** *General requirements for demonstrating compliance with soil standards.*

*a.* For the standard being applied, the demonstration of compliance shall be at the point of compliance or point of exposure as set forth in 567—105.204(455H), 567—105.205(455H), or 567—105.206(455H) relating to background standards, statewide standards, and site-specific standards and as described in a site-specific context pursuant to 105.209(7) relating to risk evaluation/response action.

*b.* Minimum sample numbers for the demonstration of compliance with the background standard for soils pursuant to 105.210(4) “*b*” or with the statewide standard when applying 105.210(5) “*a*”(1) shall be based on the volume of soil to which the selected standard is being applied as follows:

(1) For volumes less than or equal to 125 cubic yards, a minimum of eight samples.

(2) For volumes greater than 125 cubic yards, but less than or equal to 3,000 cubic yards, a minimum of 12 samples.

(3) For each additional volume of less than or equal to 3,000 cubic yards, a minimum of 12 additional samples.

(4) Additional samples may be required based on site-specific conditions.

*c.* When EPA applicable guidance used pursuant to these rules requires demonstration of a 95 percent upper confidence limit, the minimum sample number shall be as specified in that guidance.

*d.* Sample locations for demonstration of compliance shall be selected in a random fashion to be representative, both horizontally and vertically, of the volume of soil being evaluated for compliance.

*e.* Sampling for the purpose of demonstrating compliance shall be conducted after the completion of site assessment activities and after the implementation of applicable remedial measures.

**105.210(3)** *General requirements for demonstrating compliance with groundwater standards.*

*a.* For the standard being applied, the demonstration of compliance shall be at the point of compliance or point of exposure as set forth in 567—105.204(455H), 567—105.205(455H), or 567—105.206(455H) relating to background standards, statewide standards, and site-specific standards and as described in a site-specific context pursuant to 105.209(7) relating to risk evaluation/response action.

*b.* Monitoring wells installed for the purpose of demonstrating compliance shall be of sufficient number and appropriate location to evaluate all hydrologic strata of concern, based on site-specific considerations, as identified pursuant to 105.209(7), relating to risk evaluation/response action.

*c.* For statistical methods under 105.210(5) “*b*”(1), compliance with the statewide groundwater standard shall be based on eight consecutive quarters of groundwater data. As an alternative, the department may accept four consecutive quarterly sampling events or less with prior written approval from the department under the following conditions:

(1) There is adequate spatial monitoring of the plume upgradient that indicates a decreasing concentration trend toward the downgradient property boundary.

(2) Parameters affecting the fate and transport of regulated substances within the plume have been fully evaluated.

(3) Concentrations of regulated substances in the plume at the point of compliance monitoring wells along the downgradient property boundary are all less than or equal to the groundwater standard or the limit relating to the PQL, whichever is higher, in all samples collected during the quarters of monitoring.

(4) One of the following is met:

1. The age of the plume is sufficiently well known to permit a judgment to be made regarding its stability.

2. The remediation includes source removal or containment actions that would reduce chemical flux into the plume.

d. When applying a 95 percent upper confidence limit, according to EPA applicable guidance, to demonstrate compliance with the statewide standard for groundwater pursuant to 105.210(5) "b"(2) or a site-specific standard for groundwater pursuant to 105.210(6), the minimum sample number shall be as specified in that guidance.

e. Sampling for the purposes of demonstrating compliance shall be conducted after the completion of site assessment activities and after the implementation of applicable remedial measures.

**105.210(4)** *Demonstration of compliance with a background standard.*

a. To apply a background standard the participant shall demonstrate to the department, in writing, that the apparent background contamination at the site is due to widespread or naturally occurring contamination and shall obtain the department's approval to apply this subrule. Data collected for the purpose of determining the applicable background standard is subject to department approval, interpretation, and manipulation, if necessary for the purpose of establishing a meaningful background standard.

b. For soil, the minimum sample number to determine the background standard shall be ten, unless a lesser number is approved by the department, and the number of samples from the affected area shall be based on volume as described in 105.210(2) "b." No sample collected from the affected area may exceed the sum of the background arithmetic mean and three times the sample standard deviation, as calculated based on the background sampling.

c. For groundwater, a minimum of 12 locations shall be sampled in the background reference area, unless a lesser number is approved by the department, and an equal number shall be collected from the affected area. In areas involving more than one hydrologic strata, more samples may be required. Sampling shall be conducted concurrently in the background reference area and the affected area. No sample collected from the affected area may exceed the sum of the background arithmetic mean and three times the sample standard deviation, as calculated based on the background sampling.

**105.210(5)** *Demonstration of compliance with the statewide standard.* The following requirements shall be met in order to demonstrate compliance with the statewide standard. Testing shall be performed individually for each contaminant being addressed and for which a no further action certificate is sought.

a. To demonstrate compliance with the statewide standard for soils in each affected area, soil samples taken at the enrolled site must be within the statistical limits of either 105.210(5) "a"(1) or "a"(2), as well as all other applicable requirements of this rule.

(1) Seventy-five percent of all soil samples, collected during a single event, shall be less than or equal to the statewide standard, with no individual sample exceeding ten times the statewide standard.

(2) In accordance with EPA-approved methods (OSWER 9285.6-10, 2002), the 95 percent upper confidence limit of the arithmetic mean of soil sample values from the affected area shall be at or below the statewide standard.

b. To demonstrate compliance with the statewide standard for groundwater in each compliance monitoring well, water samples taken from the wells must be within the statistical limits of either 105.210(5) "a"(1) or "a"(2), as well as all other applicable requirements of this rule.

(1) Seventy-five percent of all samples collected in each compliance monitoring well over time shall be less than or equal to the statewide standard, with no individual sample exceeding ten times the statewide standard.

(2) In accordance with EPA-approved methods (OSWER 9285.6-10, 2002), the 95 percent upper confidence limit of the arithmetic mean of samples collected from a compliance well over time shall be at or below the statewide standard.

**105.210(6)** *Demonstration of compliance with a site-specific standard.* To demonstrate compliance with a site-specific standard, the participant shall use the tests identified in 105.210(5) "a"(2) and "b"(2), except that the 95 percent upper confidence limit of the arithmetic mean for samples from the medium of concern shall be at or below the site-specific standard.

**105.210(7) *Compliance with cumulative risk.*** In addition to standards for individual contaminants as prescribed above, cumulative risk criteria must be attained, except that for the soil pathway only, the cumulative risk criteria may be attained in lieu of the standards for individual contaminants. Cumulative carcinogenic health risks shall not exceed 1 in 10,000. Noncarcinogenic health risks affecting the same target organ shall not exceed a cumulative hazard quotient of 1. Cumulative risk criteria are applicable to multiple contaminants in the same medium and multiple media in which exposure is likely to occur to the same individual. Cumulative risks shall be based on the same exposure assumptions that are used for determining the selected standard.

*a.* Risks associated with background levels of contaminants shall not be included in the cumulative risk determination. Background levels of contaminants shall be determined in accordance with 105.210(4) or, if approved by the department, by the use of generally available information on background levels of contaminants.

*b.* In situations where the risk associated with exposure to a contaminant at a concentration equal to the selected standard is greater than the acceptable cumulative risk, the cumulative risk may be calculated assuming the risk associated with exposure to the contaminant at a concentration equal to the selected standard is equal to the acceptable cumulative risk criterion. The department will provide a guidance document for calculating cumulative risk and make it readily available to the public.

**105.210(8) *Final report.*** A final report shall be submitted to the department that documents the accomplishment of all provisions set forth in the risk evaluation/response action document. This shall include, as applicable to the specific situation, discussions related to verification of compliance with selected standards, successful completion of remedial actions, implementation of necessary institutional or technological controls, and initiation of any required monitoring strategy. Sufficient details shall be included to permit the department to verify that the terms proposed in the response action have been met with regard to the statistical determination of compliance with standards.

**105.210(9) *Department review and approval.***

*a.* The final report is subject to review and approval by the department. Following review, the department will either approve the report or make a written response indicating the reason(s) why the report is unacceptable. Acceptance of the report may result in the issuance of an unconditional no further action certificate or it may mark a transition to the long-term closure activities associated with the site, as proposed in the response action. A decision that the report is unacceptable may be based upon an insufficiency of the report or it may be based on a judgment that the terms of the response action have not been met.

*b.* In cases where a participant has elected to proceed through this program without department interaction and without submitting site assessment pursuant to 567—105.208(455H), or risk evaluation/response action documents pursuant to 567—105.209(455H), the final report shall contain the substantive information related to those rules in addition to information required under this rule in a manner that clearly sets forth for departmental review the same process.

[ARC 0486D, IAB 8/19/26, effective 9/23/26]

**567—105.211(455H) No further action classification.**

**105.211(1) *Eligibility.***

*a.* An enrolled site shall be eligible to obtain a no further action classification when the department determines the participant has met all compliance standards of this division applicable to the affected area, and the hazardous substances identified and evaluated such that no further response action is required other than maintenance of institutional or technological controls or certain specified continuing site activities. Upon request of a participant or other protected party, and compliance with applicable standards, the department will issue a no further action certificate to each protected party requesting it.

*b.* A no further action classification may be conditioned upon the continued maintenance and effectiveness of any applicable institutional or technological control in accordance with 567—105.207(455H).

**105.211(2) *No further action certificate.*** A no further action certificate shall be in a form recordable in the county real estate records as provided in Iowa Code chapter 558 and consistent with the model forms developed by the department. The no further action certificate may be recorded as provided by law.

**105.211(3)** *No further action certificates conditioned on institutional and technological controls.* A no further action certificate conditioned upon the continuing effectiveness and maintenance of institutional and technological controls or other continuing requirements must be recorded with the consent of the fee titleholder for each parcel of affected property subject to the controls and for parcels of property for which prevention of exposure is dependent upon the continuing effectiveness and maintenance of the controls. If a participant is not able to record the no further action certificate on a parcel within the affected area due to objections of the fee titleholder or other legal restraints, this alone shall not be a basis for denying or rescinding the no further action classification or the certificate or the legal protections attendant to the no further action classification. Any modification or termination of institutional and technological controls shall be noted in an amended no further action certificate and shall be recorded as to any property subject to an earlier recorded certificate or institutional control. If a no further action certificate is required to be recorded, the no further action classification is not effective until the document is recorded with the county recorder.

**105.211(4)** *Public notification.* The department shall prepare a public notice prior to approval of any no further action classification that is conditioned upon use of institutional or technological control(s). The public notice will describe the results of the risk assessment conducted in the affected area, any proposed or completed response action, the vertical and horizontal extent and concentrations of existing soil and groundwater contamination in the affected area, and the actual and potential pathways of exposure the controls are intended to address. The notice will describe the purpose of the institutional and technological control(s) being proposed and the predicted period of coverage. The notice will provide the opportunity for members of the public to review department files, make written comments and request a public hearing. The department may schedule a public hearing on the basis of requests from the public and when it determines the particular remedial options proposed for a site warrant public consideration, for example, when issues of whether and to what concentrations gross contamination should be allowed to remain within the affected area given the relative effectiveness of institutional controls and other community concerns and development plans.

*a.* The notice will be served by certified mail on all property owners that the actual or modeled data indicates are or may be affected by the present or future conditions addressed by the control. The notice will be published in a newspaper of general circulation most likely to reach persons in the immediate locality.

*b.* If the controls are intended to restrict surface or subsurface future land use, the notice shall be sent to each local regulatory body having jurisdiction and control over or a direct interest in regulation of these activities. These may include but are not limited to municipal or county zoning boards, municipal building authorities, public utilities, and economic development agencies. If the controls are intended to restrict groundwater use, the notice shall be sent to the county or city board of health responsible for private well permitting.

*c.* Failure to provide notice to an interested party shall not constitute a basis for invalidating a subsequently approved no further action certificate.

**105.211(5)** *Scope of liability protection.* Upon issuance of the no further action certificate by the department, the liability protection provisions contained in Iowa Code chapter 455H, subchapter 3, apply. The scope of the no further action classification and the scope of liability protection extend only to that area of affected property as defined by actual and modeled contaminant data and the specific environmental condition for which a regulatory standard has been met and approved by a no further action classification. The scope of protection corresponds to the scope of the site assessment conducted by the participant, the exposure pathways actually evaluated by the assessment report and reviewed by the department, and the hazardous substances identified in that assessment for which compliance with a department-approved standard has been achieved. Liability protection does not apply to releases, sources of contamination, hazardous substances or other environmental conditions not expressly addressed in the participant's site assessment, response action or specifically referenced in the no further action certificate.

**105.211(6)** *Reopener and reclassification conditions.*

*a.* The department shall have grounds to reopen and rescind a no further action certificate and consider reclassification of the affected area if specified conditions of the no further action certificate

are not maintained, or if institutional or technological controls fail to meet their intended purpose or are determined to be ineffective and unenforceable. If the conditions upon which the no further action certificate was issued cannot be corrected or reinstated, the department may rescind the certificate. The effect of termination is to put all parties in the same position as if the no further action certificate had not been issued.

*b.* If a no further action certificate is issued without conditions or technological and institutional controls, and conditions should arise that might require further corrective action, the department may require further response action by a participant or protected party only as provided in Iowa Code section 455H.301. The department may require further response action against a statutorily responsible party who is not a participant or other protected party. If the participant was a person having control over a hazardous substance, as defined in Iowa Code section 455B.381, at the time of the release, a no further action certificate may require further response action to protect against an imminent and substantial threat to public health and safety and the environment. Another protected party who was a person having control over a hazardous substance, as defined above, may be required by the department to conduct a further response action, where appropriate, to protect against an imminent and substantial threat to public health and safety and the environment.

[ARC 0486D, IAB 8/19/26, effective 9/23/26]

These rules are intended to implement Iowa Code chapter 455H.

CHAPTER 106  
CITIZEN CONVENIENCE CENTERS AND TRANSFER STATIONS  
Rescinded **ARC 0482D**, IAB 8/19/26, effective 9/23/26

CHAPTER 107  
BEVERAGE CONTAINER DEPOSITS  
[Prior to 7/1/83, DEQ Ch 34]  
[Prior to 12/3/86, Water, Air and Waste Management[900]]

Chapter rescission date pursuant to Iowa Code section 17A.7: 9/23/31

**567—107.1** Reserved.

**567—107.2(455C) Definitions.** In addition to the definitions in Iowa Code section 455C.1, for the purpose of this chapter, the following terms shall have the meaning indicated in this rule.

“*Act*” means Iowa Code chapter 455C.

“*Approved redemption center*” means a redemption center approved by the department pursuant to 107.4(1).

“*Carbonated*” means charged under pressure with carbon dioxide.

“*Distributor redemption center*” means a redemption center that satisfies the requirements of Iowa Code section 455C.14.

“*Emboss*” means to raise the surface in relief.

“*Exempt beverage container*” means a beverage container that is not marked with the words “Iowa Refund 5¢” because it is a refillable glass beverage container having a brand name permanently marked on it and having a refund value of 5 or more cents or because it is a refillable metal or plastic beverage container that has been exempted, in accordance with the procedure of 107.3(7), from the requirement of having the refund value marked on the container. An exempt beverage container is exempt from having the words “Iowa Refund 5¢” indicated on the container but is not necessarily exempt from the minimum deposit and redemption requirements of this chapter.

“*Handling fee*” or “*fee*” means the amount reimbursed by a distributor, in addition to the return of the 5 cent refund value, in an amount that is 1 cent per beverage container for containers accepted from a dealer agent or 3 cents per beverage container accepted from a participating dealer or redemption center. Only one fee shall be charged per container.

“*High-contrasting color*” in reference to labeling requirements means a clear differentiation in hue, value, and intensity with the background on which the redemption message appears, surrounding artwork, and other nearby printed information.

“*Incise*” means to scratch the surface to produce legible letters or characters at a precise width and depth.

“*Indelibly*” means that the refund value is permanently affixed on the beverage container and cannot be smeared or removed during regular use from the point of being offered for sale until the point of redemption.

“*Mineral water*” means water naturally or artificially infused with mineral salts or gases. Mineral water may be carbonated or uncarbonated.

“*Soda water*” means water that has been carbonated.

“*Soft drink*” means any nonalcoholic liquid other than mineral water or soda water intended for human consumption.

“*Unapproved redemption center*” means a redemption center that is not an approved redemption center.

This rule is intended to implement Iowa Code sections 455C.1 and 455C.9.

[ARC 0487D, IAB 8/19/26, effective 9/23/26]

**567—107.3(455C) Labeling requirements.**

**107.3(1)** All beer, wine, alcoholic liquor, mineral water, soda water and similar carbonated soft drink containers (other than exempt containers) sold or offered for sale in Iowa by a dealer shall have the words “Iowa Refund 5¢” or “IA 5¢” clearly, indelibly and legibly indicated on the container. Any abbreviation of the words “Iowa Refund” other than as provided in this subrule shall be submitted to and approved by the department.

**107.3(2)** The minimum size of the words “Iowa Refund 5¢” or “IA 5¢” and all approved abbreviations shall be a minimum of 9-point type (approximately .125 inch or 3 millimeters) if the words are embossed or incised and 18-point type (approximately .25 inch or 6 millimeters) if the words are otherwise affixed to the container. A stamp or label may have the words “Iowa Refund 5¢” or “IA 5¢” in less than 18-point type if the label is submitted to the department and the department determines that the high-contrasting color or the characteristics of the stamp or label make the stamp or label as easy to discern as a stamp or label with 18-point type.

**107.3(3)** The words “Iowa Refund 5¢” or “IA 5¢” shall be indicated by embossing (raised letters), by incising, by printing in high-contrasting color, by a stamp or label of high-contrasting color, or by other method approved by the department securely and permanently affixed to the container.

**107.3(4)** Reserved.

**107.3(5)** The words “Iowa Refund 5¢” or “IA 5¢” shall be on the top or on the cylindrical portion of a metal beverage container. The words “Iowa Refund 5¢” or “IA 5¢” shall be on the conical portion of a glass or plastic beverage container so that the words are visible from above or shall be on the product label. The placement of refund information solely on the bottom of the beverage container is prohibited.

**107.3(6)** An example of the label or labeled container may, but need not, be submitted to the department for informal approval.

**107.3(7)** An application for exemption from the requirement of having the words “Iowa Refund 5¢” or “IA 5¢” indicated on the container shall be submitted to the department and shall contain:

- a. The name, address and telephone number of the applicant;
- b. The refund value of the container; and
- c. A statement of why the container can be readily and permanently identified by consumers as subject to a deposit.

**107.3(8)** An example of the container for which the exemption is being requested shall be sent to the department along with the application required in 107.3(7). The example may consist of photographic images or empty containers. Examples submitted to the department shall not contain any liquid.

**107.3(9)** The department may exempt the container if the department determines that the container is subject to a deposit of 5 or more cents and that consumers can readily and permanently identify the container as one subject to a deposit.

**107.3(10)** Automatic exemption. Beverage containers sold in Iowa containing alcoholic liquor as defined in Iowa Code section 123.3(5) where the total capacity of the container is not more than 50 milliliters are automatically exempted from the labeling requirement of 567—107.3(455C). However, such beverage containers remain subject to the remainder of this chapter.

[ARC 0487D, IAB 8/19/26, effective 9/23/26]

**567—107.4(455C) Redemption centers.** The Act provides for both approved and unapproved redemption centers. Both approved and unapproved redemption centers redeem empty beverage containers and pay the refund value to consumers. Only approved redemption centers can satisfy the requirements of Iowa Code section 455C.4(2)“a”(2) and “a”(3) and 2022 Iowa Acts, Senate File 2378, section 19.1(a) or 19.1(b). Additionally, only approved redemption centers will be listed on the department’s electronic database pursuant to Iowa Code section 455C.4(2)“c.”

**107.4(1)** *Approved redemption centers.*

- a. Any person may file with the department an application for approval of a redemption center.
- b. An annual application for approval of a redemption center shall be submitted to the department electronically.

(1) Initial application. Redemption centers that wish to be considered approved under this chapter should file their application within 30 days of starting their business.

(2) Annual renewals. All redemption centers should file their annual renewal application by January 31 of each subsequent year to allow the department to update its approved redemption center list in a timely manner.

(3) Application requirements. A redemption center must submit a separate application for each facility, including if a redemption center is operating a mobile redemption system for a dealer or dealers. The information on the application will be included in an electronic database for consumers to locate the

nearest approved redemption center; as such, applications must be resubmitted annually to ensure that contact information remains accurate. There is no fee to submit the application. The application shall include the following information:

1. Name, address and telephone number of the redemption center;
2. Name, address and telephone number of the person or persons responsible for the establishment and operation of the redemption center;
3. A statement that the operator of the redemption center understands it must accept all redeemable containers, except for those containers exempted in 567—107.13(455C);
4. Whether the redemption center will be operating a mobile redemption system and the location(s) where the system will be operated.
  - c. The department will issue an electronic order of approval once a complete application is received.
  - d. The department may at any time rescind the order approving a redemption center if the department determines, after notice and hearing, that the redemption center is in violation of the Act or this chapter or that the redemption center is no longer meeting the above criteria.
  - e. An approved redemption center shall accept from consumers and shall pay the refund value for all beverage containers that bear an Iowa refund value and those containers exempted from the labeling requirement pursuant to 107.3(10).
  - f. When an approved redemption center is closing permanently, it shall give to the department notice that includes the redemption center's final date of operation. As of the final date of operation, the redemption center's approval as a redemption center shall be terminated and a dealer it was approved to serve shall no longer be an exempt dealer. An approved redemption center must notify the department and any dealers or distributors with which the redemption center has agreements 30 days prior to the redemption center's closing.

**107.4(2) *Refused container redemption centers.*** Redemption centers required by Iowa Code section 455C.14 may be either "approved" or "unapproved." To be "approved," the facility must submit an application pursuant to 107.4(1), which includes the requirement to accept all redeemable beverage containers except for those containers exempted in 567—107.13(455C).

[ARC 0487D, IAB 8/19/26, effective 9/23/26]

**567—107.5 to 107.7** Reserved.

**567—107.8(455C) Miscellaneous requirements.**

**107.8(1)** Beverage containers sold on interstate carriers, such as trains, planes, or buses that travel through Iowa, are not subject to the deposit and labeling requirements of the Act.

**107.8(2)** Transfer tanks, premix tanks and beer kegs are not subject to the deposit and labeling requirements of the Act.

**107.8(3)** Return limits. Dealers may limit the number of containers returned by an individual to 120 containers in a 24-hour period. Redemption centers may limit the number of containers returned by an individual to 500 containers in a 24-hour period.

[ARC 0487D, IAB 8/19/26, effective 9/23/26]

**567—107.9(455C) Partial pickup and acceptance of redeemed containers by distributor.**

**107.9(1) *Notification of frequency.*** A distributor shall notify each participating dealer served by the distributor of the intended frequency of pickup. A distributor shall notify each redemption center from which the distributor is required to pick up containers of the intended frequency of pickup.

**107.9(2) *Partial pickup.*** A distributor who picks up containers more often than the required frequency shall not be required to pick up all available containers from a participating dealer or redemption center at each pickup provided that all available containers are picked up from the dealer or redemption center within the required frequency.

[ARC 0487D, IAB 8/19/26, effective 9/23/26]

**567—107.10(455C) Dealer agent lists.** A dealer agent shall provide to a distributor upon request a list of the dealers that the dealer agent is serving.

[ARC 0487D, IAB 8/19/26, effective 9/23/26]

**567—107.11** and **107.12** Reserved.

**567—107.13(455C) Refusing payment of the refund value.** A distributor, participating dealer, or redemption center may refuse to pay the refund value and, if applicable, the handling fee pursuant to Iowa Code section 455C.4 and in the following situations:

**107.13(1) *Refusal of certain brands (e.g., store brands).***

*a.* For any beverage container subject to the Iowa beverage container control law, all distributors and manufacturers must charge a 5-cent deposit for each container delivered by that distributor or manufacturer to a dealer and must pick up, or facilitate the pickup of, the container from a participating dealer or an approved redemption center. This includes, at a minimum, reimbursing the participating dealer or approved redemption center for the refund value and the applicable handling fee. The requirements of this paragraph apply regardless of the relationship between the distributor or manufacturer and the dealer.

*b.* Any approved redemption center may refuse to accept containers for redemption if there is no distributor or manufacturer providing reimbursement and paying the requisite fee for the given container. In such cases, the redemption center shall notify the department and must post a notice of the brands it will not accept.

**107.13(2) *Redeemed containers must be reasonably clean and intact.*** Consumers shall return containers in a reasonably clean and intact condition. For a refillable beverage container, the container must hold liquid, be able to be resealed and be in its original shape. A nonrefillable glass container may be chipped, but it may not have the bottom broken out or the neck broken off. A nonrefillable metal container may be dented or partially crushed but may not be crushed flat. In order to be redeemed, an empty beverage container shall be dry and free of foreign materials other than the dried residue of the beverage. Redemption centers and participating dealers may refuse to redeem containers that are not reasonably clean and intact, as well as containers that do not have an Iowa 5-cent redemption label and containers that have had the Iowa 5-cent label removed or if the label is illegible for any reason.

[ARC 0487D, IAB 8/19/26, effective 9/23/26]

**567—107.14(455C) Payment to redemption centers and dealer agents delivering containers to distributors.** A distributor shall issue to a redemption center or dealer agent payment of the refund value and handling fee within one week of delivery and acceptance of empty beverage containers, unless otherwise agreed to by both the redemption center and the distributor or by both the dealer agent and the distributor, as the case may be.

[ARC 0487D, IAB 8/19/26, effective 9/23/26]

**567—107.15(455C) Sales tax on deposits.** The department of revenue has determined that the payment of the deposit by a consumer is not a sale subject to the payment of additional sales tax.

[ARC 0487D, IAB 8/19/26, effective 9/23/26]

These rules are intended to implement Iowa Code chapter 455C.

CHAPTER 109  
LANDFILL ALTERNATIVES FINANCIAL ASSISTANCE PROGRAMS

Chapter rescission date pursuant to Iowa Code section 17A.7: 9/23/31

**567—109.1(455B,455E) Purpose.** The purpose of this chapter is to provide direction for the department's implementation of certain financial assistance programs that are funded from the solid waste account within the groundwater protection fund as described in Iowa Code section 455E.11, including the solid waste alternatives program as described in Iowa Code section 455E.11(2) "a"(1)(c); the derelict building program as described in Iowa Code section 455E.11(2) "a"(1)(d); the Iowa solid waste environmental management systems program as described in Iowa Code section 455E.11(2) "a"(1)(c); and other waste management assistance programs as described in Iowa Code section 455E.11(2) "a"(2)(a)(1)(iv). All rules, standards, technical guidance, and other similar legal or technical documents referenced in this chapter shall be the version of those documents in effect on August 1, 2025, unless otherwise noted in these rules, and except for references to the Iowa Code and Iowa Administrative Code, which shall always be the most recent version unless otherwise noted in these rules.

[ARC 0488D, IAB 8/19/26, effective 9/23/26]

**567—109.2(455B,455E,455J) Definitions.** For the purposes of this rule, the definitions in 567—Chapter 100, those found in Iowa Code section 455B.301 and chapters 455E and 455J, and the following definitions shall apply.

*"Abandoned"* means that the building has been unoccupied for a minimum of six continuous months.

*"Asbestos-containing material"* or *"ACM"* means any material that contains more than 1 percent of asbestos.

*"Building renovation"* means repairs that stabilize or improve the structural integrity of the building, including but not limited to roof repair or replacement, building stabilization, and the tuck-pointing of exterior walls.

*"Cost share"* means the applicant's share of the eligible costs of the proposed project.

*"Deconstruction"* means the selective dismantlement of a building for the purpose of maximizing reuse and recycling opportunities through source separation while minimizing disposal costs.

*"Derelict building grant eligibility"* means any city with a population of 5,000 or less is eligible to apply for a derelict building grant. An applicant may partner with a local nonprofit organization on a project.

*"Financial assistance"* means monetary assistance in the form of grants, loans, or forgivable loans awarded by the department.

*"Phase I environmental assessment"* means review of known environmental records and land use information about the site and vicinity.

*"Phase II environmental assessment"* means actual soil, groundwater and structural material sampling and testing to confirm or deny the presence of contamination.

*"Recipient"* means any applicant selected to receive financial assistance under these rules.

[ARC 0488D, IAB 8/19/26, effective 9/23/26]

**567—109.3(455B,455E) Funding sources.** The department will use moneys that are appropriated by the legislature and that may be obtained from other sources for the purpose of achieving the goals outlined in these rules.

[ARC 0488D, IAB 8/19/26, effective 9/23/26]

**567—109.4(455B,455E,455J) Requirements for financial assistance programs.** In addition to any of the requirements of Iowa Code chapters 455B, 455E and 455J, the following requirements shall be met.

**109.4(1) Requests for financial assistance.** Requests for financial assistance must be made by applicants on the relevant program application form provided by the department and according to accompanying guidance documentation that specifies program criteria.

**109.4(2) Awards and agreements for financial assistance.**

*a.* Recipients shall enter into a written agreement with the department for the purposes of implementing the project for which financial assistance has been awarded. The agreement shall be signed by the appropriate department signatory and the recipient's authorized signatory.

*b.* A written agreement must be executed between the department and the award recipient prior to the recipient incurring expenses. Awarded funds are disbursed on a reimbursable basis and are not to be incurred prior to executing a written agreement.

*c.* The department may terminate agreements and seek the return of funds released under the agreement for failure by the recipient to perform under the terms and conditions of the agreement.

*d.* Amendments to agreements may be adopted by mutual written consent of the department and the recipient.

*e.* The department reserves the right to offer financial assistance awards in an amount less than that requested by the applicant.

*f.* For funds to be disbursed, the recipient shall be in compliance with all applicable statutes and regulations as specified in the written agreement.

[ARC 0488D, IAB 8/19/26, effective 9/23/26]

**567—109.5(455B,455E,455J) Denial of financial assistance.** The department reserves the right to deny financial assistance requests for any reason, including the following:

**109.5(1)** Funds are insufficient to award financial assistance to all qualified applicants.

**109.5(2)** An applicant does not meet eligibility requirements pursuant to the provisions of 109.6(1) for the solid waste alternatives program, 109.7(1) for the derelict building program or 109.8(2) for the environmental management system program.

**109.5(3)** An applicant does not provide sufficient requested information on forms provided by the department pursuant to 567—109.4(455B,455E,455J).

**109.5(4)** An applicant has previously received financial assistance under these rules and is determined by the department to be delinquent in repaying the loan or delinquent in submitting required documentation.

**109.5(5)** The goals or scope of the project is not consistent with 109.6(2) for the solid waste alternatives program, 109.7(2) for the derelict building grant program or 109.8(2) for the environmental management system program.

[ARC 0488D, IAB 8/19/26, effective 9/23/26]

**567—109.6(455B,455E) Solid waste alternatives program.** Financial assistance awarded under the solid waste alternatives program shall be used to implement activities that support the practical and beneficial use of solid waste materials and for activities leading to a reduction in the reliance on sanitary landfills for disposal of solid waste.

**109.6(1) *Eligible applicants.*** Any unit of local government, public or private group, individual or business that has an interest in or has responsibility for solid waste management in Iowa and is currently in compliance with all applicable state statutes and regulations is eligible to apply for the solid waste alternatives program.

**109.6(2) *Eligible projects.*** The department may provide financial assistance to applicants for the following types of projects that are consistent with the goal and purpose of this program:

*a.* Best practices—practices and programs that will move Iowa toward long-term pollution prevention, waste reduction and recycling sustainability;

*b.* Education—practices and programs that are consistent with a coordinated statewide message on pollution prevention, waste reduction, and recycling to ensure ongoing support of these integrated solid waste management activities; and

*c.* Market development—practices and programs that develop a demand for value-added recyclables sufficient to provide increased and stable commodity markets.

**109.6(3) *Type of financial assistance.*** The types of financial assistance offered to an applicant may include a forgivable loan, zero interest loan, or low-interest loan. The department reserves the right to offer any combination of types of financial assistance to any selected project.

**109.6(4) Loans.** The term of all loans executed under these rules shall be determined on a case-by-case basis and shall be based on the specific capital costs financed, as well as the terms of other financing provided for the project. The written agreement between the department and the recipient will establish other conditions or terms needed to manage or implement the project.

[ARC 0488D, IAB 8/19/26, effective 9/23/26]

**567—109.7(455B,455E) Derelict building grant program.** Financial assistance awarded under the derelict building grant program is available to cities of 5,000 or less to help improve the attractiveness and appearance of their jurisdictions by providing financial assistance for eligible projects. Each project must have a landfill diversion component.

**109.7(1) Eligible applicants.** Any city with a population of 5,000 or less is eligible to apply for a derelict building grant. An applicant may partner with a local nonprofit organization on a project.

**109.7(2) Eligible projects.** A city's building is eligible for the program if the building meets the following criteria:

a. The building is an abandoned commercial or public building of which a city has ownership or will obtain ownership no later than June 30 of the fiscal year in which the city applies.

b. The building is not on the National Register of Historic Places.

**109.7(3) Eligible activities and amount of financial assistance.** The eligible activities and amount of financial assistance for each are:

a. Asbestos-containing material inspections: 100 percent reimbursement for inspection costs conducted by a state of Iowa-licensed asbestos contractor.

b. Abatement of asbestos-containing material: 100 percent reimbursement, not to exceed \$10,000, for abatement of ACM performed by a state of Iowa-licensed asbestos contractor. A 50 percent cost share is required for those costs exceeding \$10,000.

c. Structural engineering analysis: 100 percent reimbursement not to exceed \$1,500 for a structural engineering analysis conducted by a licensed structural engineer or architectural historian to determine the ability to renovate the building. The recipient is responsible for all costs exceeding \$1,500.

d. Phase I environmental assessment: 100 percent reimbursement not to exceed \$3,000 for conducting a Phase I environmental assessment. The recipient is responsible for all costs exceeding \$3,000.

e. Phase II environmental assessment: 50 percent reimbursement not to exceed \$2,500 for conducting a Phase II environmental assessment. The recipient is responsible for all costs exceeding \$5,000. The need for this assessment is determined by the results of the Phase I environmental assessment and involves the sampling of structure components, soil, and groundwater to confirm or deny the presence of contamination.

f. Building renovation: 50 percent reimbursement not to exceed \$50,000 for renovation costs, including but not limited to:

- (1) Restoration or removal of materials for reuse, either at the site or off site, or for recycling.
- (2) Roof repair or replacement.
- (3) Building stabilization.
- (4) Tuck-pointing of exterior walls.

g. Deconstruction: 50 percent reimbursement not to exceed \$50,000 for costs related to deconstruction. All deconstruction projects must achieve a minimum landfill diversion rate of 30 percent of the structure by weight to receive reimbursement for deconstruction costs.

**109.7(4) Deconstruction cost-share incentive.** For every additional 10 percent above 30 percent of landfill diversion by weight that is documented upon completion of the project, the applicant's cost share is reduced by 5 percent and the grant award amount will increase by 5 percent. The maximum grant award for deconstruction projects shall not exceed \$75,000.

[ARC 0488D, IAB 8/19/26, effective 9/23/26]

**567—109.8(455E,455J) Environmental management system program.** Financial assistance awarded under the environmental management system program is to support projects that pursue continuous improvement by mitigating the environmental impacts of solid waste disposal.

**109.8(1) Eligible applicants.** Any solid waste planning or service area designated as an environmental management system is eligible to apply.

**109.8(2)** *Eligible projects.* The department may provide financial assistance to applicants for projects that pursue continuous improvement in organics waste management, hazardous household materials collection, water quality improvement, greenhouse gas reduction, recycling services, or environmental education.

[ARC 0488D, IAB 8/19/26, effective 9/23/26]

These rules are intended to implement Iowa Code sections 455B.301A and 455E.11 and chapter 455J.

CHAPTER 134  
UNDERGROUND STORAGE TANK CERTIFICATION PROGRAMS

Chapter rescission date pursuant to Iowa Code section 17A.7: 9/23/31

**567—134.1(455B) Scope.** The purpose of this chapter is to provide rules for the certification of groundwater professionals, compliance inspectors, and other UST professionals, including certification qualification, fees and administration. All rules, standards, technical guidance, and other similar legal or technical documents referenced in this chapter shall be the version of those documents in effect on August 1, 2025, unless otherwise noted in these rules and except for references to the Iowa Code and Iowa Administrative Code, which shall always be the most recent version unless otherwise noted in these rules.

[ARC 0490D, IAB 8/19/26, effective 9/23/26]

**567—134.2(455B) Definitions incorporated by reference.** The definitions in 567—Chapter 135, Iowa Code section 455B.471, and 40 CFR §280.12 (2015) shall apply to this chapter.

[ARC 0490D, IAB 8/19/26, effective 9/23/26]

**567—134.3(455B) Certification classifications for individuals and companies**

**134.3(1)** A separate certification will be issued for:

- a. UST installers;
- b. UST removers;
- c. UST testers;
- d. UST cathodic protection testers;
- e. UST liners;
- f. UST installation inspectors;
- g. UST compliance inspectors;
- h. Groundwater professionals.

**134.3(2)** A company employing certified individuals for compliance inspections, installation, upgrading, removal, lining or testing of UST systems shall be certified as a company. A company may have its certification revoked if it employs uncertified individuals to do work requiring a certification.

**134.3(3)** Service technicians as defined in 567—Chapter 135 are exempt from certification under this chapter.

[ARC 0490D, IAB 8/19/26, effective 9/23/26]

**567—134.4(455B) General certification requirements.**

**134.4(1)** *Applications and certificates.*

a. Applications for certifications shall be submitted on a form provided by the department along with all required supporting documentation. Certificates shall be issued and renewed on a two-year calendar basis. Groundwater professional certificates expire on December 31 of each odd-numbered year and all other certificates expire on December 31 of each even-numbered year. All applicants must be at least 18 years of age.

b. Applications shall contain the following information:

(1) Evidence that the applicant meets the experience, education, and other qualification prerequisites contained in this chapter for each certification.

(2) Contact information for the applicant.

(3) Other information necessary for a determination of the applicant's qualifications.

**134.4(2)** *Certification fees.* A \$200 fee shall be submitted for each groundwater professional certification. For all other certifications, a \$200 fee shall be submitted with each application for an initial company and individual certification application, including when an individual applies for multiple non-groundwater professional certifications using a single department-approved form. Fees are nonrefundable, are payable to the Department of Natural Resources, and will not be prorated.

**134.4(3)** *Reciprocity.* Persons who are certified as a UST installer, installation inspector, tester, liner, or remover under another state or federal regulatory program that has been approved by the department

may be eligible for certification in Iowa without having to take a course of instruction or pass the examination. Applicants for reciprocity shall still pay the application fee and follow certification renewal requirements.

[ARC 0490D, IAB 8/19/26, effective 9/23/26]

#### **567—134.5(455B) Liability insurance**

**134.5(1) *Environmental liability insurance.*** All certificate holders, except for compliance inspectors and groundwater professionals, must hold environmental liability insurance as required by Iowa Code section 455B.474(10). A company may provide insurance for all of its employees who are UST certificate holders.

**134.5(2) *Employer exception.*** Individuals certified by this chapter, except for groundwater professionals, employed by owners or operators of UST systems to work only on the owner's or operator's private system(s) are exempt from insurance requirements.

**134.5(3) *Forms of acceptable insurance.*** All parties certified by this chapter, except groundwater professionals and compliance inspectors, will provide evidence of environmental liability insurance to the department.

*a.* Environmental liability insurance may be provided by a private insurer authorized to do business in Iowa.

*b.* Evidence of environmental liability insurance may be provided using methods of self-insurance as outlined in 567—Chapter 136.

**134.5(4) *Professional liability insurance requirements.*** All certified compliance inspectors are required to have professional liability insurance with minimum liability limits of \$1 million per occurrence and in the aggregate.

[ARC 0490D, IAB 8/19/26, effective 9/23/26]

#### **567—134.6(455B) Training courses and examinations.**

##### **134.6(1) *Requirements.***

*a.* Prior to the issuance of a certification as a groundwater professional, compliance inspector, installer, installation inspector, or remover, the applicant will successfully complete a department-led or department-approved training course and pass a qualification examination offered or approved by the department.

*b.* Examination requirements for all individual certificate holders.

(1) A passing grade of not less than 75 percent is required on the respective examinations for installers, installation inspectors, removers and compliance inspectors. A passing grade of not less than 70 percent is required on the groundwater professional examination.

(2) Applicants who have failed the examination will not perform work unless supervised by an appropriately certified individual.

(3) A fee reflecting the actual costs of developing and administering each course of instruction and examination may be charged.

(4) Nothing in this chapter shall limit the right of the department to require additional educational requirements of certification holders.

*c.* An applicant who receives less than a passing score on an examination may retake the test within 180 days without reapplying. The application of an applicant who fails the second examination will be denied. An applicant who fails the second examination may reapply for certification but will not retake the examination until the applicant has successfully completed a course of instruction that is administered or approved by the department and that is administered after the applicant's second test.

##### **134.6(2) *Educational offering requirements.***

*a.* *Courses approved by the department.* The requirement for educational offerings may be met only by those courses that have been approved by the department.

*b.* *Form of course approval.* Approval of a course may take the form of:

(1) Program approval granted by the department to the sponsor or instructor of an educational offering;

(2) Individual requests for credit granted by the department to an installer or inspector for an educational offering whose sponsor or instructor did not seek program approval; or

(3) Blanket approval granted by the department to educational offerings sponsored by the department or other professional organizations whose standards have been approved by the department.

*c. Procedures for course approval.*

(1) Application for program approval shall be made by the sponsor or instructor to the department and include an agenda or an outline of the content of the proposed educational offering.

(2) The application shall be reviewed by the department, and notice of approval or denial of program approval shall be sent to the sponsor or instructor. Credit hours may be limited by the department based on program content.

*d. Proof of participation.* Any approved course must provide participants a certificate of satisfactory completion of the course or provide the department a list of participants who have satisfactorily completed the course.

**134.6(3)** *Exceptions to required training.*

*a.* An applicant may be issued a compliance inspector certification without the required training if all other requirements are satisfied and the required training is not offered within 60 days of the date of application. The applicant must attend required training when required training is next offered. If an applicant receives a certification under this temporary exception, the individual must attend required training, if offered, before renewal of the certification.

*b.* If an applicant receives a compliance inspector certification under the temporary training exception above, all compliance inspection activities must be conducted under the supervision of a trained Iowa-certified compliance inspector. Supervision does not require the trained Iowa-certified compliance inspector to be on site for compliance inspections conducted by an inspector who has not completed the required training. The trained Iowa-certified compliance inspector must co-sign compliance inspections conducted by the inspector who has not completed the required training.

*c.* Cathodic protection testers are not required to complete a course of instruction but are required to maintain AMPP (NACE) certification, STI cathodic protection certification, or equivalent certification approved by the department.

*d.* UST liners and UST testers are not required to complete a course of instruction or pass a state qualifying examination for initial certification purposes.

**134.6(4)** *Exemption from examination.*

*a.* A professional engineer exempted from groundwater professional certification examination pursuant to Iowa Code section 455B.474(9) “g” must meet the continuing education requirements of 567—134.8(455B) for the exemption to apply.

*b.* An engineer who is conducting business as an installation inspector or remover and who has met the requirements in Iowa to be a registered professional engineer (P.E.) is exempt from the educational requirements so long as UST-related work is in the scope of the engineer’s P.E. license and regular practice. Professional engineers must meet the continue education requirement of 567—134.8(455B) for this exemption to apply.

[ARC 0490D, IAB 8/19/26, effective 9/23/26]

**567—134.7(455B) Certification issuance.** Upon receipt, review, and acceptance of an application and corresponding fee, the department will furnish the applicant with a certificate showing the name of the individual or company and the expiration date.

[ARC 0490D, IAB 8/19/26, effective 9/23/26]

**567—134.8(455B) Certification renewal.**

**134.8(1)** *Renewal period.* Applications for renewal must be submitted on a form provided by the department and no later than 30 days prior to the expiration date. If a certificate holder fails to renew the certification by the expiration date, the department may grant a grace period during which the applicant may submit the application and payment of the renewal fee.

**134.8(2)** *Renewal requirements.*

a. The renewal application shall be accompanied by a \$200 renewal fee. Company renewal applications will include proof of liability insurance as required under 567—134.5(455B). Applications received after the December 1 deadline will be accepted with an additional \$50 late fee.

b. To be eligible for renewal, an individual certificate holder shall fulfill all continuing education requirements, along with any other requirements set forth in each certification classification rule in this chapter. The department will consider all past disciplinary actions against the certificate holder when evaluating renewal eligibility.

**134.8(3) Continuing education.** Individual certificate holders must complete continuing education requirements as follows:

a. Groundwater professionals must complete 12 hours of continuing education every two years in the areas relating to underground storage tank contamination assessment and corrective action activities.

b. Cathodic protection testers must complete continuing education sufficient to maintain AMPP (NACE) or STI cathodic protection certification or department-approved equivalent certification.

c. All other certificate holders must complete eight hours of department-approved continuing education every two years.

d. Proof of completion of continuing education must be submitted to the department no later than the date of each renewal application. The department may limit the number of hours granted for similar courses during a renewal period.

e. An individual's first certification period's continuing education requirements can be waived. Continuing education hours cannot be carried forward to the next renewal period.

f. Courses other than those currently approved by the department may be submitted to the department for consideration of approval.

[ARC 0490D, IAB 8/19/26, effective 9/23/26]

**567—134.9(455B) Groundwater professional certification requirements.** In order to be certified as a groundwater professional, a person must meet one or more of the criteria described in Iowa Code section 455B.474(9). For a person to qualify under Iowa Code section 455B.474(9) "b"(4), at least two years of related formal education is required. Pursuant to Iowa Code section 455B.474(9) "c," for persons qualified to be certified under this rule, the failure to obtain a certificate prior to conducting applicable work will result in a \$50 civil penalty.

[ARC 0490D, IAB 8/19/26, effective 9/23/26]

**567—134.10(455B) UST compliance inspector certification requirements.**

**134.10(1) Qualifications.**

a. A person retained by an owner or operator of a UST facility for the purpose of determining compliance of a UST system for a compliance inspection required by the department under 567—135.19(455B) must hold a current UST compliance inspector certification issued by the department.

b. Inspector certification will be issued by the department to a person who:

(1) Meets the certification requirements listed under 567—134.6(455B);

(2) Satisfies one of the following:

1. Is a certified installer;

2. Is a certified installation inspector;

3. Has participated on a minimum of 50 onsite compliance inspections with a certified compliance inspector;

4. Has two years of experience working with petroleum equipment, including installations, maintenance, or testing; or

5. Has other relevant experience approved by the department; and

(3) Is not found to be in violation of this chapter and has not had a certification issued by the department under this chapter revoked.

**134.10(2) Renewal qualifications.** To be eligible for certification renewal, a compliance inspector shall have:

a. Fulfilled the department's continuing education requirements in 567—134.8(455B); and

b. Conducted at least 12 compliance inspections in the past two years.

**134.10(3)** *UST compliance inspector responsibilities.*

*a. Compliance inspection.* The UST compliance inspector shall conduct a compliance inspection in accordance with this rule and 567—Chapter 135. The inspector shall notify the department of the date of a site inspection at least ten days prior to the inspection or another time frame approved by the department.

*b. Inspection process.*

(1) Upon completion of the site inspection, the inspector shall send an inspection report to the owner and operator within ten business days. At a minimum, the report shall provide the following:

1. Any violations or deficiencies related to 567—Chapter 135 or other applicable state or federal law and those specific actions necessary to correct the violations or deficiencies.

2. Applicable time frames to correct violations or deficiencies if established in 567—Chapter 135 or within 60 days of receipt of the inspection report or another reasonable time period approved by the department.

(2) A final electronic report shall be submitted to the department and a copy provided to the owner and operator as provided in 134.10(3) “c” within the following time frames:

1. Within ten business days of the inspection if the results of the inspection find no violations or deficiencies requiring corrective action.

2. Within ten business days of the inspector’s receipt of all necessary documentation of all action required to correct violations and deficiencies.

3. In any case, no later than 90 days of the site inspection.

4. Any deficiencies identified on the day of a compliance inspection must be reported to the department as a deficiency, regardless of when it is addressed.

