

481—59.3(135B,135C) TB risk assessment.

59.3(1) Annually, a health care facility or hospital shall conduct a TB risk assessment to evaluate the risk for transmission of *M. tuberculosis*, regardless of whether a person with suspected or confirmed TB disease is expected to be encountered in the facility or hospital. The TB risk assessment shall be utilized to determine the types of administrative, environmental, and respiratory protection controls needed and serves as an ongoing evaluation tool of the quality of TB infection control and for the identification of needed improvements in infection control measures.

59.3(2) The TB risk assessment shall include the number of persons with infectious TB encountered in the facility or hospital that resulted in the facility's or hospital's conducting a contact investigation of exposed HCWs or patients during the previous 12 months.

59.3(3) TB cases include persons who had undiagnosed infectious pulmonary or laryngeal TB while in the facility or hospital during the preceding year. This does not include persons with LTBI (treated or untreated), persons with extrapulmonary TB disease, or persons with pulmonary and laryngeal TB who have met criteria for noninfectiousness.