*c. Electronic inspection reporting.* The inspector shall prepare an electronic report in accordance with the following:

(1) The inspector shall enter the results of the site inspection discovered at the time of the inspection and any actions taken to correct violations and deficiencies on an internet-based electronic format developed by the department and in accordance with guidance. The department’s software will be capable of generating an inspection report.

(2) The department will develop a generally compatible electronic platform using XML or another approved format. The department will provide the XML schema file format to describe the data needed to allow an inspector to transfer multiple site inspection results in an electronic batch process over the internet using the department’s inspection website.

(3) The inspector shall provide a print copy of the electronically generated inspection report to the owner and operator or an alternative report approved by the department.

(4) The inspection report submitted to the department electronically will include at least one overall site photo.

*d. Evidence of violations or deficiencies.* Any evidence of violations or deficiencies observed during the inspection must be photographed using a digital photograph. Digital photographs must be submitted as part of the electronic inspection report and maintained by the inspector for five years as part of the inspector’s records.

*e. Records.* The inspector must provide any inspection records provided by the owner and operator to the department upon request.

*f. Inspection technical requirements.* An inspector of a UST system must check for compliance with the technical standards of 567—Chapter 135. The inspection of a UST system currently in operation shall include but not be limited to the following:

(1) The material currently stored in the UST.

(2) The type of tank and lines currently at the site as compared to the registered information on the department’s database.

(3) Checking site records demonstrating operational compliance (567—subrule 135.4(5)).

(4) Checking release detection records (567—subrule 135.5(6)).

(5) Visually checking for releases or other violations by opening covers of dispensers, manways, and containment sumps for submersible pumps and other piping connections for:

1. Damaged or deteriorated product lines and underground fuel delivery components.

2. Visible indications the shear valve is leaking or has been damaged, altered, or modified in a manner that would prevent the valve from functioning properly.

(6) Current operating status of impressed current cathodic protection system, if present.

(7) Presence and operational condition of spill and overfill equipment (567—paragraph 135.3(1)“c”).

**134.10(4) *Conflict of interest.*** A compliance inspector shall not conduct a compliance inspection if the compliance inspector is the owner or operator of the UST system, an employee of the owner or operator of the UST system, or a person having daily onsite responsibility for the operation and maintenance of the UST system.

[ARC 0490D, IAB 8/19/26, effective 9/23/26]

**567—134.11(455B) UST installer certification requirements.**

**134.11(1) *Qualifications.*** An installer of an UST system shall apply for a certification as an installer. In addition to the certification requirements listed under 567—134.6(455B), an installer must:

- a. Provide documentation of at least two years of relevant experience;
- b. Provide documentation of manufacturer certification for work, including but not limited to tank systems, piping systems, leak detection and monitoring systems, and corrosion protection systems; and
- c. Have completed a 40-hour OSHA Hazardous Waste Operations and Emergency Response (HAZWOPER) training.

**134.11(2) *Renewal qualifications.*** To be eligible for certification renewal, an installer shall:

- a. Fulfill the department’s continuing education requirements in 567—134.8(455B);
- b. Maintain manufacturer certification; and
- c. Complete an annual eight-hour HAZWOPER refresher course.

**134.11(3) *Responsibilities.***

a. *Certified installer.* A certified installer shall be on site during the performance of all work, including subcontracted work, for which the owner/operator has contracted to have completed by the installer. The certified installer is responsible for all UST-related work at the site and must ensure that the performance of the work and the finished work conform to industry standards and codes and manufacturers’ requirements.

b. *Local permits and notification.* The certified installer is responsible for ensuring that all local installation permits and notice requirements are satisfied.

c. *Work performed.* UST system installation includes all work associated with the placement of the tanks, piping, pumps, dispensers, gauging systems, monitoring systems, containment sumps, spill and overfill devices, and ancillary systems that, if installed incorrectly, could cause or delay detection of a leak. Installation specifically includes excavation, equipment placement, backfilling, piping, electrical work, testing calibration, and start-up. Tank installation also includes installation of the appropriate equipment to meet National Emissions Standards for Hazardous Air Pollutants (NESHAP) requirements (40 CFR §63.6580, Subpart ZZZZ), including submerged fill and vapor balance systems (Stage 1 vapor recovery) and the testing of those systems.

d. *Testing of UST equipment.* Spill prevention equipment, containment sumps and UDC at new installations must be tested to ensure the equipment is liquid-tight before the UST system is placed into service. Acceptable test methods include vacuum, pressure, or liquid testing used in accordance with requirements developed by the manufacturer; a code of practice such as PEI RP1200; or methods determined by the department to be no less protective of human health and the environment than the requirements listed in this subrule.

**134.11(4) *Documentation of work performed.*** Installing a new UST system or upgrading a UST system requires an installer to submit department forms and testing documents applicable to the installation, signed by the owner, to the department no later than 30 days after the final third-party inspection or 30 days after completion if no inspection is required. Each certified installer responsible for the new system installation or the upgrading of an existing system shall sign DNR Form 148 as required by 567—paragraph 135.3(3)“e.” Secondary containment testing performed at installation shall be recorded on the department’s Secondary Containment Testing form unless otherwise approved by the department. Test results shall be dated and signed by the certified installer who performed the test at installation.

[ARC 0490D, IAB 8/19/26, effective 9/23/26]

**567—134.12(455B) UST tester certification requirements.**

**134.12(1) Qualifications.** A tester of UST systems shall apply for certification as a tester. A person engaging in testing described in 567—subparagraph 134.12(3) “a”(2) need not be certified if that person is under the supervision of an individual certified under this chapter when conducting those tests. In addition to the certified requirements listed under 567—134.6(455B), a tester shall provide documentation of the following:

- a. Current manufacturer certification(s) for equipment being used for testing; and
- b. Experience as documented by at least one of the following:
  - (1) One year of relevant experience.
  - (2) Completion of a minimum of 80 on-site tests with a certified tester.
  - (3) Other relevant experience as approved by the department.

**134.12(2) Renewal qualifications.** To be eligible for certification renewal, a tester shall fulfill the department’s continuing education requirements in 567—134.8(455B) and shall maintain manufacturer certification.

**134.12(3) Responsibilities.**

a. The certified tester is responsible for testing tanks, lines, leak detection systems, or monitoring systems as required by 567—Chapter 135 and this chapter.

(1) A precision test is required when the system is covered and is ready to be placed into service; a volumetric, nonvolumetric, or vacuum test may be used as a method for testing the system and a hydrostatic pressure test may be used for testing the lines. Systems used for leak detection or monitoring (such as statistical inventory reconciliation, vapor or water monitoring wells, or tracer-type tests) shall not be acceptable as a precision test at the completion of the installation of a new system or the upgrading of an existing system. Automatic in-tank gauging may be acceptable if third-party U.S. EPA approval as a precision test has been received for testing tanks.

(2) A certified tester may also perform periodic testing of spill prevention equipment and overfill devices, containment sumps, and UDC as required by 567—Chapter 135. Spill prevention equipment, containment, sumps and UDC at new installations must be tested to ensure the equipment is liquid-tight before the UST system is placed into service. Acceptable methods include vacuum, pressure, or liquid testing used in accordance with requirements developed by the manufacture; a code of practice such as PEI RP1200; or methods determined by the department to be no less protective of human health and the environment than the requirements listed in this subrule.

(3) An individual does not need to be certified with the department to conduct periodic testing of spill prevention equipment, containment sumps, UDC, and annual release detection functionality testing of electronic release detection equipment such as automatic tank gauges, probes, sensors, or electronic line leak detectors as required by 567—Chapter 135.

b. Reserved.

EXCEPTION: Installation inspectors are not required for the testing of UST systems, lines, leak detection, and cathodic protection as required by 567—Chapter 135 after the system has been put into service.

**134.12(4) Documentation of work performed.** A copy of the test results shall be attached to DNR Form 148 when testing is done in connection with an installation. The test results shall identify the tanks and piping tested, the test method employed, and the results of the test. Test results shall be dated and signed by the certified tester who performed the tests at installation.

[ARC 0490D, IAB 8/19/26, effective 9/23/26]

**567—134.13(455B) UST liners certification requirements.**

**134.13(1) Qualifications.** A person installing or repairing the lining for a UST system shall be certified as a liner. In addition to the certification requirements listed under 567—134.6(455B), a liner shall provide documentation of at least two years of relevant experience, provide documentation of current manufacturer certification, and have completed a 40-hour HAZWOPER training.

**134.13(2) Renewal qualifications.** To be eligible for certification renewal, a liner shall:

- a. Fulfill the department’s continuing education requirements in 567—134.8(455B);
- b. Maintain manufacturer certification; and
- c. Complete an annual eight-hour HAZWOPER refresher course.

**134.13(3) Lining system investigation and installation requirements.**

*a. Inspection of internal lining.* A steel underground storage tank that satisfies the corrosion protection requirement as set forth in 567—subparagraph 135.3(2)“b”(1) by the addition of an internal lining shall be internally inspected within ten years of the date the tank was lined and every five years thereafter. The purpose of the inspection is to determine if the lining continues to perform according to the manufacturer’s specifications, state and federal rules, and national standards and codes and to determine if the tank is still structurally sound. The department accepts both manned entry and video camera periodic inspections. The lining method employed must be specifically designed for the purpose, be compatible with the product stored, and meet acceptable federal and state standards as set forth in 567—Chapter 135.

*b. Integrity testing for tanks.* Liners shall verify structural integrity, including thickness and strength of the underground storage tanks, whenever tanks are physically entered (manned entry) for periodic inspections. The following standards must be used for lining and periodic inspections and integrity testing:

(1) Manned entry inspection. American Petroleum Institute (API) Standard 1631: Interior Lining and Periodic Inspection of Underground Storage Tanks.

(2) Video camera inspection. API Standard 1631: “Recommended Practice for Inspecting Buried Lined Steel Tanks Using a Video Camera” developed by Ken Wilcox Associates Inc. (KWA), Methods A and C; and ASTM G-158 (approved prediction models).

(3) Repairs to lining. Standard 631 of the National Leak Prevention Association (NLPA): Entry, Cleaning, Interior Inspection, Repair and Lining of Underground Storage Tanks. Repaired lining must meet the requirements of API 1631 §8.

(4) Documentation of the inspection. API 1631—Form C: Tank Re-Inspection Affidavit. Liners shall document any defects noted in the system including but not limited to holes and perforations using API 1631—Form C: Tank Re-Inspection Affidavit and shall include photographs of all methods of repair.

*c. Documentation of work performed.* A liner shall submit the API 1631 report form to the department certifying that all work was performed in accordance with applicable industry standards.

[ARC 0490D, IAB 8/19/26, effective 9/23/26]

**567—134.14(455B) UST installation inspector certification requirements.**

**134.14(1) Qualifications.** A person inspecting the installation of any UST system shall be certified as an installation inspector. In addition to the certification requirements listed under 567—134.6(455B), an installation inspector shall provide documentation of at least two years of relevant experience and documentation of current manufacturer certification.

**134.14(2) Renewal qualifications.** To be eligible for certification renewal, an installation inspector shall fulfill the department’s continuing education requirements in 567—134.8(455B) and shall maintain manufacturer certification.

**134.14(3) Responsibilities.**

*a.* A copy of the inspection report must be submitted within 14 days after the inspection is complete. Both the inspection form and DNR Form 148 must be received by the department before the UST system can be activated.

*b.* The installation inspector shall be present on site, shall visually observe all inspections, and shall be able to attest to the results. A video or other recording device showing the work completed by the installer shall not be used, nor shall it be an acceptable method of providing independent inspection of the work completed.

*c.* Inspections are required when concrete is cut or excavation is required that could affect the integrity or operation of the UST system or when a component that routinely contains product is installed, replaced, or repaired. Inspections shall occur when the component is uncovered and replaced or repaired and during testing when required (i.e., piping replacement or repair) but before operation recommences.

(1) An inspection shall occur before the tanks or piping are installed.

(2) An inspection shall occur before the covering of tank or piping when all tanks and piping are exposed. The inspector shall witness testing of the primary and secondary piping and testing of the secondary containment, including sumps, UDC, and secondary containment leak detection equipment.

(3) A final inspection shall occur when all components are operational and the system has been covered but before actual operation.

(4) Whenever secondary containment (such as sumps or UDC) is installed, at least one inspection is required after the equipment is installed and before the system is backfilled.

d. Replacing, repairing, or installing the following does not require an inspection: drop tubes, overfill devices, spill buckets, ATG systems, dispensers, submersible turbine pumps, automatic line leak detectors, internal lining and periodic inspections or lining repair, cathodic protection systems, interstitial sensors, flex connectors, and line and tank tightness testing.

e. Prework notification requirement.

(1) A certified company/individual hired by an owner/operator to perform work shall notify the owner's/operator's certified installation inspector of choice prior to commencing work. Additionally, the owner/operator is responsible for supplying the name of the installation inspector if it is not a governmental entity to any state or local agency with rules affecting installations or upgrades.

(2) The prework notice given to the installation inspector shall include, at a minimum, the following information:

1. Description of the work planned.
2. The certified individual responsible for the work to be performed.
3. A schedule of the work to be performed.
4. A copy of the UST notification of intent to install form submitted to the department.

(3) The installation inspector shall review the work plan, and any required changes by the installation inspector must be submitted to the company/individual prior to the beginning of the described work. An inspection schedule must be agreed upon before work commences. Changes to the work schedule, including the inspection schedule, because of weather or unforeseen jobsite conditions shall be agreed upon as soon as the extenuating circumstances are recognized.

f. Preinstallation and installation checklist.

(1) The certified company/individual performing the work shall submit to both the installation inspector and the department a notification of intent to install form 30 days prior to an installation or upgrade.

(2) Installation inspectors are required to use the department's installation inspection checklist. The installation inspection checklist must be submitted within 14 days following the tank installation inspection.

**134.14(4) *Conflict of interest.*** In addition to the conflict-of-interest provisions outlined in 567—134.16(455B), the department may require the owner/operator to seek alternative inspection services for any reason deemed prudent to ensure quality installations.

**134.14(5) *Miscellaneous requirement.*** An installation inspector has the right to postpone work or to stop work on a job if standards as outlined in this chapter are not followed by the installer. Furthermore, once an installation inspector has been placed on a job, that installation inspector cannot be replaced without the department's approval. Installation inspectors must verify that any local permit and notice requirements are in place.

[ARC 0490D, IAB 8/19/26, effective 9/23/26]

#### **567—134.15(455B) UST remover certification requirements.**

**134.15(1) *Qualifications.*** A person removing any UST system shall be certified as a remover. In addition to the certification requirements listed under 567—134.6(455B), a remover shall provide documentation of at least two years of removal or other relevant experience and complete a 40-hour OSHA HAZWOPER training.

**134.15(2) *Renewal qualifications.*** To be eligible for certification renewal, a remover shall:

- a. Fulfill the department's continuing education requirements in 567—134.8(455B);
- b. Comply with department-issued UST closure guidance in 567—Chapter 135; and
- c. Complete an annual eight-hour HAZWOPER refresher course.

**134.15(3) *Responsibilities and documentation of work performed.*** A certified remover shall be on site during the performance of all UST closure-related work, including subcontracted work, for which the owner/operator has contracted to have completed by the remover. Removers are responsible for ensuring that all work performed complies with OSHA safety requirements. Removers shall submit to the department a notification of closure form 30 days prior to the scheduled removal or fill in place as

required in 567—subrule 135.15(2). Removers shall submit to the department the closure report within 45 days of removal or fill in place as required in 567—paragraph 135.15(3) “e.” Removers shall ensure that all local permits and notice requirements are satisfied.

[ARC 0490D, IAB 8/19/26, effective 9/23/26]

**567—134.16(455B) Conflict of interest.**

**134.16(1)** A certified individual or a company will not conduct a UST installation inspection for any facility at which the certificate holder is engaged in other professional services regulated under this chapter.

**134.16(2)** A person working for a certified company as an installer, liner, remover, or tester shall not provide services as an installation inspector on sites where UST systems are being installed or lined by the person’s prior employer until six months after leaving the prior employer’s certified company. If a certified individual is no longer employed by a certified company, the certified company shall notify the department within 30 days of that occurrence.

[ARC 0490D, IAB 8/19/26, effective 9/23/26]

**567—134.17(455B) Duty to report.** Any individual or company certified as a compliance inspector, installer, installation inspector, tester, liner, or remover shall timely report suspected and confirmed releases within 24 hours of discovery (6 hours if a hazardous condition exists) as described in 567—135.6(455B) to the owner and operator. The certificate holder shall recommend to the owner and operator any release confirmation actions or other investigatory and response actions that in the certificate holder’s judgment would be consistent with the requirements of 567—135.6(455B). The certificate holder shall report to the department within seven days of discovering a confirmed release. The certificate holder is not responsible for reporting a suspected release as described in 567—135.6(455B) directly to the department.

[ARC 0490D, IAB 8/19/26, effective 9/23/26]

**567—134.18(455B) Disciplinary actions—suspension, revocation and denial of certification.**

**134.18(1) General.**

a. It is the policy of the department to enforce standards of professional and ethical conduct that are generally accepted within the professions that qualify a person for certification in Iowa. The department intends to investigate and enforce standards of conduct by a certificate holder that fall within the scope of the certificate holder’s relationship with the department. The department may impose disciplinary actions, which may include notice of deficiency, probation, suspension, revocation, or denial of a certificate.

b. The suspension or revocation of a certificate shall prevent the certificate holder from engaging in activities for which certification is required. A certificate holder shall immediately surrender the certificate after the effective date of a suspension or revocation decision. The department may reinstate the certification if it is determined the person has satisfied the terms of the suspension order and the certification has not expired. Additional education, training, and reexamination may be required as a condition of reinstatement.

c. A notice of deficiency may be issued to any certificate holder for any reason below and is not appealable pursuant to 134.18(5).

**134.18(2) Reasons for discipline for groundwater professionals.** The department may impose probationary requirements or suspend, revoke or deny certification as a groundwater professional for any of the following reasons:

- a. A material misstatement of fact in an application for certification.
- b. Failure to provide the fee for certification.
- c. Loss of license, certification, or registration necessary to meet the certification requirements in 567—134.9(455B).
- d. Insufficient proof of qualifications required under 567—134.9(455B).
- e. Failure to successfully complete the certification requirements.
- f. Default on an obligation owed to or collected by the state as provided in Iowa Code section 421.17(27) “e.”
- g. Fraudulent omissions or misstatements of material fact in any reports, correspondence or communications with the department.

*h.* Violation of an ethical standard that the person knew or should have known and that results in or reasonably could have resulted in material consequences.

*i.* Failure to report the presence of contamination to the parties reasonably believed to be responsible for reporting the contamination to the department as provided in 567—Chapter 131 and 567—135.6(455B).

*j.* Knowingly making a materially false statement, representation or certification on any application, record, report, or document maintained or submitted to the department.

*k.* Gross incompetence in the performance of groundwater professional services and corrective action.

*l.* Material misstatement of facts or misrepresentation of information provided pursuant to Iowa Code chapter 455B, subchapter IV, part 8.

*m.* Repeated acts or omissions that, when taken together, indicate a lack of competency, professionalism, ethical conduct, or adherence to standards of performance generally expected by the profession. The severity of the sanction may be based on the gravity of the acts or omissions and the degree of culpability. Disciplinary sanctions under this subrule will not be applied without providing the person with at least one written notice of the deficiency and a written warning that future repetition may result in discipline. Conduct or omissions that may be a basis for discipline include but are not limited to the following:

(1) Repeated incidents of substandard field investigation will result in suspension or revocation.

(2) Repeated incidents of substandard, inaccurate or incomplete site cleanup reports and failure to follow site cleanup report instructions will result in suspension or revocation.

(3) Conduct warranting a sanction after prior suspension will result in a revocation.

**134.18(3)** *Reasons for discipline for compliance inspectors.*

*a. Probation or suspension.* The department may impose probationary requirements or suspend the certification of a certified inspector for good cause. The suspension may require the certificate holder to take remedial measures intended to correct or prevent future acts and omissions. Good cause includes but is not limited to:

(1) A violation of these rules.

(2) Negligent misrepresentation of material facts in a compliance report.

(3) Negligent failure to identify a material violation of UST operation and maintenance standards set out in 567—134.10(455B).

(4) Repeated failure to conduct compliance inspections and submit reports in accordance with the standards set out in 567—134.10(455B).

(5) Incompetence on the part of the certified inspector as evidenced by errors in the performance of duties and activities for which the certification was issued.

(6) Repeated failure to submit reports of inspection activities to the department or the owner and operator as provided in 567—134.10(455B).

*b. Revocation.* The department may revoke the inspector certification for one or more of the following:

(1) Willful disregard of, or willful or repeated violations of, this chapter or 567—Chapter 135.

(2) Fraudulent omissions or misstatements of material facts in a compliance inspection report or in other written or oral communications with the department.

(3) A knowing and willful failure to detect and report a material violation of UST operation and maintenance standards as part of a compliance inspection required by 567—135.19(455B).

(4) Acts or omissions warranting suspension after having certification previously suspended.

(5) The revocation of a certification as an installer or installation inspector under 567—134.11(455B) or 567—134.14(455B).

**134.18(4)** *Reasons for discipline for all other certificate holders.*

*a. Probation or suspension.* The department may impose probationary requirements or suspend the certificate of any other individual or company certified under this chapter for good cause. A suspension may require the certificate holder to take remedial measures intended to correct or prevent future acts or omissions. Good cause includes but is not limited to:

(1) A violation of these rules.

- (2) Negligent misrepresentation of material facts in a report submitted to the department.
- (3) Incompetence on the part of the certificate holder as evidenced by errors in the performance of duties and activities for which the certificate was issued.
- (4) Repeated failure to submit reports of activities to the department or the owner/operator as provided in this chapter.

*b. Revocation.* The department may revoke the certification of a company or individual for one or more of the following:

- (1) Willful disregard of, or willful or repeated violations of, this chapter or 567—Chapter 135.
- (2) Omissions or misstatements of material facts in a report or in other written or oral communications with the department.
- (3) A knowing and willful failure to detect and report a material violation of UST operation and maintenance standards.

(4) Acts or omissions warranting suspension after a certification was previously suspended.

**134.18(5)** *Disciplinary procedure for all certificate holders.*

*a.* Prior to issuance of a final department action imposing a disciplinary sanction of probation, suspension, revocation, or denial of certification, the department shall conduct such lawful investigation as it deems necessary to substantiate material facts sufficient to warrant a disciplinary sanction.

*b.* Written notice of a sanction shall be sent by certified mail to the person against whom the sanction is imposed. The notice shall provide a brief explanation of the facts relied upon and the sanction to be imposed. The notice shall inform the recipient of applicable appeal rights.

*c.* A person may appeal a decision imposing a probation, suspension, revocation or denial of certification within 30 days of receipt of the notice. Upon timely receipt of the notice of appeal, contested case procedures, including informal settlement, shall apply as provided in 7—Chapter 2506 and 561—Chapter 2506. In accordance with 7—subrule 2506.11(1), the department shall initiate pleading by the filing of a petition.

*d.* If a timely appeal has not been filed, the sanction is effective after 30 days from receipt of the notice. A party may request stay of the sanction, as provided in rule 7—2506.29(17A), after issuance of a proposed decision.

**134.18(6)** *Noncompliance with support order procedures.* Upon receipt of a certification of noncompliance with a support obligation as provided in Iowa Code section 252J.7, the department will initiate procedures to deny an application for certification or renewal or to suspend a certification in accordance with Iowa Code section 252J.8(4). The department shall issue a notice by certified mail to the person of its intent to deny or suspend professional certification based on receipt of a certification of noncompliance. The suspension or denial shall be effective 30 days after receipt of the notice unless the person provides the department with a withdrawal of the certificate of noncompliance from the child support recovery unit as provided in Iowa Code section 252J.8(4)“c.” Pursuant to Iowa Code section 252J.8(4), the person does not have a right to a hearing before the department to contest the denial or suspension action under this subrule but may seek a hearing in district court in accordance with Iowa Code section 252J.9.

[ARC 0490D, IAB 8/19/26, effective 9/23/26]

These rules are intended to implement Iowa Code section 455B.474 and chapter 252J.

CHAPTER 135  
TECHNICAL STANDARDS AND CORRECTIVE ACTION REQUIREMENTS FOR OWNERS  
AND OPERATORS OF UNDERGROUND STORAGE TANKS  
[Prior to 12/3/86, Water, Air and Waste Management[900]]

Chapter rescission date pursuant to Iowa Code section 17A.7: 9/23/31

**567—135.1(455B) Authority, purpose and applicability.**

**135.1(1) Authority.** Iowa Code chapter 455B, subchapter IV, part 8, authorizes the department to regulate underground tanks used for storage of regulated substances, and to adopt rules relating to detection, prevention and correction of releases of regulated substances from such tanks, maintenance of financial responsibility by owners or operators of such tanks, new tank performance standards, notice and reporting requirements, and designation of regulated substances.

**135.1(2) Purpose.** The purpose of these rules is to protect the public health and safety and the natural resources of Iowa by timely and appropriate detection, prevention and correction of releases of regulated substances from underground storage tanks (UST).

**135.1(3) Applicability.**

a. In conjunction with the requirements of Iowa Code chapter 455B, subchapter IV, part 8, the requirements of this chapter apply to all owners and operators of a UST system as defined in 567—135.2(455B) except as otherwise provided in 135.1(3) “b” and “c.”

(1) Previously deferred UST systems. Airport hydrant fuel distribution systems, UST systems with field-constructed tanks, and UST systems that store fuel solely for use by emergency power generators must meet the requirements of these rules as follows:

1. Airport hydrant fuel distribution systems and UST systems with field-constructed tanks must meet the requirements in 567—135.20(455B).

2. UST systems that store fuel solely for use by emergency power generators installed on or before November 28, 2007, must meet the requirements in 567—135.5(455B) by October 13, 2021.

3. UST systems that store fuel solely for use by emergency power generators installed after November 28, 2007, must meet all applicable requirements of this chapter at installation.

(2) Any UST system listed in 135.1(3) “c” must meet the requirements of 135.1(4).

b. Exclusions. The following UST systems are excluded from the requirements of this chapter:

(1) Any UST system holding hazardous wastes listed or identified under Subtitle C of the Solid Waste Disposal Act, or a mixture of such hazardous waste and other regulated substances.

(2) Any wastewater treatment tank system that is part of a wastewater treatment facility regulated under Section 402 or 307(b) of the federal Clean Water Act.

(3) Equipment or machinery that contains regulated substances for operational purposes such as hydraulic lift tanks and electrical equipment tanks.

(4) Any UST system whose capacity is 110 gallons or less.

(5) Any UST system that contains a de minimis concentration of regulated substances.

(6) Any emergency spill or overflow containment UST system that is expeditiously emptied after use.

c. Partial exclusions. Rules 567—135.3(455B), 567—135.4(455B), 567—135.5(455B), 567—135.6(455B), 567—135.15(455B) and 567—135.20(455B) do not apply to any of the following types of UST systems:

(1) Wastewater treatment tank systems;

(2) Any UST systems containing radioactive material that are regulated under the federal Atomic Energy Act of 1954 (42 U.S.C. 2011 and following);

(3) Any UST system that is part of an emergency generator system at nuclear power generation facilities regulated by the Nuclear Regulatory Commission under 10 CFR 50 Appendix A;

(4) Aboveground storage tanks associated with:

1. Airport hydrant fuel distribution systems regulated under 567—135.20(455B); and

2. UST systems with field-constructed tanks regulated under 567—135.20(455B).

d. Nonpetroleum underground storage tank systems. Rules 567—135.8(455B) through 567—135.12(455B) do not apply to any nonpetroleum underground storage tank system, except as otherwise provided for by the department.

**135.1(4)** *Installation requirements for partially excluded UST systems.*

a. Owners and operators must install a UST system listed in 135.1(3)“c”(1) through “c”(3) storing regulated substances (whether of single- or double-wall construction) that meets the following requirements:

(1) Will prevent releases due to corrosion or structural failure for the operational life of the UST system;

(2) Is cathodically protected against corrosion, constructed of noncorrodible material, steel clad with a noncorrodible material, or designed in a manner to prevent the release or threatened release of any stored substance; and

(3) Is constructed or lined with material that is compatible with the stored substance.

b. Notwithstanding 135.1(4)“a,” a UST system without corrosion protection may be installed at a site that is determined by a corrosion expert not to be corrosive enough to cause it to have a release due to corrosion during its operating life. Owners and operators must maintain records that demonstrate compliance with the requirements of this paragraph for the remaining life of the tank.

NOTE: The codes of practice referenced in 40 CFR 280.11(b) may be used as guidance for complying with this subrule.

**135.1(5)** All rules, standards, technical guidance, and other similar legal or technical documents that are referenced in this chapter shall be the version of those documents in effect on May 27, 2026, unless otherwise noted in these rules, and except for references to the Iowa Code and Iowa Administrative Code, which shall always be the most recent version unless otherwise noted in these rules.

[ARC 0491D, IAB 8/19/26, effective 9/23/26]

**567—135.2(455B) Definitions.**

“Aboveground release” means any release to the surface of the land or to surface water. This includes but is not limited to releases from the aboveground portion of a UST system and aboveground releases associated with overfills and transfer operations as the regulated substance moves to or from a UST system.

“Active remediation” means corrective action undertaken to reduce contaminant concentrations by other than passive remediation or monitoring.

“Airport hydrant fuel distribution system” or “airport hydrant system” means a UST system that fuels aircraft and operates under high pressure with large diameter piping that typically terminates into one or more hydrants (fill stands). The airport hydrant system begins where fuel enters one or more tanks from an external source such as a pipeline, barge, rail car, or other motor fuel carrier.

“Ancillary equipment” means any devices including but not limited to such devices as piping, fittings, flanges, valves, and pumps used to distribute, meter, or control the flow of regulated substances to and from a UST.

“Appurtenances” means devices such as piping, fittings, flanges, valves, dispensers and pumps used to distribute, meter, or control the flow of regulated substances to or from an underground storage tank.

“Asbestos-cement pipe” (AC refers to asbestos-cement) means a pipe or conduit constructed of asbestos fiber and Portland cement, which can be used to transport water.

“ASTM” means the American Society of Testing and Materials.

“Backflow preventer” means a check valve used to ensure water flows in one direction and designed to prevent contamination from an end user, such as a home, from getting into the general water supply. An approved backflow preventer shall be a reduced-pressure backflow preventer or an antisiphon device that complies with the standards of the American Water Works Association and has been approved by the Foundation for Cross-Connection Control and Hydraulic Research.

“Bedrock” means the rock, usually solid, underlying soil or any other unconsolidated surficial cover.

“Below-ground release” means any release to the subsurface of the land and to groundwater. This includes but is not limited to releases from the below-ground portions of an underground storage tank system and below-ground releases associated with overfills and transfer operations as the regulated substance moves to or from an underground storage tank.

*“Beneath the surface of the ground”* means beneath the ground surface or otherwise covered with earthen materials.

*“Best available technology”* means those practices that most appropriately remove, treat, or isolate contaminants from groundwater, soil or associated environment, as determined through professional judgment considering actual equipment or techniques currently in use, published technical articles, site hydrogeology and research results, engineering and groundwater professional reference materials, consultation with experts in the field, capital and operating costs, and guidelines or rules of other regulatory agencies.

*“Best management practices”* means maintenance procedures, schedule of activities, prohibition of practices, and other management practices, or a combination thereof, that, after problem assessment, is determined to be the most effective means of monitoring and preventing additional contamination of the groundwater and soil.

*“Biodiesel”* means a renewable fuel comprised of mono-alkyl esters of long-chain fatty acids derived from vegetable oils or animal fats that is blended with petroleum-based diesel fuel that meets the standards provided in Iowa Code section 214A.2.

*“Carcinogenic risk”* means the incremental risk of a person developing cancer over a lifetime as a result of exposure to a chemical, expressed as a probability such as one in a million ( $10^{-6}$ ). For carcinogenic chemicals of concern, probability is derived from application of certain designated exposure assumptions and a slope factor.

*“Cast iron pipe”* means a pipe or conduit used as a pressure pipe for transmission of water, gas, or sewage or as a water drainage pipe. It comprises predominantly a gray cast iron tube historically used uncoated, with newer types having various coatings and linings to reduce corrosion and improve hydraulics.

*“Cathodic protection”* is a technique to prevent corrosion of a metal surface by making that surface the cathode of an electrochemical cell. For example, a tank system can be cathodically protected through the application of either galvanic anodes or impressed current.

*“Cathodic protection tester”* means a person who can demonstrate an understanding of the principles and measurements of all common types of cathodic protection systems as applied to buried or submerged metal piping and tank systems. At a minimum, such persons must have education and experience in soil resistivity, stray current, structure-to-soil potential, and component electrical isolation measurements of buried metal piping and tank systems.

*“CERCLA”* means the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 as amended on October 17, 1986.

*“Certified company”* means a person or company that employs a person who meets all of the qualifications to install, upgrade, repair, test or line underground storage tank systems.

*“Certified individual”* means an individual who has received a certification to perform any of the activities regulated under this chapter.

*“Change-in-service”* means changing the use of a tank system from a regulated to a nonregulated use.

*“Chemicals of concern”* means the compounds derived from petroleum-regulated substances that are subject to evaluation for purposes of applying risk-based corrective action decision making. These compounds are benzene, ethylbenzene, toluene, and xylenes (BTEX) and naphthalene, benzo(a)pyrene, benz(a)anthracene, and chrysene. (NOTE: Concentration values for these last four constituents are determined by a conversion method from total extractable hydrocarbons, see 135.8(3).)

*“Child support recovery unit”* means the child support recovery unit created by Iowa Code section 252B.2.

*“Class A operator”* means the individual who has primary responsibility to operate and maintain the UST system in accordance with applicable requirements. The Class A operator typically manages resources and personnel, such as establishing work assignments, to achieve and maintain compliance with regulatory requirements under this chapter.

*“Class B operator”* means the individual who has day-to-day responsibility for implementing applicable regulatory requirements established by the department. The Class B operator typically implements in-field aspects of operation, maintenance, and associated recordkeeping for the UST systems.

“*Class C operator*” means the individual responsible for initially addressing emergencies presented by a spill or release from a UST system. The Class C operator typically controls or monitors the dispensing or sale of regulated substances.

“*Code of Federal Regulation*” or “*CFR*” means the federal administrative rules adopted by the United States as amended through August 1, 2025.

“*Compatible*” means the ability of two or more substances to maintain their respective physical and chemical properties upon contact with one another for the design life of the tank system under conditions likely to be encountered in the UST.

“*Conduit*” means underground structures that act as pathways and receptors for chemicals of concern, including but not limited to gravity drain lines and sanitary or storm sewers.

“*Connected piping*” means all underground piping including valves, elbows, joints, flanges, and flexible connectors attached to a tank system through which regulated substances flow. For the purpose of determining how much piping is connected to any individual UST system, the piping that joins two UST systems should be allocated equally between them.

“*Consumptive use*” with respect to heating oil means consumed on the premises.

“*Containment sump*” means a liquid-tight container that protects the environment by containing leaks and spills of regulated substances from piping, dispensers, pumps and related components in the containment area. Containment sumps may be single-walled or secondarily contained and located at the top of the tank (tank top or submersible turbine sump pump), underneath the dispenser (under-dispenser containment sump), or at other points in the piping run (transition or intermediate sump).

“*Corrective action*” means an action taken to reduce, minimize, eliminate, clean up, control or monitor a release to protect the public health and safety or the environment. Corrective action includes but is not limited to excavation of an underground storage tank for the purpose of repairing a leak or removal of a tank, removal of contaminated soil, disposal or processing of contaminated soil, cleansing of groundwaters or surface waters, natural biodegradation, institutional controls, technological controls and site management practices. Corrective action does not include replacement of an underground storage tank. Corrective action specifically excludes third-party liability.

“*Corrective action meeting process*” means a series of meetings organized by department staff with owners or operators and other interested parties such as certified groundwater professionals, funding source representatives, and affected property owners. The purpose of the meeting process is to develop and agree on a corrective action plan and the terms for implementation of the plan.

“*Corrective action plan*” means a plan that specifies the corrective action to be undertaken by the owner or operator in order to comply with requirements in this chapter and that is incorporated into a memorandum of agreement or other written agreement between the department and the owner or operator. The plan may include but is not limited to provisions for additional site assessment, site monitoring, Tier 2 revisions, Tier 3 assessment, excavation, and other soil and groundwater remedial action.

“*Corrosion expert*” means a person who, by reason of thorough knowledge of the physical sciences and the principles of engineering and mathematics acquired by a professional education and related practical experience, is qualified to engage in the practice of corrosion control on buried or submerged metal piping systems and metal tanks. Such a person must be accredited or certified as being qualified by the National Association of Corrosion Engineers or be a registered professional engineer who has certification or licensing that includes education and experience in corrosion control of buried or submerged metal piping systems and metal tanks.

“*Department*” means Iowa department of natural resources.

“*Dielectric material*” means a material that does not conduct direct electrical current. Dielectric coatings are used to electrically isolate UST systems from the surrounding soils. Dielectric bushings are used to electrically isolate portions of the UST systems (e.g., tank from piping).

“*Dispenser*” means equipment located above ground that dispenses regulated substances from the UST system.

“*Dispenser system*” means the dispenser and the equipment necessary to connect the dispenser to the underground storage tank system.

*“Drinking water well”* means any groundwater well used as a source for drinking water by humans and groundwater wells used primarily for the final production of food or medicine for human consumption.

*“Ductile iron pipe”* means a pipe or conduit commonly used for potable water distribution and for the pumping of sewage. The predominant wall material is ductile iron, a spheroidized graphite cast iron, and commonly has an internal cement mortar lining to inhibit corrosion from the carried water and various types of external coatings to inhibit corrosion from the environment.

*“Electrical equipment”* means underground equipment that contains dielectric fluid that is necessary for the operation of equipment such as transformers and buried electrical cable.

*“Enclosed space”* means space that can act as a receptor or pathway capable of creating a risk of explosion or inhalation hazard to humans and includes “explosive receptors” and “confined spaces.” Explosive receptors means those receptors designated in these rules that are evaluated for explosive risk. Confined spaces means those receptors designated in these rules for evaluation of vapor inhalation risks.

*“Ethanol”* means ethyl alcohol that is to be blended with gasoline if it meets the standards provided in Iowa Code section 214A.2.

*“Excavation zone”* means the volume containing the tank system and backfill material bounded by the ground surface, walls, and floor of the pit and trenches into which the UST system is placed at the time of installation.

*“Existing tank system”* means a tank system used to contain an accumulation of regulated substances or for which installation has commenced on or before January 14, 1987. Installation is considered to have commenced if:

1. The owner or operator has obtained all federal, state, and local approvals or permits necessary to begin physical construction of the site or installation of the tank system; and
2. Either:
  - A continuous on-site physical construction or installation program has begun; or
  - The owner or operator has entered into contractual obligations, which cannot be canceled or modified without substantial loss, for physical construction at the site or installation of the tank system to be completed within a reasonable time.

*“Farm tank”* is a tank located on a tract of land devoted to the production of crops or raising animals, including fish, and associated residences and improvements. A farm tank must be located on the farm property. “Farm” includes fish hatcheries, rangeland and nurseries with growing operations.

*“Field-constructed tank”* means a tank constructed in the field. For example, a tank constructed of concrete that is poured in the field or a steel or fiberglass tank primarily fabricated in the field is considered field-constructed.

*“Flow-through process tank”* is a tank that forms an integral part of a production process through which there is a steady, variable, recurring, or intermittent flow of materials during the operation of the process. Flow-through process tanks do not include tanks used for the storage of materials prior to their introduction into the production process or for the storage of finished products or by-products from the production process.

*“Free product”* refers to a regulated substance that is present as a light nonaqueous phase liquid (e.g., liquid not dissolved in water).

*“Gasket”* means any type of pipe seals made of a variety of rubbers including but not necessarily limited to styrene-butadiene rubber (SBR), nitrile-butadiene rubber (NBR or nitrile), ethylene propylene diene monomer (EPDM), neoprene (CR), and fluoroelastomer rubber (FKM), which are used to seal pipe connections.

*“Gathering lines”* means any pipeline, equipment, facility, or building used in the transportation of oil or gas during oil or gas production or gathering operations.

*“Groundwater ingestion pathway”* means a pathway through groundwater by which chemicals of concern may result in exposure to a human receptor as specified in rules applicable to Tier 1, Tier 2 and Tier 3.

*“Groundwater plume”* means the extent of groundwater impacted by the release of chemicals of concern.

*“Groundwater professional”* is a person who provides subsurface soil contamination and groundwater consulting services, or who contracts to perform or who supervises remediation or corrective action services at leaking underground storage tank sites. Refer to Iowa Code section 455B.474.

*“Groundwater to water line pathway”* means a pathway through groundwater that leads to a water line.

*“Groundwater vapor to enclosed space pathway”* means a pathway through groundwater by which vapors from chemicals of concern may lead to a receptor creating an inhalation or explosive risk hazard.

*“Hazardous substance UST system”* means an underground storage tank system that contains a hazardous substance defined in Section 101(14) of the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (but not including any substance regulated as a hazardous waste under subtitle C) or any mixture of such substances and petroleum and that is not a petroleum UST system.

*“Hazard quotient”* means the ratio of the level of exposure of a chemical of concern over a specified time period to a reference dose for that chemical of concern derived for a similar exposure period. Unless otherwise specified, the hazard quotient designated in these rules is one.

*“Heating oil”* means petroleum that is No. 1, No. 2, No. 4-light, No. 4-heavy, No. 5-light, No. 5-heavy, and No. 6 technical grades of fuel oil; other residual fuel oils (including Navy Special Fuel Oil and Bunker C); and other fuels when used as substitutes for one of these fuel oils. Heating oil is typically used in the operation of heating equipment, boilers, or furnaces.

*“Highly permeable soils”* means for the purpose of UST closures: fractured bedrock, any soils with a hydraulic conductivity rate greater than 0.3 meters per day, or any soil material classified by the Unified Soil Classification System as published by the United States Department of the Interior or ASTM designation as (1) GW - well graded gravel, gravel-sand mixtures, little or no fines, (2) GP - poorly graded gravel, gravel-sand mixtures, little or no fines, (3) SW - well graded sands, gravelly sands, little or no fines, or (4) SP - poorly graded sands, gravelly sands, little or no fines.

*“Hydraulic conductivity”* means the rate of water movement through the soil measured in meters per day (m/d) as determined by the following methods. For a saturated soil, the Bouwer-Rice method or its equivalent shall be used. For unsaturated soil, use a Guelph permeameter or an equivalent in situ constant-head permeameter in a boring finished above the water table. If an in situ method cannot be used for unsaturated soil because of depth, or if the soil is homogeneous and lacks flow-conducting channels, fractures, cavities, etc., laboratory measurement of hydraulic conductivity is acceptable.

If laboratory methods are used, collect undisturbed soil samples using a thin-walled tube sampler in accordance with American Society of Testing and Materials (ASTM) Standard D1587. Samples shall be clearly marked, preserved and transported to the laboratory. The laboratory shall measure hydraulic conductivity using a constant-head permeameter in accordance with ASTM Standard D2434 or a falling-head permeameter in accordance with accepted methodology.

*“Hydraulic lift tank”* means a tank holding hydraulic fluid for a closed-loop mechanical system that uses compressed air or hydraulic fluid to operate lifts, elevators, and other similar devices.

*“Install”* or *“installation”* means the physical construction of a UST system including but not limited to activities such as excavating, backfilling, testing, placement of the tank, underground piping, release detection devices, corrosion protection systems, spill and overfill devices and any associated administrative activities such as notifications, recordkeeping and record submissions.

*“Installation inspector”* means a certified individual who is engaged in the inspection and approval of the installation of new or upgraded underground storage tank systems.

*“Installer”* means a certified individual or certified company engaged in the installation of a new underground storage tank system or the upgrading of underground storage tank systems.

*“Institutional controls”* means the restriction on use or access (for example, fences, deed restrictions, restrictive zoning) to a site or facility to eliminate or minimize potential exposure to a chemical(s) of concern. Institutional controls include any of the following:

1. A law of the United States or the state;
2. A regulation issued pursuant to federal or state laws;
3. An ordinance or regulation of a political subdivision in which real estate subject to the institutional control is located;

4. A restriction on the use of or activities occurring at real estate that are embodied in a covenant running with the land that:

- Contains a legal description of the real estate in a manner that satisfies Iowa Code section 558.1 et seq.;
- Is properly executed in a manner that satisfies Iowa Code section 558.1 et seq.;
- Is recorded in the appropriate office of the county in which the real estate is located;
- Adequately and accurately describes the institutional control; and
- Is in the form of a covenant acceptable to the department.

5. Any other institutional control the owner or operator can reasonably demonstrate to the department that will reduce the risk from a release throughout the period necessary to ensure that no applicable target risk is likely to be exceeded.

*"In the aggregate"* means for all claims or suits in a single policy year seeking damages.

*"Light, nonaqueous-phase liquid"* or *"LNAPL"* means a light non-aqueous phase liquid (e.g., petroleum oil, gasoline, diesel fuel) that has a density less than water and is immiscible with water.

*"Liner"* means a certified company or an individual who provides services to install underground storage tank lining and to repair underground storage tanks.

*"Liquid trap"* means sumps, well cellars, and other traps used in association with oil and gas production, gathering, and extraction operations (including gas production plants), for the purpose of collecting oil, water, and other liquids. These liquid traps may temporarily collect liquids for subsequent disposition or reinjection into a production or pipeline stream, or may collect and separate liquids from a gas stream.

*"Maintenance"* means the normal operational upkeep to prevent an underground storage tank system from releasing product.

*"MCLs"* means the drinking water primary maximum contaminant levels set out in 567—41.3(455B).

*"Memorandum of agreement"* means a written agreement between the department and the owner or operator that specifies the corrective action that will be undertaken by the owner or operator in order to comply with requirements in this chapter and the terms for implementation of the plan. The plan may include but is not limited to provisions for additional site assessment, site monitoring, Tier 2 revisions, Tier 3 assessment, excavation, and other soil and groundwater remedial action.

*"Migrate"* or *"migrating"* means a LNAPL body that is expanding laterally into areas previously not impacted by LNAPL.

*"Mobile LNAPL"* means LNAPL that exists above residual saturation levels such that it can accumulate in monitoring wells constructed within its footprint or smear vertically with a rising or falling water table but will not migrate or spread from its current footprint (i.e., move into monitoring wells beyond its current footprint).

*"Modification"* means to change a UST system currently in use by the installation of new UST system components. "Modification" includes but is not limited to the addition of corrosion protection to a previously lined tank, installation of new underground piping or replacement of existing underground piping, changing the primary release detection method, or adding secondary containment. "Modification" does not include those activities defined in this rule as "repair" or "replacement."

*"Motor fuel"* means a complex blend of hydrocarbons typically used in the operation of a motor engine, such as motor gasoline, aviation gasoline, No. 1 or No. 2 diesel fuel, or any blend containing one or more of these substances (for example, motor gasoline blended with alcohol).

*"New tank system"* means a tank system that will be used to contain an accumulation of regulated substances and for which installation has commenced after January 14, 1987. (See also "Existing Tank System.")

*"Noncarcinogenic risk"* means the potential for adverse systemic or toxic effects caused by exposure to noncarcinogenic chemicals of concern, expressed as the hazard quotient.

*"Noncommercial purposes"* with respect to motor fuel means not for resale.

*"Non-drinking water well"* means any groundwater well (except an extraction well used as part of a remediation system) not defined as a drinking water well including a groundwater well that is not properly plugged in accordance with department rules in 567—Chapters 39 and 49.

*“Nonresidential area”* means land that is not currently used as a residential area and that is zoned for nonresidential uses.

*“Obligor”* means a natural person as defined in Iowa Code section 252B.1 who has been ordered by a court or administrative agency to pay support.

*“On the premises where stored”* with respect to heating oil means UST systems located on the same property where the stored heating oil is used.

*“Operational life”* refers to the period beginning when installation of the tank system has commenced until the time the tank system is properly closed under 567—135.15(455B).

*“OSHA”* means the Occupational Safety and Health Administration.

*“Overexcavation”* refers to the excavation of subsurface materials outside the excavation zone for the purpose of removing contaminated substances.

*“Overfill release”* is a release that occurs when a tank is filled beyond its capacity, resulting in a discharge of the regulated substance to the environment.

*“Pathway”* means a transport mechanism by which chemicals of concern may reach a receptor(s) or the location(s) of a potential receptor.

*“Permanent closure”* means removing all regulated substances from the tank system, assessing the site for contamination, and permanently removing tank and piping from the ground or filling the tank in place with a solid inert material and plugging all piping. Permanent closure also includes partial closure of a tank system such as removal or replacement of tanks or piping only.

*“Person who conveys or deposits a regulated substance”* means a person who sells or supplies the owner or operator with the regulated substance and the person who transports or actually deposits the regulated substance in the underground tank.

*“Petroleum UST system”* means an underground storage tank system that contains petroleum or a mixture of petroleum with de minimis quantities of other regulated substances. Such systems include those containing motor fuels, jet fuels, distillate fuel oils, residual fuel oils, lubricants, petroleum solvents, and used oils.

*“Pipe”* or *“piping”* means a hollow cylinder or tubular conduit that is constructed of nonearthen materials and that routinely contains and conveys regulated substances.

*“Pipeline facilities (including gathering lines)”* are new and existing pipe rights-of-way and any associated equipment, facilities, or buildings.

*“Point of compliance”* means the location(s) at the source(s) of contamination or at the location(s) between the source(s) and the point(s) of exposure where concentrations of chemicals of concern must meet applicable risk-based screening levels at Tier 1 or other target level(s) at Tier 2 or Tier 3.

*“Point of exposure”* means the location(s) at which an actual or potential receptor may be exposed to chemicals of concern via a pathway.

*“Polybutylene pipe”* (PB refers to polybutylene) means a water supply pipe comprised of a form of plastic resin that was used extensively from 1978 until 1995. The piping systems were used for underground water mains and as interior water distribution piping. Polybutylene mains are usually blue in color, but may be gray, black, or white. The pipe is usually ½ inch or 1 inch in diameter, and it may be found entering a residence through the basement wall or floor, concrete slab or through the crawlspace; frequently it enters the residence near the water heater.

*“Polyethylene pipe”* (PE refers to polyethylene) means a water supply pipe comprised of thermoplastic material produced from the polymerization of ethylene. PE pipe is manufactured by extrusion in sizes ranging from ½ inch to 63 inches. PE pipe is available in rolled coils of various lengths or in straight lengths of up to 40 feet. PE pipe is available in many forms and colors, including single-extrusion colored or black pipe, black pipe with co-extruded color striping, and black or natural pipe with a co-extruded colored layer. PE pipe has been demonstrated to be very permeable to petroleum while still retaining its flexible structure.

*“Polyvinyl chloride pipe”* (PVC refers to polyvinyl chloride) means a pipe made from a plastic and vinyl combination material. The pipes are durable, hard to damage, and long-lasting. A PVC pipe is very resistant and does not rust, nor is it likely to rot or wear over time. PVC piping is most commonly used in water systems, underground wiring, and sewer lines.

*“Portland cement”* means hydraulic cement (cement that not only hardens by reacting with water but also forms a water-resistant product) and is produced by pulverizing clinkers consisting essentially of hydraulic calcium silicates, usually containing one or more forms of calcium sulfate as an inter ground addition.

*“Potential receptor”* means a receptor not in existence at the time a Tier 1, Tier 2 or Tier 3 site assessment is prepared but that could reasonably be expected to exist within 20 years of the preparation of the Tier 1, Tier 2 or Tier 3 site assessment or as otherwise specified in these rules.

*“Precision test”* means a tank and line tightness test that meets the requirements in 567—135.5(455B).

*“Preferential pathway”* means conditions that act as a pathway permitting contamination to migrate through soils and to groundwater at a faster rate than would be expected through naturally occurring undisturbed soils or unfractured bedrock including but not limited to wells, cisterns, tile lines, drainage systems, utility lines and envelopes, and conduits.

*“Protected groundwater source”* means a saturated bed, formation, or group of formations that has a hydraulic conductivity of at least 0.44 meters per day (m/d) and a total dissolved solids of less than 2,500 milligrams per liter (mg/l) or a bedrock aquifer with total dissolved solids of less than 2,500 milligrams per liter (mg/l) if bedrock is encountered before groundwater.

*“Public water supply well”* means a well connected to a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days out of the year.

*“Receptor”* means enclosed spaces, conduits, protected groundwater sources, drinking and non-drinking water wells, surface water bodies, and public water systems that when impacted by chemicals of concern may result in exposure to humans and aquatic life, explosive conditions or other adverse effects on health, safety and the environment as specified in these rules.

*“Reference dose”* means a designated toxicity value established in these rules for evaluating potential noncarcinogenic effects in humans resulting from exposure to a chemical(s) of concern. Reference doses are designated in Appendix A.

*“Regulated substance”* means an element, compound, mixture, solution or substance that, when released into the environment, may present substantial danger to the public health or welfare or the environment. “Regulated substance” includes:

1. Substances designated in Table 302.4 of 40 CFR Part 302 (September 13, 1988),
2. Substances that exhibit the characteristics identified in 40 CFR 261.20 through 261.24 (May 10, 1984) and that are not excluded from regulation as a hazardous waste under 40 CFR 261.4(b) (May 10, 1984),
3. Any substance defined in Section 101(14) of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) (but not including any substance regulated as a hazardous waste under subtitle C), and
4. Petroleum, including crude oil or any fraction thereof that is liquid at standard conditions of temperature and pressure (60 degrees Fahrenheit and 14.7 pounds per square inch absolute). The term “regulated substance” includes but is not limited to petroleum and petroleum-based substances comprised of a complex blend of hydrocarbons such as motor fuels, jet fuels, distillate fuel oils, residual fuel oils, lubricants, petroleum solvents, and used oils.

*“Release detection”* means determining whether a release of a regulated substance has occurred from the UST system into the environment or a leak has occurred into the interstitial space between the UST system and its secondary barrier or secondary containment around it.

*“Removal”* means the process of removing and disposing of an underground storage tank system no longer in service or the process of abandoning an underground storage tank system in place in accordance with 567—135.15(455B).

*“Remover”* means a certified individual who is engaged in permanent closure activities by removal or filling in place of underground storage tank systems in accordance with 567—135.15(455B).

*“Repair”* means to restore to proper operating condition a tank, pipe, spill prevention equipment, overfill prevention equipment, corrosion protection equipment, release detection equipment or other UST

system component that has caused a release of product from the UST system or has failed to function properly.

*“Replaced”* means:

1. For a tank: to remove a tank and install another tank.
2. For piping: to remove 50 percent or more of piping and install other piping, excluding connectors, connected to a single tank. For tanks with multiple piping runs, this definition applies independently to each piping run.

*“Replacement”* means the installation of a new underground tank system or component, in substantially the same location as an existing tank system or component.

*“Residential area”* means land used as a permanent residence or domicile, such as a house, apartment, nursing home, school, child care facility or prison, land zoned for such uses, or land where no zoning is in place.

*“Residential tank”* is a tank located on property used primarily for dwelling purposes.

*“Residual LNAPL”* means LNAPL that is bound in the soil and will not move into monitoring wells or smear with a rising or falling water table.

*“Risk-based screening level”* or *“RBSL”* means the risk-based concentration level for chemicals of concern developed for a Tier 1 analysis to be met at the point(s) of compliance and incorporated in the Tier 1 Look-up Table in Appendix A.

*“Secondary containment”* or *“secondarily contained”* means a release prevention and release detection system for a tank or piping. This system has an inner and outer barrier with an interstitial space monitored for leaks. This term includes containment sumps when used for interstitial monitoring of piping.

*“Secondary containment tank”* or *“secondary containment piping”* means a tank or piping that is designed with an inner primary shell and a liquid-tight outer secondary shell or jacket that extends around the entire inner shell, and that is designed to contain any leak through the primary shell from any part of the tank or piping that routinely contains product, and that also allows for monitoring of the interstitial space between the shells and the detection of any leak.

*“Self-insured retention”* means the portion of a claim paid by insureds who self-insure a portion of their risk as part of a policy. Expenses included as a part of the self-insured retention are the cost of claims settlements or suits, the cost of adjusting, legal fees, court costs and any other investigative cost associated with the claim.

*“Septic tank”* is a watertight covered receptacle designed to receive or process, through liquid separation or biological digestion, the sewage discharged from a building sewer. The effluent from such receptacle is distributed for disposal through the soil and settled solids and scum from the tank are pumped out periodically and hauled to a treatment facility.

*“Service line”* means a pipe connected to a business or residence from a water main, typically of a size not exceeding six inches in diameter, and including its gaskets and other appurtenances. For purposes of this chapter, service lines refer to pipes specifically used for drinking water transmission.

*“Service technician”* means a noncertified individual who works for a certified individual or a certified company or who is certified by a manufacturer to conduct modification or replacement activities at UST facilities.

*“Site assessment investigation”* means an investigation conducted by a certified groundwater professional to determine relevant site historical data, the types, amounts, and sources of petroleum contaminants present, hydrogeological characteristics of the site, full vertical and horizontal extent of the contamination in soils and groundwater, direction and rate of flow of the contamination, ranges of concentration of the contaminants by analysis of soils and groundwater, the vertical and horizontal extent of the contamination exceeding department standards, and the actual or potential threat to public health and safety and the environment.

*“Site cleanup report”* means the report required to be submitted by these rules and in accordance with department guidance that may include the results of Tier 2 or Tier 3 assessment and analysis.

*“Site-specific target level”* or *“SSTL”* means the risk-based target level(s) for chemicals of concern developed as the result of a Tier 2 or Tier 3 assessment that must be achieved at applicable point(s) of compliance at the source to meet the target level(s) at the point(s) of exposure.

*“Soil leaching to groundwater pathway”* means a pathway through soil by which chemicals of concern may leach to groundwater and through a groundwater transport pathway impact an actual or potential receptor.

*“Soil plume”* means the vertical and horizontal extent of soil impacted by the release of chemicals of concern.

*“Soil to water line pathway”* means a pathway that leads from soil to a water line.

*“Soil vapor to enclosed space pathway”* means a pathway through soil by which vapors from chemicals of concern may lead to a receptor creating an inhalation or explosive risk hazard.

*“Storm water or wastewater collection system”* means piping, pumps, conduits, and any other equipment necessary to collect and transport the flow of surface water run-off resulting from precipitation, or domestic, commercial, or industrial wastewater to and from retention areas or any areas where treatment is designated to occur. The collection of storm water and wastewater does not include treatment except where incidental to conveyance.

*“Surface impoundment”* is a natural topographic depression, constructed excavation, or diked area formed primarily of earthen materials (although it may be lined with manufactured materials) that is not an injection well.

*“Surface water body”* means general use segments as provided in 567—paragraph 61.3(1)“a” and designated use segments of water bodies as provided in 567—paragraph 61.3(1)“b” and 567—subrule 61.3(5).

*“Surface water criteria”* means, for chemicals of concern, the Criteria for Chemical Constituents in Table 1 of 567—61.3(455B), except that “1,000 µg/L” will be substituted for the chronic levels for toluene for Class B designated use segments.

*“Surface water pathway”* means a pathway that leads to a surface water body.

*“Tank”* is a stationary device designed to contain an accumulation of regulated substances and constructed of nonearthen materials (e.g., concrete, steel, plastic) that provide structural support.

*“Target level”* means the allowable concentrations of chemicals of concern established to achieve an applicable target risk that must be met at the point(s) of compliance as specified in these rules.

*“Target risk”* refers to an applicable carcinogenic and noncarcinogenic risk factor designated in these rules and used in determining target levels (for carcinogenic risk assessment, target risk is a separate factor, different from exposure factors, both of which are used in determining target levels).

*“Technological controls”* means a physical action that does not involve source removal or reduction, but severs or reduces exposure to a receptor, such as caps, containment, carbon filters, point of use water treatment, etc.

*“Temporary closure”* means a regulated tank or UST system that has been out of operation for three months or more.

*“Tester”* means a certified company or individual who tests tanks, lines, leak detection systems, or monitoring systems as required by 567—Chapter 135. For the purposes of this definition, an owner, operator or an employee of an owner or operator performing leak detection or cathodic protection monitoring, as required by 567—Chapter 135, is not a tester.

*“Testing”* means the process of utilizing a system to test underground storage tank systems or any part thereof for tightness, leak detection, cathodic protection or monitoring.

*“Tier 1 level”* means the groundwater and soil levels in the Tier 1 Look-up Table set out in 567—135.9(455B) and Appendix A.

*“Tier 1 site assessment”* means the evaluation of limited site-specific data compared to the Tier 1 levels established in these rules for the purpose of determining which pathways do not require assessment and evaluation at Tier 2 and which sites warrant a no further action required classification without further assessment and evaluation.

*“Tier 2 site assessment”* means the process of assessing risk to actual and potential receptors by using site-specific contaminant concentrations and designated Tier 2 exposure and fate and transport models to determine the applicable target level(s).

*“Tier 3 site assessment”* means a site-specific risk assessment utilizing more sophisticated data or analytic techniques than a Tier 2 site assessment.

*“Training program”* means any program that provides information to and evaluates the knowledge of a Class A, Class B, or Class C operator through testing, practical demonstration, or another approach acceptable to the department regarding requirements for UST systems that meet the requirements of 135.4(6) through 135.4(12).

*“Under-dispenser containment ”* or *“UDC”* means containment underneath a dispenser system designed to prevent leaks from the dispenser and piping within or above the UDC from reaching soil or groundwater.

*“Underground area”* means an underground room, such as a basement, cellar, shaft or vault, providing enough space for physical inspection of the exterior of the tank situated on or above the surface of the floor.

*“Underground release”* means any below-ground release.

*“Underground storage tank compliance inspector”* or *“UST compliance inspector”* means a person who inspects a regulated UST to satisfy the requirements of 567—135.19(455B) for compliance with UST technical standards in 567—Chapter 135.

*“Underground storage tank professional”* or *“UST professional”* means an individual certified by the department under 567—Chapter 134, excluding groundwater professionals and compliance inspectors. The certification program includes underground storage tank system installation, installation inspection, UST system testing, tank lining, cathodic protection installation/inspection, and UST removal. The certification issued will list the type of work the individual is certified to perform.

*“Underground utility vault”* means any constructed space accessible for inspection and maintenance associated with subsurface utilities.

*“Unit,”* in reference to child support, means the child support recovery unit created in Iowa Code section 252B.2.

*“Unreasonable risk to public health and safety or the environment”* means the Tier 1 levels for a Tier 1 site assessment, the applicable target level for a Tier 2 site assessment, and the applicable target level for a Tier 3 site assessment.

*“Upgrade”* means the addition or retrofit of some systems such as cathodic protection, lining, or spill and overfill controls to improve the ability of an underground storage tank system to prevent the release of product.

*“U.S. EPA”* means the United States Environmental Protection Agency.

*“UST system”* or *“tank system”* means an underground storage tank, connected underground piping, underground ancillary equipment, and containment system, if any.

*“Utility envelope”* means the backfill and trench used for any subsurface utility line, drainage system and tile line.

*“Wastewater treatment tank”* means a tank that is designed to receive and treat an influent wastewater through physical, chemical, or biological methods.

*“Water line”* means a hollow cylinder or tubular conduit that routinely contains and conveys potable water and is constructed of nonearthen materials, including but not limited to asbestos-cement, copper, high-density polyethylene (HDPE), polybutylene, polyethylene, and wood. Such piping includes any elbows, couplings, unions, valves, or other in-line fixtures, as well as the gaskets, that contain and convey potable water.

*“Water main pipe”* means a main line to the water distribution system with feeder lines or service lines connected to it and that typically is six inches or greater in diameter, and includes its gaskets and other appurtenances.

[ARC 0491D, IAB 8/19/26, effective 9/23/26]

### **567—135.3(455B) UST systems—design, construction, installation and notification.**

**135.3(1)** *Performance standards for new UST systems.* In order to prevent releases due to structural failure, corrosion, or spills and overfills for as long as the UST system is used to store regulated substances, all owners and operators of new UST systems must meet the following requirements. The UST system must be secondarily contained in accordance with 135.3(8).

*a. Tanks.* Each tank must be properly designed and constructed, and any portion underground that routinely contains product must be protected from corrosion in accordance with a code of practice developed by a nationally recognized association or independent testing laboratory as specified below:

- (1) The tank is constructed of fiberglass-reinforced plastic; or

NOTE: The codes of practice referenced in 40 CFR 280.20(a)(1) may be used to comply with 135.3(1) "a"(1).

- (2) The tank is constructed of steel and cathodically protected in the following manner:

1. The tank is coated with a suitable dielectric material.
2. Field-installed cathodic protection systems are designed by a corrosion expert.
3. Impressed current systems are designed to allow determination of current operating status as

required in 135.4(2) "c."

4. Cathodic protection systems are operated and maintained in accordance with 135.4(2) or according to guidelines established by the department.

- (3) The tank is constructed of steel and clad or jacketed with a noncorrodible material; or

NOTE: The industry codes referenced in 40 CFR 280.20(3) may be used to comply with 135.3(1) "a"(3).

- (4) The tank is constructed of metal without additional corrosion protection measures provided that:

1. The tank is installed at a site that is determined by a corrosion expert not to be corrosive enough to cause it to have a release due to corrosion during its operating life; and

2. Owners and operators maintain records that demonstrate compliance with the requirements of 135.3(1) "a"(4) "1" for the remaining life of the tank; or

- (5) The tank construction and corrosion protection are determined by the department to be designed to prevent the release or threatened release of any stored regulated substance in a manner that is no less protective of human health and the environment than 135.3(1) "a"(1) through "a"(4).

*b. Piping.* The piping that routinely contains regulated substances and is in contact with the ground must be properly designed, constructed, and protected from corrosion in accordance with a code of practice developed by a nationally recognized association or independent testing laboratory as specified in this rule. This includes piping for remote tank fill locations.

All piping must have secondary containment, installed according to manufacturer's specifications, and be compatible with the product stored and the environment to which it will be exposed. Piping must maintain its original specifications and structural integrity. Piping whose structural integrity has degraded must be replaced. All piping installations must meet National Fire Prevention Association Standard 30 and Standard 30A or the International Fire Code as adopted by the Iowa state fire marshal in 481—Chapter 282, "Flammable or Combustible Liquids."

- (1) The piping is constructed of a noncorrodible material; or

NOTE: The codes of practice referenced in 40 CFR 280.20(b)(1) may be used to comply with 135.3(1) "b"(1).

- (2) The piping is constructed of steel and cathodically protected in the following manner:

1. The piping is coated with a suitable dielectric material;
2. Field-installed cathodic protection systems are designed by a corrosion expert;
3. Impressed current systems are designed to allow determination of current operating status as

required in 135.4(2) "c"; and

4. Cathodic protection systems are operated and maintained in accordance with 135.4(2) or guidelines established by the department; or

NOTE: The codes of practice referenced in 40 CFR 280.20(b)(2) may be used to comply with 135.3(1) "b"(2).

- (3) The piping is constructed of metal without additional corrosion protection measures provided that:

1. The piping is installed at a site that is determined by a corrosion expert to not be corrosive enough to cause it to have a release due to corrosion during its operating life; and

2. Owners and operators maintain records that demonstrate compliance with the requirements of 135.3(1) "b"(3) "1" for the remaining life of the piping; or

- (4) The piping construction and corrosion protection are determined by the department to be designed to prevent the release or threatened release of any stored regulated substance in a manner that is no less protective of human health and the environment than the requirements in 135.3(1) "b"(1) through "b"(3).

*c. Spill and overfill prevention equipment.*

(1) Except as provided in 135.3(1)“b”(2), to prevent spilling and overfilling associated with product transfer to the UST system, owners and operators must use the following spill and overfill prevention equipment:

1. Spill prevention equipment that will prevent release of product to the environment when the transfer hose is detached from the fill pipe (for example, a spill catchment basin); and
2. Overfill prevention equipment that will:
  - Automatically shut off flow into the tank when the tank is no more than 95 percent full; or
  - Alert the transfer operator when the tank is no more than 90 percent full by restricting the flow into the tank (not allowed for suction product delivery systems, for tanks with stage 1 vapor recovery or when product delivery is by pumping) or triggering a high-level alarm; or
  - Restrict flow 30 minutes prior to overfilling, alert the transfer operator with a high-level alarm one minute before overfilling, or automatically shut off the flow into the tank so that none of the fittings located on top of the tank are exposed to product due to overfilling.

(2) Owners and operators are not required to use the spill and overfill prevention equipment specified in 135.3(1)“b”(1) if:

1. Alternative equipment is used that is determined by the department to be no less protective of human health and the environment than the equipment specified in 135.3(1)“b”(1)“1” or “2”; or
2. The UST system is filled by transfers of no more than 25 gallons at one time.
- (3) Flow restrictors used in vent lines may not be used to comply with 135.3(1)“c”(1)“2” when overfill prevention is installed or replaced.
- (4) Spill and overfill prevention equipment must be periodically tested or inspected in accordance with 135.4(12).

(5) Spill prevention equipment must be kept free of any liquid and debris. Any liquid or debris must be removed prior to product delivery.

*d. Installation.* The UST system must be properly installed in accordance with a code of practice developed by a nationally recognized association or independent testing laboratory and in accordance with the manufacturer’s instructions. The UST system installation shall be conducted by an installer certified by the department under 567—Chapter 134 and in accordance with 567—subrules 134.11(3) and 134.11(4).

NOTE: Tank and piping system installation practices and procedures described in the codes referenced in 40 CFR 280.20(d) may be used to comply with the requirements of 135.3(1)“d.”

*e. Certification of installation.* All owners and operators must ensure that the following methods of certification, testing, and inspection are used to demonstrate compliance with 135.3(1)“d” by providing a certification of compliance on the UST registration form in accordance with 135.3(3).

- (1) The installer is certified by the department as provided in 567—Chapter 134; and
- (2) The installation has been inspected by a certified installation inspector as required by 567—Chapter 134.

*f. Dispenser systems.* Each UST system must be equipped with under-dispenser containment (UDC) for any new or replaced dispenser system.

(1) A dispenser system is considered new when both the dispenser and the equipment needed to connect the dispenser to the underground storage tank system are installed at a location where there previously was no dispenser (new UST system or new dispenser location at an existing UST system). The equipment necessary to connect the dispenser to the underground storage tank system includes check valves, shear valves, unburied risers or flexible connectors, or other transitional components that are underneath the dispenser and connect the dispenser to the underground piping.

(2) UDC shall be installed whenever an existing dispenser system is removed and replaced with another dispenser and the equipment used to connect the dispenser to the underground storage tank system is replaced. This equipment includes flexible connectors or risers or other transitional components that are beneath the dispenser and connect the dispenser to the piping. UDC is not required when only the emergency shutoff or shear valves or check valves are replaced.

(3) UDC must be liquid-tight on its sides, bottom, and at any penetrations. UDC must allow for visual inspection and access to the components in the containment system or be periodically monitored for leaks from the dispenser system.

**135.3(2) Upgrading of existing UST systems.** Owners and operators must permanently close any UST system that does not meet the new UST system performance standards or has not been upgraded in accordance with 135.3(2)“b” through “d.” This subrule does not apply to previously deferred UST systems. Upgrading is no longer allowed for UST systems not upgraded by December 22, 1998.

*a. Alternatives allowed.* Not later than December 22, 1998, all existing UST systems had to comply with one of the following requirements:

- (1) New UST system performance standards under 135.3(1);
- (2) The upgrading requirements in 135.3(2)“b” through “d”; or
- (3) Closure requirements under 567—135.15(455B), including applicable requirements for corrective action under 567—135.7(455B) through 567—135.12(455B).

*b. Tank upgrading requirements.* Steel tanks had to be upgraded to meet one of the following requirements in accordance with a code of practice developed by a nationally recognized association or independent testing laboratory:

- (1) Interior lining. Tanks upgraded by internal lining must meet the following:
  1. The lining was installed in accordance with the requirements of 135.4(4), and
  2. Within ten years after lining, and every five years thereafter, the lined tank is internally inspected and found to be structurally sound with the lining still performing in accordance with original design specifications.

3. If the internal lining is no longer performing in accordance with original design specifications and cannot be repaired in accordance with a code of practice developed by a nationally recognized association or independent testing laboratory, the lined tank must be permanently closed in accordance with 567—135.15(455B).

- (2) Cathodic protection. Tanks upgraded by cathodic protection meet the requirements of 135.3(1)“a”(2)“2,” “3,” and “4” and the integrity of the tank was ensured using one of the following methods:

1. The tank was internally inspected and assessed to ensure that the tank was structurally sound and free of corrosion holes prior to installing the cathodic protection system; or

2. The tank had been installed for less than ten years and is monitored monthly for releases in accordance with 135.5(4)“d” through “i”; or

3. The tank had been installed for less than ten years and was assessed for corrosion holes by conducting two tightness tests that meet the requirements of 135.5(4)“c.” The first tightness test must have been conducted prior to installing the cathodic protection system. The second tightness test must have been conducted between three and six months following the first operation of the cathodic protection system; or

4. The tank was assessed for corrosion holes by a method that is determined by the department to prevent releases in a manner that is no less protective of human health and the environment than 135.3(2)“b”(2)“1” through “3.”

- (3) Internal lining combined with cathodic protection. Tanks upgraded by both internal lining and cathodic protection must have met the following:

1. The lining was installed in accordance with the requirements of 135.4(4); and

2. The cathodic protection system was installed within six months of lining installation and meets the requirements of 135.3(1)“a”(2)“2,” “3,” and “4.”

NOTE regarding 135.3(2)“b”: The codes referenced in 40 CFR 280.21 are options for complying with 135.3(2)“b.”

NOTE regarding 135.3(2)“b”(1)“2”: The codes referenced in 40 CFR 280.21(b)(1)(ii) may be used to comply with the periodic lining inspection requirement of this subrule.

*c. Piping upgrading requirements.* Metal piping that routinely contains regulated substances and is in contact with the ground must be cathodically protected in accordance with a code of practice developed by a nationally recognized association or independent testing laboratory and must meet the requirements of 135.3(1)“b”(2)“2,” “3,” and “4.”

NOTE: The codes of practice listed in 40 CFR 280.21(c) may be used to comply with this requirement.

*d. Spill and overfill prevention equipment.* To prevent spilling and overfilling associated with product transfer to the UST system, all existing UST systems must comply with UST system spill and overfill prevention equipment requirements specified in 135.3(1)“c.”

**135.3(3) Registration and notification requirements.**

a. Except as provided in 135.3(3)“b,” the owner of an underground storage tank existing on or before July 1, 1985, shall complete and submit to the department a copy of the registration form provided by the department.

b. The owner of an underground storage tank system taken out of operation between January 1, 1974, and July 1, 1985, shall complete and submit to the department a copy of the registration form provided by the department unless the owner knows the tank has been removed from the ground. For purposes of this subrule, “owner” means the person who owned the tank immediately before the discontinuation of the tank’s use.

c. An owner or operator who brings into use an underground storage tank system after July 1, 1985, shall complete and submit to the department a copy of the registration form provided by the department within 30 days of the final installation inspection required in 567—subparagraph 134.14(3)“c”(3) by a certified installation inspector. The owner or operator shall not allow the deposit of any regulated substance into the tank without prior approval of the department or until the permanent registration tag and annual tank tag have been attached to the tank fill pipe and the tank system is covered by an approved financial responsibility mechanism in accordance with 567—Chapter 136.

d. All owners and operators of new UST systems must provide UST system details and a site diagram and certify in the registration form compliance with the following requirements:

- (1) Installation of tanks and piping under 135.3(1)“e”;
- (2) Cathodic protection of steel tanks and piping under 135.3(1)“a” and “b”;
- (3) Financial responsibility under 567—Chapter 136;
- (4) Release detection methods under 135.5(2) and 135.5(3);
- (5) Class A and B operator certification under 135.4(6);
- (6) NESHAP Stage 1 vapor recovery.

e. All owners and operators of new UST systems must ensure that the certified installer certifies in the registration form that the methods used to install the tanks and piping comply with the requirements in 135.3(1)“d.”

f. Exemption from reporting requirement. Paragraphs 135.3(1)“a” through “c” do not apply to an underground storage tank for which notice was given pursuant to Section 103, Subsection c, of the Comprehensive Environmental Response, Compensation, and Liabilities Act of 1980. (42 U.S.C. Subsection 9603(c)).

g. Notification requirement for installing a tank. A person installing an underground storage tank and the owner or operator of the underground storage tank must notify the department of their intent to install the tank 30 days prior to installation. Notification shall be on a form provided by the department.

h. Notice requirement for acquiring a UST system. A person, company or lending institution that assumes ownership or operation of a regulated underground storage tank must submit notification to the department on a form provided by the department within 30 days of acquisition and prior to tank operation. The owner must include copies of training certificates for the Class A and Class B operators (135.4(6)) and proof of financial responsibility required in 567—Chapter 136. The new owner is responsible for any current tank management fees that have not been previously paid.

i. It is unlawful for a person to deposit or accept a regulated substance into an underground storage tank if the person has received notice from the department that the underground storage tank is subject to a delivery prohibition or if there is a “red tag” attached to the UST fill pipe or fill pipe cap as provided in 135.3(7).

(1) The department may provide written authorization to receive a regulated substance when conditions warrant.

(2) The department may provide known depositors of regulated substances lists of underground storage tank sites that have been issued tank tags, those that have not been issued tank tags, and those subject to a delivery prohibition pursuant to 135.3(7). These lists do not remove the requirement for depositors to verify that current tank tags are affixed to the fill pipe prior to delivering product.

(3) A person shall not accept or deposit a regulated substance in an underground storage tank after receiving written or oral notice from the department that the tank is not covered by an approved form of financial responsibility in accordance with 567—Chapter 136.

**135.3(4)** *Farm and residential tanks.*

a. The owner or operator of a farm or residential tank of 1,100 gallons or less capacity used for storing motor fuel for noncommercial purposes is subject to the requirements of this subrule.

b. Farm and residential tanks, installed before July 1, 1987, are required to be registered with the department.

c. Farm and residential tanks installed on or after July 1, 1987, must be in compliance with all the underground storage tank regulations.

**135.3(5)** *Registration tags and annual management fee.*

a. Tanks of 1,100 gallons or less capacity that have registered with the department will be issued a permanent registration tag.

b. The owner or operator of tanks over 1,100-gallon capacity must submit a tank management fee form and fee payment of \$65 per tank by January 15 of each year.

(1) An additional \$250 per tank late fee must be paid if the tank management fee is not paid by March 1.

(2) The owner or operator must submit proof that the tanks are covered by an approved form of financial responsibility in accordance with 567—Chapter 136.

(3) Upon proper payment of the fee and acceptable proof of financial responsibility, and a determination there are no outstanding compliance violations, a one-year renewal tag will be issued for the period from April 1 to March 31.

(4) If there are outstanding compliance violations, the annual tank tags may be withheld until the violations are corrected.

(5) The department shall refund a tank management fee if the tank is permanently closed prior to April 1 for that year.

c. The owner or operator shall affix the tag to the fill pipe of the underground storage tank where it will be readily visible.

d. A person who conveys or deposits a regulated substance shall inspect the underground storage tank to determine the existence or absence of a permanent registration tag, a current annual renewal tag, or a delivery prohibition “red tag” as provided in 135.3(7). If a current annual renewal tag, or a silver permanent tag for regulated tanks less than 1,100 gallons is not affixed to the fill pipe or fill pipe cap or if a delivery prohibition “red tag” is displayed, the person shall not deposit the substance in the tank.

**135.3(6)** *Previously unregistered petroleum underground storage tanks.* A petroleum underground storage tank required to be registered under 135.3(3) and 135.3(4) that has not been registered shall be registered under the following conditions:

a. The tank registration fee under Iowa Code section 455B.473(4) and 455B.473(5) shall accompany the registration.

b. The storage tank management fee and any late fees under Iowa Code section 455B.473(8) “b” shall be paid for past years in which the tank should have been registered.

c. The department may waive the late fee(s).

**135.3(7)** *Delivery prohibition process.*

a. *Identifying sites subject to delivery response prohibition action.*

(1) Annual renewal tag and tank management fee process. Owners and operators shall certify to the following on a form prepared by the department when applying for annual tank tags pursuant to 135.3(5):

1. Installation and performance of an approved UST and piping release detection method as provided in 567—135.5(455B), including an annual line tightness test and a line leak detector test if applicable.

2. Installation of an approved overfill and spill protection system as provided in 135.3(1) “c.”

3. Installation of an approved corrosion protection system as provided in 135.3(1) “a” and “b.”

4. If the UST system has been out of operation for more than three months, that the UST system has been temporarily closed in accordance with 567—135.15(455B) and a certification of temporary closure has been submitted to the department.

5. If the UST system has been removed or filled in place within the last 12 months, the date of removal or filling in place and whether a closure report has been submitted as provided in 567—135.15(455B).

(2) Sites with provisional status. If the UST system has been classified as operating under provisional status as provided in 135.3(7)“c,” owners and operators when applying for annual tank tags pursuant to 135.3(5) must certify on a form prepared by the department that the owners and operators are in compliance with an approved provisional status remedial plan as provided in 135.3(7)“c.”

(3) Compliance inspections. The department may initiate a delivery prohibition response action based on: (1) a finding resulting from a third-party compliance inspection conducted pursuant to 567—135.19(455B); (2) a department investigation and inspection conducted pursuant to Iowa Code section 455B.475; or (3) review of a UST system check or other documentation submitted in response to a suspected release under 567—135.6(455B) or in response to a confirmed release under 567—135.7(455B).

*b. Delivery prohibition eligibility criteria.* A delivery prohibition response action may be initiated upon a finding that the UST system is out of compliance with department rules and meets the eligibility criteria as specified below. Reinstatement criteria define the standards and process for owners and operators to document that they have taken corrective action sufficient to authorize resumption of fuel to the USTs. Prior to initiation of the delivery prohibition, owners and operators are afforded a minimum level of procedural due process such as prior notice and the opportunity to present facts to dispute the finding. Where notice and the opportunity to take corrective action prior to initiation of a delivery prohibition response action are required, notice by the department or by a certified compliance inspector as provided in 567—135.19(455B) shall be sufficient.

If the department finds that any one of the following criteria has been satisfied, the department may initiate a delivery prohibition response action following the notice procedures outlined in 135.3(7)“e.” After initiation of the delivery prohibition response action, the department will offer the owner or operator an opportunity to establish reinstatement criteria by written documentation and, if requested, an in-person meeting.

(1) An approved release detection method for USTs or UST piping is not installed, such as automatic tank gauging, groundwater monitoring wells and line leak detectors, and there is no record that an approved method such as inventory control, statistical inventory reconciliation, or interstitial space monitoring has been employed during the previous three months. If the owner or operator claims to have documentation that an approved release detection method has been conducted, the owner or operator will be given two business days to produce the documentation.

REINSTATEMENT CRITERIA: The owner or operator must submit results of a passing UST system precision tightness test at the 0.1 gallon-per-hour leak rate in 135.5(4)“c” and 135.5(5)“b.” The owner or operator must also document installation and operation of an approved release detection system. This may include proof that a contract has been signed with a qualified statistical inventory reconciliation provider or that a qualified inventory control method has been implemented and training has been provided to onsite supervisory personnel.

(2) No documentation of a required annual line tightness test or line leak detector test has been provided, and the owner or operator has failed to conduct the required testing within 14 days of written notice by the department or a certified compliance inspector as provided in 567—135.19(455B).

REINSTATEMENT CRITERIA: The owner or operator must provide documentation of a passing line precision tightness test at the 0.1 gallon-per-hour leak rate in 135.5(5)“b” and a line leak detector test as provided in 135.5(5)“a.”

(3) Overfill and spill protection is not installed.

REINSTATEMENT CRITERION: The owner or operator must provide documentation that overfill and spill protection equipment has been installed.

(4) A corrosion protection system is not installed or there is no record that an impressed current corrosion protection system has been in operation for the prior six months.

REINSTATEMENT CRITERIA: A manned entry tank integrity inspection must be completed prior to installation of a corrosion protection system, and the owner or operator must submit results of a passing

UST system precision tightness test at the 0.1 gallon-per-hour leak rate in 135.5(4)“c” and 135.5(5)“b.” A corrosion protection analysis must be completed and approved by the department.

(5) The owner or operator has failed to provide proof of financial responsibility in accordance with 567—Chapter 136.

REINSTATEMENT CRITERION: The owner or operator must submit acceptable proof of financial responsibility in accordance with 567—Chapter 136.

(6) A qualified UST system release detection method is installed and is being used but the documentation or the absence of documentation is sufficient to question the reliability of the release detection over the past 12-month period. The owner or operator shall be notified of the deficiencies, shall be given at least two business days to produce documentation of compliance and, if necessary, shall be required to conduct a leak detection system analysis and a system tightness test within 14 days. If the owner or operator fails to produce documentation of compliance or to conduct the system analysis and the UST system precision tightness test at the 0.1 gallon-per-hour leak rate in 135.5(4)“c” and 135.5(5)“b,” the department may initiate a delivery prohibition response action. Notice by the department or a compliance inspector as provided in 567—135.19(455B) shall be sufficient to initiate a delivery prohibition response action.

REINSTATEMENT CRITERIA: The owner or operator must submit documentation that the leak detection method analysis sufficiently documents compliance and explains the reasons for the accuracy and reliability concerns. If necessary, the owner or operator must submit passing results of a UST system precision tightness test at the 0.1 gallon-per-hour leak rate in 135.5(4)“c” and 135.5(5)“b.”

(7) The owner or operator has failed to document completion of a three-year corrosion protection test or to repair defective corrosion protection equipment within 30 days after notice of the violation by the department or a certified compliance inspector as provided in 567—135.19(455B).

REINSTATEMENT CRITERION: The owner or operator must submit documentation of a three-year corrosion protection test as provided in 567—135.3(455B).

(8) The owner or operator has failed to complete a compliance inspection required by 567—135.19(455B) within 60 days after written notice of the violation by the department.

REINSTATEMENT CRITERION: The owner or operator must submit a compliance inspection report as provided in 567—135.19(455B).

(9) The owner or operator has failed to take necessary abatement action in response to a confirmed release as provided in 135.7(2) and 135.7(3).

REINSTATEMENT CRITERION: The owner or operator must document compliance with the abatement provisions in 135.7(2) and 135.7(3).

(10) The owner or operator has failed to undertake and document release investigation and confirmation steps within seven days in response to a suspected release as provided in 135.6(3)“a.”

REINSTATEMENT CRITERION: The owner or operator must document release confirmation and system check as provided in 135.6(3)“a.”

(11) The owner or operator has failed to provide documentation of Class A or B operator training.

REINSTATEMENT CRITERION: The owner or operator must submit a copy of the certificates of training for Class A and B operators.

(12) The owner or operator has failed to install required secondary containment.

REINSTATEMENT CRITERION: The owner or operator must document secondary containment has been installed as provided in 135.3(8).

(13) The owner or operator has failed to pay the annual tank management fee.

REINSTATEMENT CRITERION: The owner or operator must pay the current and any previous unpaid tank management fees in addition to any late fees as provided in 135.3(5)“b.”

(14) When tanks are no longer in use or in temporary closure.

REINSTATEMENT CRITERION: The owner or operator must provide a completed Return to Service form along with required documents.

c. *Provisional status.* The department may classify a UST system as operating under a provisional status when the department documents a pattern of UST operation and maintenance violations under 567—135.3(455B) through 567—135.5(455B) and suspected release and confirmed release response

actions under 567—135.6(455B) and 567—135.7(455B). The department shall provide the owner or operator with a notice specifying the basis for the proposed classification and a proposed remedial action plan. The objective of the remedial action plan is to provide the owner and operator an opportunity to undertake certain remedial actions sufficient to establish a reasonable likelihood that future regulatory compliance will be achieved.

The remedial action plan may include but is not limited to provisions for owner/operator training, development of a facility-specific compliance manual, more frequent third-party compliance inspections than otherwise required under 567—135.19(455B), monthly reporting, and retention of a third-party compliance manager/consultant. If the owner or operator and the department cannot reach agreement on a remedial action plan, the department may initiate enforcement action by issuance of an administrative order pursuant to 567—Chapter 10. This provision does not grant the owner or operator an entitlement to this procedure, and the department reserves all discretion to undertake an enforcement action and assess penalties as provided in Iowa Code sections 455B.476 and 455B.477.

*d. Administrative orders.* The department may impose a delivery prohibition as a remedy for violations of the operation and maintenance provisions in 567—135.3(455B) through 567—135.5(455B) and the suspected and confirmed release response actions in 567—135.6(455B) and 567—135.7(455B). This remedy may be in addition to the assessment of penalties as provided in Iowa Code section 455B.476 and other appropriate injunctive relief necessary to correct violations.

*e. Due process prior to initiation of a delivery prohibition response action.*

(1) Prior to imposing a delivery prohibition response action under 135.3(7)“b” above, the department will provide notice to the owner or operator or, if notice to the owner or operator cannot be confirmed, to a person in charge at the UST facility of the basis for the finding and the intent to initiate a delivery prohibition response action. Notice may be by verbal contact, by electronic mail, or by regular or certified mail to the UST facility address or the owner’s or operator’s last-known address. The owner and operator will be given a minimum of three business days to provide documentation that the finding is inaccurate or that reinstatement criteria in 135.3(7)“b”(1) through “b”(5) have been satisfied. Additional days and the opportunity for a telephone or in-person conference may be provided the owner and operator to contest the factual basis for a finding under 135.3(7)“b”(6) through “b”(14). Additional procedural due process may be afforded the owner and operator on a case-by-case basis sufficient to satisfy Constitutional due process standards.

If insufficient information is submitted to change the finding, the department will notify the owner or operator and a person in charge at the UST facility of the final decision to impose the delivery prohibition response action.

(2) Provisional status. Upon a finding that an owner or operator under provisional status has failed to comply with the terms of a remedial action plan as provided above, the department may initiate a delivery prohibition response action by giving actual notice to the owner or operator of the basis for the finding of noncompliance and the department’s intent to initiate a delivery prohibition response action. The delivery prohibition response action shall not be imposed without providing the owner or operator the opportunity for an evidentiary hearing consistent with the provisions for suspension and revocation of certifications under 7—Chapter 2506 and 561—Chapter 2506.

*f. Delivery prohibition procedure.* Upon oral or written notice that the delivery prohibition response action has been imposed, the owner or operator and any person in charge of the UST facility shall be notified that they are not authorized to receive any further delivery of regulated substances until conditions for reinstatement of eligibility are satisfied. Owners and operators are required to provide the department with names and contact information for all persons who convey or deposit regulated substances to the USTs. The department will attempt to notify known persons who convey or deposit regulated substances to the USTs that they are not authorized to deliver to the USTs until further notice by the department as provided in Iowa Code section 455B.473(8)“a” and in 135.3(5).

The department shall visit the site and affix a “red tag” to the fill pipes or fill pipe caps of all affected USTs. It is unlawful for any person to deposit or accept a regulated substance into a UST that has a “red tag” affixed to the fill pipe or fill pipe cap. The department may allow the owner and operator to dispense and sell the remainder of existing fuel unless the department determines there is an immediate risk of a

release or other risk to human health, safety or the environment. The department shall confirm in writing the basis for the delivery prohibition response action, contacts made prior to the action, and steps the owner or operator must take to reinstate fuel delivery.

**135.3(8) Secondary containment requirements for UST system installations.** All new and replacement underground storage tank systems and appurtenances used for the storage and dispensing of petroleum products shall have secondary containment in accordance with this subrule. The secondary containment provision includes the installation of containment sumps.

*a.* Tanks and piping installed or replaced after November 28, 2007, must have secondary containment that is designed, installed, and maintained according to the performance standards in 135.3(1) and 135.5(3) “*b.*”

(1) The secondary containment may be manufactured as an integral part of the primary containment or constructed as a separate containment system.

(2) At a minimum, the secondary containment must:

1. Contain regulated substances leaked from the UST system until detected and removed.  
2. Prevent the release of regulated substances into the environment at any time during the operational life of the underground storage tank system.

3. Be checked for evidence of a release from the tank at least every 30 days as provided in 135.5(2) “*a.*”

*b.* Testing and inspection. Containment sumps shall be liquid-tight and must be inspected and tested in accordance with the following:

(1) Inspections for secondary containment sumps (spill catchment basins, turbine sumps, transition or intermediate sumps, and under-dispenser containment).

1. Inspections for secondary containment sumps shall consist of visual inspection every year.  
2. Containment sumps must be intact (no cracks or perforations) and liquid-tight, including sides and bottom.

3. Containment sumps must be maintained and kept free of debris, liquid, and ice at all times.

4. Regulated substances leaked or spilled into any containment sumps shall be immediately removed.

(2) Secondary containment sumps used for interstitial monitoring of piping shall be tested upon installation and periodically in accordance with 135.4(12).

[ARC 0491D, IAB 8/19/26, effective 9/23/26]

## **567—135.4(455B) General operating requirements.**

### **135.4(1) Spill and overfill control.**

*a.* Owners and operators must ensure that releases due to spilling or overfilling do not occur. The owner and operator must ensure that the volume available in the tank is greater than the volume of product to be transferred to the tank before the transfer is made and that the transfer operation is monitored constantly to prevent overfilling and spilling.

NOTE: The transfer procedures referenced in 40 CFR 280.30 may be used to comply with 135.4(1) “*a.*”

*b.* The owner and operator must report, investigate, and clean up any spills and overfills in accordance with 135.6(4).

**135.4(2) Operation and maintenance of corrosion protection.** All owners and operators of metal UST systems with corrosion protection must comply with the following requirements to ensure that releases due to corrosion are prevented until the UST system is permanently closed or undergoes a change in service in accordance with 135.15(2):

*a.* All corrosion protection systems must be operated and maintained to continuously provide corrosion protection to the metal components of that portion of the tank and piping that routinely contain regulated substances and are in contact with the ground.

*b.* All UST systems equipped with cathodic protection systems must be inspected for proper operation by a qualified cathodic protection tester in accordance with the following requirements:

(1) Frequency. All cathodic protection systems must be tested within six months of installation and at least every three years thereafter or according to another reasonable time frame established by the department; and

(2) Inspection criteria. The criteria that are used to determine that cathodic protection is adequate as required by this subrule must be in accordance with a code of practice developed by a nationally recognized association.

NOTE: The codes of practice in 40 CFR 280.31(b)(2) may be used to comply with 135.4(2) “b”(2).

c. UST systems with impressed current cathodic protection systems must also be inspected every 60 days to ensure the equipment is running properly.

d. For UST systems using cathodic protection, records of the operation of the cathodic protection must be maintained (in accordance with 135.4(5)) to demonstrate compliance with the performance standards in this subrule. These records must provide the following:

(1) The results of the last three inspections required in 135.4(2) “c”; and

(2) The results of testing from the last two inspections required in 135.4(2) “b.”

e. When an impressed current cathodic protection system is failing cathodic protection for the time periods given below, owners and operators must take the following actions:

(1) For impressed current cathodic protection systems that have been inoperative for 0 to 90 days after failing a corrosion protection test or after discovering the system is not operating, all of the following must be completed:

1. Power must be restored to an inoperative corrosion protection system. A damaged or failed corrosion protection system must be repaired by a qualified service technician. A corrosion expert must approve any modifications to the system that are outside of the original design.

2. The corrosion protection system must be retested within six months of repair.

3. A copy of the test and any repairs must be kept as part of the cathodic protection records.

4. A copy of the new design standards must be kept as part of the cathodic protection records.

(2) For impressed current corrosion protection systems that have been inoperative for 90 to 365 days or repaired 90 to 365 days after failing a corrosion protection test, all of the following must be completed:

1. Notify the department.

2. Power must be restored to an inoperative corrosion protection system.

3. The corrosion protection system must be repaired, tested and returned to service under the supervision of a corrosion expert.

4. A precision tightness test must be conducted in accordance with 135.5(4) “c” and 135.5(5) “b.”

5. The corrosion protection system must be retested within six months of the repair or power being restored.

6. A copy of the test and any repairs must be kept as part of the cathodic protection records.

7. A copy of the new design standards must be kept as part of the cathodic protection records.

8. If determined the tank is not suitable for corrosion protection, the tank must be permanently closed in accordance with 135.15(2).

(3) If the impressed current corrosion protection system has been inoperative for more than 365 days or was not repaired for more than 365 days after failing a corrosion protection test, all of the following must be completed:

1. Notify the department.

2. Immediately empty and stop using the tank system.

3. An internal inspection of the steel tank must be conducted according to a national standard (e.g., API 1631). If the UST fails the internal inspection, the UST owner must permanently close the tank in accordance with 135.15(2).

4. If the piping and metallic components do not pass a line tightness test or a cathodic protection test and cannot be repaired in accordance with this chapter, the line must be replaced.

5. A precision test must be conducted in accordance with 135.5(4) “c” and 135.5(5) “b.”

6. The corrosion protection system must be retested within six months of repair.

7. A copy of the tests and any repairs must be kept as part of the cathodic protection records.

(4) If the impressed current cathodic protection system has been inoperable for more than 365 days and cannot be brought back into immediate use, the tank system must be permanently closed in accordance with 135.15(2).

**135.4(3) Compatibility.** Owners and operators must use a UST system made of or lined with materials that are compatible with the substance stored in the UST system.

*a.* Owners and operators must notify the department at least 30 days prior to switching to a regulated substance containing greater than 10 percent ethanol, greater than 20 percent biodiesel, or any other regulated substance identified by the department.

*b.* Owners and operators must have a UST installer certified under 567—Chapter 134 submit the department's checklist for equipment compatibility for the UST system to the department at least 30 days prior to switching to a regulated substance containing greater than 10 percent ethanol or greater than 20 percent biodiesel, or any other regulated substance identified by the department.

*c.* A retail dealer, as defined in Iowa Code section 214A.1, must show compliance with the requirements of Iowa Code sections 455G.32 and 455G.33, if applicable, by submitting and maintaining the applicable reporting and recordkeeping documentation listed in 135.4(5)“*a*”(10), “*a*”(11), “*b*”(12), and “*b*”(13).

NOTE: Owners and operators storing alcohol blends may use the code in 40 CFR 280.32(b)(2) to comply with the requirements of 135.4(3).

**135.4(4) Repairs and replacement.** Owners and operators of UST systems must ensure that repairs will prevent releases due to structural failure or corrosion as long as the UST system is used to store regulated substances. The repairs must meet the following requirements:

*a.* Repairs to UST systems must be properly conducted in accordance with a code of practice developed by a nationally recognized association or an independent testing laboratory.

NOTE: The codes and standards referenced in 40 CFR 280.33(a) may be used to comply with 135.4(4)“*a*.”

*b.* Repairs to fiberglass-reinforced plastic tanks may be made by the manufacturer's authorized representatives or in accordance with a code of practice developed by a nationally recognized association or an independent testing laboratory.

*c.* Piping and fitting

(1) Metal pipe sections and fittings that have released product as a result of corrosion or other damage must be replaced. Noncorrodible pipes and fittings may be repaired in accordance with the manufacturer's specifications.

(2) If 50 percent or more of any piping run is removed, the entire piping run must be removed and replaced with secondarily contained piping and interstitial monitoring.

(3) All piping replacements requiring secondary containment shall be constructed with transition or intermediate containment sumps.

*d.* Repairs to secondary containment areas of tanks and piping used for interstitial monitoring and to containment sumps used for interstitial monitoring of piping must have the secondary containment tested for tightness according to the manufacturer's instructions, a code of practice developed by a nationally recognized association or independent testing laboratory, or according to requirements established by the department within 30 days following the date of completion of the repair. All other repairs to tanks and piping must be tightness tested in accordance with 135.5(4)“*c*” and 135.5(5)“*b*” within 30 days following the date of the completion of the repair except as provided in 135.4(4)“*d*”(1) through “*d*”(3):

(1) The repaired tank is internally inspected in accordance with a code of practice developed by a nationally recognized association or an independent testing laboratory; or

(2) The repaired portion of the UST system is monitored monthly for releases in accordance with a method specified in 135.5(4)“*d*” through “*i*”; or

(3) Another test method is used that is determined by the department to be no less protective of human health and the environment than those listed above.

NOTE regarding 135.4(4)“*d*”: The codes of practice referenced in 40 CFR 280.33(d)(3) may be used to comply with 135.4(4)“*d*.”

*e.* Within six months following the repair of any cathodically protected UST system, the cathodic protection system must be tested in accordance with 135.4(2)“*b*” and “*c*” to ensure that it is operating properly.

f. Within 30 days following any repair to spill or overfill prevention equipment, the repaired spill or overfill prevention equipment must be tested or inspected, as appropriate, in accordance with 135.4(1) to ensure it is operating properly.

g. UST system owners and operators must maintain records of each repair until the UST system is permanently closed or undergoes a change-in-service pursuant to 135.15(2).

**135.4(5) Reporting and recordkeeping.** Owners and operators of UST systems must cooperate fully with inspections, monitoring and testing conducted by the department, as well as requests for document submission, testing, and monitoring by the owner or operator pursuant to Section 9005 of Subtitle I of the Solid Waste Disposal Act as amended.

a. *Reporting.* Owners and operators must submit the following information to the department:

(1) Notification for all UST systems (135.3(3)), which includes certification of installation for new UST systems (135.3(1) “e”);

(2) Notification of equipment replacement or addition of new equipment;

(3) Reports of all releases including suspected releases (135.6(1)), spills and overfills (135.6(4)), and confirmed releases (135.7(2));

(4) Corrective actions planned or taken including initial abatement measures (135.7(3)), initial site characterization (567—135.9(455B)), free product removal (135.7(4)), investigation of soil and groundwater cleanup and corrective action plan (567—135.8(455B) through 567—135.12(455B));

(5) A notification before permanent closure or change-in-service (135.15(2));

(6) Notification of any change in ownership;

(7) Notification of any change in Class A or Class B operators;

(8) Notification of any loss of financial responsibility (i.e., insurance);

(9) Notification prior to UST systems switching to certain regulated substances;

(10) Documentation establishing compatibility as required in Iowa Code section 455G.32, if applicable;

(11) Documentation establishing compatibility as required in Iowa Code section 455G.33, if applicable.

b. *Recordkeeping.* Owners and operators must maintain the following information:

(1) A corrosion expert’s analysis of site corrosion potential if corrosion protection equipment is not used (135.3(1) “a”(4); 135.3(1) “b”(3)).

(2) Documentation of operation of corrosion protection equipment (135.4(2));

(3) Documentation of UST system repairs (135.4(4) “h”);

(4) Documentation of compliance with release detection requirements (135.5(6));

(5) Results of the site investigation conducted at permanent closure (135.15(3));

(6) Cathodic protection system testing results (135.4(2));

(7) Class A, B and C operator training certificates (135.4(6));

(8) Secondary containment test results (135.3(8));

(9) Documentation of periodic walkthrough inspections (135.4(13));

(10) Documentation of compatibility for UST systems (135.4(3));

(11) Documentation of compliance for spill and overfill prevention equipment and containment sumps used for interstitial monitoring of piping (135.4(12));

(12) Documentation establishing compatibility as required in Iowa Code section 455G.32, if applicable;

(13) Documentation establishing compatibility as required in Iowa Code section 455G.33, if applicable.

c. *Availability and maintenance of records.* Owners and operators must keep the records required either:

(1) At the UST site and immediately available for inspection by the department; or

(2) At a readily available alternative site and be provided for inspection to the department within two business days of department request.

(3) In the case of permanent closure records required under 135.15(5), owners and operators are also provided with the additional alternative of mailing closure records to the department if they cannot be kept at the site or an alternative site as indicated above.

**135.4(6) Training required for UST operators.**

a. An owner or operator shall designate Class A, Class B, and Class C operators for each underground storage tank system or facility that has underground storage tanks regulated by the department, except for unstaffed facilities, which may designate only Class A and Class B operators.

b. A facility may not operate unless operators have been designated and trained as required in this rule or unless otherwise agreed upon by the department based on a finding of good cause for failure to meet this requirement and a plan for designation and training at the earliest practicable date.

c. Trained operators must be readily available to respond to suspected or confirmed releases, equipment shut-offs or failures, and other unusual operating conditions.

d. A Class A or Class B operator should be immediately available for telephone consultation with the Class C operator when a facility is in operation.

e. For staffed facilities, a Class C operator must be on site whenever the UST facility is in operation.

f. For unstaffed facilities, a Class B operator must be geographically located such that the person can be on site within two hours of being contacted by the public, the owner or operator of the facility, or the department. An unstaffed facility shall have an emergency shutoff device as provided in 135.5(1). An approved emergency procedures sign shall be posted in a conspicuous location and shall read:

IN CASE OF FIRE, SPILL OR RELEASE

1. USE EMERGENCY PUMP SHUTOFF

2. REPORT THE ACCIDENT!

FIRE DEPARTMENT TELEPHONE NO. \_\_\_\_\_

FACILITY ADDRESS & PHONE NUMBER \_\_\_\_\_

g. Designated operators must successfully complete required training under 135.4(9).

h. A person may be designated for more than one class of operator.

i. When a facility is found to be out of compliance, the department may require that the designated UST system Class A, B, or C operator be retrained under a plan approved by the department. The retraining must occur within 30 days from departmental notice for Class A and Class B operators and within 15 days for Class C operators.

**135.4(7) UST operator responsibilities.**

*a. Class A operator.*

(1) Class A operators have the primary responsibility to operate, maintain, and have knowledge of the regulatory requirements for the underground storage tank system and facility. The Class A operator's responsibilities include managing resources and personnel to achieve and maintain compliance with regulatory requirements under this chapter in the following ways:

1. Class A operators assist the owner by ensuring that underground storage tank systems are properly installed and expeditiously repaired and inspected; financial responsibility is maintained; and records of system installation, modification, inspection and repair are retained and made available to the department and certified compliance inspectors. The Class A operator shall properly respond to and report emergencies caused by releases or spills from UST systems, ensure that the annual tank management fees are paid, and ensure that Class B and Class C operators are properly trained.

2. Class A operators shall be familiar with training requirements for each class of operator and may provide required training for Class C operators.

3. Class A operators shall provide site drawings that indicate equipment locations for Class B and Class C operators.

(2) Department-certified installers, installation inspectors, and department-certified compliance inspectors may perform Class A operator duties when employed or contracted by the tank owner to perform these functions so long as they are properly trained and designated as Class A operators pursuant to 135.4(9) through 135.4(11). Class A operators who are also certified compliance inspectors under 567—Chapter 134 may perform in-house facility inspections of the UST system, but shall not perform department-mandated compliance inspections pursuant to 567—135.19(455B). Compliance inspections of a UST facility required by 567—135.19(455B) must be completed by a third-party compliance inspector certified under 567—Chapter 134.

(3) When there is a change in ownership or operator status, the new owner or operator is responsible for designating a Class A operator prior to bringing the UST system into operation. The Class A operator

is responsible for ensuring that all necessary documentation for change of ownership is completed and submitted to the department and that all compliance requirements of this chapter are satisfied prior to bringing the UST system into operation. The compliance requirements may be provided to the owner or operator using the department's checklist.

If the UST system was temporarily closed, the designated Class A operator must ensure the department's checklist for returning a UST into service is followed, all compliance requirements of this chapter have been met, and the necessary documentation is submitted to the department.

(4) When there is a change in UST ownership, property ownership or operator status, the designated Class A operator for the current owner and operator is responsible for notifying the department when the change is final and, if possible, prior to the new owner or operator taking possession of the site.

*b. Class B operator.*

(1) A Class B operator is knowledgeable of the applicable underground storage tank regulatory requirements and standards and implements them in the field or at the tank facility. A Class B operator oversees and implements the day-to-day aspects of operation, maintenance, and recordkeeping for the underground storage tanks at facilities within four hours of travel time from the Class B operator's principal place of business. A Class B operator's responsibilities include but are not limited to:

1. Performing mandated system tests at required intervals and making sure spill prevention, overfill control equipment, and corrosion protection equipment are properly functioning.

2. Assisting the owner by ensuring that release detection equipment is operational, release detection monitoring and tests are performed at the proper intervals, and release detection records are retained and made available to the department and compliance inspectors.

3. Making sure recordkeeping and reporting requirements are met and that relevant equipment manufacturers' or third-party performance standards are available and followed.

4. Properly responding to, investigating, and reporting emergencies caused by releases or spills from USTs.

5. Performing UST release detection in accordance with 567—135.5(455B).

6. Monitoring the status of UST release detection.

7. Meeting spill prevention, overfill prevention, and corrosion protection requirements.

8. Reporting suspected and confirmed releases and taking release prevention and response actions according to the requirements of 567—135.6(455B).

9. Training and documenting Class C operators to make sure at least one Class C operator is on site during operating hours. Class B operators shall be familiar with Class C operator responsibilities and may provide training for Class C operators.

(2) Department-certified installers, installation inspectors, and department-certified compliance inspectors may perform Class B operator duties when employed or contracted by the tank owner to perform these functions so long as they are properly trained and designated as Class B operators under 135.4(9) through 135.4(11). Class B operators who are also certified compliance inspectors under 567—Chapter 134 may perform in-house facility inspections of the UST system, but cannot perform department-mandated compliance inspections pursuant to 567—135.19(455B). Compliance inspections of a UST facility pursuant to 567—135.19(455B) must be completed by a third-party compliance inspector certified under 567—Chapter 134.

(3) The owner or operator of a site undergoing a change in ownership shall designate a Class B operator prior to bringing the UST system into operation. The Class B operator must conduct an inspection using the department's inspection checklist and submit the completed checklist along with the change of ownership form prior to operation. If a UST system was temporarily closed, the Class B operator shall ensure that the department's checklist for returning a UST to service is followed and that the necessary documentation is submitted to the department prior to operation of the UST system.

*c. Class C operator.* A Class C operator is an on-site employee who typically controls or monitors the dispensing or sale of regulated substances and is the first to respond to events indicating emergency conditions. A Class C operator must be present at the facility at all times during normal operating hours. A Class C operator monitors product transfer operations to ensure that spills and overfills do not occur. The Class C operator must know how to properly respond to spills, overfills and alarms when they do occur. In

the event of a spill, overfill or alarm, a Class C operator shall notify the Class A and Class B operators, as well as the department and appropriate local emergency authorities as required by rule.

(1) Written basic operating instructions, emergency contact names and telephone numbers, and basic procedures specific to the facility shall be provided to all Class C operators and readily available on site.

(2) There may be more than one Class C operator at a storage tank facility, but not all employees of a facility need be Class C operators.

**135.4(8)** *UST operator training course requirements.* Individuals must attend a department-approved training course covering material designated for each operator class. Individuals must attend every session of the training, take the examination, and attend examination review.

*a. Class A operators.* To be certified as a Class A operator, the applicant must successfully complete a department-approved training course that covers underground storage tank system requirements as outlined in 567—Chapters 134 through 136. The course must also provide a general overview of the department's UST program, purpose, groundwater protection goals, public safety and administrative requirements. The training must include but is not limited to the following:

(1) Components and materials of underground storage tank systems.

(2) A general discussion of the content of PEI/RP900, Recommended Practices for the Inspection and Maintenance of UST Systems, and PEI/RP500, Recommended Practices for Inspection and Maintenance of Motor Fuel Dispensing Equipment.

(3) Spill and overfill prevention, to include the American Petroleum Institute (API) Publication RP1621, "Recommended Practice for Bulk Liquid Stock Control at Retail Outlets," and National Fire Protection Association Standard 30, "Flammable and Combustible Liquids Code."

(4) Ensuring product delivery to the correct tank by using color-symbol codes in the API Standard RP1637, "Using the API Color-Symbol System to Mark Equipment and Vehicles for Product Identification at Service Stations and Distribution Terminals."

(5) Proper fuel ordering and delivery, including procedures in API RP1007, "Loading and Unloading of MC/DOT 406 Cargo Tank Motor Vehicles."

(6) Release detection methods and related reporting requirements.

(7) Corrosion protection and inspection requirements, including the requirement to have a department-certified cathodic protection tester.

(8) Discussion of the benefits of monthly or frequent inspections and content and use of inspection checklists. Training materials for operators shall include the department's "Iowa UST Operator Inspection Checklist" or a checklist template similar to the department's document.

(9) Requirement and content of third-party compliance inspections.

(10) How to properly respond to an emergency, including hazardous conditions.

(11) Product and equipment compatibility, including the department's ethanol compatibility guidance and certification.

(12) Financial responsibility, including detailed explanation of liability, notice and claim procedures, and the six-month window to check for and report a release prior to insurance termination to maintain coverage for corrective action.

(13) Notification of installation and storage tank registration requirements.

(14) Requirement to use department-certified companies and individuals for UST installation, testing, lining, and removal.

(15) Temporary and permanent closure procedures and requirements.

(16) NESHAP vapor recovery requirements.

(17) Conditions under which the department may stop fuel delivery and take enforcement action.

(18) Ensuring that annual tank management fees are paid.

(19) Ensuring that suspected and confirmed releases are investigated and reported according to 135.6(1).

*b. Class B operators.* To be certified as a Class B operator, the individual must successfully complete a department-approved training course that provides in-depth understanding of UST system regulations applicable to this class. Training must also provide a general overview of the department's UST program, purpose, groundwater protection goals, public safety and administrative requirements. Training shall cover

the operation and maintenance requirements set forth in this chapter, including but not limited to the following:

(1) A general discussion of the content of PEI/RP900, Recommended Practices for the Inspection and Maintenance of UST Systems, and PEI/RP500, Recommended Practices for Inspection and Maintenance of Motor Fuel Dispensing Equipment.

(2) Components and materials of underground storage tank systems.

(3) Spill and overfill prevention.

(4) Ensuring product delivery to the correct tank by using color-symbol codes in the API Standard RP1637.

(5) Proper fuel ordering and delivery, including procedures from API RP1007.

(6) Methods of release detection and related reporting requirements.

(7) Corrosion protection and related testing.

(8) Requirements of 30-day and annual walkthrough inspections. Training materials for operators shall include the department's "Iowa UST Operator Inspection Checklist" or a checklist template similar to the department's document.

(9) Requirement and content of third-party compliance inspections.

(10) Emergency response, reporting and investigating releases.

(11) Product and equipment compatibility, including the department's ethanol compatibility guidance and certification.

(12) Financial responsibility, including detailed explanation of liability, notice and claim procedures, and the six-month window to check for and report a release prior to insurance termination to maintain coverage for corrective action.

(13) Notification of installation and storage tank registration requirements.

(14) Requirement to use department-certified companies and individuals for UST installation, testing, lining, and removal.

(15) Reporting and recordkeeping requirements.

(16) Overview of Class C operator training requirements.

(17) NESHAP vapor recovery requirements.

(18) Conditions under which the department may stop fuel delivery and take enforcement action.

(19) Requirements for facilities that operate unstaffed at any time.

*c. Class C operators.* To be certified as a Class C operator, an individual must complete a department-approved training course. A Class A or Class B operator who has completed a department-approved training course may provide the Class C training. Class C operator training must include at a minimum:

(1) A general overview of the department's UST program and purpose;

(2) Groundwater protection goals;

(3) Public safety;

(4) UST system overview;

(5) Administrative requirements; and

(6) Action to be taken in response to an emergency condition due to a spill or release from a UST system.

Training must include written procedures for the Class C operator, including notification instructions necessary in the event of emergency conditions. The written instructions and procedures must be readily available on site. A Class A or Class B operator may provide additional on-site Class C training specific to the operator's UST system.

**135.4(9) Examination and review requirement.** Class A and Class B operators must complete the department-approved training course and take an examination to verify their understanding and knowledge. The examination may include both written and practical (hands-on) testing activities. The trainer must follow up the examination with a review of missed test questions with the class or individual to ensure understanding of problem areas. Upon successful completion of the training course, the applicant will receive a certificate verifying the applicant's status as a Class A, Class B, or Class C operator.

*a. Reciprocity.* The department may waive the training course for operators upon a showing of successful completion of a training course and examination approved by another state or regulatory agency that the department determines are substantially equivalent to the UST requirements contained in this chapter.

*b. Transferability to another UST site.* Class A and Class B operators may transfer to other UST facilities in Iowa provided the operator is properly designated by the facility owner as a Class A or Class B operator according to 567—subrule 135.4(11). Class A and Class B operators transferring from other states shall seek prior approval of training qualifications, unless the department has preapproved the out-of-state program as substantially equivalent to the requirements of this chapter.

**135.4(10)** *Timing of UST operator training.*

*a.* An owner shall ensure that Class A, Class B, and Class C operators are trained by approved training providers before an operator assumes duties of that class of operator.

*b.* When a Class A or Class B operator is replaced, a new operator must be trained prior to assuming duties for that class of operator. A copy of the certificate of training must be submitted to the department within 30 days of assuming duties.

*c.* Class C operators must be trained before assuming the duties of a Class C operator. Written basic operating instructions, emergency contact names and telephone numbers, and basic procedures specific to the facility shall be provided to all Class C operators and readily available on site. A Class C operator may be briefed on these procedures concurrent with annual safety training required under Occupational Safety and Health Administration regulations, 29 CFR, Part 1910.

**135.4(11)** *Documentation of operator training.*

*a.* The owner of an underground storage tank facility shall maintain a list of designated operators. The list shall be made available to the department in accordance with 135.4(5). The list shall represent the current Class A, Class B and Class C operators for the UST facility and must include:

(1) The name of each operator and the operator's class(es); contact information for Class A and Class B operators; the date each operator successfully completed initial training and refresher training, if any; the name of the company providing the training; and the name of the trainer.

(2) For all classes of operators, the site(s) for which an operator is responsible if more than one site.

*b.* A copy of the certificates of training for Class A and Class B operators shall be on file and readily available for inspection in accordance with 135.4(5). Records verifying completion of training or retraining of Class A, Class B, and Class C operators must identify name of trainee, date trained, operator training class completed, and list the name of the trainer or examiner and the training company name, address, and telephone number. Owners and operators must maintain these records for as long as Class A, Class B, and Class C operators are designated.

*c.* A copy of the certificates of training for Class B and Class C operators shall be available at each facility for which the operator is responsible.

**135.4(12)** *Periodic testing of spill prevention equipment and containment sumps used for interstitial monitoring of piping and periodic inspection of overfill prevention equipment.*

*a.* Owners and operators of UST systems with spill and overfill prevention equipment and containment sumps used for interstitial monitoring of piping must meet these requirements to ensure the equipment is operating properly and will prevent releases to the environment:

(1) Spill prevention equipment (such as a catchment basin, spill bucket, or other spill containment device) and containment sumps used for interstitial monitoring of piping must prevent releases to the environment by meeting one of the following:

1. The equipment is double walled and the integrity of both walls is periodically monitored at a frequency of not less than the frequency of the walkthrough inspections described in 135.4(13). If owners and operators discontinue periodic monitoring of this equipment, they must begin meeting 135.4(12) "a"(1) "2" and conduct a test within 30 days of discontinuing periodic monitoring of this equipment; or

2. The spill prevention equipment and containment sumps used for interstitial monitoring of piping are tested at least once every three years to ensure the equipment is liquid tight by using vacuum, pressure, or liquid testing in accordance with one of the following criteria:

- Requirements developed by the manufacturer (Note: Owners and operators may use this option only if the manufacturer has developed requirements); or
- A code of practice developed by a nationally recognized association or independent testing laboratory; or
- Requirements determined by the department to be no less protective of human health and the environment than the requirements listed in this subrule.

(2) Overfill prevention equipment must be inspected at least once every three years. At a minimum, the inspection must ensure that overfill prevention equipment is set to activate at the correct level specified in 135.3(1)“c” and will activate when regulated substance reaches that level. Inspections must be conducted in accordance with one of the following criteria:

1. Requirements developed by the manufacturer (Note: Owners and operators may use this option only if the manufacturer has developed requirements); or
2. A code of practice developed by a nationally recognized association or independent testing laboratory; or
3. Requirements determined by the department to be no less protective of human health and the environment than the requirements listed in this subrule.
  - b. Owners and operators must begin meeting these requirements as follows:
    - (1) For UST systems in use on or before June 23, 2021, the initial spill prevention equipment test and overfill prevention equipment inspection must be conducted not later than October 13, 2021.
    - (2) For UST systems brought into use after June 23, 2021, these requirements apply at installation.
  - c. Owners and operators must maintain records as follows for spill prevention equipment and overfill prevention equipment:
    - (1) All records of testing or inspection must be maintained for three years; and
    - (2) For spill prevention equipment and containment sumps used for interstitial monitoring of piping not tested every three years, documentation showing that the prevention equipment is double-walled and the integrity of both walls is periodically monitored must be maintained for as long as the equipment is periodically monitored.

NOTE: The code of practice referenced in 40 CFR 280.35(a)(2) may be used to comply with this section.

**135.4(13)** *Periodic operation and maintenance walkthrough inspections.* Conduct inspections to properly operate and maintain UST systems.

a. Conduct a walkthrough inspection every 30 days that, at a minimum, checks the following equipment as specified below (Exception: spill prevention equipment at UST systems receiving deliveries at intervals greater than every 30 days may be checked prior to each delivery):

- (1) Spill prevention equipment: visually check for damage; remove liquid or debris; check for and remove obstructions in the fill pipe; check the fill cap to make sure it attaches securely on the fill pipe and gasket is in good condition; and, for double-walled spill prevention equipment with interstitial monitoring, check for a leak in the interstitial area, and
- (2) Release detection equipment: check to make sure the release detection equipment is operating with no alarms or other unusual operating conditions present, and ensure records of release detection testing are reviewed and current.

b. Conduct a walkthrough inspection annually, at a minimum, checking the following equipment as specified below:

- (1) Containment sumps: visually check for damage, leaks to the containment area, or releases to the environment; remove liquid (in contained sumps) or debris; and, for double-walled sumps with interstitial monitoring, check for a leak in the interstitial area, and
- (2) Handheld release detection equipment: check devices such as tank gauge sticks or groundwater bailers for operability and serviceability;

c. Conduct operation and maintenance walkthrough inspections according to a standard code of practice developed by a nationally recognized association or independent testing laboratory that checks equipment comparable to 135.4(13)“a” and “b”; or

NOTE regarding 135.4(13) “c”: The code of practice referenced in 40 CFR 280.36(a)(2) may be used to comply with 135.4(13) “c.”

d. Conduct operation and maintenance walkthrough inspections developed by the department that checks equipment comparable to 135.4(13) “a” and “b.”

e. Owners and operators must maintain records (in accordance with 135.4(5)) of operation and maintenance walkthrough inspections for 12 consecutive months. Records must include a list of each area checked, whether each area checked was acceptable or needed action taken, a description of actions taken to correct an issue, and delivery records if spill prevention equipment is checked less frequently than every 30 days due to infrequent deliveries.

[ARC 0491D, IAB 8/19/26, effective 9/23/26]

#### **567—135.5(455B) Release detection.**

##### **135.5(1) General requirements for all UST systems.**

a. Owners and operators of UST systems must provide a method, or combination of methods, of release detection that:

(1) Can detect a release from any portion of the tank and the connected underground piping that routinely contains product;

(2) Is installed and calibrated in accordance with the manufacturer’s instructions, including routine maintenance and service checks for operability or running condition; and

(3) Beginning October 13, 2021, is operated and maintained, and electronic and mechanical components are tested for proper operation, in accordance with one of the following:

1. Manufacturer’s instructions;

2. A code of practice developed by a nationally recognized association or independent testing laboratory; or

3. Requirements determined by the department to be no less protective of human health and the environment than the two options listed above.

(4) A test of the proper operation must be performed at least annually and, at a minimum, as applicable to the facility, cover the following components and criteria:

1. Automatic tank gauge and other controllers: test alarm, verify system configuration, test battery backup;

2. Probes and sensors: inspect for residual buildup, ensure floats move freely, ensure shaft is not damaged, ensure cables are free of kinks and breaks, test alarm operability or running condition and communication with controller;

3. Automatic line leak detector: test operation to meet criteria in 135.5(5) “a” by simulating a leak;

4. Vacuum pumps and pressure gauges: ensure proper communication with sensors and controller; and

5. Handheld electronic sampling equipment associated with groundwater and vapor monitoring: ensure proper operation.

The code of practice referenced in 40 CFR 280.40(a)(3) may be used to comply with 135.5(1) “a”(3) and “a”(4).

(5) Meets the performance requirements in 135.5(4) or 135.5(5), with any performance claims and their manner of determination described in writing by the equipment manufacturer or installer. In addition, methods conducted in accordance with 135.5(4) “b,” “c,” and “d” and 135.5(5) “a” and “b” must be capable of detecting the leak rate or quantity specified for that method with a probability of detection of 0.95 and a probability of false alarm of 0.05.

b. When an owner and operator continually show the inability to conduct leak detection with the method being used, the department may require the owner and operator to find an alternative leak detection method.

c. Any UST system that cannot apply a method of release detection that complies with the requirements of this rule must complete the closure procedures in 567—135.15(455B). For previously deferred UST systems described in 567—135.1(455B) and 567—135.20(455B), this requirement applies after the effective dates described in 135.1(3) and 567—135.20(455B).

d. Any UST facility that uses pressurized piping and dispenses product in the absence of a Class A, B, or C operator shall comply with the following requirements:

- (1) Employ automatic line leak detectors that do one or more of the following:
  1. Shut down the submersible pump when a leak is detected.
  2. Restrict the flow of product when a leak is detected.
  3. Trigger an audible or visual alarm when a leak is detected.
- (2) At facilities implementing 135.5(1) "d"(1)"2" or "3," the facility's operator shall be notified or shall conduct a visit through one of the following methods:
  1. Notification of the Class B operator by immediate electronic communication.
  2. An approved emergency procedures sign shall be posted in a conspicuous location and shall read:  
IN CASE OF FIRE, SPILL OR RELEASE  
1. USE EMERGENCY PUMP SHUTOFF  
2. REPORT THE ACCIDENT!  
FIRE DEPARTMENT TELEPHONE NO. \_\_\_\_\_  
FACILITY ADDRESS & PHONE NUMBER \_\_\_\_\_  
IN THE EVENT OF AN ALARM OR SLOW FLOW, CONTACT THE FACILITY.
  3. Daily visit to the site by a Class A, B, or C operator or designee. Visits shall include observation of every automatic line leak detector for shutdown, alarm, or restricted flow conditions. Methods of observing for restricted flow conditions may include dispensing product into a proper container or personal vehicle, observing a customer dispense product into a vehicle, or another method approved by the department. Owners and operators shall maintain an onsite log of site visits to demonstrate compliance with this provision. The log shall include the name of the observer and method used to observe the status of the automatic line leak detectors.

(3) All UST facilities subject to 135.5(1) "d" must comply with its provisions by July 1, 2014.

**135.5(2)** *Requirements for petroleum UST systems.* Owners and operators of petroleum UST systems must provide release detection for tanks and piping as follows:

a. *Tanks.* Tanks must be monitored at least every 30 days for releases using one of the methods listed in 135.5(4) "d" through "i" except that:

(1) Tanks installed after November 28, 2007, must use interstitial monitoring of the secondary containment as the primary leak detection method in accordance with 135.5(4) "g."

(2) Tanks installed on or before November 28, 2007, with capacity of 550 gallons or less and tanks with a capacity of 551 to 1,000 gallons that meet the tank diameter criteria in 135.5(4) "b" may use manual tank gauging (conducted in accordance with 135.5(4) "b").

b. *Piping.* Underground piping that routinely contains regulated substances must be monitored for releases in a manner that meets one of the following requirements:

- (1) Pressurized piping. Underground piping that conveys regulated substances under pressure must:
  1. Be equipped with an automatic line leak detector conducted in accordance with 135.5(5) "a"; and
  2. Have an annual line tightness test conducted in accordance with 135.5(5) "b" or have monthly monitoring conducted in accordance with 135.5(5) "c." Piping installed after November 28, 2007, must use interstitial monitoring of the piping secondary containment in accordance with 135.5(5) "d."

(2) Suction piping. Underground piping that conveys regulated substances under suction must either have a line tightness test conducted at least every three years and in accordance with 135.5(5) "b," or use a monthly monitoring method conducted in accordance with 135.5(5) "c." Remote fill is considered suction piping. No release detection is required for suction piping that is designed and constructed to meet the following standards:

1. The below-grade piping operates at less than atmospheric pressure;
  2. The below-grade piping is sloped so that the contents of the pipe will drain back into the storage tank if the suction is released;
  3. Only one check valve is included in each suction line;
  4. The check valve is located directly below and as close as practical to the suction pump; and
  5. A method is provided that allows compliance with "2" through "4" to be readily determined.
- (3) Piping installed or replaced must meet one of the following:

1. Pressurized piping must be monitored for releases at least every 30 days in accordance with 135.5(5) “d” and be equipped with an automatic line leak detector.

2. Suction piping must be monitored for releases at least every 30 days. No release detection is required for suction piping that meets 135.5(5) “b”(2)“1” through “5.”

**135.5(3) Requirements for hazardous substance UST systems.** Owners and operators of hazardous substance UST systems must have containment that meets the following requirements and monitor these systems pursuant to 135.5(4) “g” at least every 30 days:

a. Secondary containment systems must be designed, constructed and installed to:

(1) Contain regulated substances leaked from the primary containment until they are detected and removed;

(2) Prevent the release of regulated substances to the environment at any time during the operational life of the UST system; and

(3) Be checked for evidence of a release at least every 30 days.

b. Double-walled tanks must be designed, constructed, and installed to:

(1) Contain a leak from any portion of the inner tank within the outer wall; and

(2) Detect the failure of the inner wall.

c. External liners (including vaults) must be designed, constructed, and installed to:

(1) Contain 100 percent of the capacity of the largest tank within its boundary;

(2) Prevent the interference of precipitation or groundwater intrusion with the ability to contain or detect a release of regulated substances; and

(3) Surround the tank completely (i.e., it is capable of preventing lateral as well as vertical migration of regulated substances).

d. Underground piping must be equipped with secondary containment that satisfies the requirements of this subrule (e.g., trench liners, jacketing of double-walled pipe). In addition, underground piping that conveys regulated substances under pressure must be equipped with an automatic line leak detector in accordance with 135.5(5) “a”;

e. For hazardous substance UST systems installed on or before November 28, 2007, other methods of release detection may be used if owners and operators:

(1) Demonstrate to the department that an alternate method can detect a release of the stored substance as effectively as any of the methods allowed in 135.5(4) “b” through “i” can detect a release;

(2) Provide information to the department on effective corrective action technologies, health risks, and chemical and physical properties of the stored substance, and the characteristics of the UST site; and

(3) Obtain approval from the department to use the alternate release detection method before the installation and operation of the new UST system.

**135.5(4) Methods of release detection for tanks.** Each method of release detection for tanks used to meet the requirements of 135.5(2) must be conducted in accordance with the following:

a. *Inventory control.* Product inventory control (or another test of equivalent performance) must be conducted monthly to detect a release of at least 1.0 percent of flow-through plus 130 gallons on a monthly basis in the following manner:

(1) Inventory volume measurements for regulated substance inputs, withdrawals, and the amount still remaining in the tank are recorded each operating day;

(2) The equipment used is capable of measuring the level of product over the full range of the tank’s height to the nearest 1/8 inch;

(3) The regulated substance inputs are reconciled with delivery receipts by measurement of the tank inventory volume before and after delivery;

(4) Deliveries are made through a drop tube that extends to within one foot of the tank bottom;

(5) Product dispensing is metered and recorded within the local standards for meter calibration or an accuracy of six cubic inches for every five gallons of product withdrawn; and

(6) The measurement of any water level in the bottom of the tank is made to the nearest 1/8 inch at least once a month.

NOTE: Practices described in 40 CFR 280.43(a)(6) may be used, where applicable, as guidance in meeting the requirements of 135.5(4) “a”(1) through “a”(6).

b. *Manual tank gauging.* Manual tank gauging must meet the following requirements:

- (1) Tank liquid level measurements are taken at the beginning and end of the test period during which no liquid is added to or removed from the tank;
- (2) Level measurements are based on an average of two consecutive stick readings at both the beginning and ending of the period;
- (3) The equipment is capable of measuring the level of product over the full range of the tank's height to the nearest 1/8 inch;
- (4) A release is suspected and subject to the requirements of 567—135.6(455B) if the variation between the beginning and ending measurements exceeds the weekly or monthly standards in the following table. Immediately contact the department if these standards are exceeded.

| Nominal Tank Capacity                                              | Minimum Duration of Test | Weekly Standard (one test) | Monthly Standard (four-test average) |
|--------------------------------------------------------------------|--------------------------|----------------------------|--------------------------------------|
| 550 gallons or less                                                | 36 hours                 | 10 gallons                 | 5 gallons                            |
| 551-1,000 gallons<br>(when tank diameter is 64 inches)             | 44 hours                 | 9 gallons                  | 4 gallons                            |
| 551-1,000 gallons<br>(when tank diameter is 48 inches)             | 58 hours                 | 12 gallons                 | 6 gallons                            |
| 551-1,000 gallons<br>(also requires annual tank tightness testing) | 36 hours                 | 13 gallons                 | 7 gallons                            |
| 1,001-2,000 gallons<br>(also requires annual tank tightness test)  | 36 hours                 | 26 gallons                 | 13 gallons                           |

(5) Only those tanks of 550 gallons or less nominal capacity or tanks of 551 to 1,000 gallons nominal capacity with diameters of 64 inches or 48 inches may use this as the sole method of release detection. Other tanks of 551 to 2,000 gallons may use this method in place of inventory control in 135.5(4)“a.” Tanks of greater than 2,000 gallons nominal capacity may not use this method to meet the requirements of this rule.

c. *Tank tightness testing.* Tank tightness testing (or another test of equivalent performance) must be capable of detecting a 0.1 gallon-per-hour leak rate from any portion of the tank that routinely contains product while accounting for the effects of thermal expansion or contraction of the product, vapor pockets, tank deformation, evaporation or condensation, and the location of the water table.

The tank tightness test procedure must be certified by a third party and meet US EPA testing procedures. The testing procedures are found in *Standard Test Procedures for Evaluating Leak Detection Methods: Volumetric Tank Tightness Testing Methods* (EPA /530/UST-90/004) March 1990 or as revised by EPA or *Non-Volumetric Tank Tightness Testing Methods* (EPA /530/UST-90/005) March 1990 or as revised by EPA.

d. *Automatic tank gauging.* Equipment for automatic tank gauging that tests for the loss of product and conducts inventory control must meet the following requirements:

- (1) The automatic product level monitor test can detect a 0.2 gallon-per-hour leak rate from any portion of the tank that routinely contains product;
- (2) The automatic tank gauging equipment must meet the inventory control (or other test of equivalent performance) requirements of 135.5(4)“a”;
- (3) The leak test must be performed according to manufacturer specifications;
- (4) The automatic tank gauging equipment must be certified by a third party and meet US EPA testing procedures in *Standard Test Procedures for Evaluating Leak Detection Methods: Automatic Tank Gauging Systems* (ATGS) (EPA /530/UST-90/006) March 1990 or as revised by US EPA; and
- (5) The test must be performed with the system operating in one of the following modes:
  1. In-tank static testing conducted at least once every 30 days; or
  2. Continuous in-tank leak detection operating on an uninterrupted basis or operating within a process that allows the system to gather incremental measurements to determine the leak status of the tank at least once every 30 days.

e. *Vapor monitoring.* Testing or monitoring for vapors within the soil gas of the excavation zone must meet the following requirements:

(1) The materials used as backfill are sufficiently porous (e.g., gravel, sand, crushed rock) to readily allow diffusion of vapors from releases into the excavation area;

(2) The stored regulated substance, or a tracer compound placed in the tank system, is sufficiently volatile (e.g., gasoline) to result in a vapor level that is detectable by the monitoring devices located in the excavation zone in the event of a release from the tank;

(3) The measurement of vapors by the monitoring device is not rendered inoperative by the groundwater, rainfall, or soil moisture or other known interferences so that a release could go undetected for more than 30 days;

(4) The level of background contamination in the excavation zone will not interfere with the method used to detect releases from the tank;

(5) The vapor monitors are designed and operated to detect any significant increase in concentration above background of the regulated substance stored in the tank system, a component or components of that substance, or a tracer compound placed in the tank system;

(6) In the UST excavation zone, the site is assessed to ensure compliance with the requirements in 135.5(4)“e”(1) through “e”(4) and to establish the number and positioning of monitoring wells that will detect releases within the excavation zone from any portion of the tank that routinely contains product;

(7) Monitoring wells are clearly marked and secured to avoid unauthorized access and tampering; and

(8) The vapor product detector must be certified by a third party and meet US EPA testing procedures in *Standard Test Procedures for Evaluating Leak Detection Methods: Vapor-Phase Out-of-Tank Product Detectors* (EPA/530/UST-90/008) March 1990 or as revised by US EPA.

*f. Groundwater monitoring.* Testing or monitoring for liquids on the groundwater must meet the following requirements:

(1) The regulated substance stored is immiscible in water and has a specific gravity of less than 1;

(2) Groundwater is never more than 20 feet from the ground surface and the hydraulic conductivity of the soil(s) between the UST system and the monitoring wells or devices is not less than 0.01 cm/sec (e.g., the soil should consist of gravels, coarse to medium sands, coarse silts or other permeable materials);

(3) The slotted portion of the monitoring well casing must be designed to prevent migration of natural soils or filter pack into the well and to allow entry of regulated substance on the water table into the well under both high and low groundwater conditions;

(4) Monitoring wells shall be sealed from the ground surface to the top of the filter pack;

(5) Monitoring wells or devices intercept the excavation zone or are as close to it as is technically feasible;

(6) The continuous monitoring devices or manual methods used can detect the presence of at least 1/8 inch of free product on top of the groundwater in the monitoring wells;

(7) Within and immediately below the UST system excavation zone, the site is assessed to ensure compliance with the requirements in 135.5(4)“f”(1) through “f”(5) and to establish the number and positioning of monitoring wells or devices that will detect releases from any portion of the tank that routinely contains product; and

(8) Monitoring wells are clearly marked and secured to avoid unauthorized access and tampering.

*g. Interstitial monitoring.* Interstitial monitoring between the UST system and a secondary barrier immediately around or beneath it may be used, but only if the system is designed, constructed and installed to detect a leak from any portion of the tank that routinely contains product and also meets one of the following requirements:

(1) For secondary containment systems, the sampling or testing method must be able to detect a leak through the inner wall in any portion of the tank that routinely contains product:

1. Continuously, by means of an automatic leak sensing device that signals to the operator the presence of any regulated substance in the interstitial space; or

2. Monthly, by means of a procedure capable of detecting the presence of any regulated substance in the interstitial space.

3. The interstitial space shall be maintained and kept free of liquid, debris or anything that could interfere with leak detection capabilities.

(2) For UST systems with a secondary barrier within the excavation zone, the sampling or testing method used can detect a leak between the UST system and the secondary barrier:

1. The secondary barrier around or beneath the UST system consists of artificially constructed material that is sufficiently thick and impermeable (at least  $10^{-6}$  cm/sec for the regulated substance stored) to direct a leak to the monitoring point and permit its detection;

2. The barrier is compatible with the regulated substance stored so that a leak from the UST system will not cause a deterioration of the barrier allowing a release to pass through undetected;

3. For cathodically protected tanks, the secondary barrier must be installed so that it does not interfere with the proper operation of the cathodic protection system;

4. The groundwater, soil moisture, or rainfall will not render the testing or sampling method used inoperative so that a release could go undetected for more than 30 days;

5. The site is assessed to ensure that the secondary barrier is always above the groundwater and not in a 25-year flood plain, unless the barrier and monitoring designs are for use under such conditions; and

6. Monitoring wells are clearly marked and secured to avoid unauthorized access and tampering.

(3) For tanks with an internally fitted liner, an automated device can detect a leak between the inner wall of the tank and the liner, and the liner is compatible with the substance stored.

*h. Statistical inventory reconciliation.* Release detection methods based on the application of statistical principles to inventory data that test for the loss of product must meet the following requirements:

- (1) Use a leak threshold that does not exceed one-half the minimum detectable leak rate;

- (2) The statistical test must be able to detect at least a 0.2 gallon per hour leak rate from any portion of the tank that routinely contains product; and

- (3) The report by the SIR company must be a quantitative result with a calculated leak rate and include the leak threshold (leak rate at which a leak is declared), the calculated leak rate (leak rate calculated from the inventory records) and minimum detectable leak rate (minimum leak rate that can be determined from the inventory records).

1. A “pass” means that the calculated leak rate for the data set is less than the leak threshold and the minimum detectable leak rate is less than or equal to the certified performance standard;

2. A “fail” means the calculated leak rate for the data set is equal to or greater than the leak threshold;

3. An “inconclusive” means the minimum detectable leak rate exceeds the certified performance standard and the calculated leak rate is less than the leak threshold. If for any other reason the test result is not a “pass” or “fail,” the result is “inconclusive”;

- (4) Owners and operators must notify the department in accordance with 567—135.6(455B) when a monthly SIR report of “fail” occurs or two consecutive inconclusive results occur.

- (5) Owners and operators must assure the SIR analytical results are complete and available to the department upon request.

- (6) The statistical inventory reconciliation method must be certified by a third party and meet US EPA testing procedures in *Standard Test Procedures for Evaluating Release Detection Methods: Statistical Inventory Reconciliation* (EPA 510-B-19-004) May 2019 or as revised by EPA.

*i. Other methods.* Any other type of release detection method, or combination of methods, can be used if:

- (1) It can detect a 0.2 gallon-per-hour leak rate or a release of 150 gallons within a month with a probability of detection of 0.95 and a probability of false alarm of 0.05; or

- (2) The department may approve another method if the owner and operator can demonstrate that the method can detect a release as effectively as any of the methods allowed in 135.5(5) “c” through “h.” In comparing methods, the department shall consider the size of release that the method can detect and the frequency and reliability with which it can be detected. If the method is approved, the owner and operator must comply with any conditions imposed by the department on its use to ensure the protection of human health and the environment.

**135.5(5) Methods of release detection for piping.** Each method of release detection for piping used to meet the requirements of 135.5(2) must be conducted in accordance with the following:

*a. Automatic line leak detectors.* Methods that alert the operator to the presence of a leak in pressurized piping by restricting or shutting off the flow of regulated substances through piping or triggering an audible or visual alarm may be used only if they detect leaks of 3 gallons per hour at 10 pounds per square inch line pressure within one hour. An annual test of the operation of the leak detector must be conducted in accordance with 135.5(1)“a.”

*b. Line tightness testing.* A periodic test of piping may be conducted only if it can detect a 0.1 gallon-per-hour leak rate at one and one-half times the operating pressure. The line leak detection method must be certified by a third party and meet US EPA testing procedures in *Standard Test Procedures for Evaluating Release Detection Methods: Pipeline Release Detection* (EPA 510-B-19-005) May 2019 or as revised by EPA.

*c. Applicable tank methods.* Except as described in 135.5(2)“a,” any of the methods in 135.5(4)“e” through “i” may be used if they are designed to detect a release from any portion of the underground piping that routinely contains regulated substances.

*d. Interstitial monitoring of secondary containment.* Interstitial monitoring may be used for any piping with secondary containment designed for and capable of interstitial monitoring.

(1) Leak detection shall be conducted:

1. Continuously, by means of an automatic leak sensing device that signals to the operator the presence of any regulated substance in the interstitial space or containment sump; or

2. Monthly, by means of a procedure capable of detecting the presence of any regulated substance in the interstitial space or containment sump, such as visual inspection.

(2) The interstitial space or sump shall be maintained and kept free of water, debris or anything that could interfere with leak detection capabilities.

(3) At least every two years, any sump shall be visually inspected for integrity of sides and floor and tightness of piping penetration seals. Any automatic sensing device shall be tested for proper function.

**135.5(6) Release detection recordkeeping.** All UST system owners and operators must maintain records in accordance with 135.4(5) demonstrating compliance with all applicable requirements of this rule. These records must include the following:

*a.* All written performance claims pertaining to any release detection system used, and the manner in which these claims have been justified or tested by the equipment manufacturer or installer, must be maintained for five years, or for another reasonable period of time determined by the department, from the date of installation. Records of site assessments required for vapor monitoring under 135.5(4)“e”(6) and groundwater monitoring under 135.5(4)“f”(7) must be maintained for as long as the methods are used. Records of site assessments must be signed by a professional engineer or professional geologist, or equivalent certified professional with experience in environmental engineering, hydrogeology, or other relevant technical discipline acceptable to the department;

*b.* The results of any sampling, testing, or monitoring must be maintained for at least one year, or for another reasonable period of time determined by the department, except as follows:

(1) The results of tank tightness testing conducted in accordance with 135.5(4)“c” must be retained until the next test is conducted; and

(2) The results of annual operation tests conducted in accordance with 135.5(1)“a”(3) and “a”(4), must be maintained for three years. At a minimum, the results must list each component tested, indicate whether each component tested meets criteria in 135.5(1)“a”(3) and “a”(4), or needs to have action taken, and describe any action taken to correct an issue; and

(3) The results of tank tightness testing, line tightness testing, and vapor monitoring using a tracer compound placed in the tank system conducted in accordance with 567—135.20(455B) must be retained until the next test is conducted; and

*c.* Written documentation of all calibration, maintenance, and repair of release detection equipment permanently located on-site must be maintained for at least one year after the servicing work is completed, or for another reasonable time period determined by the department. Any schedules of required calibration and maintenance provided by the release detection equipment manufacturer must be retained for five years from the date of installation.

**567—135.6(455B) Release reporting, investigation, and confirmation.**

**135.6(1) *Reporting of suspected releases.*** Owners and operators of UST systems must report to the department within 24 hours, or within 6 hours in accordance with 567—Chapter 105 if a hazardous condition exists as defined in 567—105.3(455B), or another reasonable time period specified by the department, and follow the procedures in 135.8(1) for any of the following conditions:

*a.* The discovery by owners and operators or others of released regulated substances at the UST site or in the surrounding area (such as the presence of free product or vapors in soils, basements, sewer and utility lines, and nearby surface water);

*b.* Unusual operating conditions observed by owners and operators (such as the erratic behavior of product dispensing equipment, the sudden loss of product from the UST system, an unexplained presence of water in the tank, or liquid in the interstitial space of secondarily contained systems) unless:

(1) The system equipment or component is found not to be releasing regulated substances to the environment;

(2) Any defective system equipment or component is immediately repaired or replaced; and

(3) For secondarily contained systems, except as provided for in 135.5(4)“g”(2)“4,” any liquid in the interstitial space not used as part of the interstitial monitoring method (for example, brine filled) is immediately removed.

*c.* Monitoring results, including investigation of an alarm, from a release detection method required under 135.5(2) and 135.5(3) that indicate a release may have occurred unless:

(1) The monitoring device is found to be defective, and is immediately repaired, recalibrated or replaced, and additional monitoring does not confirm the initial result; or

(2) The leak is contained in the secondary containment and:

1. Except as provided for in 135.5(4)“g”(2)“4,” any liquid in the interstitial space not used as part of the interstitial monitoring method (for example, brine filled) is immediately removed; and

2. Any defective system equipment or component is immediately repaired or replaced;

(3) In the case of inventory control, a second month of data does not confirm the initial result or the investigation determines no release has occurred; or

(4) The alarm was investigated and determined to be a non-release event (for example, from a power surge or caused by filling the tank during release detection testing).

**135.6(2) *Investigation due to off-site impacts.*** When required by the department, owners and operators of UST systems must follow the procedures in 135.6(3) to determine if the UST system is the source of off-site impacts. These impacts include the discovery of regulated substances (such as the presence of free product or vapors in soils, basements, sewer and utility lines, and nearby surface and drinking waters) that has been observed by the department or brought to its attention by another party.

**135.6(3) *Release investigation and confirmation steps.*** Owners and operators must immediately investigate and confirm all suspected releases of regulated substances requiring reporting under 135.6(1) within seven days, or another reasonable time period specified by the department, using either the following steps or another procedure approved by the department:

*a.* System test. Owners and operators must conduct tests (according to the requirements for tightness testing in 135.5(4)“c” and 135.5(5)“b”) or, as appropriate, secondary containment testing described in 135.4(4).

(1) The test must determine whether:

1. A leak exists in that portion of the tank that routinely contains product, or the attached delivery piping; or

2. A breach of either wall of the secondary containment has occurred.

(2) If the system test confirms a leak into the interstice or a release, owners and operators must repair, replace, upgrade, or close the UST system. In addition, owners and operators must begin corrective action in accordance with 567—135.9(455B) if the test results for the system, tank, or delivery piping indicate a release exists.

(3) Further investigation is not required if the test results for the system, tank, and delivery piping do not indicate a release exists and if environmental contamination is not the basis for suspecting a release.

(4) Owners and operators must conduct a site check as described in 135.6(3) “b” if the test results for the system, tank, and delivery piping do not indicate a release exists but environmental contamination is the basis for suspecting a release.

*b. Site check.* A certified groundwater professional must conduct a site check in accordance with the tank closure in place procedures as provided in 135.15(3) or they may conduct a Tier 1 assessment in accordance with 135.9(3). Under either procedure, the certified groundwater professional must follow the policies and procedures applicable to sites where bedrock is encountered before groundwater as provided in 135.8(5) to avoid creating a preferential pathway for soil or groundwater contamination to reach a bedrock aquifer. The certified groundwater professional must measure for the presence of a release where contamination is most likely to be present at the UST site. The certified groundwater professional must follow the policies and procedures applicable to sites where bedrock is encountered before groundwater as provided in 135.8(5) to avoid creating a preferential pathway for soil or groundwater contamination to reach a bedrock aquifer. In selecting sample types, sample locations, and measurement methods, the certified groundwater professional must consider the nature of the stored substance, the type of initial alarm or cause for suspicion, the type of backfill, the depth of groundwater, and other factors appropriate for identifying the presence and source of the release.

(1) If the test results of the site check indicate action levels in 567—135.14(455B) have been exceeded, owners and operators must begin corrective action in accordance with 567—135.7(455B) through 567—135.12(455B).

(2) If the test results for the excavation zone or the UST site do not indicate a release has occurred, further investigation is not required.

**135.6(4) *Reporting and cleanup of spills and overfills.***

*a. Reportable releases.* Owners and operators of UST systems must contain and immediately clean up a spill, overfill or any aboveground release, and report to the department within 24 hours, or within 6 hours in accordance with 567—Chapter 105 if a hazardous condition exists as defined in 567—105.3(455B) and begin corrective action in accordance with 567—135.7(455B) through 567—135.12(455B) in the cases identified in 40 CFR 280.53(a)(1) and (2).

*b. Nonreportable releases.* Owners and operators of UST systems must contain and immediately clean up a spill, overfill or any aboveground release of petroleum that is less than 25 gallons and a spill, overfill or any aboveground release of a hazardous substance that is less than the reportable quantity. If cleanup cannot be accomplished within 24 hours, owners and operators must immediately notify the department.

NOTE: Any spill or overfill that results in a hazardous condition as defined in 567—105.3(455B) must be reported within 6 hours. This includes the transporter of the product. A release of a hazardous substance equal to or in excess of its reportable quantity must also be reported immediately (rather than within 24 hours) to the National Response Center under Sections 102 and 103 of the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 and to appropriate state and local authorities under Title III of the Superfund Amendments and Reauthorization Act of 1986.

[ARC 0491D, IAB 8/19/26, effective 9/23/26]

**567—135.7(455B) Release response and corrective action for UST systems containing petroleum or hazardous substances.**

**135.7(1) *General.*** Owners and operators of petroleum or hazardous substance UST systems must, in response to a confirmed release from the UST system, comply with the requirements of this rule except for USTs excluded under 135.1(3) “b” and UST systems subject to RCRA Subtitle C corrective action requirements under Section 3004(u) of the Resource Conservation and Recovery Act, as amended.

**135.7(2) *Initial response.*** Upon confirmation of a release in accordance with 135.6(3) or after a release from the UST system is identified in any other manner, owners and operators must perform the following initial response actions within 24 hours of a release or within another reasonable period of time specified by the department:

- a.* Report the release to the department (e.g., by telephone or electronic mail);
- b.* Take immediate action to prevent any further release of the regulated substance into the environment; and

- c. Identify and mitigate fire, explosion, and vapor hazards.

**135.7(3) Initial abatement measures.**

- a. Unless directed to do otherwise by the department, owners and operators must perform the following abatement measures:

- (1) Remove as much of the regulated substance from the UST system as is necessary to prevent further release to the environment;

- (2) Visually inspect any aboveground releases or exposed below-ground releases and prevent further migration of the released substance into surrounding soils and groundwater;

- (3) Continue to monitor and mitigate any additional fire and safety hazards posed by vapors or free product that have migrated from the UST excavation zone and entered into subsurface structures (such as sewers or basements);

- (4) Remedy hazards posed by contaminated soils that are excavated or exposed as a result of release confirmation, site investigation, abatement, or corrective action activities. If these remedies include treatment or disposal of soils, the owner and operator must comply with applicable state and local requirements;

- (5) Investigate to determine the possible presence of free product, and begin free product removal as soon as practicable and in accordance with 135.7(4).

- b. Within 20 days after release confirmation, or within another reasonable period of time determined by the department, owners and operators must submit a report to the department summarizing the initial abatement steps taken under 135.7(3)“a” and any resulting information or data.

**135.7(4) Free product assessment and removal.** The free product assessment and removal requirements in this chapter are primarily concerned with a regulated substance that is present as a light nonaqueous phase liquid (LNAPL) in a monitoring well, boring, excavation, or other location at a thickness of more than 0.01 ft. At sites where investigations under 135.7(3)“a”(5) indicate 0.01 ft. or more of free product, owners and operators must immediately initiate a free product recovery assessment and submit a report in accordance with 135.7(4)“d” and initiate interim free product removal while continuing, as necessary, any actions initiated under 135.7(2) and 135.7(3), or preparing for actions required under 567—135.8(455B) through 567—135.12(455B). Owners and operators must immediately begin interim free product removal by bailing or by installation and maintenance of passive skimming equipment until an alternative removal method is required by or approved by the department. A certified groundwater professional must initially determine the frequency of bailing and proper installation and maintenance of the skimming equipment based on a determination of the recharge rate of the free product. The department may approve implementation of this interim removal process by persons not certified as groundwater professionals. For approval a certified groundwater professional must submit (1) sufficient documentation establishing that the bailing or skimming system has been adequately designed and tested, and (2) a written plan for regular maintenance, reporting and supervision by a certified groundwater professional. Interim free product recovery reports must be submitted to the department on a monthly basis and on forms provided by the department. In meeting the requirements of this subrule, owners and operators must:

- a. Conduct free product removal at a frequency determined by the recharge rate of the product and in a manner that minimizes the spread of contamination into previously uncontaminated zones by using recovery and disposal techniques appropriate to the hydrogeologic conditions at the site, and that properly treats, discharges or disposes of recovery by-products in compliance with applicable local, state and federal regulations. Unless approved by the department, free product assessment and recovery activities must be conducted by a certified groundwater professional. Owners and operators must report the results of free product removal activities on forms designated by the department;

- b. Use abatement of free product migration as a minimum objective for the design of the free product removal system. Free product recovery systems must be designed to remove free product in accordance with 135.7(4)“a”;

- c. Handle any flammable products in a safe and competent manner to prevent fires or explosions; and

- d. Free product recovery assessment and report. Unless directed to do otherwise by the department, prepare and submit to the department, within 45 days after confirming a release, a free product recovery

assessment report and a proposal for subsequent free product removal activities. The free product recovery assessment report and removal proposal must contain at least the following information:

- (1) The name of the person(s) responsible for implementing the free product removal measures;
- (2) The estimated quantity, type and thickness of free product observed or measured in monitoring wells, boreholes, and excavations, the recharge rate in all affected monitoring wells and a detailed description of the procedures used to determine the recharge rate;
- (3) A detailed justification for the free product removal technology proposed for the site. Base the justification narrative on professional judgment considering the characteristics of the free product plume (i.e., estimated volume, type of product, thickness, extent), an assessment of cost effectiveness based on recovery costs compared to alternative methods, site hydrology and geology, when the release event occurred, testing conducted to verify design assumptions and the potential for petroleum vapors or explosive conditions to occur in enclosed spaces. Proposals for removal systems other than hand bailing or passive skimming systems must be completed and submitted on a format consistent with the department's corrective action design report.
- (4) A schematic and narrative description of the free product recovery system used;
- (5) Whether any discharge will take place on site or off site during the recovery operation and where this discharge will be located;
- (6) A schematic and narrative description of the treatment system, and the effluent quality expected from any discharge;
- (7) The steps that have been or are being taken to obtain necessary permits for any discharge;
- (8) The disposition of the recovered free product;
- (9) Free product plume definition and map. The extent of free product must be assessed. If monitoring wells are used to define the free product plume, the number and location of wells and separation distance between the wells used to define the plume must be based on the receptors present and the site hydrology and geology. A minimum of five monitoring wells are required to construct the plume map. The boundary of the plume may be determined by half the distance between wells with free product and wells with no free product. If the groundwater professional can adequately define the plume using other technology as approved by the department, fewer than five wells may be used to define the boundary of the plume;
- (10) The estimated volume of free product present, how the volume was calculated, recoverable volume and estimated recovery time; and
- (11) Identification of all water lines, regardless of construction material, within the area of free product. Water lines and gaskets that are susceptible to petroleum contamination shall be considered within the area of free product if they are located within the boundary of the free product plume as defined by wells unless it can be demonstrated that no LNAPL exists within ten feet (horizontally or vertically) of the water line and the LNAPL is not migrating nor is likely to migrate. Water lines and gaskets that are susceptible to petroleum contamination within the area of free product must be relocated unless the department has approved an alternate plan of construction or it can be demonstrated that mobile LNAPL is not in contact with water lines or gaskets. See 135.12(3) "c."

*e.* The department will review the free product assessment report; and, if approved, the owner or operator must implement the installation of the approved recovery system within 60 days or other time period approved by the department.

*f.* Termination of free product recovery activities. Owners and operators may propose to the department to terminate free product recovery activities when significant amounts of hydrocarbons are not being recovered. The department will consider proposals to terminate free product recovery when the amount of product collected from a monitoring well is equal to or less than 0.1 gallon each month for a year or it is documented that the free product plume has been adequately delineated horizontally and vertically and free product is documented to not be migrating. When free product activities have been terminated based on the recovery rate of equal to or less than 0.1 gallon each month for a year, owners and operators must inspect the monitoring wells monthly for at least a year unless another schedule is approved by the department. The department must be notified and may require that free product recovery activities be reinitiated if during the monthly well inspections it is determined the product thickness in a

monitoring well exceeds 0.02 ft. The monthly well inspection records must be kept available for review by the department.

g. Unless directed to do otherwise by the department, prepare and submit to the department within 180 days after confirming a release, a Tier 2 site cleanup report.

[ARC 0491D, IAB 8/19/26, effective 9/23/26]

**567—135.8(455B) Risk-based corrective action.**

**135.8(1) General.** The objective of risk-based corrective action is to effectively evaluate the risks posed by contamination to human health, safety and the environment using a progressively more site-specific, three-tiered approach to site assessment and data analysis. Based on the tiered assessment, a corrective action response is determined sufficient to remove or minimize risks to acceptable levels. Corrective action response includes a broad range of options including reduction of contaminant concentrations through active or passive methods, monitoring of contamination, use of technological controls or institutional controls.

a. *Tier 1.* The purpose of a Tier 1 assessment is to identify whether a site poses an unreasonable risk to public health and safety or the environment based on limited site data. The objective is to determine maximum concentrations of chemicals of concern at the source of a release(s) in soil and groundwater. The Tier 1 assessment assumes worst-case scenarios in which actual or potential receptors could be exposed to these chemicals at maximum concentrations through certain soil and groundwater pathways. The point of exposure is assumed to be the source showing maximum concentrations. Risk-based screening levels (Tier 1 levels) contained in the Tier 1 Look-Up Table have been derived from models that use conservative assumptions to predict exposure to actual and potential receptors. (These models and default assumptions are contained in Appendix A.) If Tier 1 levels are not exceeded for a pathway, that pathway may not require further assessment. If the maximum concentrations exceed a Tier 1 level, the options are to conduct a more extensive Tier 2 assessment, apply an institutional control, or in limited circumstances excavate contaminated soil to below Tier 1 levels. If all pathways clear the Tier 1 levels, it is possible for the site to obtain a no action required classification.

b. *Tier 2.* The purpose of a Tier 2 assessment is to use site-specific data to assess the risk from chemicals of concern to existing receptors and potential receptors using fate and transport models in accordance with 567—135.10(455B). See 135.10(2)“a.”

c. *Tier 3.* Where site conditions may not be adequately addressed by Tier 2 procedures, a Tier 3 assessment may provide more accurate risk assessment. The purpose of Tier 3 is to identify reasonable exposure levels of chemicals of concern and to assess the risk of exposure to existing and potential receptors based on additional site assessment information, probabilistic evaluations, or sophisticated chemical fate and transport models in accordance with 567—135.11(455B).

d. *Notification.* Whenever the department requires a tiered site assessment and a public water supply well is within 2,500 feet of a leaking underground storage tank site, the department will notify the public water supply operator.

e. *Pathway reevaluation.* Prior to issuance of a no further action certificate in accordance with 135.12(10) and Iowa Code section 455B.474(1)“h”(3), if it is determined that the conditions for an individual pathway that has been classified as “no action required” no longer exist, or the site presents an unreasonable risk to a public water supply well and the model used to obtain the pathway clearance underpredicts the actual contaminant plume, the individual pathway shall be further assessed consistent with the risk-based corrective action provisions in 567—135.8(455B) through 567—135.12(455B).

**135.8(2) Certified groundwater professional.** All assessment, corrective action, data analysis and report development required under 567—135.6(455B) through 567—135.12(455B) must be conducted by or under the supervision of a certified groundwater professional in accordance with these rules and department guidance as specified.

**135.8(3) Chemicals of concern.** Soil and groundwater samples from releases of petroleum regulated substances must always be analyzed for the presence of benzene, ethylbenzene, toluene, and xylenes. In addition, if the release is suspected to include any petroleum regulated substance other than gasoline or gasoline blends, or if the source of the release is unknown, the samples must be tested for the presence of Total Extractable Hydrocarbons (TEH). Appendices A and B and department Tier 2 guidance

define a method for converting TEH values to a default concentration for naphthalene, benzo(a)pyrene, benz(a)anthracene and chrysene and conversion back to a representative TEH value. These default values must be used in order to apply Tier 2 modeling to these constituents in the absence of accurate laboratory analysis.

**135.8(4) Boring depth for sampling.** When drilling for the placement of groundwater monitoring wells, if groundwater is encountered, drilling must continue to the maximum of 10 feet below the first encountered groundwater or to the bottom of soil contamination as estimated by field screening. If groundwater is not encountered, drilling must continue to the deeper of 10 feet below the soil contamination as estimated by field screening or 75 feet from the ground surface.

**135.8(5) Bedrock aquifer assessment.** Prior to conducting any groundwater drilling, a groundwater professional must determine if there is a potential to encounter bedrock before groundwater. These potential areas include (1) areas where karst features or outcrops exist in the vicinity and (2) areas with bedrock less than 50 feet from the surface as illustrated in Tier 1 and Tier 2 guidance. The purpose of this determination is to prevent drilling through contaminated subsurface areas thereby creating a preferential pathway to a bedrock aquifer. If the first encountered groundwater is above bedrock but near the bedrock surface or fluctuates above and below bedrock, the groundwater professional should evaluate the subsurface geology and aquifer characteristics to determine the potential for creating a preferential pathway. If it is determined that the aquifer acts like a nongranular aquifer as provided in 135.10(3) "a" or bedrock is encountered before groundwater, the groundwater professional must conduct a Tier 2 assessment for all pathways under 567—135.10(455B), including the specified bedrock procedures under 135.10(3).

If the first encountered groundwater is above bedrock with sufficient separation and aquifer characteristics to establish that it acts as a granular aquifer, site assessment may proceed under the site check procedure in 567—135.6(455B), the Tier 1 procedure in 567—135.9(455B) or the Tier 2 procedure in 567—135.10(455B) as would be customary regardless of the bedrock designation. However, even under this condition, drilling through bedrock should be avoided in contaminated areas.

[ARC 0491D, IAB 8/19/26, effective 9/23/26]

#### **567—135.9(455B) Tier 1 site assessment policy and procedure.**

**135.9(1) General.** The main objective of a Tier 1 site assessment is to reasonably determine the highest concentrations of chemicals of concern that would be associated with any suspected or confirmed release and an accurate identification of applicable receptors. The potential source of a release, nature of the substance released, site stratigraphy, depth to groundwater, and other appropriate factors must be considered when selecting the sample types, sample locations, and measurements methods. The placement and depth of borings and the construction of monitoring wells must be sufficient to determine the sources of all releases, the vertical extent of contamination, an accurate description of site stratigraphy, and a reliable determination of groundwater flow direction.

*a. Pathway assessment.* The pathways to be evaluated at Tier 1 are the groundwater ingestion pathway, soil leaching to groundwater pathway, groundwater vapor to enclosed space pathway, soil vapor to enclosed space pathway, soil to water line pathway, groundwater to water line pathway and the surface water pathway. Assessment requires a determination of whether a pathway is complete, an evaluation of actual and potential receptors, and a determination of whether conditions are satisfied for obtaining no further action clearance for individual pathways or for obtaining a complete site classification of "no action required." A pathway is considered complete if a chemical of concern has a route that could be followed to reach an actual or potential receptor.

*b. Pathway clearance.* If contaminant concentrations for an individual pathway do not exceed the applicable Tier 1 levels or if a pathway is incomplete, no further action is required to evaluate the pathway unless otherwise specified in these rules. If the contaminant concentrations for a pathway exceed the applicable Tier 1 level(s) in the "Iowa Tier 1 Look-up Table," the response is to conduct further assessment under Tier 2 or Tier 3 unless an effective institutional control is approved. In limited circumstances excavation of contaminated soils may be used as an option to obtain pathway clearance. If further site assessment indicates site data exceeds an applicable Tier 1 level(s) for a previously cleared pathway or the conditions justifying a determination of pathway incompleteness change, that pathway must be reevaluated as part of a Tier 2 or Tier 3 assessment.

c. *Chemical group clearance.* If concentrations for all chemicals of concern within a designated group of chemicals are below the Tier 1 levels, no further action is required as to the group of chemicals unless otherwise specified in these rules. Group one consists of benzene, ethylbenzene, toluene, and xylenes (BTEX). Group two consists of naphthalene, benzo(a)pyrene, benz(a)anthracene and chrysene; TEH default values are incorporated into the Iowa Tier 1 Look-Up Table and Appendix A for group two chemicals.

d. *Site classification.* A site can be classified as no action required only after all pathways have met the conditions for pathway clearance as provided in this rule.

e. *Groundwater sampling procedure.* Groundwater sampling and field screening must be conducted in accordance with department Tier 1 guidance. A minimum of three properly constructed groundwater monitoring wells must be installed, subject to the limitations on maximum drilling depths, for the purpose of identifying maximum concentrations of groundwater contamination, suspected sources of releases, and groundwater flow direction.

(1) Field screening must be used to locate suspected releases and to determine locations with the greatest concentrations of contamination. Field screening is required as per department guidance at each former and current tank basin, each former and current pump island, along the piping, and at any other areas of actual or suspected releases. In placing monitoring wells, the following must be considered: field screening data, available current and historical information regarding the releases, tank and piping layout, site conditions, and drilling data available from sites in the vicinity. At least one well must be placed at each suspected source of release that shall include at a minimum: the pump island with the greatest field screening level, each current and former underground storage tank basin, and if field screening shows greater levels than at the pump islands or tank basins, at other suspected sources of releases. As a general rule, wells should be installed outside of the tank basin through native soils but as close to the tank basin as feasible. A well must be installed in a presumed downgradient direction and within 30 feet of the sample with the greatest field screening level. Three of the wells must be placed in a triangular arrangement to determine groundwater flow direction.

(2) Where the circumstances that prompt a Tier 1 assessment identify a discrete source and cause of a release, and the groundwater professional is able to rule out other suspected sources or contributing sources such as pump islands, piping runs and tank basins, the application of field screening and groundwater well placement may be limited to the known source.

f. *Soil sampling procedure.* The objective of soil sampling is to identify the maximum concentrations of soil contamination in the vadose and saturated zones and to identify sources of releases. The same principles stated above apply to soil sampling. Soil samples must be taken from borings with the greatest field screening levels even if the boring will not be converted to a monitoring well. At a minimum, soil and groundwater samples must be collected for analysis from all borings that are converted to monitoring wells.

Iowa Tier 1 Look-Up Table

| Media                 | Exposure Pathway                    | Receptor                        | Group 1 |         |              |         | Group 2: TEH |           |

|                       | Surface Water                       | All                             | 290     | 1,000   | 3,700        | 73,000  | 75,000       | 40,000    |
| Soil (mg/kg)          | Soil Leaching to Groundwater        | All                             | 0.54    | 42      | 15           | NA      | 3,800        | NA        |

| Media | Exposure Pathway             | Receptor | Group 1 |         |              |         | Group 2: TEH |           |
|-------|------------------------------|----------|---------|---------|--------------|---------|--------------|-----------|
|       |                              |          | Benzene | Toluene | Ethylbenzene | Xylenes | Diesel*      | Waste Oil |
|       | Soil Vapor to Enclosed Space | All      | 1.16    | 48      | 79           | NA      | 47,500       | NA        |
|       | Soil to Water Line           | All      | 2.0     | 3.2     | 45           | 52      | 10,500       | NA        |

NA: Not applicable. There are no limits for the chemical for the pathway, because for groundwater pathways the concentration for the designated risk would be greater than the solubility of the pure chemical in water, and for soil pathways the concentration for the designated risk would be greater than the soil concentration if pure chemical were present in the soil.

TEH: Total Extractable Hydrocarbons. The TEH value is based on risks from naphthalene, benzo(a)pyrene, benz(a)anthracene, and chrysene. Refer to Appendix B for further details.

Diesel\*: Standards in the Diesel column apply to all low volatile petroleum hydrocarbons except waste oil.

**135.9(2) Conditions requiring Tier 1 site assessment.** Unless owners and operators choose to conduct a Tier 2 assessment, the presence of bedrock requires a Tier 2 assessment as provided in 135.8(5), or these rules otherwise require preparation of a Tier 2 site assessment, a Tier 1 site assessment must be completed in response to release confirmation as provided in 567—135.6(455B), or tank closure investigation under 567—135.15(455B), or other reliable laboratory analysis that confirms the presence of contamination above the action levels in 567—135.14(455B).

**135.9(3) Tier 1 assessment report.** Unless directed to do otherwise by the department or the owners or operators choose to prepare a Tier 2 site cleanup report, owners and operators must assemble information about the site and the nature of the release in accordance with the department Tier 1 guidance, including information gained while confirming the release under 567—135.6(455B), tank closure under 567—135.15(455B) or completing the initial abatement measures in 135.7(1) and 135.7(2). This information must include but is not necessarily limited to the following:

- a. Data on the nature and estimated quantity of release.
- b. Results of any release investigation and confirmation actions required by 135.6(3).
- c. Results of the free product investigations required under 135.7(3) “a”(5), to be used by owners and operators to determine whether free product must be recovered under 135.7(4).
- d. Chronology of property ownership and underground storage tank ownership, identification of the person(s) having control of, or having responsibility for the daily operation of the underground storage tanks and the operational history of the underground storage tank system. The operational history shall include but is not limited to a description of or suspected known subsurface or aboveground releases, past remediation or other corrective action, type of petroleum product stored, recent tank and piping tightness test results, any underground storage tank system repairs, upgrades or replacements and the underground storage tank and piping leak detection method being utilized. The operational history shall confirm that current release detection methods and recordkeeping comply with the requirements of 567—135.5(455B), that all release detection records have been reviewed and report any evidence that a release detection standard has been exceeded as provided in 135.5(4) and 135.5(5).
- e. Appropriate diagrams of the site and the underground storage tank system and surrounding land use, identifying site boundaries and existing structures and uses such as residential properties, schools, hospitals, child care facilities and a general description of relevant land use restrictions and known future land use.
- f. Current proof of financial responsibility as required by 567—Chapter 136 and the status of coverage for corrective action under any applicable financial assurance mechanism or other financial assistance program.
- g. A receptor survey including but not limited to the following: existing buildings, enclosed spaces (basements, crawl spaces, utility vaults, etc.), conduits (gravity drain lines, sanitary and storm sewer mains and service lines), water lines and other utilities within 500 feet of the source. For conduits and enclosed spaces, there must be a description of construction material, conduit backfill material, slope of conduit and trenches (include flow direction of sewers), burial depth of utilities or subsurface enclosed spaces, and the relationship to groundwater elevations.

*h.* An explosive vapor survey of enclosed spaces where there may be the potential for buildup of explosive vapors. The groundwater professional must provide a specific justification for not conducting an explosive vapor survey.

*i.* A survey of all surface water bodies within 200 feet of the source.

*j.* A survey of all active, abandoned and plugged groundwater wells within 1,000 feet of the source with a description of construction and present or future use.

*k.* Accurate and legible site maps showing the location of all groundwater monitoring wells, soil borings, field screening locations and screening values, and monitoring well and soil boring construction logs.

*l.* A tabulation of all laboratory analytical results for chemicals of concern and copies of the laboratory analytical reports.

*m.* Results of hydraulic conductivity testing and description of the procedures utilized.

*n.* A Tier 1 site assessment in accordance with the department's Tier 1 guidance. The Tier 1 report shall be submitted on forms and in a format prescribed by this guidance.

**135.9(4)** *Groundwater ingestion pathway assessment.* The groundwater ingestion pathway addresses the potential for human ingestion of petroleum-regulated substances from existing groundwater wells or potential drinking water wells.

*a. Pathway completeness.* This pathway is considered complete if: (1) there is a drinking or non-drinking water well within 1,000 feet of the source(s) exhibiting the maximum concentrations of the chemicals of concern; or (2) the first encountered groundwater is a protected groundwater source.

*b. Receptor evaluation.* A drinking or non-drinking water well within 1,000 feet of the source(s) is an actual receptor. The Tier 1 levels for actual receptors apply to drinking water wells and the Tier 1 levels for potential receptors apply to non-drinking water wells. Potential receptor points of exposure exist if the first encountered groundwater is a protected groundwater source but no actual receptors presently exist within 1,000 feet of the source.

*c. Pathway clearance.* If the pathway is incomplete, no further action is required for this pathway. If the Tier 1 level for actual or potential receptors is not exceeded, no further action is required for this pathway. Groundwater wells that are actual or potential receptors may be plugged in accordance with 567—Chapters 39 and 49 and may result in no further action clearance if the groundwater is not a protected groundwater source and the pathway is thereby incomplete.

*d. Corrective action response.* If maximum concentrations exceed the applicable Tier 1 levels for either actual or potential receptors, a Tier 2 assessment must be conducted unless effective institutional controls are implemented as provided below. Technological controls are not acceptable at Tier 1 for this pathway. Abandonment and plugging of drinking and non-drinking water wells in accordance with 567—Chapters 39 and 49 is an acceptable corrective action response.

*e. Use of institutional controls.* To apply an effective institutional control, if drinking or non-drinking water wells are present within 1,000 feet of the source, and the applicable Tier 1 level is exceeded, the well(s) for which there is an exceedance must be properly plugged. If the groundwater is a protected groundwater source and the maximum concentrations do not exceed the Tier 1 level for potential receptors but do exceed the Tier 1 level for actual receptors, the owner or operator must provide notification of site conditions on a department form to the department water supply section, or if a county has delegated authority, then the designated county authority responsible for issuing private water supply construction permits or regulating non-public water well construction as provided in 567—Chapters 39 and 49.

If the groundwater is a protected source and the maximum concentrations exceed the Tier 1 level for potential receptors, the owner or operator must (1) implement an institutional control prohibiting the use of the groundwater for installation of drinking and non-drinking water wells within 1,000 feet of the source; and (2) provide notification as provided above. If an effective institutional control is not feasible, a Tier 2 assessment must be performed for this pathway in accordance with 567—135.10(455B).

**135.9(5)** *Soil leaching to groundwater pathway assessment.* This pathway addresses the potential for soil contamination to leach to groundwater creating a risk of human exposure through the groundwater ingestion pathway.

a. *Pathway completeness.* If the groundwater ingestion pathway is complete, the soil leaching to groundwater pathway is considered complete.

b. *Receptor evaluation.* There is a single receptor type for this pathway and one applicable Tier 1 level.

c. *Pathway clearance.* If the pathway is incomplete or the pathway is complete and the maximum concentrations of chemicals of concern do not exceed the Tier 1 levels, no further action is required for assessment of this pathway.

d. *Corrective action response.* If the Tier 1 levels are exceeded for this pathway, a Tier 2 assessment must be conducted or alternatively, institutional controls or soil excavation may be undertaken in accordance with 135.9(7)“h.”

e. *Use of institutional controls.* Institutional controls must satisfy the conditions applicable to the groundwater ingestion pathway as provided in 135.9(4)“e.”

**135.9(6)** *Groundwater vapor to enclosed space pathway assessment.* This pathway addresses the potential for vapors from contaminated groundwater to migrate to enclosed spaces where humans could inhale chemicals of concern at unacceptable levels. This pathway assessment assumes the health-based Tier 1 levels will adequately protect against any associated short- and long-term explosive risks.

a. *Pathway completeness.* This pathway is always considered complete for purposes of Tier 1 and must be evaluated.

b. *Explosive vapor survey.* An explosive vapor survey must be conducted in accordance with procedures outlined in the department Tier 1 guidance. If potentially explosive levels are detected, the groundwater professional must notify the owner or operator with instructions to report the condition in accordance with 567—Chapter 105. The owner or operator must begin immediate response and abatement procedures in accordance with 567—135.7(455B) and 567—Chapter 105.

c. *Receptor evaluation.* For purposes of Tier 1, there is one receptor type for this pathway and the Tier 1 level applies regardless of the existence of actual or potential receptors.

d. *Pathway clearance.* No further action is required for this pathway, if the maximum groundwater concentrations do not exceed the Tier 1 levels for this pathway.

e. *Corrective action response.* If the maximum concentrations exceed the Tier 1 levels for this pathway, a Tier 2 assessment of this pathway must be conducted unless institutional controls are implemented. Technological controls are not acceptable at Tier 1 for this pathway.

f. *Use of institutional controls.* An institutional control must be effective to prohibit the placement of enclosed space receptors within 500 feet of the source.

**135.9(7)** *Soil vapor to enclosed space pathway assessment.* This pathway addresses the potential for vapors from contaminated soils to migrate to enclosed spaces where humans could inhale chemicals of concern at unacceptable levels. This pathway assessment assumes health-based screening levels at Tier 1 will adequately protect against short- and long-term explosive risks.

a. *Pathway completeness.* This pathway is always considered complete for purposes of Tier 1 and must be evaluated.

b. *Explosive vapor survey.* An explosive vapor survey must be conducted in accordance with procedures outlined in the department Tier 1 guidance. If potentially explosive levels are detected, the groundwater professional must notify the owner or operator with instructions to report the condition in accordance with 567—Chapter 105. The owner or operator must begin immediate response and abatement procedures in accordance with 567—135.7(455B) and 567—Chapter 105.

c. *Receptor evaluation.* For purposes of Tier 1, there is one receptor type for this pathway, and the Tier 1 level applies regardless of existing or potential receptors.

d. *Pathway clearance.* No further action is required for this pathway, if the maximum soil concentrations do not exceed the Tier 1 levels for this pathway. If the Tier 1 levels are exceeded, soil gas measurements may be taken in accordance with the Tier 2 guidance at the area(s) of maximum concentration. Subject to confirmation sampling, if the soil gas measurements do not exceed the target levels in 135.10(7)“f,” no further action is required for this pathway. If the Tier 1 level is not exceeded but the soil gas measurement exceeds the target level, further action is required for the pathway.

*e. Soil gas samples.* To establish that the soil gas measurement is representative of the highest expected levels, a groundwater professional must obtain two soil gas samples taken at least two weeks apart. One of the samples should be collected beneath the frost line depth during a seasonal period of lowest groundwater elevation.

*f. Corrective action response.* If the maximum concentrations exceed the Tier 1 levels and the soil gas measurements exceed target levels for this pathway, or if no soil gas measurement was taken, a Tier 2 assessment of this pathway must be conducted unless institutional controls are implemented or soil excavation is conducted as provided below. Technological controls are not acceptable at Tier 1 for this pathway.

*g. Use of institutional controls.* An institutional control must be effective to eliminate the placement of enclosed space receptors within 500 feet of the source.

*h. Soil excavation.* Excavation of contaminated soils for the purpose of removing soils contaminated above the Tier 1 levels is permissible as an alternative to conducting a Tier 2 assessment. Adequate field screening methods must be used to identify maximum concentrations during excavation. At a minimum, one soil sample must be taken for field screening every 100 square feet of the base and each sidewall. Soil samples must be taken for laboratory analysis at least every 400 square feet of the base and each sidewall of the excavated area to confirm that remaining concentrations are below Tier 1 levels. If the base or a sidewall of the excavation is less than 400 square feet, a minimum of one sample must be analyzed for each sidewall and the base.

**135.9(8)** *Groundwater to water line pathway assessment.* This pathway addresses the potential for creating a drinking water ingestion risk due to contact with water lines and causing infusion to the drinking water.

*a. Pathway completeness and receptor evaluation.*

(1) Actual receptors. This pathway is considered complete for an actual receptor if there is an existing water line within 200 feet of the source and the first encountered groundwater is less than 20 feet below ground surface.

(2) Potential receptors. This pathway is considered complete for a potential receptor if the first encountered groundwater is less than 20 feet below ground surface.

*b. Pathway clearance.* If the pathway is not complete, no further action is required for this pathway. If the pathway is complete and the maximum concentrations of all chemicals of concern do not exceed the Tier 1 levels for this pathway, no further action is required for this pathway.

*c. Utility company notification.* The utility company that supplies water service to the area must be notified of all actual and potential water line impacts as soon as knowledge of a potential risk is determined.

*d. Corrective action response.*

(1) For actual receptors, if the Tier 1 levels are exceeded for this pathway, all water lines within 200 feet must be replaced with water line materials and gasket materials of appropriate construction in accordance with current department standards set forth in 567—Chapter 43 and with no less than nitrile or FKM gaskets or as otherwise approved by the department, or the water lines must be relocated beyond the 200-foot distance from the source. A Tier 2 assessment must be conducted for this pathway if lines are not replaced or relocated.

(2) For potential receptors, upon utility company notification, no further action will be required for this pathway.

**135.9(9)** *Soil to water line pathway assessment.* This pathway addresses the potential for creating a drinking water ingestion risk due to contact with water lines and infusion into the drinking water.

*a. Pathway completeness and receptor evaluation.*

(1) Actual receptors. This pathway is considered complete for an actual receptor if a water line exists within 200 feet of the source.

(2) Potential receptors. This pathway is always considered complete for potential receptors.

*b. Pathway clearance.* If the pathway is not complete for actual receptors, no further action is required for this pathway. If the pathway is complete for actual receptors and the maximum concentrations of all chemicals of concern do not exceed Tier 1 levels for this pathway, no further action is required. For

potential receptors, upon utility company notification, no further action will be required for this pathway for potential receptors.

*c. Utility company notification.* The utility company that supplies water service to the area must be notified of all actual and potential water line impacts as soon as knowledge of a potential risk is determined.

*d. Corrective action response.* For actual receptors, if the Tier 1 levels are exceeded for this pathway, all water lines within 200 feet must be replaced with water line materials and gasket materials of appropriate construction in accordance with current department standards set forth in 567—Chapter 43 and with no less than nitrile or FKM gaskets or as otherwise approved by the department, or the water lines must be relocated beyond the 200-foot distance from the source. Excavation of soils to below Tier 1 levels may be undertaken in accordance with 135.9(7)“h.” If none of these options is implemented, a Tier 2 assessment must be conducted for this pathway.

**135.9(10) Surface water pathway assessment.** This pathway addresses the potential for contaminated groundwater to impact surface water bodies creating risks to human health and aquatic life.

*a. Pathway completeness.* This pathway is considered complete if a surface water body is present within 200 feet of the source. For purposes of Tier 1, surface water bodies include both general use segments and designated use segments as provided in 567—subrule 61.3(1).

*b. Receptor evaluation.* The Tier 1 levels for this pathway only apply to designated use segments of surface water bodies as provided in 567—subrules 61.3(1) and 61.3(5). The point of compliance is the source with the highest concentrations of chemicals of concern. General use segments of surface water bodies as provided in 567—paragraph 61.3(1)“a” are only subject to the visual inspection criteria.

*c. Visual inspection requirements.* A visual inspection of all surface water bodies within 200 feet of the source must be conducted to determine if there is evidence of a sheen on the water or there is evidence of petroleum residue along the bank. If a sheen or residue is evident or has been reported to be present, the groundwater professional must make a sufficient investigation to reasonably determine its source. If in the opinion of the groundwater professional, the sheen is not associated with the underground storage tank site, the professional must report and reasonably justify this opinion. If in the opinion of the groundwater professional the sheen is not a petroleum-regulated substance, a sample must be laboratory tested in accordance with 567—135.16(455B) to confirm it is not a petroleum-regulated substance.

*d. Pathway clearance.* If the pathway is not complete or it is complete and the maximum concentrations of all chemicals of concern at the point of compliance do not exceed the Tier 1 levels and there is no petroleum sheen or residue attributable to the site, no further action is required for assessment of this pathway.

*e. Corrective action response.* If a Tier 1 level is exceeded for any chemical of concern for a designated use segment within 200 feet of the source, or the groundwater professional determines the presence of a petroleum-regulated substance sheen or residue, a Tier 2 assessment of this pathway must be conducted.

**135.9(11) Tier 1 submission and review procedures.**

*a.* Within 90 calendar days of release confirmation or another reasonable period of time determined by the department, owners and operators must submit to the department a Tier 1 report in a format prescribed by the department and in accordance with these rules and the department Tier 1 guidance.

*b.* If the owner or operator elects to prepare a Tier 2 site cleanup report instead of a Tier 1 assessment, the department must be notified in writing prior to the expiration of the Tier 1 submission deadline. The Tier 2 site cleanup report must be submitted to the department in accordance with 567—135.10(455B) within 180 calendar days of release confirmation or another reasonable period of time determined by the department.

*c.* A Tier 1 report is considered to be complete if it contains all the information and data required by this rule and the department Tier 1 guidance. The report is accurate if the information and data is reasonably reliable based first on application of the standards in these rules and department guidance and second, generally accepted industry standards.

*d.* The certified groundwater professional shall include the following certification with the Tier 1 site assessment report:

I, \_\_\_\_\_, Groundwater Professional Certification No. \_\_\_\_\_, am familiar with all applicable requirements of Iowa Code section 455B.474 and all rules and procedures adopted thereunder including, but not limited to, 567—Chapter 135 and the Department of Natural Resources Tier 1 guidance. Based on my knowledge of those documents and information I have prepared and reviewed regarding this site, UST Registration No. \_\_\_\_\_, LUST No. \_\_\_\_\_ I certify that this document is complete and accurate as provided in 567 IAC 135.9(11) “c” and meets the applicable requirements of the Tier 1 site assessment.

Signature:

Date:

e. Upon receipt of the groundwater professional’s certified Tier 1 report, the groundwater professional’s proposed site classification for the site shall be determinative unless, within 90 days of receipt, the department identifies material information in the report that is inaccurate or incomplete. Material information may be data found to be inaccurate or incomplete or a report that lacks information that, if correct and complete, would result in a different site classification than proposed by the certified groundwater professional. If the department determines that the site cleanup report is inaccurate or incomplete, the department shall notify the groundwater professional of the inaccurate or incomplete information within 90 days of receipt of the report and shall work with the groundwater professional and the party responsible for cleanup to obtain correct information or additional information necessary to appropriately classify the site. If the groundwater professional recommends proceeding to Tier 2, or a Tier 2 site cleanup report is required pursuant to 135.7(4) “g,” 135.8(5), or 567—135.9(455B), the groundwater professional’s site classification and pathway classification recommendations shall not be considered determinative until the Tier 2 report is submitted for review as provided in 135.10(11).

f. If a “no action required” site classification is proposed, the department shall review the report in accordance with 135.12(6) and the review standards in 135.9(11) “e.”

**135.9(12) Tier 1 site classification and corrective action response.**

a. No action required site classification. At Tier 1, a site is only eligible for a “no action required” classification. To be classified as no action required, each pathway must meet the requirements for pathway clearance as specified in this rule. If the department determines a no action required site classification is appropriate, a no further action certificate will be issued as provided in 135.12(10).

b. Where an individual pathway or a chemical group meets the requirements for clearance but the site is not entitled to a no action required classification, only those pathways and chemical groups that do not meet the no further action requirements must be evaluated as part of a Tier 2 assessment as provided in 567—135.10(455B).

c. Compliance monitoring and confirmation sampling. Compliance monitoring is not an acceptable corrective action at Tier 1. Except for soil gas sampling under 135.9(7), confirmation sampling to verify a sample does not exceed a Tier 1 level is not required. However, the department retains the authority to require confirmation sampling from existing groundwater monitoring wells if a no action required classification is being proposed at Tier 1 and the department has a reasonable basis to question the representative validity of the samples based on, for example, the seasonal bias of the sampling, evidence of multiple sources of releases, marginal groundwater monitoring well locations and analytical variability.

d. Expedited corrective action is permissible in accordance with 135.12(11).

[ARC 0491D, IAB 8/19/26, effective 9/23/26]

**567—135.10(455B) Tier 2 site assessment policy and procedure.**

**135.10(1) General conditions.** A Tier 2 site assessment must be conducted and a site cleanup report submitted for all sites that have not obtained a no action required site classification and for all pathways and chemicals of concern groups that have not obtained no further action clearance as provided in 567—135.9(455B). If in the course of conducting a Tier 2 assessment, data indicates the conditions for pathway clearance under Tier 1 no longer exist, the pathway shall be further assessed under this rule. The Tier 2 assessment and report must be completed whenever free product is discovered as provided in 567—135.7(455B). If the owner or operator elects to complete the Tier 2 site assessment without doing a Tier 1 assessment, all the Tier 1 requirements as provided in 567—135.9(455B) must be met in addition to requirements under this rule.

a. *Guidance.* The Tier 2 site assessment shall be conducted in accordance with the department's "Tier 2 Site Assessment Guidance" and these rules. The site cleanup report shall be submitted on forms and in a format prescribed by this guidance. The Tier 2 data analysis shall be performed by using computer software or online application developed by the department.

b. *Classification.* At Tier 2, individual pathways may be classified as high risk or low risk or no action required and separate classification criteria may apply to actual and potential receptors for any pathway. A single pathway may have multiple classifications based on actual or potential receptor evaluations. A pathway must meet both the criteria for actual and potential receptors for the pathway to obtain a classification of no action required. Sites may have multiple pathway classifications. For a site to obtain a no action required classification, all pathways must meet the individual pathway criteria for no action required classification.

c. *Public right-of-way.* As a general rule, public right-of-way will not be considered an area of potential receptor exposure except for potential sanitary sewer evaluation under the soil and groundwater vapor pathways (135.10(6) and 135.10(7)).

**135.10(2) General Tier 2 assessment procedures.**

a. *Objectives.* The objective of a Tier 2 assessment is to collect site-specific data and with the use of Tier 2 modeling determine what actual or potential receptors could be impacted by chemicals of concern and what concentrations at the source are predicted to achieve protection of these receptors. Both Tier 1 and Tier 2 are based on achieving similar levels of protection of human health, safety and the environment.

b. *Groundwater modeling.* Tier 2 uses fate and transport models to predict the maximum distance groundwater contamination is expected to move and the distribution of concentrations of chemicals of concern within this area. The model is used for two basic purposes. One, it is used to predict at what levels of concentration contamination would be expected to impact actual and potential receptors. Two, it is used to determine a concentration at the source that if achieved, and after dispersion and degradation, would protect actual and potential receptors at the point of exposure. In predicting the transport of contaminants, the models assume the contaminant plume is at "steady state" such that concentrations throughout the plume have reached a maximum level and are steady or decreasing. The Tier 2 models are only designed to predict transport in a direct line between the source and downgradient to a receptor. In order to more reasonably define a modeled plume in all directions, 135.10(2) "i" defines a method of decreasing modeled concentrations as a percentage of their distance in degrees from the downgradient direction.

c. *Soil vapor models.* The soil vapor models are vertical transport models and do not use modeling to predict soil contaminant transport horizontally to receptors.

d. *Soil leaching to groundwater modeling.* The soil leaching to groundwater model is a model that predicts the maximum concentrations of chemicals of concern that would be expected in groundwater due to vertical leaching from the area of maximum soil concentrations and then incorporates the groundwater transport models to predict contaminant transport through groundwater pathways.

e. *Modeling default parameters.* The Tier 2 model formulas and applicable parameters are designated in Appendix B and must be followed unless otherwise specified in these rules. Unless otherwise specified, target levels at a point of exposure may be the Tier 1 level(s) or may be determined using site-specific parameters. The target level at a point of exposure is calculated using the Tier 1 formulas in Appendix A and either site-specific measurements or the default values for those parameters identified as "optional" and "site-specific" in Appendix B.

f. *Source width.* The source width and source length are variables used in modeling and must be determined by the following criteria and as specified in the department's Tier 2 guidance. The following are not to be used as criteria for defining the extent of the contaminant plumes.

(1) Source width (equals  $S_w$  in models) for groundwater transport modeling. The sum of group one chemical (benzene, toluene, ethylbenzene, xylenes or "BTEX") concentrations for each groundwater sample is determined and the location of the sample with the maximum total BTEX is identified. Linear interpolation is used to estimate the area where groundwater concentrations would be expected to exceed 50 percent of the maximum BTEX value, and this area is considered for the source width measurement. The same procedure is used to determine source width for group two chemicals, using TEH in groundwater. The width of the groundwater contamination perpendicular to estimated groundwater flow direction ( $S_w$ ) is

determined, and the larger of either group one or group two chemicals is used in the groundwater transport model.

(2) Source width ( $S_w$ ) and source length (equals  $W$  in models) for soil leaching to groundwater transport modeling. Both the source width perpendicular to the estimated groundwater flow direction ( $S_w$ ) and the source length parallel to the estimated groundwater flow direction ( $W$ ) are used in the soil leaching to groundwater model. The sum of BTEX concentrations for each soil sample is determined and the location of the sample with the maximum total BTEX is identified. Concentrations from both the vadose zone and the saturated zone must be considered when determining the maximum. Linear interpolation is used to estimate the area where soil concentrations would be expected to exceed 50 percent of the maximum BTEX value, and this area is considered for the source width and source length measurements. The same procedure is used to determine source width for group 2 chemicals, using TEH in soil. Source width and source length measurements for BTEX in groundwater are also taken following the same linear interpolation criteria in 135.10(2)“f”(1). The source width value used in the model is the greatest of either the soil source width measurements or the groundwater source width measurement. The source length value used in the model is the greatest of either of the soil source length measurements or the groundwater length measurement.

g. *Modeled simulation line.* The simulation line represents the predicted maximum extent of groundwater contamination and distribution of contaminant concentrations between the source(s) and actual or potential receptor locations. The model calculates the simulation line using maximum concentrations at the source(s) and predicting the amount of dispersion and degradation. Modeled data in the simulation line are compared with actual contaminant concentrations to verify the predictive validity of the model and to make risk classification decisions.

h. *Modeled site-specific target level (SSTL) line.* The modeled SSTL line represents acceptable levels of contaminant concentrations at points between and including the source(s) and an applicable point(s) of exposure or other point(s) of compliance (ex. a potential receptor point of exposure). The SSTL line is calculated by assuming an applicable target level concentration at the point(s) of exposure or point(s) of compliance and modeling back to the source to determine the maximum concentrations at the source (SSTL) that must be achieved to meet the target level at the point of exposure or compliance. Comparison of contaminant concentrations from actual samples to this SSTL line is used to determine a risk classification and determine appropriate corrective action response.

i. *Crossgradient and upgradient modeling.* In determining the SSTL line and the simulation line in directions other than downgradient, the modeled contaminant concentrations are applied to reduced distances as specified in the “Tier 2 Guidance.” The modeled results are applied to 100 percent of the distance within an angle of 30 degrees on either side of the range of downgradient directions as specified in Tier 2 guidance. The modeled results are applied to 20 percent of the distance in the upgradient direction and directly proportional distances between these two outer limits. If the groundwater gradient is less than 0.005 or the groundwater contaminant plume shows no definitive direction or shows directional reversals, the modeled concentrations are applied to 100 percent of the distance in all directions from the source. As the downgradient velocity increases, the upgradient modeled distance is reduced to less than 20 percent of the downgradient modeled distance.

j. *Plume definition.* The purpose of plume definition at Tier 2 is to obtain sufficient data to determine the impact on actual and potential receptors, to determine and confirm the highest levels of contamination, to verify the validity of the models, and to determine groundwater flow direction. The number and location of borings and monitoring wells and the specificity of plume definition will depend on the pathway or pathways being assessed and the actual or potential receptors of concern. Unless otherwise specified, groundwater and soil contamination shall be defined to Tier 1 levels for the applicable pathways. Linear interpolation between two known concentrations must be used to delineate plume extent. Samples with no concentrations detected shall be considered one-half the detection limit for interpolation purposes.

k. *Pathway completeness.* Unless a pathway has obtained clearance under Tier 1, each pathway must be evaluated at Tier 2. Pathways are generally considered complete (unless otherwise specified) and receptors affected if actual receptors or potential receptor points of exposure exist within the modeled contaminant plume using the modeled simulation line calculated to the applicable target level at a point of

exposure. If the actual contaminant plume exceeds the modeled plume, the pathway is complete and must be evaluated if actual or potential points of exposure exist within a distance extending 10 percent beyond the edge of the defined plume.

*l. Points of exposure and compliance.* For actual receptors, the point(s) of exposure is the receptor. For potential receptors, the potential receptor point(s) of exposure is determined by using actual plume definition or the modeled simulation line to determine all points that exceed the target level(s) for potential receptors. The potential receptor point(s) of exposure is the location(s) closest to the source where a receptor could reasonably exist and that is not subject to an institutional control; for example, the source is the potential receptor point of exposure if not subject to an institutional control or an adjoining property boundary line if that property is not subject to an institutional control. At Tier 2, the point(s) of exposure or potential receptor point(s) of exposure is a point of compliance unless otherwise specified. Other points of compliance are specified by rules and will generally include all points along the SSTL line for purposes of pathway and site classification and corrective action response.

**135.10(3) Bedrock assessment.**

*a. General.* As provided in 135.8(5), if bedrock is encountered before groundwater, special assessment procedures under this subrule apply. The Tier 2 assessment procedures apply to the extent they are not inconsistent with this subrule. The objectives of these special procedures are to avoid creating a preferential pathway for contamination through a confining layer to a bedrock aquifer; to avoid creating a preferential pathway to a fractured system, and to determine whether groundwater transport modeling can be used and, if not, what alternative procedures are required. The owner or operator may choose to conduct a Tier 3 assessment under 567—135.11(455B) as an alternative to proceeding under this subrule. For sites where bedrock is encountered before groundwater, there are three general categories of site conditions that determine the assessment procedures that apply:

(1) Nongranular bedrock. Nongranular bedrock is bedrock that is determined to not act as a granular aquifer as provided in 135.10(3)“a”(2). Nongranular bedrock generally has some type of fractured system where groundwater transport modeling cannot be applied and that makes it difficult to define the extent of contamination.

(2) Granular bedrock. Granular bedrock is bedrock that is determined to act as a granular aquifer and for which monitoring wells do not exist at the source. For purposes of this rule, a granular aquifer is one that shows no extraordinary variations or inconsistencies in groundwater elevations across the site, groundwater flow, hydraulic conductivities, or total dissolved solid concentrations among monitoring wells. Although the extent of contamination can be defined in granular bedrock, groundwater transport modeling cannot be used because monitoring wells shall not be installed at the source if soil contamination is present. If soil contamination above a Tier 1 level is not identified or an overexcavation of contaminated soil has successfully removed all soil contamination greater than a Tier 1 level, then monitoring wells can be installed in the source area and the site can be evaluated as exempt granular bedrock.

(3) Exempt granular bedrock. Exempt granular bedrock is bedrock that is determined to act as a granular aquifer as provided in 135.10(3)“a”(2) and for which monitoring wells exist at the source as of August 15, 1996. Sites in exempt granular bedrock shall be evaluated using regular Tier 1 and Tier 2 procedures in this rule.

NOTE: Nongranular bedrock is subject to special bedrock assessment procedures even if groundwater monitoring wells exist at the source because the flow is not predictable by the Tier 2 model.

*b. Exempt soil pathways.* The soil vapor to enclosed space pathway and the soil to water lines pathway shall be assessed under the regular Tier 2 procedures in 135.10(7) and 135.10(9), respectively. In all cases, the assessment must comply with the policy of avoiding a preferential pathway to groundwater consistent with 135.8(5) and this subrule.

*c. Soil and groundwater assessment.* The vertical and horizontal extent of soil contamination shall first be defined to Tier 1 levels for the soil leaching to groundwater pathway without drilling into bedrock. A minimum of three groundwater monitoring wells shall be located and installed between 50 to 100 feet beyond the soil contamination Tier 1 levels to avoid creating a preferential pathway. Analytical data as normally required by these rules and guidance must be obtained.

*d. Soil contamination remediation.* For all sites where soil contamination exceeds the soil leaching to groundwater Tier 1 levels, soil excavation or other active soil remediation technology must be conducted in accordance with department guidance to reduce concentrations to below this Tier 1 level. Soil remediation monitoring must be conducted in accordance with 567—135.12(455B).

*e. Groundwater plume definition.* If it is determined the groundwater acts in a manner consistent with a granular aquifer as provided in 135.10(3)“a”(2) and guidance but does not meet the criteria for exemption under 135.10(3)“a”(3), the plume must be defined. The policy of avoiding the creation of a preferential pathway to the bedrock aquifer in accordance with 135.8(5) must be followed.

*f. Soil leaching to groundwater ingestion pathway.* Under this subrule, the soil leaching to groundwater pathway only need be evaluated in combination with the groundwater ingestion pathway. Because of the policies requiring soil remediation to the soil leaching to groundwater Tier 1 levels under 135.10(3)“d” and “k,” the soil leaching pathway target levels applicable to other groundwater transport pathways and other soil pathways would not be exceeded. If a soil leaching to groundwater Tier 1 level is exceeded, the pathway is high risk.

*g. Special procedures for the groundwater ingestion pathway.*

(1) A protected groundwater source is assumed without measurements of hydraulic conductivity for all sites designated as granular or nongranular bedrock.

(2) Groundwater well receptor evaluation for granular and nongranular bedrock designations. All drinking and non-drinking water wells within 1,000 feet of the source must be identified and tested for chemicals of concern. All public water supply systems within one mile of the source must be identified and raw water tested for chemicals of concern. All area within 1,000 feet of the source is considered a potential receptor point of exposure.

(3) Target levels. The following target levels apply regardless of granular aquifer designation. If drinking water wells are within 1,000 feet of the source, the applicable target level is the groundwater ingestion pathway Tier 1 level for actual receptors. If non-drinking water wells are within 1,000 feet of the source, the applicable target level is the groundwater ingestion pathway Tier 1 level for potential receptors. For potential wells, the applicable target level is the groundwater ingestion pathway Tier 1 level for potential receptors.

(4) Sentry well. If the Tier 1 level for actual receptors is exceeded at sites designated as granular bedrock and the receptor has not yet been impacted, a monitoring well shall be placed between the source and an actual receptor, outside the defined plume and approximately 200 feet from the actual receptor. For alternative well placement, the certified groundwater professional must provide justification and obtain department approval. This monitoring well is to be used for monitoring potential groundwater contamination of the receptor.

(5) High risk classification. A site where bedrock is encountered before groundwater shall be classified high risk for this pathway if any of the following conditions exist regardless of granular aquifer determination: The target level at any actual receptor is exceeded; drinking water well receptors are present within 1,000 feet and groundwater concentrations in any monitoring well exceed the groundwater ingestion Tier 1 level for actual receptors; non-drinking water wells are within 1,000 feet and groundwater concentrations in any monitoring well exceed the groundwater ingestion pathway Tier 1 level for potential receptors; or for sites designated nongranular bedrock, if groundwater concentrations for chemicals of concern from any public water system well within one mile of the source exceed 40 percent of the Tier 1 level for actual receptors, and groundwater concentrations in any monitoring well exceed the groundwater ingestion Tier 1 level for actual receptors. Corrective action shall be undertaken as provided in 135.10(3)“k.”

(6) Low risk classification. Sites without an actual receptor within 1,000 feet shall be classified as low risk for this pathway if no high risk conditions exist and the Tier 1 level for potential receptors is exceeded. The site is subject to monitoring as provided in 135.10(3)“l.” If an actual receptor exists within 1,000 feet, a site designated as granular or nongranular bedrock shall be classified low risk for this pathway when soil contamination has been removed or remediated to below the soil leaching to groundwater Tier 1 levels and all groundwater monitoring wells are non-detect or below the applicable target level for actual and potential receptors. A site may be reclassified to no action required for this pathway after all monitoring

wells meet the exit monitoring criteria as specified in 135.10(3)“l.” (NOTE: Exit monitoring is required because groundwater monitoring wells are not located at the source or if they are, the data is highly unreliable given the nature of bedrock.) If actual receptors do not exist or have been properly plugged and concentrations exceed the Tier 1 level for potential receptors, institutional controls and notification to permitting authorities may be employed in accordance with 135.10(4)“h.” The institutional control must prohibit use of groundwater for 1,000 feet.

*h. Special procedures for the groundwater vapor to enclosed space pathway.*

(1) Soil gas plume. Soil gas measurements must be taken regardless of granular aquifer determination and in accordance with Tier 2 guidance to determine a soil gas plume. Soil gas where practical should be measured at the soil-bedrock interface. At a minimum, soil gas must be measured at the suspected area of maximum contamination and near the three monitoring wells with the highest concentrations that exceed the Tier 1 level for the groundwater to enclosed space pathway. Where the plume has been defined, soil gas measurements should be taken near wells exceeding the Tier 1 level. Other soil gas measurements must be taken as needed to define the extent of contamination where soil gas measurements exceed the soil gas vapor target levels.

(2) The soil gas target levels are those defined in 135.10(7)“f.”

(3) High risk classification. A site designated as granular or nongranular bedrock shall be classified high risk for this pathway if an actual confined space receptor exists within 50 feet of the soil gas plume based on the soil gas target level as defined in 135.10(6).

(4) Low risk classification. A site designated as granular or nongranular bedrock shall be classified as low risk for this pathway if the soil gas exceeds the vapor target level at any point and no actual confined space receptors exist within 50 feet of the soil gas contaminant plume.

*i. Special procedure for the groundwater to water line pathway.*

(1) Target level. The applicable target level is the Tier 1 level for the specific type of water line.

(2) High risk classification. A site designated as granular or nongranular bedrock shall be classified high risk for this pathway if the highest groundwater elevation is within three feet of the bottom of a water line as provided in 135.10(8)“a”(1), risk classification cannot be determined as provided in 567—135.12(455B) due to limitations on placement of monitoring wells, and water lines exist within 200 feet of a monitoring well that exceeds the Tier 1 level.

*j. Special procedures for the surface water pathway.* Any surface water body within 200 feet of the source must be evaluated under the following for sites designated as granular or nongranular bedrock. The provisions of 135.10(10) apply to the extent they are not inconsistent with the following, including the visual inspection requirements.

(1) Point of compliance. The monitoring well closest to the surface water body must be used as the point of compliance to evaluate impacts to designated use segments as described in 135.10(10) and for general use segments that fail the visual inspection criteria of 135.10(10)“b.” If the surface water criteria are exceeded for a designated use segment, an allowable discharge concentration must be calculated and met at the point of compliance. For general use segments failing the visual inspection criteria, the acutely toxic target level must be met at the point of compliance.

(2) High risk classification. A site designated as granular or nongranular bedrock shall be classified high risk for this pathway if the surface water body is within 200 feet of the source, risk classification cannot be determined as per 567—135.12(455B) due to limitations on placement of monitoring wells, and the monitoring well closest to the designated use segment exceeds the allowable discharge concentration. A general use segment failing the visual inspection criteria is high risk if, after the sheen is removed, the monitoring well closest to the general use segment exceeds the acutely toxic target level.

(3) Low risk classification. If the allowable discharge concentration is not exceeded at the point of compliance, the site shall be classified as low risk for this pathway and subject to monitoring under 135.10(3)“l.” The monitoring well closest to the receptor shall serve as the sentry well for monitoring purposes.

*k. High risk corrective action response.* Owners and operators have the option to conduct a Tier 3 assessment in accordance with 567—135.11(455B).

(1) Groundwater ingestion pathway. For high risk sites, where soil exceeds the soil leaching to groundwater Tier 1 level for actual receptors, soil excavation or other active remediation of soils must be conducted in accordance with department guidance to reduce soil concentrations to below the soil leaching Tier 1 level. Corrective action other than monitoring of groundwater is required at sites designated as nongranular bedrock if the actual receptor has been or is likely to be impacted. Corrective action other than monitoring of groundwater is required at sites designated as granular bedrock if the actual receptor has been impacted or the sentry well required by 135.10(3)“g”(4) has been impacted above Tier 1 levels. Acceptable corrective action for impacted or vulnerable groundwater wells may include active remediation, technological controls, institutional controls, well plugging, relocation, and well reinstallation with construction measures sufficient to prevent contaminant infiltration to the well and to prevent formation of a preferential pathway.

(2) Groundwater ingestion pathway high risk monitoring. For high risk sites designated as nongranular or granular bedrock, if the soil concentrations do not exceed the soil leaching to groundwater Tier 1 levels or have been reduced to this level by corrective action, and corrective action of groundwater is not required as in 135.10(3)“k”(1), these sites shall be subject to groundwater monitoring as provided in 135.10(3)“l.” Corrective action other than monitoring of groundwater is required at sites designated as granular bedrock if groundwater concentrations exceed the applicable target level less than 200 feet from an actual receptor. Reevaluation of the potential for impact to actual receptors is required at sites designated as nongranular bedrock if concentrations from monitoring wells increase more than 20 percent of the previous samples.

(3) For water line pathways. For high risk sites, active remediation must be conducted to reduce concentrations below the applicable target levels, or water lines and gaskets must be replaced or relocated, including the use of institutional and technological controls. If lines are polybutylene, polyethylene, or asbestos-cement, the lines must be removed or relocated. All water lines that are replaced must be replaced with water line materials and gasket materials of appropriate construction in accordance with current department standards set forth in 567—Chapter 43 and with no less than nitrile or FKM gaskets or as otherwise approved by the department.

(4) Other pathways. For high risk sites other than groundwater ingestion and water lines, active remediation must be conducted to reduce concentrations below the applicable target levels, including the use of institutional and technological controls.

*l. Monitoring.* For high and low risk sites, annual monitoring at a minimum is required as specified below, and potential receptor status for low risk sites must be confirmed. Annual monitoring may be used to meet the exit requirements for no action required classification in accordance with 135.10(3)“m.”

(1) Groundwater in nongranular bedrock designations. All groundwater monitoring wells must be monitored at least annually.

(2) Groundwater in granular bedrock designations. The following monitoring wells must be monitored at least annually: a well with detected levels of contamination closest to the leading edge of the groundwater plume between the source and the receptor, and a sentry well with concentrations below the applicable target level consistent with 135.10(3)“g”(4) and 135.10(3)“j.”

(3) Soil gas. For sites where the soil gas target level is exceeded, annual monitoring of soil gas is required at the suspected area of maximum contamination and between the soil gas plume and any actual receptors within 100 feet of the soil gas plume.

*m. No action required classification.* A site may be given a no action required classification after conducting a Tier 2 assessment as provided in this subrule if maximum soil concentrations do not exceed the Tier 1 levels for the soil leaching pathway, and if groundwater exit monitoring criteria and soil gas confirmation sampling are met as specified below.

(1) Groundwater in nongranular bedrock designations. Exit monitoring requires that samples from all groundwater monitoring wells must not exceed the applicable target levels for annual sampling for three consecutive years. If soil contamination above a Tier 1 level is not identified or if an overexcavation has successfully removed all soil contamination greater than a Tier 1 level and monitoring wells are installed in the source area, exit monitoring criteria are met when two consecutive samples collected at least six months apart from all monitoring wells show concentrations less than the lowest target level.

(2) Groundwater in granular bedrock designations. Exit monitoring must be met in two ways: A monitoring well between the source and the receptor must not exceed applicable target levels for three sampling events, and samples must be separated by at least six months; and the three most recent consecutive groundwater samples from a monitoring well between the source and the receptor with detected levels of contamination must show a steady or declining trend and meet the following criteria: The first of the three samples must be greater than detection limits, concentrations cannot increase more than 20 percent from the first of the three samples to the third sample; concentrations cannot increase more than 20 percent from the previous sample; and samples must be collected at least six months apart.

(3) Soil gas. Confirmation sampling for soil gas must be conducted as specified in 135.12(6) “c.”

*n. Properly plugged monitoring wells.* After receiving a no action required classification, all monitoring wells must be properly plugged in accordance with 567—Chapters 39 and 49.

**135.10(4) Groundwater ingestion pathway assessment.**

*a. Pathway completeness.* Unless cleared at Tier 1, this pathway is complete and must be evaluated under any of the following conditions: (1) the first encountered groundwater is a protected groundwater source; or (2) there is a drinking water well or a non-drinking water well within the modeled groundwater plume or the actual plume as provided in 135.10(2) “j” and “k.”

*b. Receptor evaluation.* All drinking and non-drinking water wells located within 100 feet of the largest actual plume (defined to the appropriate target level for the receptor type) must be tested, at a minimum, for chemicals of concern as part of the receptor evaluation. Actual plumes refer to groundwater plumes for all chemicals of concern. Untreated or raw water must be collected for analysis unless it is determined to be infeasible or impracticable.

All existing drinking water wells and non-drinking water wells within the modeled plume or the actual plume as provided in 135.10(4) “a” must be evaluated as actual receptors. Potential receptors only exist if the groundwater is a protected groundwater source. Potential receptor points of exposure are those points within the modeled plume or actual plume that exceed the potential point of exposure target level. The point(s) of compliance for actual receptor(s) is the receptor. The point(s) of compliance for potential receptor(s) is the potential receptor point of exposure as provided in 135.10(2) “j” and “k.”

*c. Target levels.* For drinking water wells, the target level at the point(s) of exposure is the Tier 1 level for actual receptors. For non-drinking water wells, the target level at the point(s) of exposure is the Tier 1 levels for potential receptors. For potential receptors, the target level at the potential receptor point(s) of exposure is the Tier 1 level for potential receptors.

*d. Pathway evaluation.* The soil leaching to groundwater pathway must be evaluated in accordance with 135.9(5) if this pathway is complete.

*e. Modeling.* At Tier 2, the groundwater well located within the modeled plume is assumed to be drawing from the contaminated aquifer, and the groundwater transport model is designed to predict horizontal movement to the well. If the groundwater professional determines that assessment of the vertical movement of contamination is advisable to determine the potential or actual impact to the well source, a Tier 3 assessment of this vertical pathway may be conducted. The groundwater professional shall submit a work plan to the department specifying the assessment methods and objectives for approval in accordance with 567—135.11(455B). Factors that should be addressed include but are not limited to well depth and construction, radius of influence, hydrogeologic separation of aquifer, preferential pathways, and differing water quality characteristics.

*f. Plume definition.* The groundwater plume shall be defined to the applicable Tier 1 level for actual receptors except, where there are no actual receptors and the groundwater is a protected groundwater source, the plume shall be defined to the Tier 1 level for potential receptors.

*g. Pathway classification.* This pathway shall be classified as high risk, low risk or no action required in accordance with 567—135.12(455B).

*h. Corrective action response.* Corrective action must be conducted in accordance with 567—135.12(455B). Abandonment and plugging of wells in accordance with 567—Chapters 39 and 49 is an acceptable corrective action response.

*i. Use of institutional controls.* Institutional controls may be used to obtain no action required pathway classification. If the pathway is complete and the concentrations exceed the applicable Tier

1 level(s) for actual receptors, the drinking or non-drinking water well must be properly plugged in accordance with 567—Chapters 39 and 49 and the institutional control must prohibit the use of a protected groundwater source (if one exists) within the actual or modeled plume as provided in 135.10(2)“j” and “k.” If the Tier 1 level is exceeded for potential receptors, the institutional control must prohibit the use of a protected groundwater source within the actual or modeled plume, whichever is greater. If concentrations exceed the Tier 1 level for drinking water wells and the groundwater is a protected groundwater source, the owner or operator must provide notification of the site conditions on a department form to the department water supply section, or if a county has delegated authority, then the designated county authority responsible for issuing private water supply construction permits or regulating non-public water well construction as provided in 567—Chapters 39 and 49.

j. *Notification of well owners.* Upon receipt of a Tier 2 site cleanup report and as soon as practicable, the department shall notify the owner of any public water supply well identified within the Tier 2 site cleanup report that a leaking underground storage tank site is within 2,500 feet and an assessment has been performed.

**135.10(5) Soil leaching to groundwater pathway assessment.**

a. *General.* The soil leaching to groundwater pathway is evaluated using a one-dimensional model that predicts vertical movement of contamination through soil to groundwater and transported by the groundwater to a receptor. The model is used to predict the maximum concentrations of chemicals of concern that would be present in groundwater beneath a source that is representative of residual soil contamination and maximum soil concentrations. The predicted groundwater concentrations then must be used as a groundwater source concentration to evaluate its impact on other groundwater transport pathways, including the groundwater ingestion pathway, the groundwater vapor pathway, the groundwater water line pathway and the surface water pathway.

b. *Pathway completeness.* This pathway is complete whenever a groundwater transport pathway is complete as provided in this rule.

c. *Plume definition.* The soil plume shall be defined to the Tier 1 levels for the soil leaching to groundwater pathway.

d. *Receptor evaluation.* Receptors for this pathway are the same as the receptors for each complete groundwater transport pathway.

e. *Modeling and target levels.* The soil and groundwater parameters shall be measured as provided in 135.10(2).

The soil leaching to groundwater model shall be used to calculate the predicted groundwater source concentration. Each applicable groundwater transport pathway model shall then be used in accordance with the rules for that pathway to predict potential impact to actual receptors, the location of potential receptor points of exposure and the SSTL in groundwater at the source. This SSTL then is used to calculate a SSTL for soil at the source. If the soil concentrations exceed the SSTL for soil, corrective action response shall be evaluated.

f. *Corrective action response.* If the maximum soil concentration at the source exceeds the SSTL for soil for actual or potential receptors, corrective action must be taken in accordance with 567—135.12(455B).

**135.10(6) Groundwater vapor to enclosed space pathway assessment.**

a. *Pathway completeness.* Unless cleared at Tier 1, this pathway is always considered complete for purposes of Tier 2.

b. *Explosive vapor survey.* If an explosive vapor survey has not been conducted as part of a Tier 1 assessment, an explosive vapor survey of enclosed spaces must be conducted during the Tier 2 assessment in accordance with 135.9(6)“b” and procedures outlined in the department’s Tier 1 guidance.

c. *Confined space receptor evaluation.* Actual and potential receptors are evaluated at Tier 2 for this pathway.

(1) *Actual receptors.* An existing confined space within the modeled groundwater plume or the actual groundwater plume as provided in 135.10(2)“j” and “k” is an actual receptor. For the purpose of Tier 2, a confined space is a basement in a building occupied by humans. Buildings constructed with a concrete slab on grade or buildings constructed without a concrete slab, but with a crawl space are not considered

confined spaces. Sanitary sewers are considered confined space receptors and preferential pathways if an occupied building exists within 200 feet of where the sewer line crosses over or through actual or modeled groundwater contamination that exceeds the target levels calculated for sewers. The sanitary sewer includes its utility envelope. The point of exposure is the receptor and points of compliance include the locations where target level measurements may be taken as provided in 135.10(6) “f” and “g.”

(2) Potential receptors. Potential receptors are confined spaces that do not presently exist but could exist in the future. Areas within the actual groundwater plume perimeter or modeled groundwater plume perimeter are considered potential receptor points of exposure. Potential receptors are evaluated and target levels established based on the current zoning as provided in 135.10(6) “f.” The potential receptor point of exposure is a point of compliance.

d. *Vapor inhalation hazards.* Owners and operators may be required to address vapor inhalation hazards in occupied spaces other than confined spaces as defined in these rules when evidence arises that would give the department a reasonable basis to believe vapor hazards are present or may occur.

e. *Plume definition.*

(1) The soil plume must be defined in accordance with 135.10(2) “f” for the purposes of estimating source width and source length used in soil leaching to groundwater and groundwater transport models.

(2) The groundwater plume must be defined to the target levels derived from site-specific data as provided in 135.10(6) “f.”

f. *Target levels.* Target levels can be based on groundwater concentrations, soil gas measurements, and indoor vapor measurements as provided below.

(1) For actual receptors and potential receptors, groundwater modeling as provided in 135.10(2) is used to calculate the groundwater concentration target level at the point of exposure. Default residential exposure factors, default residential building parameters, and a target risk of  $10^{-4}$  are used to determine target levels for actual receptors and potential receptor points of exposure in residential areas and areas with no zoning. Default nonresidential exposure factors, default nonresidential building parameters, and a target risk of  $10^{-4}$  are used to determine target levels for actual receptors and potential receptor points of exposure in nonresidential areas. Default values are provided in Appendices A and B.

(2) For actual receptors, the indoor vapor target levels are designated in 135.10(7) “f.” For actual and potential receptors, the soil gas target levels are designated in 135.10(7) “f.”

(3) Sanitary sewers are treated as human health receptors, and groundwater concentration target levels at the point of exposure are based on the application of a target risk of  $2 \times 10^{-4}$  for carcinogens and a hazard quotient of 2 for noncarcinogens.

g. *Pathway evaluation and classification.* Upon completion of evaluation of analytical results of appropriate samples and modeled data, the pathway must be classified high risk, low risk or no further action as provided in 567—135.12(455B).

(1) Actual receptors. If it can be demonstrated that the groundwater plume has reached steady state concentrations under a confined space, indoor vapor measurements at the point(s) of exposure and soil gas measurements at an alternative point(s) of compliance may be used for the pathway evaluation. When assessing sanitary sewers for pathway clearance, soil gas measurements may be evaluated against the soil gas target levels; however, indoor vapor cannot be used as criteria for pathway clearance. Soil gas measurements shall be taken and analyzed in accordance with 135.16(5) and the department’s Tier 2 guidance, and at locations in the plume where measured groundwater concentrations exceed the levels that are projected by modeling to exist beneath the actual receptor. If measured groundwater concentrations beneath the actual receptor exceed the levels projected from modeling, then the soil gas measurements may be taken either adjacent to the actual receptor in areas expected to exhibit the greatest soil gas measurements or at an alternative point of compliance between the source and receptor where the actual groundwater concentrations exceed the groundwater concentrations that exist beneath the confined space. If the soil gas measurements and confirmation samples taken in accordance with 135.12(6) “c” do not exceed the soil gas target levels, the pathway as to actual receptors shall be classified no action required. If the soil gas target levels are exceeded, either the pathway shall be classified high risk, or indoor vapor measurements may be taken in accordance with the department’s Tier 2 guidance. If indoor vapor measurements and confirmation samples do not exceed the indoor vapor target levels, the pathway as to

actual confined space receptors shall be classified no action required. If the Tier 1 indoor vapor target levels are exceeded, the pathway shall be classified high risk.

(2) Potential receptors. If the potential receptor groundwater concentration target level(s) is exceeded at any potential receptor point of exposure based on actual data or modeling, the pathway shall be classified low risk. However, if soil gas measurements taken at the potential receptor point(s) of exposure and alternate point(s) of compliance and confirmation samples do not exceed the target levels in 135.10(7) "f," the pathway, as to potential receptors, shall be classified no action required. If the target level(s) for potential sanitary sewer receptors is exceeded, the pathway shall be classified as low risk. Where the area of potential receptor exposure includes public right-of-way, the pathway may be classified as no action required if the owner or operator provides sufficient documentation to establish that there are no foreseeable plans for construction of sanitary sewers through the area of potential receptor exposure. The municipal authority must acknowledge consent to the no action required classification whenever target levels are exceeded. If the municipal authority reports that it has confirmed plans for construction of sanitary sewers through the area of potential receptor exposure, the pathway shall be reevaluated as an actual receptor.

*h. Corrective action response.* Unless the pathway is classified as no action required, corrective action for this pathway must be conducted as provided in 567—135.12(455B). Actual receptors are subject to corrective actions that (1) reduce groundwater concentrations beneath the enclosed space to below the target level; (2) reduce the measured soil gas levels to below the soil gas target levels; (3) reduce the indoor vapor concentrations to below the indoor vapor target level; or (4) reduce the vapor level to below 10 percent of the lower explosive limit (LEL), if applicable. Potential receptors are subject to the monitoring requirements in 135.12(5). Soil vapor monitoring may be conducted in lieu of groundwater monitoring for this pathway. Institutional or technological controls as provided in 567—135.12(455B) may be used.

*i. Municipal authority notification for potential sewer receptors.* The municipal authority responsible for sewer construction must be notified of the environmental conditions whenever target level(s) is exceeded for potential sanitary sewers. The notification must show the area where groundwater concentrations and soil gas samples exceed target levels. The owner or operator must acknowledge what plans, if any, exist for construction of sanitary sewers through the area of potential receptor exposure.

**135.10(7) Soil vapor to enclosed space pathway assessment.**

*a. Pathway completeness.* Unless cleared at Tier 1, this pathway is always considered complete for purposes of Tier 2.

*b. Explosive vapor survey.* If an explosive vapor survey has not been conducted as part of a Tier 1 assessment, an explosive vapor survey of enclosed spaces must be conducted during the Tier 2 assessment in accordance with 135.9(6) "b" and procedures outlined in the department's Tier 1 guidance.

*c. Confined space receptor evaluation.* Actual and potential receptors are evaluated at Tier 2 for this pathway.

(1) Actual receptors. An existing confined space within 50 feet of the edge of the plume is an actual receptor. For the purpose of Tier 2, a confined space is a basement in a building occupied by humans. Buildings constructed with a concrete slab on grade or buildings constructed without a concrete slab, but with a crawl space are not considered receptors. Sanitary sewers are considered confined space receptors and preferential pathways if an occupied building exists within 200 feet of where the sewer line crosses over or through soil contamination that exceeds the target levels calculated for sewers. The sanitary sewer includes its utility envelope. The point of exposure is the receptor and points of compliance include the locations where target level measurements may be taken as provided in 135.10(7) "f" and "g."

(2) Potential receptors. Potential receptors are confined spaces that do not presently exist but could exist in the future. Areas where soil concentrations are greater than the Tier 1 level applicable to residential areas or alternative target levels for nonresidential areas as specified in 135.10(7) "f" are considered potential receptor points of exposure. Potential receptors are evaluated and target levels established based on the current zoning. An area with no zoning is considered residential. The potential receptor point of exposure is a point of compliance.

*d. Vapor inhalation hazards.* Owners and operators may be required to address vapor inhalation hazards in occupied spaces other than confined spaces as defined in these rules when evidence arises that would give the department a reasonable basis to believe vapor hazards are present or may occur.

*e. Plume definition.* The soil plume must be defined to the Tier 1 level for this pathway unless vapor measurements taken at the area(s) with the maximum levels of soil contamination do not exceed the soil gas target level in 135.10(7)“*f.*” If soil gas measurements taken from the area(s) of maximum soil concentration do not exceed target levels, confirmation sampling must be conducted in accordance with 135.12(6)“*c.*” prior to proposing a no action pathway classification.

*f. Target levels.* Target levels can be based on soil concentrations, soil gas measurements, and indoor vapor measurements as provided below:

(1) For actual receptors, the soil concentration target level is the Tier 1 level. For potential receptors, the soil concentration target level for residential areas and areas with no zoning is the Tier 1 level. For areas zoned nonresidential, the target level is calculated using the default nonresidential exposure factors and building parameters from Appendix A and a target risk of  $10^{-4}$ .

(2) The following indoor vapor target levels apply to actual receptors other than sanitary sewers and the soil gas target levels apply to all actual and potential receptors. These levels were derived from the ASTM indoor air inhalation and the soil vapor to enclosed space models designated in Appendix A.

|         | <b>Indoor Vapor (<math>\mu\text{g}/\text{m}^3_{\text{air}}</math>)</b> | <b>Soil Gas (<math>\mu\text{g}/\text{m}^3</math>)</b> |
|---------|------------------------------------------------------------------------|-------------------------------------------------------|
| Benzene | 39.2                                                                   | 600,000                                               |
| Toluene | 555                                                                    | 9,250,000                                             |

(3) Sanitary sewers are treated as human health receptors, and soil concentration target levels at the point of exposure are based on application of a target risk of  $2 \times 10^{-4}$  for carcinogens and hazard quotient of 2 for noncarcinogens.

*g. Pathway evaluation and classification.*

(1) Actual receptors. Confined space receptors may be evaluated using soil gas measurements and indoor vapor measurements. When assessing sanitary sewers for pathway clearance, soil gas measurements may be evaluated against the soil gas target levels, however, indoor vapor cannot be used as criteria for pathway clearance. Soil gas measurements shall be taken adjacent to the actual receptor or at an alternative point of compliance between the source and receptor such as the property boundary and in accordance with 135.16(5) and the department’s Tier 2 guidance. If the soil gas measurements and confirmation samples taken in accordance with 135.12(6)“*c.*” do not exceed the soil gas target levels, the pathway as to actual receptors shall be classified no action required. If the soil gas target levels are exceeded, either the pathway shall be classified high risk, or indoor vapor measurements may be taken in accordance with the department’s Tier 2 guidance. If indoor vapor measurements and confirmation samples do not exceed the indoor vapor target levels, the pathway as to actual receptors shall be classified no action required. If the indoor vapor target levels are exceeded, the pathway shall be classified high risk.

(2) Potential receptors. If the potential receptor target level(s) based on soil concentrations is exceeded at any potential receptor point of exposure, the pathway shall be classified low risk. However, if soil gas measurements taken at the potential receptor point(s) of exposure and alternate point(s) of compliance and confirmation samples do not exceed the target levels in 135.10(7)“*f.*” the pathway shall be classified no action required as to potential receptors. If the target level(s) for potential sanitary sewer receptors is exceeded, the pathway shall be classified as low risk. Where the area of potential receptor exposure includes public right-of-way, the pathway may be classified as no action required if the owner or operator provides sufficient documentation to establish that there are no foreseeable plans for construction of sanitary sewers through the area of potential receptor exposure. The municipal authority must acknowledge consent to the no action required classification whenever target levels are exceeded. If the municipal authority reports that it has confirmed plans for construction of sanitary sewers through the area of potential receptor exposure, the pathway shall be reevaluated as an actual receptor.

*h. Corrective action response.* Unless the pathway is classified as no action required, corrective action for this pathway must be conducted as provided in 567—135.12(455B) and in accordance with department Tier 2 guidance. Actual receptors are subject to corrective actions that (1) reduce the indoor

vapor concentrations to below the target level; (2) reduce measured soil gas levels to below the soil gas target levels; and (3) if applicable, reduce the vapor level to below 10 percent of the lower explosive limit (LEL). Potential receptors are subject to monitoring requirements as provided in 135.12(5). Soil vapor monitoring may be conducted in lieu of soil monitoring for this pathway. Institutional or technological controls as provided in 567—135.12(455B) may be used.

*i. Municipal authority notification for potential sewer receptors.* The municipal authority responsible for sewer construction must be notified of the environmental conditions whenever target level(s) is exceeded for potential sanitary sewers. The notification must show the area where soil concentrations and soil gas samples exceed target levels. The owner or operator must acknowledge what plans, if any, exist for construction of sanitary sewers through the area of potential receptor exposure.

**135.10(8) Groundwater to water line pathway assessment.**

*a. Pathway completeness and receptor evaluation.*

(1) Actual receptors include all water lines where the highest groundwater elevation is higher than three feet below the bottom of the water line at the measured or predicted points of exposure. The highest groundwater elevation is the estimated average of the highest measured groundwater elevations for each year. All water lines must be evaluated for this pathway regardless of distance from the source and regardless of the Tier 1 evaluation, if the lines are in areas with actual data above the applicable Tier 1 level and modeled data above the SSTL line. If actual data exceeds modeled data, then all water lines are considered actual receptors if they are within a distance extending 10 percent beyond the edge of the contaminant plume defined by the actual data.

(2) Potential receptors include all areas where the first encountered groundwater is less than 20 feet deep and where actual data or modeled data are above Tier 1 levels.

(3) The point(s) of exposure is the water line, and the points of compliance are monitoring wells between the source and the water line that would be effective in monitoring whether the line has been or may be impacted by chemicals of concern.

*b. Plume definition.* If this pathway is complete for an actual receptor, the groundwater plume must be defined to the Tier 1 levels, with an emphasis between the source and any actual water lines. The water inside the water lines shall be analyzed for all chemicals of concern.

*c. Target levels.* Groundwater modeling as provided in 135.10(2) must be used to calculate the projected concentrations of chemicals of concern and site-specific target levels. The soil leaching to groundwater pathway must be evaluated to ensure contaminated soil will not cause future groundwater concentrations to exceed site-specific target levels. The target level at the point(s) of exposure is the Tier 1 level.

*d. Pathway evaluation and classification.* Upon completion of evaluation of analytical results of appropriate samples and modeled data, the pathway must be classified high risk, low risk or no further action as provided in 567—135.12(455B). The water quality inside the water lines is not a criterion for clearance of this pathway.

*e. Utility company notification.* The utility company that supplies water service to the area must be notified of all actual and potential water line impacts as soon as knowledge of a potential risk is determined. If the extent of contamination has been defined, this information must be included in utility company notification, and any previous notification made at Tier 1 must be amended to include this information.

*f. Corrective action response.*

(1) For actual receptors, unless the pathway is classified as no further action, corrective action for this pathway must be conducted as provided in 567—135.12(455B). If the concentrations of chemicals of concern in a water line exceed the Tier 1 levels for actual receptors for the groundwater ingestion pathway, immediate corrective action must be conducted to eliminate exposure to the water, including but not limited to replacement of the line with an approved material.

(2) For potential receptors, upon utility company notification, no further action will be required for this pathway for potential receptors.

**135.10(9) Soil to water line pathway assessment.**

*a. Pathway completeness and receptor evaluation.*

(1) All water lines must be evaluated for this pathway regardless of distance from the source if the lines are in areas where Tier 1 levels are exceeded. Actual receptors include all water lines within ten feet of the soil plume defined to the Tier 1 level unless it can be demonstrated that the water line inside the soil plume is not in contact with the soil contamination.

(2) Potential receptors include all areas where Tier 1 levels are exceeded.

*b. Plume definition.* The extent of soil contamination must be defined to Tier 1 levels for the chemicals of concern.

*c. Target level.* The point(s) of exposure includes all areas within ten feet of the water line. The target level at the point(s) of exposure is the Tier 1 level.

*d. Pathway classification.* Upon completion of evaluation of analytical results of appropriate samples, the pathway must be classified high risk, low risk or no further action as provided in 567—135.12(455B). Measurements of water quality inside the water lines may be required, but are not allowed as criteria to clear this pathway.

*e. Utility company notification.* The utility company that supplies water service to the area must be notified of all actual and potential water line impacts as soon as knowledge of the potential risk is determined. If the extent of contamination has been defined, this information must be included in utility company notification, and any previous notification made at Tier 1 must be amended to include this information.

*f. Corrective action response.*

(1) For actual receptors, unless the pathway is classified as no further action, corrective action for this pathway must be conducted as provided in 567—135.12(455B).

(2) For potential receptors, upon utility company notification, no further action will be required for this pathway for potential receptors.

**135.10(10) Surface water pathway assessment.**

*a. Pathway completeness.* Unless maximum concentrations are less than the applicable Tier 1 levels, this pathway is complete and must be evaluated under any of the following conditions: (1) there is a designated use surface water within the modeled groundwater plume or the actual plume as provided in 135.10(2) “f” and “g”; or (2) any surface water body that failed the Tier 1 visual inspection as provided in 135.9(10).

*b. Visual inspection.* A visual inspection must be conducted according to 135.9(10) “c.” If a sheen or residue from a petroleum-regulated substance is present, soil and groundwater sampling must be conducted to identify the source of the release and to define the extent of the contaminant plume to the levels acutely toxic to aquatic life as provided in 567—subrule 61.3(2).

*c. Receptor evaluation.*

(1) Surface water criteria apply only to designated use segments of surface water bodies as provided in 567—subrules 61.3(1) and 61.3(5). If the surface water body is a designated use segment and if maximum groundwater concentrations exceed applicable surface water criteria, the extent of contamination must be defined as provided in 135.10(10) “d.” The point of compliance for measuring chemicals of concern at the point of exposure is the groundwater adjacent to the surface water body because surface water must be protected for low flow conditions. In-stream measurements of concentrations are not allowed as a basis for no further action.

(2) If the visual inspection indicates the presence of a petroleum sheen in a general use segment within 200 feet of the source, as defined in 567—paragraph 61.3(1) “a,” the segment must be evaluated as an actual receptor. The point of compliance for measuring chemicals of concern at the point of exposure is the groundwater adjacent to the general use segment.

*d. Plume definition.* The groundwater plume must be defined to the surface water criteria levels for designated use segment receptors and to the acutely toxic levels for general use segment receptors, with an emphasis between the source and the surface water body.

*e. Target levels.* Determining target levels for this pathway involves a two-step process.

(1) Groundwater modeling as provided in 135.10(2) must be used to calculate the projected concentrations of chemicals of concern at the point of compliance. If the modeled concentrations or field data at the point of compliance exceed surface water criteria for designated use segments, an allowable

discharge concentration must be calculated. If the projected concentrations and actual concentrations at the point of compliance do not exceed surface water criteria, no further action is required to assess this pathway.

(2) The department water quality section will calculate the allowable discharge concentration using information provided by the certified groundwater professional on a department form. Required information includes, at a minimum, the site location and a discharge flow rate calculated according to the department's Tier 2 guidance. The allowable discharge concentration is the target level that must be met adjacent to the surface water body that is the point of compliance.

(3) The target level at the point of exposure/compliance for general use segments subject to evaluation is the acutely toxic levels established by the department under 567—Chapter 61 and 567—subrule 62.8(2). If the modeled concentrations of contaminant concentrations at the point of exposure/compliance exceed the acutely toxic levels, modeling must be used to determine site classifications and corrective action in accordance with 567—135.12(455B).

*f. Pathway evaluation and classification.* Upon completion of evaluation of analytical results of appropriate samples and modeled data, the pathway must be classified high risk, low risk or no further action as provided in 567—135.12(455B).

(1) For general use segments, as defined in 567—subrule 61.3(1), if the groundwater professional determines there is no sheen or residue present or if the site is not the source of the sheen or residue or if the sheen does not consist of petroleum-regulated substances, no further action is required for assessment of this pathway. If a petroleum-regulated substance sheen is present, the pathway is high risk and subject to classification in accordance with 567—135.12(455B).

(2) For designated use segments, as provided in 567—subrules 61.3(1) and 61.3(5), if projected concentrations of chemicals of concern and actual contaminant concentrations at the point of compliance do not exceed the target level adjacent to the surface water, and the groundwater professional determines there is no sheen or residue present, no further action is required for assessment of this pathway.

*g. Corrective action response.* Unless the pathway is classified as no further action, corrective action for this pathway must be conducted as provided in 567—135.12(455B). For surface water bodies failing the visual inspection criteria, corrective action must eliminate the sheen and reduce concentrations to below the site specific target level in accordance with 567—135.12(455B).

**135.10(11) Tier 2 submission and review procedures.**

*a.* Owners and operators must submit a Tier 2 site cleanup report within 180 days of the date the department approves or is deemed to approve a Tier 1 assessment report under 135.9(12). If the owner or operator has elected to conduct a Tier 2 assessment instead of a Tier 1, or a Tier 2 assessment is required due to the presence of free product under 135.7(4), the Tier 2 site cleanup report must be submitted within 180 days of the date the release was confirmed. The department may establish an alternative schedule for submittal.

*b.* Site cleanup report completeness and accuracy. A Tier 2 site cleanup report is considered to be complete if it contains all the information and data required by this rule and the department's Tier 2 guidance. The report is considered accurate if the information and data are reasonably reliable based first on the standards in these rules and department guidance, and second, on generally accepted industry standards.

*c.* The certified groundwater professional responsible for completion of the Tier 2 site assessment and preparation of the report must accompany each Tier 2 site cleanup report with a certification as set out below:

I, \_\_\_\_\_, groundwater professional certification number \_\_\_\_\_, am familiar with all applicable requirements of Iowa Code section 455B.474 and all rules and procedures adopted thereunder including, but not limited to, the Department of Natural Resources' Tier 2 guidance. Based on my knowledge of those documents and the information I have prepared and reviewed regarding this site, UST registration number \_\_\_\_\_, LUST No. \_\_\_\_\_, I certify that this document is complete and accurate as provided in 135.10(11) and meets the applicable requirements of the Tier 2 site cleanup report.

Signature

Date

*d.* Upon receipt of the groundwater professional's certified Tier 2 report, the groundwater professional's proposed site classification for the site shall be determinative unless, within 90 days of receipt, the department identifies material information in the report that is inaccurate or incomplete. Material information may be data found to be inaccurate or incomplete or a report that lacks information that, if accurate and complete, would result in a different site or pathway classification than proposed by the certified groundwater professional. If the department determines that the site cleanup report is inaccurate or incomplete, the department shall notify the groundwater professional of the inaccurate or incomplete information within 90 days of receipt of the report and shall work with the groundwater professional and the party responsible for cleanup to obtain correct information or additional information necessary to appropriately classify the site. If the groundwater professional recommends proceeding to Tier 3, the groundwater professional's site classification and any pathway classification recommendations subject to or influenced by a Tier 3 assessment shall not be considered determinative until the Tier 3 report is submitted for review as provided in 567—135.11(455B).

*e.* If a "no action required" site classification is proposed, the department shall review the report in accordance with 135.12(6) and the review standards in 135.10(11) "*d.*"

*f.* The department may, in the interest of minimizing environmental or public health risks and promoting a more effective cleanup, require owners and operators to begin cleanup of soil and groundwater before the Tier 2 site cleanup report is approved.

[ARC 0491D, IAB 8/19/26, effective 9/23/26]

**567—135.11(455B) Tier 3 site assessment policy and procedure.**

**135.11(1)** *General.* Tier 3 site assessment. Unless specifically limited by rule or an imminent hazard exists, an owner or operator may choose to prepare a Tier 3 site assessment as an alternative to completion of a Tier 2 assessment under 567—135.10(455B) or as an alternative to completion of a corrective action design report under 567—135.12(455B). Prior to conducting a Tier 3 site assessment, a groundwater professional must submit a work plan to the department for approval. The work plan must contain an evaluation of the specific site conditions that justify the use of a Tier 3 assessment, an outline of the proposed Tier 3 assessment procedures, a reporting format and a method for determining a risk classification consistent with the provisions underlying the risk classification system in 567—135.12(455B). Upon approval, the groundwater professional may implement the assessment plan and submit a report within a reasonable time designated by the department.

**135.11(2)** *Tier 3 site assessment.* A Tier 3 assessment may include but is not limited to the use of more site-specific or multidimensional models and assessment data, methods for calibrating Tier 2 models to make them more predictive of actual site conditions, and more extensive assessment of receptor construction and vulnerability to contaminant impacts. If use of Tier 2 models is proposed with substitution of other site-specific data (as opposed to the Tier 2 default parameters), the groundwater professional must adequately justify how site-specific data is to be measured and why it is necessary. The groundwater professional must demonstrate that the proposal has a proven applicability to underground storage tank sites or similar conditions or has a strong theoretical basis for applicability and is not biased toward underestimating assessment results. The Tier 3 assessment report shall make a recommendation for site classification as high risk, low risk or no action required, at least two corrective action response technologies and provide justification consistent with the standards and policies underlying risk classification and corrective action response under 567—135.12(455B) and Iowa Code chapter 455B, subchapter IV, part 8.

**135.11(3)** *Review and submittal.* The department will review the Tier 3 assessment for compliance with the terms of the approved work plan and based on principles consistent with these rules and Iowa Code chapter 455B, subchapter IV, part 8. Upon approval of the Tier 3 assessment, the department may require corrective action in accordance with 567—135.12(455B).

[ARC 0491D, IAB 8/19/26, effective 9/23/26]

**567—135.12(455B) Tier 2 and 3 site classification and corrective action response.**

**135.12(1) General.** Iowa Code section 455B.474(1) “a”(4)(b) provides that sites shall be classified as high risk, low risk and no action required. Risk classification is accomplished by comparing actual contaminate concentrations to the concentrations that are predicted by the use of models. Concentrations must be compared to the simulation model that uses the maximum concentrations at a source and predicts at what levels actual or potential receptors could be impacted in the future. Concentrations must also be compared to the site-specific target level line that assumes a target level concentration at the point of exposure and is used to predict the reduction in concentration that must be achieved at the source in order to meet the applicable target level at the point of exposure. These models not only predict concentrations at points of exposure or a point of compliance at a source but also predict a distribution of concentrations between the source and the point of exposure, which may also be points of compliance. The comparison of contaminate concentrations with these distribution curves primarily is considered for purposes of judging whether the modeled data is reasonably predictive and what measures such as monitoring are prudent to determine the reliability of modeled data and actual contaminate concentrations.

For the soil vapor to enclosed space and soil to water line pathways, there are no horizontal transport models to use for predicting future impacts. Therefore, for these pathways, sites are classified as high risk, low risk or no action required based on specified criteria below and in 567—135.10(455B).

**135.12(2) High risk classification.** Except as provided below, sites shall be classified as high risk if, for any pathway, any actual contaminate concentrations exceed the site-specific target level line at any point for an actual receptor.

*a.* For the soil vapor to enclosed space and soil to water line pathways, sites shall be classified as high risk if the target levels for actual receptors are exceeded as provided in 135.10(7) and 135.10(9).

*b.* For the soil vapor or groundwater vapor to enclosed space pathways, sites shall be classified as high risk if the explosivity levels at applicable points of compliance are exceeded as provided in 135.10(6) and 135.10(7).

*c.* Generally, sites are classified as low risk if only potential receptor points of compliance are exceeded. The following is an exception. For the soil leaching to groundwater ingestion pathway for potential receptor conditions, the site shall be classified as high risk if the groundwater concentration(s) exceeds the groundwater Tier 1 level for potential receptor and the soil concentration exceeds the soil leaching site-specific target level at the source.

**135.12(3) High risk corrective action response.**

*a.* Objectives. The primary objectives of corrective action in response to a high risk classification are both short-term and long-term. The short-term goal is to eliminate or reduce the risk of exposure at actual receptors that have been or are imminently threatened with exposure above target levels. The longer term goal is to prevent exposure to actual receptors that are not currently impacted or are not imminently threatened with exposure. To achieve these objectives, it is the intent of these rules that concentrations of applicable chemicals of concern be reduced by active remediation to levels below the site-specific target level line at all points between the source(s) and the point(s) of exposure as well as to undertake such interim corrective action as necessary to eliminate or prevent exposure until concentrations below the SSTL line are achieved. If it is shown that concentrations at all applicable points have been reduced to below the SSTL line, the secondary objective is to establish that the actual chemical concentrations can be reasonably relied upon to predict future conditions at points of exposure rather than reliance on the modeled data. Reliance on actual contaminant concentrations is achieved by establishing through monitoring that concentrations within the contaminant plume are steady or declining. Institutional controls and technological controls may be used to sever pathways or control the risk of receptor impacts.

*b.* For the groundwater to water line and soil to water line receptors, these objectives are achieved by active remediation, replacement or relocation of high risk water line receptors in the actual and modeled plume areas. If water lines and gaskets are replaced in an area of contamination, they must be replaced with water line materials and gasket materials of appropriate construction in accordance with current department standards set forth in 567—Chapter 43 and with no less than nitrile or FKM gaskets or as otherwise approved by the department.

c. In areas of free product, all water lines, regardless of construction material, must be relocated unless there is no other option and the department has approved an alternate plan of construction. Refer to 135.7(4) "d"(11). If a service line remains in the area of LNAPL, a backflow preventer shall be installed to prevent impacts to the larger water distribution system.

d. For the soil vapor pathway, these objectives are achieved by active remediation of soil contamination below the target level at the point(s) of exposure or other designated point(s) of compliance using the same measurement methods for receptor evaluation under 135.10(7) and 135.10(9).

e. For a site classified as high risk or reclassified as high risk for the soil leaching to groundwater ingestion pathway, these objectives are achieved by active remediation of soil contamination to reduce the soil concentration to below the site-specific target level at the source.

f. A corrective action design report (CADR) must be submitted by a certified groundwater professional for all high risk sites unless the terms of a corrective action plan are formalized in a memorandum of agreement within a reasonable time frame specified by the department. The CADR must be submitted on a form provided by the department and in accordance with department CADR guidance within 60 days of site classification approval as provided in 135.10(11). The CADR must identify at least two principally applicable corrective action options designed to meet the objectives in 135.12(3), an outline of the projected timetable and critical performance benchmarks, and a specific monitoring proposal designed to verify its effectiveness and must provide sufficient supporting documentation consistent with industry standards that the technology is effective to accomplish site-specific objectives. The CADR must contain an analysis of its cost-effectiveness in relation to other options. The department will review the CADR in accordance with 135.12(9).

g. Interim monitoring. From the time a Tier 2 site cleanup report is submitted and until the department determines a site is classified as no action required, interim monitoring is required at least annually for all sites classified as high risk. Groundwater samples must be taken: (1) from a monitoring well at the maximum source concentration; (2) from a transition well, meaning a monitoring well with detected levels of contamination closest to the leading edge of the groundwater plume as defined to the pathway-specific target level, and between the source(s) and the point(s) of exposure; and (3) from a guard well, meaning a monitoring well between the source(s) and the point(s) of exposure with concentrations below the SSTL line. If a receptor is located within an actual plume contoured to the applicable target level for that receptor, the point of exposure must be monitored. If concentrations at the receptor already exceed the applicable target level for that receptor, corrective actions must be implemented as soon as practicable. Monitoring conducted as part of remediation or as a condition of establishing a no action required classification may be used to the extent it meets these criteria. Soil monitoring is required at least annually for all applicable pathways in accordance with 135.12(5) "d." All drinking water wells and non-drinking water wells within 100 feet of the largest actual plume (defined to the appropriate target level for the receptor type) must be tested annually for chemicals of concern. Actual plumes refer to groundwater plumes for all chemicals of concern.

h. Remediation monitoring. Remediation monitoring during operation of a remediation system is required at least four times each year to evaluate effectiveness of the system. A remediation monitoring schedule and plan must be specified in the corrective action design report and approved by the department.

i. Technological controls. The purpose of a technological control is to effectively sever a pathway by use of technologies such that an applicable receptor could not be exposed to chemicals of concern above an applicable target risk level. Technological controls are an acceptable corrective action response either alone or in combination with other remediation systems. The purpose of technological controls may be to control plume migration through use of containment technologies, barriers, etc., both as an interim or permanent corrective action response or to permanently sever a pathway to a receptor. Controls may also be appropriate to treat or control contamination at the point of exposure. Any technological control proposed as a permanent corrective action option without meeting the reduction in contaminant concentrations objectives must establish that the pathway to a receptor will be permanently severed or controlled. The effectiveness of a technological control must be monitored under a department approved plan until concentrations fall below the site-specific target level line or its effectiveness as a permanent response is established and no adverse effects are created.

j. Following completion of corrective action, the site must meet exit monitoring criteria to be reclassified as no action required as specified in 135.12(6)“c.” At any point where an institutional or technological control is implemented and approved by the department, the site may be reclassified as no action required consistent with 135.12(6).

**135.12(4) *Low risk classification.*** A site shall be classified as low risk if none of the pathways are high risk and if any of the pathways are low risk. A pathway shall be classified low risk if it meets one of the following conditions:

a. For actual and potential receptors, if the modeled data and the actual concentrations are less than the site-specific target level line, and any of the actual concentrations are greater than the simulation line.

b. For potential receptors, if any actual concentrations exceed the site-specific target level line at any point.

c. For the soil leaching to groundwater ingestion pathway where modeling predicts that the Tier 1 levels for potential receptors would be exceeded in groundwater at applicable potential receptor points of compliance and the soil concentration exceeds the soil leaching to groundwater site-specific target level but groundwater concentrations are currently below the Tier 1 level for potential receptors, the site shall be initially classified as low risk and subject to monitoring under 135.12(5)“d”(2). If at any time during the three-year monitoring period, groundwater concentrations exceed the Tier 1 level for potential receptors, the site shall be classified as high risk requiring soil remediation in accordance with 135.12(3)“d.”

**135.12(5) *Low risk corrective action response.***

a. Purpose. For sites or pathways classified as low risk, the purpose of monitoring is to determine if concentrations are decreasing such that reclassification to no action required may be appropriate or if the contaminant plume is stable such that reclassification to no action required can be achieved with implementation of an institutional control in accordance with 135.12(8), or if concentrations are increasing above the site-specific target level line such that reclassification to high risk is appropriate. Monitoring is necessary to evaluate impacts to actual receptors and assess the continued status of potential receptor conditions. Low risk monitoring shall be conducted and reported by a certified groundwater professional.

b. For sites or pathways classified as low risk, provide a best management practices plan. The plan must include maintenance procedures, schedule of activities, prohibition of practices, and other management practices, or a combination thereof, which, after problem assessment, are determined to be the most effective means of monitoring and preventing additional contamination of the groundwater and soil. The plan will also contain a contamination monitoring proposal containing sufficient sampling points to ensure the detection of any significant movement of or increase in contaminant concentration.

c. Groundwater monitoring. For groundwater pathways, samples must be taken at a minimum of once per year: (1) from a monitoring well at the maximum source concentration; (2) a transitional well meaning a well with detected levels of contamination closest to the leading edge of the groundwater plume as defined to the pathway-specific target level and between the source and the receptor; and (3) a guard well meaning a monitoring well between the source and the point of exposure with concentrations below the SSTL line. (NOTE: Monitoring under this provision may be used to satisfy exit monitoring if it otherwise meets the criteria in 135.12(6).)

d. Soil monitoring.

(1) For the soil vapor to enclosed space pathway potential receptors, soil gas samples must be taken at a minimum of once per year in the area(s) of expected maximum vapor concentrations where an institutional control is not in place.

(2) For the soil leaching to groundwater pathway potential receptors, annual groundwater monitoring is required for a minimum of three years as provided in 135.12(5)“c.” If groundwater concentrations are below the applicable SSTL line for all three years, no further action is required. If groundwater concentrations exceed the applicable SSTL line in any of the three years, corrective action is required to reduce soil concentrations to below the Tier 1 levels for soil leaching to groundwater. Therefore, annual monitoring of soil is not applicable.

(3) For the soil to water line pathway potential receptors, notification of the utility company is required. Notification will result in reclassification to no action required. Therefore, annual monitoring of soil is not applicable.

e. Receptors must be evaluated at least annually to ensure no actual or modeled data are above the site-specific target level line for any actual receptors. Potential receptor areas of concern must be evaluated at least annually and the presence of no actual receptors confirmed. If actual receptors are present or reasonably expected to be brought into existence, the owner or operator must report this fact to the department as soon as practicable. Annual monitoring that also meets the exit criteria under 135.12(6) may be used for that purpose.

f. The site or pathway must meet exit monitoring criteria to be reclassified as no action required as specified in 135.12(6) "b." If concentrations for actual receptors increase above the site-specific target level line or potential receptor status changes to actual receptor status, the site must be reclassified as high risk and further corrective action required in accordance with 135.12(3).

**135.12(6) No action required classification.** A site shall be classified as no action required if all of the pathways are classified as no action required as provided below:

a. Soil pathways shall be classified as no action required if samples are less than the applicable target levels as defined for each pathway and confirmational sampling requirements have been met.

b. For initial classification, groundwater pathways shall be classified as no action required if the contaminant concentrations are below the site-specific target level line and all concentrations are at or less than the simulation line, and confirmation monitoring has been completed successfully. Confirmation sampling for groundwater is a second sample that confirms the no action required criteria.

c. A groundwater pathway shall be reclassified from high risk to no action required if:

(1) All contaminant concentrations are below the site-specific target level and if exit monitoring criteria have been met. Exit monitoring criteria means that the three most recent consecutive groundwater samples from all monitoring wells must show a steady or declining trend and the most recent samples are below the site-specific target level. A steady and declining trend includes the following: the first of the three samples for the source well and transition well must be more than detection limits, concentrations cannot increase more than 20 percent from the first of the three samples to the third sample, concentrations cannot increase more than 20 percent of the previous sample, and samples must be separated by at least six months; or

(2) There are no actual receptors within the actual groundwater plume defined to the applicable target level and plume stability has been documented to show that the actual plume is not migrating to actual receptors.

d. A low risk site shall be reclassified as "no action required" if contaminant concentrations are below the site-specific target level and if exit monitoring criteria have been met pursuant to 135.12(6) "c" or if the site has maintained less than the applicable target level for four consecutive sampling events separated by at least six months as defined in the monitoring plan regardless of exit monitoring criteria and guidance.

e. Confirmation sampling for soil gas and indoor vapor. For the enclosed space pathways, confirmation sampling is required to reasonably establish that the soil gas and indoor vapor samples represent the highest expected levels. A groundwater professional must obtain two samples taken at least two weeks apart. One of the samples should be collected beneath the frost line depth during a seasonal period of lowest groundwater elevation.

f. As a condition of obtaining site classification as no action required, all groundwater monitoring wells must be properly plugged in accordance with 567—Chapters 39 and 49 unless the department requires selected wells to be maintained or a written request with justification and a plan for properly maintaining the wells are submitted to the department for approval. Approval to maintain wells shall be deemed granted if not disapproved with reason within 30 days of request.

g. Prior to acceptance of a request to classify the site as no action required, and in the event there is a question of validity of the data or sampling methods, laboratory analysis procedures, indication of plume movement, or the department obtains information about new conditions at the site, the department may conduct or require the owner to conduct confirmation sampling of the soil, groundwater, soil gas, or indoor vapor to confirm that the no action required criteria have been met.

h. The department may waive, at its discretion, the exit monitoring criteria based on a certified groundwater professional's written justification to support a no action required classification for the site

based on a reasoned assessment of data, trends, receptor status, and corrective actions performed. One example is when steady and declining criteria have not been met due solely to variations among a laboratory's lowest achievable detection limits.

**135.12(7) *Reclassification.*** Any site or pathway that is classified as high risk may be reclassified to low risk if in the course of corrective action the criteria for low risk classification are established. Any site or pathway that is classified as low risk may be reclassified to high risk if in the course of monitoring the conditions for high risk classification are established. Sites subject to department-approved institutional or technological controls are classified as no action required if all other criteria for no action required classification are satisfied.

**135.12(8) *Use of institutional and technological controls.***

*a. Purpose.* The purpose of an institutional control is to restrict access to or use of property such that an applicable receptor could not be exposed to chemicals of concern for as long as the target level is exceeded at applicable points of exposure and compliance. Institutional controls include:

- (1) A law of the United States or the state;
- (2) A regulation issued pursuant to federal or state laws;
- (3) An ordinance or regulation of a political subdivision in which real estate subject to the institutional control is located;
- (4) An environmental covenant as provided in Iowa Code chapter 455I;
- (5) Any other institutional control the owner or operator can reasonably demonstrate to the department will reduce the risk from a release throughout the period necessary to ensure that no applicable target level is likely to be exceeded.

*b. Modification or termination of institutional and technological controls.* At a point when the department determines that an institutional or technological control has been removed or is no longer effective for the purpose intended, regardless of the issuance of a no further action certification or previous site classification, it may require owners and operators to undertake such reevaluation of the site conditions as necessary to determine an appropriate site classification and corrective action response. If the owner or operator is in control of the affected property, the department may require reimplementing of the institutional or technological control or may require a Tier 2 assessment of the affected pathway(s) be conducted to reevaluate the site conditions and determine alternative corrective action response. An owner or operator subject to an institutional or technological control may request modification or termination of the control by conducting a Tier 2 assessment of the affected pathway or conduct such other assessment as required by the department to establish that the control is no longer required given current site conditions.

*c. If the owner or operator is not in control of the affected property or cannot obtain control and the party in control refuses to continue implementation of an institutional control, the department may require the owner or operator to take such legal action as available to enforce institution of the control or may require the owner or operator to undertake a Tier 2 assessment to determine site classification and an alternative corrective action response. If a person in control of the affected property appears to be contractually obligated to maintain an institutional or technological control, the department may, but is not required to, attempt enforcement of the contractual obligation as an alternative to requiring corrective action by the owner or operator.*

*d. If a site is classified no action required, subject to the existence of an institutional control or technological control, the holder of the fee interest in the real estate subject to the institutional control or technological control may request, at any time, that the department terminate the institutional control or technological control requirement. The department shall terminate the requirement for an institutional control if the holder demonstrates by completion of a Tier 2 assessment of the applicable pathway or other assessment as required by the department that the site conditions warranting the control no longer exist and that the site or pathway has met exit criteria for no action required classification under 135.12(6).*

**135.12(9) *Corrective action design report submission and review procedures.***

*a. Owners and operators must submit a CADR within 60 days of the date the department approves or is deemed to approve a Tier 2 assessment report under 135.10(11) or a Tier 3 assessment is to be conducted. The department may establish an alternative schedule for submittal. As an alternative to submitting a CADR, owners or operators may participate in a corrective action meeting process to develop*

a corrective action plan that would be incorporated into a memorandum of agreement or other written agreement approved by the department. Owners or operators shall implement the terms of an approved CADR, memorandum of agreement or other corrective action plan agreement.

b. Corrective action design report completeness and accuracy. A CADR is considered to be complete if it contains all the information and data required by this rule and the department's guidance. The report is considered accurate if the information and data are reasonably reliable based first on the standards in these rules and department guidance, and second, on generally accepted industry standards.

c. The certified groundwater professional responsible for completion of the CADR must provide the following certification with the CADR:

I, \_\_\_\_\_, groundwater professional certification number \_\_\_\_\_, am familiar with all applicable requirements of Iowa Code section 455B.474 and all rules and procedures adopted thereunder including, but not limited to, the Department of Natural Resources' guidance and specifications for corrective action design reports. Based on my knowledge of those documents and the information I have prepared and reviewed regarding this site, UST registration number \_\_\_\_\_, LUST No. \_\_\_\_\_, I certify that this document is complete and accurate as provided in 135.12(9) and meets the applicable requirements of the corrective action design report, and that the recommended corrective action can reasonably be expected to meet its stated objectives.

Signature

Date

d. Review. A CADR submitted by a groundwater professional shall be accepted by the department and shall be primarily relied upon by the department to determine the corrective action response requirements of the site. However, if within 90 days of receipt of a CADR, the department identifies material information in the CADR that is inaccurate or incomplete, and if based upon information in the report the appropriate corrective action response cannot be reasonably determined by the department based on industry standards, the department may reject the report and require modifications. If the department does not reject the report within 90 days of receipt, the report shall be deemed approved as submitted unless changes to the report are requested by the groundwater professional. The department shall work with the groundwater professional and the owner or operator to correct any materially inaccurate information or to obtain the additional information necessary to determine the appropriate corrective action response as soon as practicable.

e. Memorandums of agreement. Owners or operators that fail to implement the actions or meet the activity schedule in a memorandum of agreement resulting from a corrective action meeting or other written corrective action plan agreement or that fail to implement the actions or meet the schedule outlined in an approved CADR are subject to legal action.

**135.12(10)** *Monitoring certificates and no further action certificates.*

a. Monitoring certificate. The department will issue a monitoring certificate to the owner or operator of an underground storage tank from which a release has occurred, the current property owner, or other responsible party who has undertaken the corrective action warranting issuance of the certificate. Sites classified as low risk or sites classified as high risk/monitoring shall be eligible for a monitoring certificate. The monitoring certificate will be valid until the site is reclassified to a high risk requiring active remediation or no action required site. A site that has been issued a monitoring certificate shall not be eligible to receive a certificate evidencing completion of remediation until the site is reclassified as no action required. The monitoring certificate may be invalidated and the site reclassified to high risk if it is determined by the department that the owner of the site is not in compliance with the requirements specified in the monitoring certificate.

b. No further action certificate. When the no action required site classification has been determined based on a recommendation of the certified groundwater professional as provided in 135.9(11), 135.10(11) and 135.12(6) (see also Iowa Code section 455B.474(1) "a"(8)(a) and (c)), the department shall issue a no further action certificate.

The department will issue a no further action certificate to an owner or operator of an underground storage tank from which a release has occurred, the current property owner, or other responsible party who has undertaken the corrective action warranting classification of the site as no action required. Prior

to the issuance of a no further action certificate, an accurate legal description of the property on which the underground storage tanks are or were formerly located shall be submitted to the department. The following conditions apply:

(1) If free product is present, the department shall not issue a no further action certificate until the department has approved termination of all free product assessment and recovery in accordance with 135.7(4).

(2) The site has been determined by a certified groundwater professional not to present an unreasonable risk to the public health and safety or the environment.

(3) A person issued the certificate or a subsequent purchaser of the site cannot be required to perform further corrective action because action standards are changed at a later date. Action standards refer to applicable standards under this rule.

(4) The certified groundwater professional has certified that all groundwater monitoring wells have been permanently closed in accordance with 135.12(6) "f" with the exception of wells that are allowed to be maintained pursuant to 135.12(6) "f." Wells not properly maintained shall be referred to the water supply section of the department that enforces 567—Chapters 39 and 49.

(5) The certificate shall not prevent the department from ordering remediation of a release identified subsequent to the release for which the no further action certificate was issued. The certificate shall not prevent the department from requiring corrective action of a release of a regulated substance from an unregulated tank.

(6) The certificate will not constitute a warranty of any kind to any person as to the condition, marketability or value of the described property.

(7) The certificate shall reflect any institutional control utilized to ensure compliance with any applicable Tier 2 level; and may include a notation that the classification is based on the fact that designated potential receptors are not in existence.

(8) The certificate shall be in a form provided by the department that is recordable in accordance with Iowa Code section 558.1 et seq.

(9) The owner or operator or other persons conducting corrective action shall be responsible for recording the no further action certificate with the county recorder and return a file-stamped copy to the department within 30 days of the issue date. At its discretion, the department may record the no further action certificate with the appropriate county recorder as authorized in Iowa Code section 455B.474(1) "a" (8)(c).

c. The department shall modify any issued no further action certificates containing institutional controls once the owner, operator or their successor or assign has demonstrated that the institutional control is no longer necessary to meet the applicable Tier 2 level as provided in 135.12(10).

**135.12(11) Expedited corrective action.** An owner, operator or responsible party of a site at which a release of regulated substance is suspected to have occurred may carry out corrective actions at the site so long as the department receives notice of the expedited cleanup activities prior to 30 calendar days of their commencement; the owner, operator, or responsible party complies with the provisions of these rules; and the corrective action does not include active treatment of groundwater other than:

a. As previously approved by the department; or

b. Free product recovery pursuant to 135.7(4).

c. Soil overexcavation. When undertaking overexcavation of contaminated soils, adequate field screening methods must be used to identify maximum concentrations during excavation. At a minimum one soil sample must be taken for field screening every 100 square feet of the base and each sidewall. Soil samples must be taken for laboratory analysis at least every 400 square feet of the base and each sidewall of the excavated area to confirm remaining concentrations are below Tier 1 levels. If the excavation is less than 400 square feet, a minimum of one sample must be analyzed for each sidewall and the base. The owner or operator must maintain adequate records of the excavation area to document compliance with this procedure unless submitted to the department and must provide it to the department upon request.

[ARC 0491D, IAB 8/19/26, effective 9/23/26]

**567—135.13(455B) Public participation.**

**135.13(1)** For each confirmed release that is classified as high or low risk, the department must provide notice to the public by means designated to reach those members of the public directly affected by the release and the recommended corrective action response. This notice may include but is not limited to public notice in local newspapers, block advertisements, public service announcements, publication in a state register, letters to individual households, or personal contacts by the staff.

**135.13(2)** The department must ensure site release information and decisions concerning the Tier 1 assessment report, Tier 2 and Tier 3 site cleanup reports are made available to the public for inspection upon request.

**135.13(3)** Before approving the Tier 2 or Tier 3 site cleanup report, the department may hold a public meeting to consider comments on the proposed corrective action response if there is sufficient public interest, or for any other reason.

**135.13(4)** The department must give a public notice that complies with 135.13(1) above if the implementation of the approved Tier 2 or Tier 3 site cleanup report does not achieve the established cleanup levels in the report and the termination of that report is under consideration by the department.

[ARC 0491D, IAB 8/19/26, effective 9/23/26]

**567—135.14(455B) Action levels.** The following corrective action levels apply to petroleum-regulated substances as regulated by this chapter. These action levels shall be used to determine if further corrective action under 567—135.6(455B) through 567—135.12(455B) or 567—135.15(455B) is required as the result of tank closure sampling under 135.15(3) or other analytical results submitted to the department. The contaminant concentrations must be determined by laboratory analysis as stated in 567—135.16(455B). Final cleanup determination is not limited to these contaminants. The contamination corrective action levels are:

|                                          | Soil (mg/kg) | Groundwater<br>(µg/L) |
|------------------------------------------|--------------|-----------------------|
| Benzene                                  | 0.54         | 5                     |
| Toluene                                  | 3.2          | 1,000                 |
| Ethylbenzene                             | 15           | 700                   |
| Xylenes                                  | 52           | 10,000                |
| Total Extractable                        |              |                       |
| Hydrocarbons—Diesel                      | 3,800        | 1,200                 |
| Total Extractable Hydrocarbons—Waste Oil |              | 400                   |

[ARC 0491D, IAB 8/19/26, effective 9/23/26]

**567—135.15(455B) Out-of-service UST systems, temporary closure, and permanent closure.****135.15(1) Out-of-service UST systems and temporary closure.**

*a.* UST systems not meeting either the performance standards in 135.3(1) for new UST systems or the upgrading requirements in 135.3(2) by December 22, 1998, must be permanently closed according to 135.15(2). The tanks cannot be brought back into use.

*b.* When a UST system in compliance with new tank standards is out of service for less than three months, owners and operators must:

- (1) Continue operation and maintenance of corrosion protection in accordance with 135.4(2);
- (2) Continue operation and maintenance of any release detection in accordance with 567—135.5(455B) unless the system is empty. The UST system is empty when all materials have been removed using commonly employed practices. No more than 2.5 centimeters (one inch) of residue, or 0.3 percent by weight of the total capacity of the UST system, may remain in the system;
- (3) Comply with 567—135.6(455B) through 567—135.12(455B) if a release is suspected or confirmed;
- (4) Maintain financial responsibility in accordance with 567—Chapter 136.
- (5) Continue to pay the tank management fee as required in 135.3(5).

(6) Continue to have compliance inspections conducted as required in 567—135.19(455B).

c. When a UST system is out of service for three months or more, an owner must submit a notification of temporary closure form to the department. Owners and operators must complete the requirements in 135.15(1) “b” for temporary closure and certify the following:

- (1) The UST system is empty of all regulated substances (e.g., receipt of product removal).
- (2) Vent lines are open and functioning.
- (3) All other piping, pumps, accesses, and ancillary equipment are capped and locked.
- (4) The corrosion protection system is being maintained in accordance with 135.4(2).
- (5) Maintain financial responsibility (e.g., insurance) according to 567—Chapter 136.

d. When a tank system is temporarily closed for more than 12 months, the owner must remain in compliance with the department’s temporary closure requirements in 135.15(1) “c.” The department may provide an extension to the 12-month temporary closure period. Owners and operators must complete a site check in accordance with 135.6(3) “b” before such an extension can be applied for.

e. If a tank system is temporarily closed for more than 12 months, but the tank system has not been temporarily closed according to the requirements of 135.15(1) “c,” or the owner or operator has failed to maintain out-of-service requirements in 135.15(1) “b,” the UST system must be permanently closed in accordance with 135.15(2).

f. Prior to returning a temporarily closed tank back into service, the owner or operator must complete and submit the department’s return-to-service form signed by the owner/operator and provide the following documentation unless otherwise approved by the department. The tank system cannot be operated or receive fuel until current tank tags have been issued.

(1) Where applicable, documentation that corrosion protection has been maintained continuously in accordance with 135.4(2). The owner or operator must provide an inspection log of the cathodic protection system and the inspection report of the cathodic protection system completed by an Iowa-certified cathodic protection tester.

(2) For lined tanks, provide a lining and tank integrity inspection report in accordance with 135.3(2) “b.”

(3) Results of precision tightness tests (0.1 gph) conducted on tanks in accordance with 567—135.5(455B).

(4) Results of precision tightness tests (0.1 gph) conducted on lines in accordance with 567—135.5(455B).

(5) Function test (3.0 gph) results of mechanical or electronic leak detectors conducted in accordance with 567—135.5(455B).

(6) Tank and piping leak detection is operational and in good condition.

(7) Provide test results of the periodic testing of spill and overfill prevention equipment and containment sumps used for interstitial monitoring in accordance with 135.4(12) in the last 12 months.

(8) Copy of the financial responsibility (e.g., UST insurance) mechanism in accordance with 567—Chapter 136.

(9) Copies of Class A and Class B operator training certificates.

(10) Change of ownership form (if the UST system was sold).

**135.15(2) Permanent closure and changes-in-service.** Permanent closure of an underground storage tank system must be conducted by an Iowa-certified tank remover. Closure sampling must be conducted by or under the supervision of an Iowa-certified groundwater professional.

a. At least 30 days before beginning either permanent closure or a change-in-service under 135.15(2) “b” and “c,” owners and operators must notify the department of their intent to permanently close or make the change-in-service. An owner or operator must seek prior approval to permanently close a tank in a time frame shorter than the 30-day notice. The required assessment of the excavation zone under 135.15(3) must be performed after notifying the department but before completion of the permanent closure or a change-in-service.

b. To permanently close a tank or piping, owners and operators must empty and clean them by removing all liquids and accumulated sludge. All tanks taken out of service permanently must also be removed from the ground, filled with an inert solid material, or closed in place by a method approved by

the department. Piping must be removed from the ground or have the ends plugged with an inert solid material.

c. Continued use of a UST system to store a nonregulated substance is considered a change-in-service. Before a change-in-service, owners and operators must empty and clean the tank by removing all liquid and accumulated sludge and conduct a site assessment in accordance with 135.15(3).

d. Permanent closure procedures must be followed in the replacement of tanks or piping. Notification must be made using DNR Form 542-1308, "Notification of Tank Closure or Change-in-Service." The form must include the date scheduled for the closure. Confirmation of the closure date must be given to the DNR field office 24 hours prior to the actual closure. The required assessment of the excavation zone under 135.15(3) must be performed after notifying the department but before completion of the permanent closure or change-in-service.

NOTE: The cleaning and closure procedures listed in 40 CFR 280.71(c) may be used to comply with 135.15(2).

**135.15(3)** *Assessing the site at closure or change-in-service.*

a. Before permanent closure or a change-in-service is completed, owners or operators must measure for the presence of a release where contamination is most likely to be present at the UST site. This soil and groundwater closure investigation must be conducted or supervised by a groundwater professional certified under 567—Chapter 134 unless the department in its discretion grants an exemption and provides direct supervision of the closure investigation. In selecting the sample types, sample locations, and measurement methods, owners and operators must consider the method of closure, the nature of the stored substance, the type of backfill, the depth to groundwater, and other factors appropriate for identifying the presence of a release.

(1) At UST sites with a history of petroleum storage, soil and groundwater samples shall in every case be analyzed for benzene, toluene, ethylbenzene, and xylenes (BTEX) with each compound reported separately in accordance with 567—135.16(455B). If there has been a history or suspected history of petroleum storage other than gasoline or gasoline blends (i.e., all grades of diesel fuels, fuel oil, kerosene, oil and mineral spirits), or such storage history is unknown or uncertain, soil and groundwater samples shall also be analyzed for total extractable hydrocarbons in accordance with 567—135.16(455B).

(2) All such samples shall be collected separately and shipped to a laboratory certified under 567—Chapter 83 within 72 hours of collection. Samples shall be refrigerated and protected from freezing during shipment to the laboratory.

(3) When a UST is removed from an area of confirmed contamination, the department may waive closure sampling if written documentation is submitted with the closure notification. Documentation should include laboratory analytical reports and a site map showing tank and piping locations along with contamination plume and sampling locations.

b. For all permanent tank and piping closures or changes-in-service, at least one water sample must be taken from the first saturated groundwater zone via a developed monitoring well except as provided in 135.15(3)“g.” The well must be located downgradient from and as close as possible to the UST system but no farther away than 20 feet from system components. At some tank and piping closures, a minimum of one monitoring well may not be sufficient to represent a release where it is most likely to be present. An additional groundwater monitoring well or wells may be necessary.

If, however, the first saturated groundwater zone is not encountered within 10 feet below the lowest elevation of the tank excavation, the requirement for groundwater sampling shall not apply unless:

(1) Sands or highly permeable soils are encountered within 10 feet below the lowest level of the tank excavation that together with the underlying geology would, in the judgment of the department, pose the reasonable possibility that contamination may have reached groundwaters deeper than 10 feet below the lowest level of the tank excavation. The method of determining highly permeable soil is found in the departmental guidance document entitled “Underground Storage Tank Closure Guidance.”

(2) Indications of potential groundwater contamination, including petroleum products in utility lines, petroleum products in private wells, petroleum product vapors in basements or other structures, occur in the area of the tank installation undergoing closure or change-in-service.

c. For permanent closure by tank removal, the departmental guidance document entitled “Underground Storage Tank Closure Guidance” must be followed. The minimum number of soil samples that must be taken depends on the tank size and length of product piping. Samples must be taken at a depth of one to two feet beneath the tank fill area below the base of the tank along the tank’s centerline. Soil samples must also be taken at least every ten feet along the product piping at a depth of one to two feet beneath the piping fill area below the piping, unless alternate sampling is approved by the department.

If sands or other highly permeable soils are encountered, alternative sampling methods may be required.

If contamination is suspected or found in any area within the excavation (i.e., sidewall or bottom), a soil sample must be taken at that location.

The numbers of samples required for tanks are as follows:

| Nominal Tank Capacity<br>(gallons) | Number of<br>Samples | Location on Centerline                        |
|------------------------------------|----------------------|-----------------------------------------------|
| 1,000 or less                      | 1                    | center of tank                                |
| 1,001 - 8,000                      | 2                    | 1/3 from ends                                 |
| 8,001 - 30,000                     | 3                    | 5 feet from ends and at center of tank        |
| 30,001 - 40,000                    | 4                    | 5 and 15 feet from ends                       |
| 40,001 and more                    | 5                    | 5 and 15 feet from ends and at center of tank |

d. For closing a tank in place by filling with an inert solid material or for a change-in-service, the departmental guidance document entitled “Underground Storage Tank Closure Guidance” must be followed. The minimum number of soil borings required for sampling depends on the size of the tank and the length of the product piping. Soil samples must be taken within five feet of the sides and ends of the tank at a depth of two to four feet below the base of the tank, but outside the backfill material, at equal intervals around the tank. Soil samples must also be taken at least every ten feet along the product piping at a depth of one to two feet beneath the piping fill area below the piping, unless alternate sampling is approved by the department. If sands or other highly permeable soils are encountered, alternative sampling methods may be required.

The minimum numbers of soil borings and samples required are as follows:

| Nominal Tank Capacity<br>(gallons) | Number of<br>Samples | Location of Samples        |
|------------------------------------|----------------------|----------------------------|
| 6,000 or less                      | 4                    | 1 each end and each side   |
| 6,001 - 12,000                     | 6                    | 1 each end and 2 each side |
| 12,001 or more                     | 8                    | 1 each end and 3 each side |

e. A closure report in a format prescribed by the department must be submitted to the department within 45 days of the tank removal or closure in place. Refer to the Underground Storage Tank Closure Guidance for reporting format. The tank tags must be returned with the closure report.

f. The requirements of this subrule are satisfied if one of the external release detection methods allowed in 135.5(4) “e” and “f” is operating in accordance with the requirements in 135.5(4) at the time of closure and indicates no release has occurred.

g. If contaminated soils, contaminated groundwater, or free product as a liquid or vapor is discovered during the site assessment or by any other manner, contact the department in accordance with 135.6(1). Normal closure procedures no longer apply. Owners and operators must begin corrective action in accordance with 567—135.7(455B) through 567—135.12(455B).

Identification of free product requires immediate response in accordance with 135.7(4). If contamination appears extensive or the groundwater is known to be contaminated, a full assessment of the contamination will be required. When a full assessment is required or anticipated, collection of the required closure samples is not required. If contamination appears limited to soils, overexcavation of the contaminated soils in accordance with 135.15(4) may be allowed at the time of closure.

**135.15(4)** *Overexcavation of contaminated soils at closure.*

a. If contaminated soils are discovered while assessing a site at closure in accordance with 135.15(3), owners and operators may overexcavate up to one foot of the contaminated soils surrounding the tank pit. The contamination and overexcavation must be reported to the department in accordance with the requirements of 135.6(4)“a” prior to backfilling the excavation. If excavation is limited to one foot of contaminated soils, a soil sample shall be taken and laboratory analyzed in accordance with 567—135.16(455B) from the area showing the greatest contamination. Any overexcavation of contaminated soils beyond one foot of contaminated soils is considered expedited corrective action and must be conducted by or under supervision of a certified groundwater professional in accordance with the procedures in 135.12(11).

b. Excavated contaminated soils must be properly disposed in accordance with 567—Chapters 100, 101, 102, 120, and 121.

c. A report must be submitted to the department within 30 days of completion of the laboratory analysis. The report must include the requirements of 135.15(3)“e” and a dimensional drawing showing the depth and area of the excavation prior to and after overexcavation. The area of contamination must be shown.

**135.15(5) *Applicability to previously closed UST systems.*** When directed by the department, the owner and operator of a UST system permanently closed before October 24, 1988, must assess the excavation zone and close the UST system in accordance with this rule if releases from the UST may, in the judgment of the department, pose a current or potential threat to human health and the environment.

**135.15(6) *Closure records.*** Owners and operators must maintain records in accordance with 135.4(5) that are capable of demonstrating compliance with closure requirements under this rule. The results of the excavation zone assessment required in 135.15(3) must be maintained for at least three years after completion of permanent closure or change-in-service in one of the following ways:

a. By the owners and operators who took the UST system out of service;

b. By the current owners and operators of the UST system site; or

c. By mailing these records to the department if they cannot be maintained at the closed facility.

**135.15(7) *Applicability to pre-1974 USTs.*** The closure provisions of 567—135.15(455B) are not applicable to USTs that have been out of operation prior to January 1, 1974. For purposes of this subrule, out of operation means that no regulated substance has been deposited into or dispensed from the tanks and that the tanks do not currently contain an accumulation of regulated substances other than a de minimis amount as provided in 135.15(1)“a.”

Owners and operators or other interested parties are not required to submit documentation that USTs meet the exemption conditions and may rely on this subrule as guidance. However, should a question arise as to whether USTs meet the exemption, or owners and operators or other interested parties request acknowledgment by the department that USTs are exempt, they must submit an affidavit on a form provided by the department. The affiant must certify that based on a reasonable investigation and to the best of the affiant’s knowledge, the USTs were taken out of operation prior to January 1, 1974, the USTs have not contained a regulated substance since January 1, 1974, and the USTs do not currently contain an accumulation of regulated substances.

If the department has a reasonable basis to suspect a release has occurred, the release investigation and confirmation steps of 567—135.6(455B) and the corrective action requirements as provided in 567—135.7(455B) through 567—135.12(455B) shall apply.

[ARC 0491D, IAB 8/19/26, effective 9/23/26]

### **567—135.16(455B) Laboratory analytical methods for petroleum contamination of soil and water.**

**135.16(1) *General.*** When analyzing for petroleum or hazardous substances, owners and operators of UST systems must use a laboratory certified under 567—Chapter 83. In addition they must ensure that all samples are properly preserved and shipped within 72 hours of collection to a laboratory certified under 567—Chapter 83. This rule provides acceptable analytical procedures for petroleum substances and required information that must be provided in all laboratory reports.

**135.16(2) *Laboratory report.*** All laboratory reports must contain the following information:

*a.* Laboratory name, address, telephone number and Iowa laboratory certification number. If analytical work is subcontracted to another laboratory, the analytical report from the certified laboratory that analyzed the sample must be submitted and include the information required in this subrule.

*b.* Medium sampled (soil, water).

*c.* Client submitting sample (name, address, telephone number).

*d.* Sample collector (name, telephone number).

*e.* UST site address.

*f.* Client's sample location identifier.

*g.* Date sample was collected.

*h.* Date sample was received at laboratory.

*i.* Date sample was analyzed.

*j.* Results of analyses and units of measure.

*k.* Detection limits.

*l.* Methods used in sample analyses (preparation method, sample detection method, and quantitative method).

*m.* Laboratory sample number.

*n.* Analyst name.

*o.* Signature of analyst's supervisor.

*p.* Condition in which the sample was received at the laboratory and whether it was properly sealed and preserved.

*q.* Note that analytical results are questionable if a sample exceeded an established holding time or was improperly preserved. (The recommended holding time for properly cooled and sealed petroleum contaminated samples is 14 days, except for water samples containing volatile organic compounds that have a 7-day holding time unless acid-preserved.)

*r.* Laboratory reports required by this chapter for tank closure investigations under 567—135.15(455B) and site checks under 135.6(3) or Tier 1 or Tier 2 assessments under 567—135.9(455B) through 567—135.11(455B) must include a copy of the chromatograms and associated quantitation reports for the waste oil, diesel and gasoline standard used by the laboratory in analyzing submitted samples. The laboratory analytical report for each sample must state whether the sample tested matches the laboratory standard for waste oil, diesel or gasoline or that the sample cannot be reliably matched with any of these standards. A copy of the chromatograms and associated quantitation reports for only the soil and groundwater samples with the maximum concentrations of BTEX and TEH must be included.

**135.16(3)** *Analysis of soil and water for high volatile petroleum compounds (i.e., gasoline, benzene, ethylbenzene, toluene, xylene).* Sample preparation and analysis shall be by Method OA-1, "Method for Determination of Volatile Petroleum Hydrocarbons (gasoline)," revision 12/01/2019, state hygienic laboratory at the University of Iowa, or EPA Method 8260D, "Test Methods for Evaluating Solid Waste," 3rd Edition—Update 6, July 2018. Copies of Method OA-1 are available from the department.

**135.16(4)** *Analysis of soil and water for low volatile petroleum hydrocarbon contamination (i.e., all grades of diesel fuel, fuel oil, kerosene, oil, and mineral spirits).* Sample preparation and analysis shall be by Method OA-2, "Determination of Extractable Petroleum Products (and Related Low Volatility Organic Compounds)," revision 12/01/2019, state hygienic laboratory at the University of Iowa. Copies of Method OA-2 are available from the department.

**135.16(5)** *Analysis of soil gas for volatile petroleum hydrocarbons.* Analysis of soil gas for volatile petroleum hydrocarbons shall be conducted in accordance with the National Institute for Occupational Safety and Health (NIOSH) Method 1501, Issue 3, March 15, 2003, or a department-approved equivalent method.

**135.16(6)** *Analytical methods for methyl tertiary-butyl ether (MTBE).* Analysis of water for MTBE must be conducted by a laboratory certified under 567—Chapter 83 for petroleum analyses.

*a.* Sample preparation and analysis shall be by U.S. Environmental Protection Agency Method 8260D, "Test Methods for Evaluating Solid Waste," 3rd Edition—Update 6, July 2018.

b. Laboratories performing the analyses must run standards for MTBE on a routine basis, and standards for other possible compounds like ethyl tertiary-butyl ether (ETBE), tertiary-amyl methyl ether (TAME), di-isopropyl ether (DIPE), and tertiary-butyl alcohol (TBA) to be certain of their identification should they be detected.

c. Laboratories must run a method detection limit study and an initial demonstration of capability for MTBE. These records must be kept on file.

d. The minimum detection level for MTBE in water is 15 µg/L.

[ARC 0491D, IAB 8/19/26, effective 9/23/26]

**567—135.17(455B) Evaluation of ability to pay.**

**135.17(1)** General. The ability to pay guidance procedures referenced in this rule will be used by the department when an owner or operator of an underground storage tank (UST) claims to be financially unable to comply with corrective action requirements under 567—135.7(455B) through 567—135.12(455B) or closure investigation requirements under 567—135.15(455B). If an owner or operator of a regulated UST claims to be financially unable to meet these departmental requirements, that responsible party must provide documentation of the party's finances on forms provided by the department in order for the department to act on the claim of financial inability. The department may request additional financial documentation to verify or supplement reported information.

**135.17(2)** Individual claims. The financial ability of individual owners and operators of USTs, with or without an active business (including but not limited to sole proprietorships and general partnerships), may be evaluated using the most current version of "INDIPAY" developed by the U.S. Environmental Protection Agency and generally accepted principles of financial analysis. This guidance is only one tool the department may use in evaluating claims of financial inability.

**135.17(3)** Corporate claims. The financial ability of corporate owners and operators of USTs may be evaluated using the most current version of "ABEL" developed by the U.S. Environmental Protection Agency and generally accepted principles of financial analysis. This guidance is only one tool the department may use in evaluating claims of financial inability.

**135.17(4)** Federal LUST Trust Fund. The financial ability of owners and operators of USTs shall be evaluated for the purpose of determining if the department is authorized to use Federal LUST Trust Fund moneys as provided in the current cooperative agreement with the U.S. Environmental Protection Agency, Region VII. A determination of financial inability does not create an entitlement or any expectation interest on behalf of an owner or operator that Federal LUST Trust Fund moneys will be used for corrective action at any individual site.

**135.17(5)** The evaluation of financial ability will also be used by the department in making other administrative planning decisions including but not limited to decisions as to whether to pursue and when to pursue administrative or judicial enforcement of regulatory and statutory duties and the assessment of penalties. A determination of financial inability does not create an entitlement or expectation interest that enforcement actions will be deferred or suspended. The evaluation of this factor is only one of many affecting the department's fully discretionary decisions regarding enforcement options and program planning.

**135.17(6)** An evaluation of financial inability as provided in this rule does not relieve any owner or operator of legal liability to comply with department rules or Iowa Code chapter 455B or provide a defense to any legal actions to establish liability or enforce compliance.

[ARC 0491D, IAB 8/19/26, effective 9/23/26]

**567—135.18(455B) Analyzing for methyl tertiary-butyl ether (MTBE).**

**135.18(1)** General. The objective of analyzing for MTBE is to determine its presence in water samples collected as part of investigation and remediation of contamination for underground storage tank facilities.

**135.18(2)** Required MTBE testing. Water samples must be analyzed for MTBE when collected for risk-based corrective action as required in 567—135.8(455B) through 567—135.12(455B). These sampling requirements include but are not limited to Tier 2 and Tier 3 assessments where groundwater ingestion pathway evaluation and subsequent monitoring is required.

**135.18(3)** *MTBE testing not required.* Analysis for MTBE is not required for the following:

- a. Closure sampling under 567—135.15(455B).
- b. Site checks under 135.6(3).
- c. If prior analysis under 135.18(2) has not shown MTBE present.
- d. If the department determines MTBE analysis is no longer needed at a site.

**135.18(4)** *Reporting.* The analytical data must be submitted in a format prescribed by the department.

[ARC 0491D, IAB 8/19/26, effective 9/23/26]

**567—135.19(455B) Compliance inspection of UST system.**

**135.19(1)** The owner or operator must have the UST system inspected and an inspection report submitted to the department by a UST compliance inspector certified by the department under 567—Chapter 134. An initial compliance site inspection shall be conducted within two years after new tank installation. All subsequent compliance site inspections conducted after the initial compliance site inspection shall be conducted within 24 months of the prior compliance site inspection. Compliance site inspections must be separated by at least six months.

**135.19(2)** Compliance inspection requirements. The owner and operator must comply with the following as part of the inspection process.

a. Review and respond to the inspection report provided by the certified compliance inspector and complete the corrective actions specified in the compliance inspection report within the specified time frames.

b. Provide all records and documentation required by the certified compliance inspector and this chapter.

c. Upon notification of a suspected release by the certified compliance inspector pursuant to 567—paragraph 134.10(3) “b,” report the condition to the department and undertake steps to investigate and confirm the suspected release as provided in 567—135.6(455B).

d. Ensure that the compliance inspector completes and submits an electronic inspection form in accordance with 567—subrule 134.10(3).

**135.19(3)** The owner and operator shall do the following upon receipt of a compliance inspection report as provided in 567—paragraph 134.10(3) “b,” which finds violations of the department’s rules:

a. Take all actions necessary to correct any compliance violations or deficiencies in accordance with this chapter. Corrective action must be taken within 60 days of receipt of the inspector’s report or another reasonable time period approved by the department. The granting of time to remedy a violation does not preclude the department from exercising its discretion to assess penalties for the violation.

b. Within 60 days of receipt of the inspector’s report, provide documentation to the compliance inspector that the violation or deficiencies have been corrected.

c. Conduct a follow-up inspection in instances where there are serious problems or a history of repeated violations when required by the department.

**135.19(4)** Conflict of interest. A compliance site inspection must be conducted by a certified compliance inspector who is not the owner or operator of the UST system being inspected, an employee of the owner or operator of the UST system being inspected, or a person having daily on-site responsibility for the operation and maintenance of the UST system.

[ARC 0491D, IAB 8/19/26, effective 9/23/26]

**567—135.20(455B) UST systems with field-constructed tanks and airport hydrant fuel distribution systems.** The commission adopts by reference the definitions and requirements of 40 CFR 280 Subpart K.

[ARC 0491D, IAB 8/19/26, effective 9/23/26]

**567—135.21(455B) Waivers.** A request for a waiver to these rules will be reviewed in accordance with law and procedures of Iowa Code chapter 17A and 7—Chapter 2504.

[ARC 0491D, IAB 8/19/26, effective 9/23/26]

These rules are intended to implement Iowa Code sections 455B.304, 455B.424 and 455B.474.

## Appendix A - Tier 1 Table, Assumptions, Equations and Parameter Values

Iowa Tier 1 Look-Up Table

| Media              | Exposure Pathway                    | Receptor                        | Group 1 |         |              |         | Group 2: TEH |           |
|--------------------|-------------------------------------|---------------------------------|---------|---------|--------------|---------|--------------|-----------|
|                    |                                     |                                 | Benzene | Toluene | Ethylbenzene | Xylenes | Diesel*      | Waste Oil |
| Groundwater (µg/L) | Groundwater Ingestion               | Actual                          | 5       | 1,000   | 700          | 10,000  | 1,200        | 400       |
|                    |                                     | Potential                       | 290     | 7,300   | 3,700        | 73,000  | 75,000       | 40,000    |

|                    | Groundwater to Water Line           | PVC or Gasketed Mains           | 7,500   | 6,250   | 40,000       | 48,000  | 75,000       | 40,000    |
|                    |                                     | PVC or Gasketed Service Lines   | 3,750   | 3,120   | 20,000       | 24,000  | 75,000       | 40,000    |
|                    |                                     | PE/PB/AC Mains or Service Lines | 200     | 3,120   | 3,400        | 19,000  | 75,000       | 40,000    |
|                    | Surface Water                       | All                             | 290     | 1,000   | 3,700        | 73,000  | 75,000       | 40,000    |
| Soil (mg/kg)       | Soil Leaching to Groundwater        | All                             | 0.54    | 42      | 15           | NA      | 3,800        | NA        |
|                    | Soil Vapor to Enclosed Space        | All                             | 1.16    | 48      | 79           | NA      | 47,500       | NA        |
|                    | Soil to Water Line                  | All                             | 2.0     | 3.2     | 45           | 52      | 10,500       | NA        |

NA: Not applicable. There are no limits for the chemical for the pathway, because for groundwater pathways the concentration for the designated risk would be greater than the solubility of the pure chemical in water, and for soil pathways the concentration for the designated risk would be greater than the soil concentration if pure chemical were present in the soil.

TEH: Total Extractable Hydrocarbons. The TEH value is based on risks from naphthalene, benzo(a)pyrene, benz(a)anthracene, and chrysene. Refer to Appendix B for further details.

Diesel\*: Standards in the Diesel column apply to all low volatile petroleum hydrocarbons except waste oil.

### Assumptions Used for Iowa Tier 1 Look-Up Table Generation

1. Groundwater ingestion pathway. The maximum contaminant levels (MCLs) were used for Group 1 chemicals. The target risk for carcinogens for actual receptors is  $10^{-6}$  and for potential receptors is  $10^{-4}$ . A hazard quotient of one, and residential exposure and building parameters are assumed.
2. Groundwater vapor to enclosed space pathway. Residential exposure and residential building parameters are assumed; no inhalation reference dose is used for benzene; the capillary fringe is assumed to be the source of groundwater vapor; and the hazard quotient is 1 and target risk for carcinogens is  $1 \times 10^{-4}$ .
3. Groundwater to water line. This pathway uses the same assumptions as the groundwater ingestion pathway for potential receptors, including a target risk for carcinogens of  $10^{-4}$ .
4. Surface water. This pathway uses the same assumptions as the groundwater ingestion pathway for potential receptors, including a target risk for carcinogens of  $10^{-4}$ , except for toluene which has a chronic level for aquatic life of 1,000 as in the definition for surface water criteria in 567—135.2(455B).
5. Soil leaching to groundwater. This pathway assumes the groundwater will be protected to the same levels as the groundwater ingestion pathway for potential receptors, using residential exposure and a target risk for carcinogens of  $10^{-4}$ .
6. Soil vapor to enclosed space pathway. The target risk for carcinogens is  $1 \times 10^{-4}$ ; the hazard quotient is 1; no inhalation reference dose is used for benzene; residential exposure factors are assumed; and the average of the residential and nonresidential building parameters is assumed.
7. Soil to water line pathway. This pathway uses the soil leaching to groundwater model with nonresidential exposure and a target risk for carcinogens of  $10^{-4}$ .

In addition to these assumptions, the equations and parameter values used to generate the Iowa Tier 1 Look-Up Table are described below.

Groundwater Ingestion Equations

Carcinogens:

$$RBSL_w \left[ \frac{mg}{L - H_2O} \right] = \frac{TR \times BW \times AT_c \times \frac{365 \text{ days}}{\text{year}}}{SF_o \times IR_w \times EF \times ED}$$

Noncarcinogens:

$$RBSL_w \left[ \frac{mg}{L - H_2O} \right] = \frac{THQ \times RfD_o \times BW \times AT_n \times \frac{365 \text{ days}}{\text{year}}}{IR_w \times EF \times ED}$$

Soil Leaching to Groundwater Equations

$$RBSL_{sl} \left[ \frac{mg}{kg - soil} \right] = \frac{RBSL_w \left[ \frac{mg}{L - H_2O} \right]}{LF}$$

$$LF \left[ \frac{mg/L - H_2O}{mg/kg - soil} \right] = \frac{\rho_s}{\theta_{ws} + k_s \rho_s + H \theta_{as} \left( 1 + \frac{U \delta}{IW} \right)}$$

Soil Vapor to Enclosed Space Equations

$$RBSL_{sv} \left[ \frac{mg}{kg - soil} \right] = \frac{RBSL_{air} \left[ \frac{\mu g}{m^3 - air} \right]}{VF_{sv}} \left( \frac{mg}{1000 \mu g} \right)$$

$$VF_{sv} \left[ \frac{mg/m^3 - air}{mg/kg - soil} \right] = \frac{\frac{H\rho_s}{\theta_{ws} + k_s\rho_s + H\theta_{as}} \left[ \frac{D_s^{eff}/L_s}{ER L_B} \right]}{1 + \left[ \frac{D_s^{eff}/L_s}{ER L_B} \right] + \left[ \frac{D_s^{eff}/L_s}{(D_{crack}^{eff}/L_{crack})^\eta} \right]} \left( 10^3 \frac{cm^3 - kg}{m^3 - g} \right)$$

$$D_{crack}^{eff} \left[ \frac{cm^2}{s} \right] = D^{air} \frac{\theta_{acrack}^{3.33}}{\theta_T^2} + D^{wat} \frac{1}{H} \frac{\theta_{wcrack}^{3.33}}{\theta_T^2}$$

$$D_s^{eff} \left[ \frac{cm^2}{s} \right] = D^{air} \frac{\theta_{as}^{3.33}}{\theta_T^2} + D^{wat} \frac{1}{H} \frac{\theta_{ws}^{3.33}}{\theta_T^2}$$

Indoor Air Inhalation Equations

Carcinogens:

$$RBSL_{air} \left[ \frac{\mu g}{m^3 - air} \right] = \frac{TR \times BW \times AT_c \times \frac{365 days}{year} \times \frac{1000 \mu g}{mg}}{SF_i \times IR_{air} \times EF \times ED}$$

Noncarcinogens:

$$RBSL_{air} \left[ \frac{\mu g}{m^3 - air} \right] = \frac{THQ \times RfD_i \times BW \times AT_n \times \frac{365 days}{year} \times \frac{1000 \mu g}{mg}}{IR_{air} \times EF \times ED}$$

Groundwater Vapor to Enclosed Space Equations

$$RBSL_{gw} \left[ \frac{mg}{L - H_2O} \right] = \frac{RBSL_{air} \left[ \frac{\mu g}{m^3 - air} \right]}{VF_{gw}} \left( \frac{mg}{1000 \mu g} \right)$$

$$VF_{gw} \left[ \frac{(mg/m^3 - air)}{(mg/L - H_2O)} \right] = \frac{H \left[ \frac{D_s^{eff}/L_{gw}}{ERL_B} \right]}{1 + \left[ \frac{D_s^{eff}/L_{gw}}{ERL_B} \right] + \left[ \frac{D_s^{eff}/L_{gw}}{(D_{crack}^{eff}/L_{crack})^\eta} \right]} \left( \frac{10^3 L}{m^3} \right)$$

## Variable Definitions

| Chrysene          | 0.025                                 | 6.2e-6                                | 4.9e-7            | 5.30                        |

## Saturation Values Used to Determine “NA” for the Iowa Tier 1 Table

| Chemical          | Solubility in Water (mg/L)<br>S | Saturation in Soil (mg/kg)<br>$C_s^{sat}$ |
|-------------------|---------------------------------|-------------------------------------------|
| Benzene           | 1,750                           | 801                                       |
| Toluene           | 535                             | 765                                       |
| Ethylbenzene      | 152                             | 159                                       |
| Xylenes           | 198                             | 492                                       |
| Naphthalene       | 31                              | 401                                       |
| Benzo(a)pyrene    | 0.0012                          | 4.69                                      |
| Benz(a)anthracene | 0.014                           | 193.3                                     |
| Chrysene          | 0.0028                          | 5.59                                      |

The maximum solubility of the pure chemical in water is listed in the table above. The equation below is used to calculate the soil concentration ( $C_s^{sat}$ ) at which dissolved pore-water and vapor phases become saturated. Tier 1 default values are used in the equation. “NA” (for not applicable) is used in the Tier 1 table when the risk-based value exceeds maximum solubility for water (S) or maximum saturation for soil ( $C_s^{sat}$ ).

$$C_s^{sat} \left[ \frac{mg}{kg - soil} \right] = \frac{S}{\rho_s} \times (H\theta_{as} + \theta_{ws} + k_s\rho_s)$$

## Slope Factors and Reference Doses Used for Iowa Tier 1 Table Generation

| Chemical          | SF <sub>i</sub> ((kg-day)/mg) | SF <sub>e</sub> ((kg-day)/mg) | RfD <sub>i</sub> (mg/(kg-day)) | RfD <sub>e</sub> (mg/(kg-day)) |

### Appendix B – Tier 2 Equations and Parameter Values (Revised Model)

All Tier 1 equations and parameters apply at Tier 2 except as specified below.

#### Equation for Tier 2 Groundwater Contaminant Transport Model

Equation (1)

$$C(x) = C_s \exp \left( \frac{X_m}{2a_x} \left[ 1 - \sqrt{1 + \frac{4\lambda a_x}{u}} \right] \right) \operatorname{erf} \left( \frac{S_w}{4\sqrt{a_y x_m}} \right) \operatorname{erf} \left( \frac{S_d}{4\sqrt{a_z x_m}} \right)$$

Equation (2)

Where  $x_m = ax + bxc$

The value of  $X_m$  is computed from Equation (2), where the values for a, b and c in Equation (2) are given in Table 1.

Table 1. Parameter Values for Equation (2)

| Chemical      | a | b              | c           |
|---------------|---|----------------|-------------|
| Benzene       | 1 | 0.000000227987 | 3.929438689 |
| Toluene       | 1 | 0.000030701    | 3.133842393 |
| Ethylbenzene  | 1 | 0.0001         | 2.8         |
| Xylenes       | 1 | 0.0            | 0.0         |
| TEH-Diesel    | 1 | 0.000000565    | 3.625804634 |
| TEH-Waste Oil | 1 | 0.000000565    | 3.625804634 |
| Naphthalene   | 1 | 0              | 0           |

#### Variable definitions

x: distance in the x direction downgradient from the source

$\operatorname{erf}()$ : the error function

$C(x)$ : chemical concentration in groundwater at x

$C_s$ : Source concentration in groundwater (groundwater concentration at  $x=0$ )

$S_w$ : width of the source (perpendicular to x)

$S_d$ : vertical thickness of the source

u: groundwater velocity (pore water velocity);  $u=Ki/\theta_e$

K: hydraulic conductivity

i: groundwater head gradient

$\theta_e$ : effective porosity

$\lambda$ : first order decay coefficient, chemical specific

$\alpha_x, \alpha_y, \alpha_z$ : dispersivities in the x, y and z directions, respectively

For the following lists of parameters, one of three is required: site-specific measurements, defaults or the option of either (which means the default may be used or replaced with a site-specific measurement).

#### Soil parameters

| Parameter                                             | Default Value                                              | Required |
|-------------------------------------------------------|------------------------------------------------------------|----------|
| $\rho_s$ soil bulk density                            | 1.86 g/cm <sup>3</sup>                                     | option   |
| $f_{oc}$ fraction organic carbon in the soil          | 0.01 kg-C/kg-soil                                          | option   |
| $\theta_t$ total soil porosity                        | 0.3cm <sup>3</sup> -voids/cm <sup>3</sup> -soil            | option   |
| $\theta_{as}$ volumetric air content in vadose zone   | 0.2cm <sup>3</sup> -air/cm <sup>3</sup> -soil              | default  |
| $\theta_{ws}$ volumetric water content in vadose zone | 0.1cm <sup>3</sup> -H <sub>2</sub> O/cm <sup>3</sup> -soil | default  |

| Parameter                |                                                    | Default Value                                              | Required |
|--------------------------|----------------------------------------------------|------------------------------------------------------------|----------|
| $\theta_{\text{crack}}$  | volumetric air content in foundation/wall cracks   | 0.2cm <sup>3</sup> -air/cm <sup>3</sup> -soil              | default  |
| $\theta_{\text{wcrack}}$ | volumetric water content in foundation/wall cracks | 0.1cm <sup>3</sup> -H <sub>2</sub> O/cm <sup>3</sup> -soil | default  |
| I                        | infiltration rate of water through soil            | 7 cm/year                                                  | default  |

If the total porosity is measured, assume 1/3 is air filled and 2/3 is water filled for determining the water and air fraction in the vadose zone soil and floor cracks.

#### Groundwater Transport Modeling Parameters

| Parameter  |                                  | Default Value                        | Required      |
|------------|----------------------------------|--------------------------------------|---------------|
| K          | hydraulic conductivity           | 16060 cm/year                        | site-specific |
| i          | groundwater head gradient        | 0.01 cm/cm                           | site-specific |
| $S_w$      | width of the source              | use procedure specified in 135.10(2) | site-specific |
| $S_d$      | vertical thickness of the source | 3 m                                  | default       |
| $\alpha_x$ | dispersivity in the x direction  | 0.1x                                 | default       |
| $\alpha_y$ | dispersivity in the y direction  | 0.33 $\alpha_x$                      | default       |
| $\alpha_z$ | dispersivity in the z direction  | 0.05 $\alpha_x$                      | default       |
| $\theta_e$ | effective porosity               | 0.1                                  | default       |

where  $u=Ki/\theta_e$

#### First-order Decay Coefficients

| Chemical      | Default Value $\lambda$ (d-1) | Required |
|---------------|-------------------------------|----------|
| Benzene       | 0.000127441                   | default  |
| Toluene       | 0.0000208066                  | default  |
| Ethylbenzene  | 0.0                           | default  |
| Xylenes       | 0.0005                        | default  |
| Naphthalene   | 0.00013                       | default  |
| TEH-Diesel    | 0.0000554955                  | default  |
| TEH-Waste Oil | 0.0000554955                  | default  |

#### Other Parameters for Groundwater Vapor to Enclosed Space

| Parameter   |                                                         | Default Value | Required |
|-------------|---------------------------------------------------------|---------------|----------|
| $L_{gw}$    | depth to groundwater from the enclosed space foundation | 1 cm          | option   |
| $L_B$       | enclosed space volume/infiltration area ratio           | 200 cm        | option   |
| ER (s-1)    | enclosed space air exchange rate                        | 0.00014       | default  |
| $L_{crack}$ | enclosed space foundation or wall thickness             | 15 cm         | default  |
| $\eta$      | areal fraction of cracks in foundation/wall             | 0.01          | default  |

#### Other Parameters for Soil Vapor to Enclosed Space

| Parameter   |                                                                     | Default Value | Required |
|-------------|---------------------------------------------------------------------|---------------|----------|
| $L_s$       | depth to subsurface soil sources from the enclosed space foundation | 1 cm          | option   |
| $L_B$       | enclosed space volume/infiltration area ratio                       | 250 cm *      | option   |
| ER (s-1)    | enclosed space air exchange rate                                    | 0.000185 *    | default  |
| $L_{crack}$ | enclosed space foundation or wall thickness                         | 15 cm         | default  |
| $\eta$      | areal fraction of cracks in foundation/wall                         | 0.01          | default  |

\*These values are an average of residential and nonresidential factors.

## Soil Leaching to Groundwater

| Parameter |                         | Default Value | Required |
|-----------|-------------------------|---------------|----------|
| $\delta$  | groundwater mixing zone | 2 m           | default  |

## Building Parameters for Iowa Tier 2

| Parameter |                                               | Residential | Nonresidential |
|-----------|-----------------------------------------------|-------------|----------------|
| ER (s-1)  | enclosed space air exchange rate              | 0.00014     | 0.00023        |
| $L_B$     | enclosed space volume/infiltration area ratio | 200 cm      | 300 cm         |

Other Parameters

For Tier 2, the following are the same as Tier 1 values (refer to Appendix A): chemical-specific parameters, slope factors and reference doses, and exposure factors (except for those listed below).

Exposure Factors for Tier 2 Groundwater Vapor to Enclosed Space Modeling:

Potential Residential: use residential exposure and residential building parameters.

Potential Nonresidential: use nonresidential exposure and nonresidential building parameters.

Diesel and Waste Oil

| Diesel and Waste Oil               |                                     |           | Chemical-Specific Values for Tier 1 |                 |                    |          |
|------------------------------------|-------------------------------------|-----------|-------------------------------------|-----------------|--------------------|----------|
| Media                              | Exposure Pathway                    | Receptor  | Naphthalene                         | Benzo(a) pyrene | Benz(a) anthracene | Chrysene |

Due to difficulties with analytical methods for the four individual chemicals listed in the above table, Total Extractable Hydrocarbon (TEH) default values were calculated for each chemical, using the assumption that diesel contains 0.2% naphthalene, 0.001% benzo(a)pyrene, 0.001% benz(a)anthracene, and 0.001% chrysene. Resulting TEH Default Values are shown in the following table.

| Diesel             |                                     |           | TEH Default Values |                |                   |          |
|--------------------|-------------------------------------|-----------|--------------------|----------------|-------------------|----------|
| Media              | Exposure Pathway                    | Receptor  | Naphthalene        | Benzo(a)pyrene | Benz(a)anthracene | Chrysene |
| Groundwater (µg/L) | Groundwater Ingestion               | actual    | 75,000             | 1,200          | 12,000            | 120,000  |

The lowest TEH default value for each pathway (shown as a shaded box) was used in the Tier 1 Table.

Due to difficulties with analytical methods for the four individual chemicals, Total Extractable Hydrocarbon (TEH) default values were calculated for each chemical, using the assumption that waste oil contains no naphthalene, 0.003% benzo(a)pyrene, 0.003% benz(a)anthracene, and 0.003% chrysene. Resulting TEH Default Values are shown in the following table.

| Waste Oil          |                                     |           | TEH Default Values |                |                   |          |
|--------------------|-------------------------------------|-----------|--------------------|----------------|-------------------|----------|
| Media              | Exposure Pathway                    | Receptor  | Naphthalene        | Benzo(a)pyrene | Benz(a)anthracene | Chrysene |

The lowest TEH default value for each pathway (shown as a shaded box) was used in the Tier 1 Table.

## Water Line Calculations

**Explanation of Target Levels for  
Petroleum Fuel-Derived BTEX Compounds in Groundwater and Soil**

**GROUNDWATER**PVC or Gasketed Mains*Benzene: 7,500 µg/L*

Gasoline-saturated groundwater was considered to be an extreme condition of environmental contamination, and it was considered unacceptable to leave water lines, regardless of material, in contact with this level of benzene contamination. While Ong et al. (2008) showed that gasoline-saturated groundwater would not pose a significant risk of permeation exceeding the 5 µg/L MCL for benzene of gasketed DI or PVC water mains, a safety factor of 1/8th was applied to the level of benzene in premium gasoline-saturated water determined by Ong et al. (2008). A 1/2 safety factor was compounded for each of four potential safety risks: material defects in the pipe (= 1/2), presence of service line taps (= 1/4), stagnation of water (= 1/6), and water line breaks (= 1/8). This was an average of 67.5 mg/L ± 4.9 mg/L for multiple preparations of gasoline-saturated water and was rounded to 60.0 mg/L to conservatively account for the statistical uncertainty. Hence,

$$\text{Target Level} = \frac{1}{8} \times 60,000 \mu\text{g/L} = 7,500 \mu\text{g/L benzene}$$

*Toluene: 6,250 µg/L*

The target level for toluene was determined similarly to that for benzene. The level of toluene in premium gasoline-saturated water was determined by Ong et al. (2008) to be 56.2 mg/L ± 4.9 mg/L and conservatively rounded to 50.0 mg/L. Hence,

$$\text{Target Level} = \frac{1}{8} \times 50,000 \mu\text{g/L} = 6,250 \mu\text{g/L toluene}$$

*Ethylbenzene: 40,000 µg/L*

The target level was set to be double that for PVC or Gasketed Service Lines (20,000 µg/L – see below).

*Total Xylenes: 48,000 µg/L*

The target level was set to be double that for PVC or Gasketed Service Lines (24,000 µg/L – see below).

PVC or Gasketed Service Lines*Benzene: 3,750 µg/L*

The target level was set to be one-half of that for PVC or Gasketed Mains (7,500 µg/L as above) since service lines tend to be of higher risk than mains owing to their smaller diameter and greater potential for stagnation.

*Toluene: 3,120 µg/L*

Similar to benzene, the target level was set to be one-half of that for PVC or Gasketed Mains (6,250 µg/L as above) since service lines tend to be of higher risk than mains owing to their smaller diameter and greater potential for stagnation. Odd-even rounding to 3 significant figures was applied.

*Ethylbenzene: 20,000 µg/L*

The target level was based on two observations by Ong et al. (2008): (1) premium gasoline-saturated water has an average concentration of 3.4 mg/L ethylbenzene and (2) ethylene permeates high density polyethylene 46 times slower than does benzene (presumably, this is reasonably representative of other materials such as rubber gaskets). The 1/8 safety factor was also applied, as above. Odd-even rounding to 2 significant figures was applied. Hence:

$$\text{Target Level} = 3,400 \mu\text{g/L} \times 46 \times \frac{1}{8} = 19,550 \mu\text{g/L} = 20,000 \mu\text{g/L}$$

*Total Xylenes: 24,000 µg/L*

Similar to ethylbenzene, the target level was based on (1) premium gasoline-saturated water has an average concentration of 19 mg/L total xylenes and (2) total xylenes permeate high density polyethylene 10 times slower than does benzene. The 1/8 safety factor was also applied, as above. Odd-even rounding to 2 significant figures was applied. Hence:

$$\text{Target Level} = 19,000 \mu\text{g/L} \times 10 \times \frac{1}{8} = 23,750 \mu\text{g/L} = 24,000 \mu\text{g/L}$$

#### PE/PB/AC

*Benzene: 200 µg/L*

The target level was set at the concentration of benzene in groundwater surrounding a 1" HDPE service line (SIDR 9 IPS) that would result in a concentration of 2 µg/L benzene in the service line after a 24 hr stagnation period. This level was chosen because 2 µg/L is generally the minimum reportable concentration of benzene in laboratory reports received by the department.

The permeation rate is a function of the concentration of benzene in the groundwater as described by Ong et al. (2008), equation 3.4a:

$$P_m = 0.0079 C_{bulk}^{1.1323}$$

where  $P_m$  is the benzene permeation rate in µg/cm<sup>2</sup>/day through the pipe described above (cm<sup>2</sup> refers to the inner surface of the pipe) and  $C_{bulk}$  is the concentration of benzene in the groundwater (mg/L).

For any length of exposed 1" SIDR 9 IPS pipe,  $l$  (cm), the concentration in the pipe after 24 hr stagnation,  $C_{24hr}$  (µg/L), can be computed from  $P_m$  and the ratio of the inner surface of the pipe to the internal volume:

$$C_{24hr} = P_m \times \left( \frac{2\pi r l}{\pi r^2 l / 1000} \right) = 0.0079 C_{bulk}^{1.1323} \times \frac{2000}{r}$$

where  $r$  is the inside radius of the pipe (cm),  $l$  is the length of exposed pipe (cm), and dividing by 1000 converts from cm<sup>3</sup> to liters (and, therefore, 2000/ $r$  converts µg/cm<sup>2</sup>/day to µg/L/day).

Solving for  $C_{bulk}$  (mg/L) with  $C_{24hr} = 2$  µg/L and  $r = 1.28$  cm (per manufacturer's specifications):

$$C_{bulk}^{1.1323} \times \frac{2 \times 1.28}{0.0079 \times 2000}$$

and

$$C_{bulk} = {}^{1.1323}\sqrt{0.162} = 0.200 \text{ mg/L} = 200 \mu\text{g/L}$$

While the target level is expressed as 200 µg/L for clarity, the underlying data support only two significant figures. In a stricter treatment of the data, this would be expressed as  $20 \times 10^1$  µg/L.

*Toluene: 3,120 µg/L*

The target level was set to be equal to that for PVC or Gasketed Service Lines. Calculations similar to those used above for benzene (Ong et al. (2008), equation 3.4b) indicate that 3,120 µg/L toluene in groundwater

would result in 50 µg/L inside a 1" SIDR 9 IPS HDPE pipe after 24 hours of stagnation, which is 1/20th of the 1,000 µg/L MCL for toluene.

*Ethylbenzene: 3,400 µg/L*

The target level was set to be equal to the concentration of ethylbenzene in premium gasoline-saturated water (see discussion above for PVC or Gasketed Mains/Benzene). Unlike other target levels based on contaminant concentrations in gasoline-saturated water, the 1/8th safety factor was not applied because of the very low permeation rate of ethylbenzene through HDPE, the relatively low solubility of ethylbenzene in water, and the relatively high MCL (700 µg/L). Ong et al. (2008) found that permeation of HDPE by aqueous ethylbenzene was minimal and of no consequence for public health.

*Total Xylenes: 19,000 µg/L*

The target level was set to be equal to the concentration of ethylbenzene in premium gasoline-saturated water following the same reasoning for ethylbenzene (above). The permeation rate and water solubility are also very low, and the MCL is 10,000 µg/L. Ong et al. (2008) found that permeation of HDPE by aqueous xylenes was minimal and of no consequence for public health.

## SOIL

Target levels for soil were set to be the same for mains and service lines of any material discussed above under "Groundwater." The underlying data support two significant figures for target levels in soil. Odd-even rounding was applied where appropriate.

*Benzene: 2.0 mg/Kg*

The target level was derived from the concentration of benzene (mg/Kg) that would result if soil that was 10% moisture and 1% organic matter was equilibrated with premium gasoline-saturated water (60 mg/L benzene – as per discussion of PVC or Gasketed Mains/Benzene above). The equilibrium concentration in soil was calculated using the approach of Chiou et al. (1983). The 1/8th safety factor discussed previously for groundwater was applied. Accordingly:

$$C_T = C_w K_d + C_w^\theta$$

where  $C_T$  is the total concentration of benzene in soil (mg/Kg),  $\theta$  is the fraction of moisture in the soil (Kg/Kg), and  $K_d$  is the partition coefficient from water to soil (L/Kg). Further:

$$K_d = K_{om} f_{om}$$

where  $K_{om}$  is the partition coefficient from water to organic matter in the soil, which is 16.8 L/Kg for benzene in soils with naturally occurring organic matter (Chiou et al. (1983)), and  $f_{om}$  is the fraction of organic matter in the dry soil (Kg/Kg).

For soil containing 1% naturally occurring organic matter and 10% moisture, the total concentration of benzene upon exposure to premium gasoline-saturated groundwater (60 mg/L benzene, as per above discussion of PVC or Gasketed Mains) would be:

$$C_T = \left( \frac{60 \text{ mg}}{\text{L}} \times \left( \frac{16.8 \text{ L}}{\text{Kg}} \times \frac{0.01 \text{ Kg}}{\text{Kg}} \right) \right) + \left( \frac{60 \text{ mg}}{\text{L}} \times \frac{0.1 \text{ Kg}}{\text{Kg}} \right) = \frac{16 \text{ mg}}{\text{Kg}}$$

Applying the 1/8th safety factor:

$$\text{Target Level} = \frac{1}{8} \times \frac{16 \text{ mg}}{\text{Kg}} = \frac{2.0 \text{ mg}}{\text{Kg}}$$

*Toluene: 3.2 mg/Kg*

The target level was derived in the same manner as for benzene except that the concentration of toluene in premium gasoline-saturated water is 50 mg/L and  $K_{om}$  is 42 L/Kg. Accordingly:

$$C_T = \left( \frac{50mg}{L} \times \left( \frac{42L}{Kg} \times \frac{0.01Kg}{Kg} \right) \right) + \left( \frac{50mg}{L} \times \frac{0.1Kg}{Kg} \right) = \frac{26mg}{Kg}$$

and

$$Target\ Level = \frac{1}{8} \times \frac{26mg}{Kg} = \frac{3.2mg}{Kg}$$

*Ethylbenzene: 45 mg/Kg*

The target level was based on the target level set for Groundwater/PVC or Gasketed Mains (40,000 µg/L, rounded from 39,100 µg/L, or 39.1 mg/L) and the principles of Chiou et al. (1983) discussed above. In a manner similar to that for benzene in soil,  $C_w$  was 3.4 mg/L,  $K_d$  was 0.106 L/Kg, and  $C_T$  was calculated to be 3.9 mg/Kg. The target level for soil that is equivalent to the target level set for groundwater was calculated as follows:

$$Target\ Level\ mg/Kg = 39.1\ mg/L \times \frac{3.9\ mg/Kg}{3.4\ mg/L} = 45\ mg/Kg$$

*Total Xylenes: 52 mg/Kg*

The target level was set in the same manner as for ethylbenzene (above), based on the groundwater target level of 48,000 µg/L (rounded from 47.5 mg/L).  $C_w$  was 19 mg/L,  $K_d$  was 1.001 L/Kg (assuming a mixture of m-, o-, and p-xylenes which is 60%, 20%, and 20%, respectively, which is typical of xylenes derived from petroleum), and  $C_T$  was calculated to be 21 mg/Kg. Hence:

$$Target\ Level\ mg/Kg = 47.5\ mg/L \times \frac{21\ mg/Kg}{19\ mg/L} = 52\ mg/Kg$$

**NOTE:** The 1/8th safety factor was applied above to the target levels for ethylbenzene and total xylenes for Groundwater, PVC or Gasketed Service Lines, thence the target levels for Groundwater, PVC or Gasketed Mains, were derived. Consequently, the 1/8th safety factor has also been applied to the target levels for both ethylbenzene and total xylenes in soil.

### Appendix B-1 – Tier 2 Equations and Parameter Values (Old Model)

All Tier 1 equations and parameters apply at Tier 2 except as specified below.

#### Equation for Tier 2 Groundwater Contaminant Transport Model

$$C(x) = C_s \exp \left( \frac{X}{2a_x} \left[ 1 - \sqrt{1 + \frac{4\lambda a_x}{u}} \right] \right) \operatorname{erf} \left( \frac{S_w}{4\sqrt{a_y x}} \right) \operatorname{erf} \left( \frac{S_d}{4\sqrt{a_z x}} \right)$$

#### Variable definitions

x: distance in the x direction downgradient from the source

erf( ): the error function

C(x): chemical concentration in groundwater at x

C<sub>s</sub>: Source concentration in groundwater (groundwater concentration at x=0)

S<sub>w</sub>: width of the source (perpendicular to x)

S<sub>d</sub>: vertical thickness of the source

u: groundwater velocity (pore water velocity); u=Ki/θe

K: hydraulic conductivity

i: groundwater head gradient

θe: effective porosity

λ: first-order decay coefficient, chemical specific

α<sub>x</sub>, α<sub>y</sub>, α<sub>z</sub>: dispersivities in the x, y and z directions, respectively

For the following lists of parameters, one of three is required: site-specific measurements, defaults or the option of either (which means the default may be used or replaced with a site-specific measurement).

#### Soil parameters

| Parameter           |                                                    | Default Value                                              | Required |
|---------------------|----------------------------------------------------|------------------------------------------------------------|----------|
| ρ <sub>s</sub>      | soil bulk density                                  | 1.86 g/cm <sup>3</sup>                                     | option   |
| f <sub>oc</sub>     | fraction organic carbon in the soil                | 0.01 kg-C/kg-soil                                          | option   |
| θ <sub>T</sub>      | total soil porosity                                | 0.3cm <sup>3</sup> -voids/cm <sup>3</sup> -soil            | option   |
| θ <sub>as</sub>     | volumetric air content in vadose zone              | 0.2cm <sup>3</sup> -air/cm <sup>3</sup> -soil              | default  |
| θ <sub>ws</sub>     | volumetric water content in vadose zone            | 0.1cm <sup>3</sup> -H <sub>2</sub> O/cm <sup>3</sup> -soil | default  |
| θ <sub>acrack</sub> | volumetric air content in foundation/wall cracks   | 0.2cm <sup>3</sup> -air/cm <sup>3</sup> -soil              | default  |
| θ <sub>wcrack</sub> | volumetric water content in foundation/wall cracks | 0.1cm <sup>3</sup> -H <sub>2</sub> O/cm <sup>3</sup> -soil | default  |
| I                   | infiltration rate of water through soil            | 7 cm/year                                                  | default  |

If the total porosity is measured, assume 1/3 is air filled and 2/3 is water filled for determining the water and air fraction in the vadose zone soil and floor cracks.

#### Groundwater Transport Modeling Parameters

| Parameter      |                                  | Default Value                        | Required      |
|----------------|----------------------------------|--------------------------------------|---------------|
| K              | hydraulic conductivity           | 16060 cm/year                        | site-specific |
| i              | groundwater head gradient        | 0.01 cm/cm                           | site-specific |
| S <sub>w</sub> | width of the source              | use procedure specified in 135.10(2) | site-specific |
| S <sub>d</sub> | vertical thickness of the source | 3 m                                  | default       |
| α <sub>x</sub> | dispersivity in the x direction  | 0.1x                                 | default       |

| Parameter  |                                 | Default Value  | Required |
|------------|---------------------------------|----------------|----------|
| $\alpha_y$ | dispersivity in the y direction | $0.33\alpha_x$ | default  |
| $\alpha_z$ | dispersivity in the z direction | $0.05\alpha_x$ | default  |
| $\theta_e$ | effective porosity              | 0.1            | default  |

where  $u = Ki/\theta_e$

#### First-order Decay Coefficients

| Chemical          | Default Value $\lambda$ (d-1) | Required |
|-------------------|-------------------------------|----------|
| Benzene           | 0.0005                        | default  |
| Toluene           | 0.0007                        | default  |
| Ethylbenzene      | 0.00013                       | default  |
| Xylenes           | 0.0005                        | default  |
| Naphthalene       | 0.00013                       | default  |
| Benzo(a)pyrene    | 0                             | default  |
| Benz(a)anthracene | 0                             | default  |
| Chrysene          | 0                             | default  |

#### Other Parameters for Groundwater Vapor to Enclosed Space

| Parameter   |                                                         | Default Value | Required |
|-------------|---------------------------------------------------------|---------------|----------|
| $L_{gw}$    | depth to groundwater from the enclosed space foundation | 1 cm          | option   |
| $L_B$       | enclosed space volume/infiltration area ratio           | 200 cm        | option   |
| ER (s-1)    | enclosed space air exchange rate                        | 0.00014       | default  |
| $L_{crack}$ | enclosed space foundation or wall thickness             | 15 cm         | default  |
| $\eta$      | areal fraction of cracks in foundation/wall             | 0.01          | default  |

#### Other Parameters for Soil Vapor to Enclosed Space

| Parameter   |                                                                     | Default Value | Required |
|-------------|---------------------------------------------------------------------|---------------|----------|
| $L_s$       | depth to subsurface soil sources from the enclosed space foundation | 1 cm          | option   |
| $L_B$       | enclosed space volume/infiltration area ratio                       | 250 cm *      | option   |
| ER (s-1)    | enclosed space air exchange rate                                    | 0.000185 *    | default  |
| $L_{crack}$ | enclosed space foundation or wall thickness                         | 15 cm         | default  |
| $\eta$      | areal fraction of cracks in foundation/wall                         | 0.01          | default  |

\*These values are an average of residential and nonresidential factors.

#### Soil Leaching to Groundwater

| Parameter |                         | Default Value | Required |
|-----------|-------------------------|---------------|----------|
| $\delta$  | groundwater mixing zone | 2 m           | default  |

#### Building Parameters for Iowa Tier 2

| Parameter |                                               | Residential | Nonresidential |
|-----------|-----------------------------------------------|-------------|----------------|
| ER (s-1)  | enclosed space air exchange rate              | 0.00014     | 0.00023        |
| $L_B$     | enclosed space volume/infiltration area ratio | 200 cm      | 300 cm         |

#### Other Parameters

For Tier 2, the following are the same as Tier 1 values (refer to Appendix A): chemical-specific parameters, slope factors and reference doses, and exposure factors (except for those listed below).

Exposure Factors for Tier 2 Groundwater Vapor to Enclosed Space Modeling:

Potential Residential: use residential exposure and residential building parameters.

Potential Nonresidential: use nonresidential exposure and nonresidential building parameters.

#### Diesel and Waste Oil

| Diesel and Waste Oil |                                     |           | Chemical-Specific Values for Tier 1 |                |                   |          |
|----------------------|-------------------------------------|-----------|-------------------------------------|----------------|-------------------|----------|
| Media                | Exposure Pathway                    | Receptor  | Naphthalene                         | Benzo(a)pyrene | Benz(a)anthracene | Chrysene |

Due to difficulties with analytical methods for the four individual chemicals listed in the above table, Total Extractable Hydrocarbon (TEH) default values were calculated for each chemical, using the assumption that diesel contains 0.2% naphthalene, 0.001% benzo(a)pyrene, 0.001% benz(a)anthracene, and 0.001% chrysene. Resulting TEH Default Values are shown in the following table.

| Diesel             |                                     |           | TEH Default Values |                |                   |          |
|--------------------|-------------------------------------|-----------|--------------------|----------------|-------------------|----------|
| Media              | Exposure Pathway                    | Receptor  | Naphthalene        | Benzo(a)pyrene | Benz(a)anthracene | Chrysene |
| Groundwater (ug/L) | Groundwater Ingestion               | actual    | 75,000             | 1,200          | 12,000            | 120,000  |

- <sup>1</sup> July 15, 1987, effective date of 135.9(4) delayed 70 days by Administrative Rules Review Committee at its June 1987 meeting.
- <sup>2</sup> August 6, 2008, effective date of **ARC 6892B** delayed 70 days by Administrative Rules Review Committee at its July 2008 meeting. At its meeting held October 14, 2008, the Committee delayed until adjournment of the 2009 Session of the General Assembly the following provisions: **567—135.2(455B)**, definition of “Sensitive area”; **135.9(4)“f”**; **135.10(4)“a,”** last sentence: “A public water supply screening and risk assessment must be conducted in accordance with 135.10(4)“f” for this pathway” and **135.10(4)“b,”** last sentence of the first paragraph: “The certified groundwater professional or the department may request additional sampling of drinking water wells and non-drinking water wells as part of its evaluation”; **135.10(4)“f”**; **135.10(11)“h.”**
- <sup>3</sup> February 17, 2010, effective date of 135.5(1)“e” delayed 70 days by the Administrative Rules Review Committee at its meeting held February 8, 2010. At its meeting held April 13, 2010, the Committee delayed the effective date of 135.5(1)“e” until adjournment of the 2011 Session of the General Assembly.

CHAPTER 136  
FINANCIAL RESPONSIBILITY FOR UNDERGROUND STORAGE TANKS

Chapter rescission date pursuant to Iowa Code section 17A.7: 9/23/31

**567—136.1(455B) Applicability.**

**136.1(1)** This chapter applies to owners and operators of all petroleum underground storage tank (UST) systems, except as otherwise provided in this rule.

**136.1(2)** State and federal government entities whose debts and liabilities are the debts and liabilities of a state or the United States are exempt from the requirements of this chapter.

**136.1(3)** The requirements of this chapter do not apply to owners and operators of farm or residential tanks of 1,100 gallons or less capacity installed prior to July 1, 1987, or any UST system described in 567—paragraph 135.1(3) “b” or 567—subparagraph 135.1(3) “c”(1), “c”(3) or “c”(4).

[ARC 0492D, IAB 8/19/26, effective 9/23/26]

**567—136.2(455B) Policy; adoption by reference.**

**136.2(1)** It is the policy of the commission to ensure consistency, equity, and efficiency in providing financial responsibility for Iowans and the businesses providing services to Iowans that owners and operators of UST systems in this state must comply with the provisions of the federal rules requiring and regulating the financial assurance of UST systems. This rule shall be interpreted in a manner consistent with this policy.

**136.2(2)** The commission hereby adopts by reference 40 CFR Chapter I, Subchapter I, Part 280, Subpart H (2015), subject to the following conditions:

*a.* All uses of “Agency,” “Environmental Protection Agency,” “EPA,” and “implementing agency,” and any reference to the regional offices of the Environmental Protection Agency, shall be replaced with “Department of Natural Resources,” except where the context of the rule requires notice or submission to both federal and state entities, in which case the replacement language shall be in addition to the original language.

*b.* All uses of “Administrator” and “regional administrator,” and any reference to the designee of either, are replaced with “the director of the Department of Natural Resources or their designee,” except where the context of the rule requires notice or submission to both federal and state entities, in which case the replacement language shall be in addition to the original language.

*c.* 40 CFR 280.100 is not adopted by reference.

*d.* 40 CFR 280.101 is not adopted by reference.

[ARC 0492D, IAB 8/19/26, effective 9/23/26]

**567—136.3(455B) Additional requirements.**

**136.3(1)** *Notice of extended reporting.* In any written final cancellation or nonrenewal notice, an entity that provides insurance pursuant to this chapter shall notify the primary insured party and any additional named insured parties of the six-month extended reporting expiration date provided in 40 CFR 280.97 (2015).

**136.3(2)** *Notice and claim by the department.* Notwithstanding any other requirement or limit in 40 CFR Chapter I, Subchapter I, Part 280, Subpart H (2015), timely notice of a release and claim for coverage to the insurer by the department of natural resources shall be deemed sufficient notice on behalf of the insured under the terms, conditions, and exclusions of a policy issued to demonstrate compliance with this chapter. Notice by the department shall not modify or enlarge the terms, conditions, and exclusions of coverage, but is only intended to preserve coverage to which the insured may otherwise be entitled under the policy.

[ARC 0492D, IAB 8/19/26, effective 9/23/26]

These rules are intended to implement Iowa Code sections 455B.424 and 455B.474.
